Will be performed in the original Greek at HARVARD UNIVERSITY, in the SANDERS THEATRE, on the evenings of May 17, 19, and 20. The part of Œdipus will be taken by Mr. GEORGE RIDDLE, instructor in Elocution, and the other parts by students of the University. The music for the Choruses has been composed for this performance by Professor J. K. PAINE; and the choral odes will be sung by a dramatic chorus of fifteen students, assisted by a supplementary chorus composed chiefly of graduates, with orchestral accompaniment.

Five hundred tickets for the first performance, at $3 each, and eight hundred for each of the other performances, at $2 each, will be offered to the public. Each ticket will entitle the holder to a reserved seat.

Of these tickets, a number not exceeding 100 for the first evening, and 200 for each of the succeeding evenings, will be assigned by the committee to persons living in places distant from Cambridge. Applications for these may be made to Mr. C. W. SEVER, University Bookstore, Cambridge, and must be received by him on or before March 25. These tickets will be assigned by lot, and adjacent seats (when desired) will be given to each applicant. If more tickets are asked for than can be assigned in this way, the committee will distribute those which are at their disposal to the applicants according to their judgment. All applicants will be informed immediately by mail of the number of tickets assigned them; and payment for the tickets will be deferred until such notice is received.

The regular sale of tickets will begin at the University Bookstore in Cambridge, and at 146 Tremont Street in Boston, on Monday, April 4, at 10 A.M.

The text of the "Œdipus Tyrannus," in Greek and English, will be for sale at both places at which tickets are sold, and will be sent by mail to any address. Price 50 cents; by mail, 60 cents.

The music of the choruses, composed by Professor PAINE, with Greek and English words, and Piano accompaniment, will be published March 30 by Mr. ARTHUR P. SCHMIDT, 146 Tremont Street, Boston, who will send it by mail to any address on receipt of the price, $1 25.

W. W. GOODWIN,
J. W. WHITE,
J. K. PAINE,
Committee of Arrangements.

HARVARD UNIVERSITY, March 16, 1881.

NEW AND PRACTICAL SOLUTION OF THE IRISH LAND PROBLEM.

Occupying Ownership in Ireland.

By the late Vincent Scully, Q.C. Making, with his Registration of Title and Land Debentures Acts of 1865, a complete scheme for enabling Occupying Tenants to Purchase the Ownership in Fee of their Farms. Edited by his Son. Price Sixpence.

London: EDWARD STAMFORD, 55 Charing Cross, S. W.
Dublin: HODGES, FIGGIS & CO.

UNMOUNTED PHOTOGRAPHS

Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architectural subjects, etc. Price, cabinet size, $1 50 per doz. Send stamp for catalogue of 1,600 subjects. JOHN P. SOULE, Publisher, 338 Washington Street, Boston, Mass.

THE ART AMATEUR will purchase original and well-written articles on Decorative Art topics: embroidery, ceramics, bric-à-brac, furniture, interior decoration, industrial art, etc. Send stamps for return of MS. if not accepted. Address THE ART AMATEUR, 23 Union Square, N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 24, 1881.

The Week.

THE week in Wall Street was the dullest of the year, mainly because of the uncertainty respecting an extra session of Congress. The Secretary of the Treasury naturally enough declined to foreshadow what his policy would be respecting the maturing debt, and incidentally the money market, until it was decided whether the new Congress should be called together. The principal reason for an extra session is the need of a refunding bill. If this is not obtained, the existing laws will be used to the fullest extent to provide for the six-hundred-odd millions of debt which is payable at the option of the Government before July next. If there is to be an extra session, there are doubts whether a practicable refunding bill can be secured, as the new Congress may insist on the folly of the old one in linking refunding to national-bank regulation. All this uncertainty restricted the volume of business in and out of Wall Street. The demand for loans was accordingly decreased, and the supply of loanable funds was kept up by receipts of foreign gold, about $1,250,000 having arrived. The result was, therefore, an easy money market, without further extraordinary disbursements by the Treasury. The Western railroads have been again afflicted by heavy snow-storms, and general trade in that region has suffered somewhat. In London money continues very easy. British consols advanced during the week to 100 to 100⅛. The new French loan (3 per cent. at 83¼) was brought out during the week, and the subscriptions amounted, by resort to the usual tactics, to about forty times the amount offered. The price of silver bullion in London fell to 52*d.* per ounce, and here the bullion value of the "buzzard" dollar was at the close $0.8662.

Pending the President's decision as to the extra session, the Republicans of the Senate have abstained from precipitating a conflict over the filling of the offices which afforded the ground of coalition with General Mahone. Their resolve in caucus on Tuesday, however, to wait no longer, but to nominate George C. Gorham for secretary, Henry Riddleberger, of Virginia, for sergeant-at-arms, and J. R. Young, of Pennsylvania, for principal executive clerk, may be taken as one of the signs that the extra session is more probable than not, and that it will be called soon. There would be a certain indecency in turning out the present incumbents on the eve of the long recess; and, if the Republicans were not incapable of it, the Democrats would probably seize it as a pretext for resisting the change by all manner of obstruction, which the relative proportion of parties makes easy. On general principles the minority have no cause of complaint. Just two years ago they made a clean sweep in the same manner, and are now getting turnabout. We advise them, as the best thing they can do in the debate upon it, to quote freely from Mr. Conkling's warm denunciation of the practice, in March, 1879. He was then a great stickler for the "usage and propriety of the Senate," which "had decided that those places ought not to be put up in a political raffle and made rewards for party services, but that those who held them should be allowed to retain them on their merits." "Able and conscientious officers," he went on to say, "proficient in all their duties, were to be removed at the behest of party cupidity, that the offices might be subject to the voracity and hunger of those who were supposed to be entitled to reward."

The crowd of office-seekers in Washington is described as something unprecedented, although there has been no change of the party in power. The White House and all the departments are besieged with them from morning till night, and the time which the President and members of the Cabinet ought to give to mastering the details of their several departments is taken up in listening to persistent beggars for small places and in devising modes for getting rid of them. Mr. Lincoln has sought relief by posting up a notice that he will not see applicants for office, but we do not hear that the President has adopted any similar expedient. There is nothing very strange in all this; it is an old story. What is strange is that in the newspapers which tell of it, side by side with lamentations over it we find sneers and denunciations of the efforts of those who seek to deliver the officers of the Government from this plague by a few simple rules which would keep the office-seekers at home. The present state of things has almost all the evils, as regards the community at large, of a Government lottery, in turning the minds of tens of thousands away from regular industry, and causing them to waste money they can ill afford, and time which might be usefully employed, in hanging round Washington and practising all sorts of base arts, in order to get into places for which they have no fitness. President Garfield has made a general announcement that no changes will be made except for cause. If this is a good and useful announcement to make, where is the harm of embodying it in a law?

The renomination of Mr. Stanley Matthews for the Supreme Court by President Garfield has been, we think, a genuine surprise for the whole country. The expressions of opinion which were called forth by the nomination when Mr. Hayes made it seemed sufficiently strong and general to be decisive, and the hostility of the Senate seemed equally well ascertained. That the President thinks it has any better chance of success under him than under his predecessor it is hard to believe, and we are forced to the conclusion that he has made it in compliance with some sort of dying request from Mr. Hayes, and in this way reconciles his making it with his sense of duty by the consideration that it is most probably a barren compliment. But if any one said that a nomination for one of the highest judicial offices in the country ought not to be used in this way, we should not contend with him. In fact, it ought to be a well-settled practice that no nomination for a judicial office ought to be pressed to which there has been any widespread or weighty objection on moral grounds, for the plain reason that the bench should not only be pure, but should command universal confidence.

The joy with which Senator Mahone has been received into the Republican ranks in the Senate seems, considering that he is a repudiator, or "readjuster," as it is euphemistically called, of the State debt, a little scandalous in view of the horror caused in the best Republican minds by the alliance of the Democrats with the Greenbackers. The managers in Washington are evidently a little conscious of this, for they have made, through the Washington correspondent of the *Herald*, a very ingenious excuse for Mahone. It appears from this that "readjustment" is "simply the occasion and not the purpose of an anti-Democratic movement in Virginia, just as Greenbackism was the occasion for a similar anti-Democratic movement in other Southern States." In support of this view the saying is cited of a Mississippian, who, being asked what a Greenbacker was in Mississippi, explained that "he was a man who would be hanged before he would cast another vote for the proscriptive and intolerant Bourbon Democracy." So that it appears it is wrong to denounce Mahone as a "repudiator of debts," inasmuch as his object in advocating repudiation is simply to show his dislike of the Bourbons. It is quite right to make this explanation, because nobody would ever have guessed what he was really about. But is not this a roundabout, odd way of doing good? Is it not somewhat like the plan, pursued by the rioters in New York in 1863, of hanging peaceable negroes in order to express their dislike of the war? Can it be possible that Governor Plaisted's peculiar financial views are simply a mode of testifying his dislike of a third term, or a desire for free ships, or for the abolition of capital punishment?

The Cincinnati *Commercial*, nothing daunted by painful experience, has actually begun to prophesy again about silver. It maintained with the utmost fury, after the fall in silver began in 1875, that it was caused

by our Coinage Act; although, as we pointed out to it, our Coinage Act threw no silver out of use, and therefore could have had no effect on the market. In other words, it maintained that the natural ratio between silver and gold was 15½ to 1, and that the fall of silver to 17 and 18 to 1 was the result of a conspiracy of the "gold bugs." Entirely unabashed by this little miscarriage, it now maintains with a certain cheerful simplicity, as if approaching the subject for the first time, that "Gold had been gradually gaining for centuries on silver in comparative value. It is vain to expect an equilibrium to be preserved without that fact is fully recognized. In the European ratio of 15½ to 1 gold, silver is overvalued. The American ratio of 16 to 1 is the true thing. We are tied to that by our bonds. Europe should move according to the experience of centuries, and come to us. Then, with unlimited coinage of both metals, the gold and silver dollars would be equal to gold and remain so." The operations of the silver mind are so mysterious that we shall not undertake to criticise this extraordinary conclusion. But we must observe that it is highly absurd to call on Europe to "move according to the experience of centuries and come to us." Europe will be amused by it. There was no "experience of centuries" in our silver legislation. It was brought about in the wildest excitement, as the means of defeating a terrible conspiracy against "the debtor class," and restoring to the American people a large quantity of metal relics of deceased ancestors, which the "conspirators" were charged with having wickedly purloined.

Mr. George Jones, of the *Times*, as treasurer of the "Presidential Retiring Fund for the benefit of General Grant," has made his report through the columns of that paper. The total amount subscribed is $250,000. The total number of subscribers for $249,850 of this amount is 144. But $229,500 of the whole came from 76 persons, and $170,000 of it from 23 persons. Mr. Jones says that about $50,000 have been subscribed "on the distinct understanding that the names of the donors should be kept secret." He gives no names whatever. The New York *Tribune*, however, is not equally reticent, and professes to know as much about the matter as Mr. Jones. It gives the names of subscribers of $169,000 of the fund, numbering 47 in all. Of this amount $75,000 is attributed to Messrs. Jay Gould, J. W. Mackey, and William H. Vanderbilt, each giving $25,000, although Mr. Jones says only two gave $25,000 each. Mr. J. M. Forbes, of Boston, according to the *Tribune*, gives $10,000, and the others give various sums down to $250, contributed by Vice-President Arthur. The account given in the *Times* from day to day of the character, aims, and activity of Jay Gould is held by the evil-minded to explain Mr. Jones's apparent reluctance to publish the names. It is right to add that Mr. Jones declares that there is "enough of truth" in the *Tribune's* list "to give it a certain air of plausibility, and more than enough of falsehood to make it ridiculous," and he warns the curious that in speculating about the contributors they are meddling in what does not concern them. This seems to us an extreme view, and we must remind Mr. Jones that no one can see the laughableness of the *Tribune's* list but the very small body who are in the secret. Why not publish the true list, leaving out the modest ones who have stipulated for secrecy, and let us all have a share in the fun? The destination of the fund seems to have been changed since the subscription was started. It was originally intended for the benefit of the oldest ex-Presidents, beginning with General Grant, but Mr. Jones now says that it is to be regarded as an "imperfect substitute for the want of national provision for General Grant," and the disposition to be made of it after his death is to be settled hereafter by the "subscribers of the major portion of the amount."

The Schurz dinner in Boston, if it accomplished nothing else, drew from the guest of the occasion one more of those apt and impressive speeches in which he is almost without a rival. It was entirely devoid of personalities, though Mr. Schurz could not help alluding to the strange circumstance that his best motives had been impugned by those whom "an identity of general purpose" should have made his friends. He depicted very forcibly the heterogeneousness of the Interior Department, which he characterized as the most difficult and the most dangerous department of the Government, offering the most numerous temptations and facilities for fraud and plunder, and taxing all the vigilance of its head, even after he has understood its different branches and mastered its machinery. He could say without exaggeration that "the Interior Department devolves as much labor and responsibility upon its head personally as any other two departments impose upon their chiefs joined." Though Mr. Schurz spoke a good word for his successor, such a revelation of the qualities required in an efficient Secretary is calculated to cause serious misgiving in the case of a man who takes office in the sixty-eighth year of his age. We shall never have any fairer warning that it is high time to divide the Department, and we some months ago showed how much relief might be afforded it by grouping around a real Agricultural Department the bureaus which properly belong to it.

Judge Albion W. Tourgee has an article in the current number of the *North American*, in which he undertakes to point out some of the objections to civil-service reform. The judge is not a powerful reasoner, and his discovery that the question hinges upon the difference between the meaning of the word "reform" and what he calls "re-formation," is about as valueless a contribution to the discussion as has yet been made. The facts that "Luther fought the See of Rome, but poured the fiercest vials of his wrath upon Zwinglius for differing as to the method of assault," and that "Calvin thundered for the right of private conscience, but struck hands with the Papal prosecutor and roasted Servetus for inventing a new theory of the operation of grace," have very little bearing on the question of the best method of making appointments in the lower grades of the civil service. There is, however, a more serious objection to the judge's article than the wildness of its argument, and that is that he evidently does not know what the proposals of the civil-service reformers are. He puts it down as one of the "essential elements" of their plan that no officer in the service shall be allowed to take "part in any caucus or other political organization farther than to cast his own vote," and adds, so that there may be no mistake about it, that this is one of the "significant provisions" of "the bill recently presented from the Democratic caucus, and said to have the approval of Mr. Eaton, the Chairman of the Civil-Service Commission." Now, the bill "to regulate and improve the civil service of the United States," reported back to the Senate by Mr. Pendleton's committee on the civil service, contains no such provision at all; but, on the contrary, a provision designed to prevent superior officers from *compelling* their subordinates to do political work or make political contributions. Under this bill there is nothing to prevent employees of the Government taking just as much part in caucuses and conventions as they now do, and if the judge had looked into the bill before analyzing its provisions he would have perceived this.

We have commented elsewhere upon the spirited meeting on Friday evening at the Cooper Union in regard to the abominable condition of our city streets. The doctors had taken up the subject the day before, in the Academy of Medicine, passed the proper resolutions, and sent a delegate to the lay gathering. The Mayor had already taken the Police Commissioners to task for their non-performance, calling their attention to the prima-facie appearance that the Street-Cleaning Bureau had achieved less and spent more money last year than the year before, and requesting a specific account of the way in which they had discharged their trust. They seemed to have much difficulty about doing so, asked for an extension of time, and in all actually took twenty days to prepare the report in question. The sum of it is, that on their showing the Bureau did more and spent less in 1880 than in 1879; but it is impossible to check their statements, while their want of system and vigor is ludicrously apparent throughout. The Committee of Twenty-one appointed at the Citizens' Meeting have, as was to have been expected, begun by seeking relief at Albany, where they will speedily present and urge a bill taking the care of the streets out of the hands of the police, and probably giving it to some responsible head. Doubtless if they are successful there will be a temporary change for the better; but when shall we see an organization of this fundamental branch of municipal economy on a plan as permanent as the physical conditions of the island, with an equipment worthy of the metropolis,

and with a service as regular, efficient, and impartial as it is in cities nearly as densely populated and not nearly so well circumstanced as New York?

The objections of the Bar Association of this city to the adoption by the Legislature of the Field Code are in substance as follows: The new code abolishes the common law in all cases "where the law is declared" by it; it does not merely codify the law, but introduces at all points material and ill-considered changes; it introduces new terms and expressions into the statement of the law, the meaning of which cannot be determined without much needless litigation. In support of these objections the Association gives, in a published report on the subject, numerous instances. One of the most important of these is that all the provisions of the Revised Statutes concerning estates in land and trusts are re-written, "with some changes of substance and very many changes of language." As to this the Association says: "For half a century this part of the Revised Statutes has been the law of the State, with hardly the alteration of a word. Its construction has been thoroughly recognized and declared by repeated decisions save in those border cases which inevitably arise under any system of law and are proper to be determined upon general principles as specially applied to the particular facts of the case. No change of either substance or language ought to be tolerated unless for reasons of great and overruling necessity." Besides this, radical changes are introduced into the law of succession to real and personal property and the law governing the property rights of husband and wife. Some of the reforms introduced are rather singular—*e.g.*, "one who hires part of a room for a dwelling is entitled to the whole of the room, notwithstanding any agreement to the contrary" (sec. 998); one who sells personal property "must bring it to *his own door*, or other convenient place, for its acceptance by the buyer" (sec. 873). The Association has appointed a committee to go to Albany and oppose the passage of the code, and we presume that in the face of these serious criticisms no action will be taken by the Senate without much fuller consideration than the subject seems yet to have received.

It already seems probable that the proposed International Cotton Exposition to be held at Atlanta, next October, will be successful. Of the $100,000 deemed necessary $35,000 were subscribed in Atlanta as soon as books were opened, and the director, Mr. H. I. Kimball, has no doubt, he says, that the remainder will be easily made up, three firms, indeed, of this city having subscribed $10,000 between them. Ex-Governor Bullock will leave for Europe early next month, commissioned to obtain exhibits from the spinners and manufacturers of England, France, and Germany, whose co-operation is already assured. Every kind of cotton grown will be planted in the Exposition grounds, the building itself will be a model factory, and the entire industry in all its processes, from seed-planting to cloth-making, displayed to the 200,000 visitors upon whom the managers say they count. The value of the Exposition to the industry is apparent enough, but scarcely less obvious is the benefit which Northern business men, and others perhaps, ought to reap from so favorable an opportunity of seeing the South as it is, its resources, and the capacity of the people to develop them. To this end, Mr. Edward Atkinson, of Boston, who has exhibited great interest in the project, offers the excellent suggestion that the scope of the Exposition be enlarged so as to show, in an auxiliary exhibition, the resources in coal, iron, copper, salt, lead, zinc, corundum, and different sorts of timber which the region possesses. In wealth of this kind parts of the "New South," as he says, exceed that of Great Britain and France combined, and yet are at present "the *terra* (almost) *incognita* of the nation."

The Minnesota Legislature has passed a bill providing for the payment of fifty per cent. of the State railroad indebtedness, bonds and interest. It received executive approval at once, of course, its passage having doubtless been due in some measure to the message of Governor Pillsbury at the opening of the session, in which he spoke of the State's repudiation in such terms as it deserved. The minority contested every step in the progress of the bill, and the fulfilment of its provisions is still dependent upon the decision of a tribunal created by it to the effect that the repudiating constitutional amendment of 1860 is void; or, in case the decision should be adverse, upon the judgment of the people at the next general election thereafter. It seems to be admitted, however, that there will be no trouble about these conditions nor about disposing of a legal question raised by the minority as to the necessity of a two-thirds majority in the matter; they assert that as the payment is to be made out of the internal-improvement lands it is in the nature of a tax, which does require that vote. The bonds are held all over the country, but very largely by Mr. Selah Chamberlain, of Cleveland, who was one of the contractors for building the roads in question, and who has, in person or by his agents, fought strongly for his dues with every legislature for years. The bonds will be redeemed January 1, 1884, to which date the interest will be computed in "new adjustment bonds," bearing five per cent. interest, and to run for thirty years or ten at the option of the State. There are minor provisions, as to supply-claims, etc.

The chances in the East are still strongly and increasingly in favor of war. The ambassadors at Constantinople have been now for a month negotiating with the Porte, not exactly collectively but severally in concert, and all they have succeeded in extracting from it in the way of concession is a very small patch of territory in Thessaly and the island of Crete. Crete is not much of a concession, because it already enjoys autonomy, and is on the verge of an insurrection, in which the remaining vestiges of Turkish authority will almost certainly be got rid of. The ambassadors are said to demand Thessaly as well as Crete, and the news may come any day now that the negotiations are at an end, and that the Greeks are marching. The Turkish fleet will probably not be allowed by England to go to Greek waters, but it is doubtful whether it could do so in any case owing to the condition of the ships, and then the Greeks are making ample preparation for them in the way of torpedoes. The gravity of the situation has been much increased by indications which we noticed some weeks ago, apropos of the report of the German staff on the condition of the Turkish forces in Thessaly, that Germany is really not opposed to a war, and would as lief have it break out as not. The influence of the German ambassador at Constantinople has, therefore, not been pacific of late.

The French Republicans are somewhat distracted over the proposition now pending to substitute election by a general departmental ticket, or *scrutin de liste*, for election by districts, or *scrutin d'arrondissement*. Gambetta favors the former, while President Grévy and the majority of the Ministers are said to cling to the latter. The two systems have been tolerably fairly tried. The general ticket has been three times in use, the last time in 1871. Since then the district system has prevailed, and the objections to it are, that the members of the Assembly are reduced to the condition of mere local delegates, and so pestered and weighed upon by small local interests and aims that the very idea of the national unity has been weakened in their minds, and the treatment of national questions from the national point of view becomes increasingly difficult. It is expected that by enlarging the constituencies representatives will find not only their responsibility but their independence increased, and Gambetta, who detests parish politics, and is essentially what used to be called here a "national man," is ardently preaching the change through his paper, the *République Française*. M. Grévy, on the other hand, fears a sudden change in the composition of the Assembly, and an over-violent disturbance of the political habits of the electors. Other enemies of the proposal predict a reapportionment which would change the distribution of seats very seriously, in revenge for the monarchical apportionment of 1875, in which there was apparently some gerrymandering; and then the Extreme Right discovers in it a plan for ousting the Right from the representation altogether, and finally for filling the Assembly with Gambetta's creatures, and enabling him to create himself a dictator, and so on. The main importance of the matter to foreigners lies in the fact that it brings Gambetta and the Ministers into collision, though, according to the latest advices, the Ministry has agreed to remain neutral.

"POLITICS" AND DIRT.

THE great street-cleaning meeting in this city on Friday night was, both as regards numbers and enthusiasm and weight, fully entitled to the character now so well known in New York of an "uprising of the business men." The house was crowded, the speakers were famous, and the speeches were eloquent and impassioned, and when the meeting adjourned the usual committee was appointed to pursue the wrong-doers to their lairs. The wrong-doers in this case are the Police Commissioners, who, by one of those odd arrangements so seldom seen out of New York, are charged with the duty of keeping the streets clean. They discharge this duty by cleaning a few streets—very few. Some of the remainder are cleaned by the people who live in them. Most of the streets of the very well-to-do are cleaned in this way. The rest, where the poor live, are not cleaned at all; and this year the accumulations of dirt happen to be unusually great, and the doctors report much resulting disease. The Commissioners profess to be a good deal surprised by the violence of the language used with regard to them, and we have no doubt are really surprised. Since the meeting it is reported that several streets have been cleaned, and there are signs that others will be cleaned by and by. But there is no sign at all that the streets will be kept clean hereafter. Strange as it may seem, things have gone this year exactly as they have gone for twenty-five or thirty years. The streets of New York have not been regularly swept within the memory of any of its inhabitants under forty. The indignation expressed at the meeting the other night was the indignation which has been for thirty years finding vent in conversation and in the newspapers. The well-established and, one might almost say, immemorial practice of the city government has been to clean Broadway and Fifth Avenue every night in good weather; to clean the other streets once in the spring after the thaw, and perhaps once in the fall after the summer heats. Some streets have always been cleaned somewhat oftener, but apparently on no definite plan. Some one seems to go round and every now and then select a street as a good one to clean, and put a force to work on it for a day or two. But nobody in this generation has ever seen a systematic, periodical, and complete street-cleaning in New York. The inhabitants of the district between Fourteenth Street and the Central Park, and between Fourth and Sixth Avenues, fully twenty years ago began to give up all reliance on the municipal authorities, and to clean their own streets by private subscription, in the manner in which the whole city ought to be cleaned —viz., by a daily or nightly sweeping and removal of the accumulated dirt. Every year, too, for the last thirty years, an enormous sum has been spent by the persons charged with the duty of cleaning the streets, and every year there has been the same outspoken and angry desire to know what had become of the money. Every year the street-cleaners have made answer that it had been spent in cleaning the streets, and when the furious public roared out that the streets had not been cleaned the cleaners calmly pleaded, just as the Police Commissioners now plead, that this was because they had not had money enough. In fact, to some of the middle-aged men who were at the meeting the other night there must have been in the proceedings a sad reminiscence of their youth, "the bright, the happy, the unforgotten," when the streets used to be left uncleaned by a former race of villains now in their graves, or absorbed in some other calling more profitable even than pretending to clean streets. What adds to the exasperation of those of the citizens who have a taste for clean streets is that they frequently see the street-cleaners at work. They are mainly aged or decrepit men, whose appearance to a foreigner just landed might speak volumes for the humanity of the city authorities, and for the permanence of the tenure in the American civil service. He might conclude that they were veterans of the street-cleaning department, and that they had worn themselves out and become crippled with rheumatism in sweeping the New York thoroughfares. But the New-Yorker knows better. He is painfully aware that these venerable men are quite new to the business, and, in fact, enter the street-sweeping business because they know there will not be much sweeping to do, and consequently the sight of street-cleaning, instead of soothing and cheering him, only increases his exasperation. So, unhappily, does foreign travel. When he goes abroad he may go through the whole civilized world without finding as dirty a city as his own. He will find nothing to match it in any European civilized state, and nothing to surpass it, not only in filth but in the apparent indifference of the public authorities to the condition of the streets. He may travel through the United States with the same result. There is no Northern city certainly, professing to have paved streets and sewers, which approaches New York in failure to keep the thoroughfares clean. Another and crowning cause of irritation to the taxpayer is the oft-repeated attempt by the Legislature to find out why the streets of New York are not cleaned. There is nothing more amusing in comic literature than some of the evidence taken in these investigations. The single fact that the dirt has to be carried out eighteen or twenty miles to sea, in a species of bark called a "scow," by very unwilling crews, whom nobody looks after very sharply, shows what materials for fun the performance contains. One of the jokes is that when the weather is bad the scows cannot go to sea, and then the streets are not cleaned because there is no place to put the filth. Another issues from the comparative cost of not cleaning New York and of cleaning other cities. It has often been published, and always received with merriment. Mayor Grace, the other day, gave the cost per mile of cleaning the streets of Manchester, England, as $350, while the cost per mile of *not* cleaning the streets of New York is $2,100. A moment's reflection on these figures shows what a fund of innocent and even useful mirth a good bouffe writer might find in the Street-Cleaning Bureau of this city.

This account of the experience of the city in the matter of street-cleaning is, like all accounts we have ever seen, considerably understated. No account can be adequate to any one who has not seen the condition of the streets in the poorer quarters, and who has not followed the history of New York street-cleaning for the last twenty-five years. At first sight it seems inexplicable that such a state of things should exist in one of the three greatest cities of the world, with a million of population and the revenues of a kingdom. But it is not only explicable, but easily explained. Mr. Choate explained it the other night at the meeting in one word when he said that the reason why the streets were not cleaned—why the fourteen hundred street-cleaners are "paupers and vagabonds," who do not earn their wages—is that "politics" was at the bottom of it. Curiously enough, the mention of "politics" as the cause of the trouble brought down the house. The reports say that it was received with "enthusiastic cheering." Everybody knew what "politics" meant without Mr. Choate's telling them—that it meant that "the four Commissioners were in the hands of the Machine politicians of both parties, and they could not and did not dare to do their duty. They might dictate the number of hours of labor the laborers might be employed, but they could not dictate who should be employed or what laborers should be discharged."

"Fourteen hundred laborers," he added, "are employed, and it has been truly said by one of the speakers that you may see one holding a hoe and another a broom, and a small army of inspectors on the curbstone looking at them. (Laughter.) When some of us called upon a police inspector to enquire about this, we were told that those laborers were appointed at the urgent request of reputable citizens, who don't want their names to be disclosed, and that in each case it is an act of charity to the recipient. (Laughter.) Now, gentlemen, you perfectly understand the situation."

In other words, the system known as "the spoils system" in national affairs, by which the money raised from the taxpayers for the public use is treated as in part a campaign fund for the reward of services rendered to the party in power, is in New York applied vigorously to the street-cleaning department, and the reason why the streets of New York are dirtier than those of any other city is simply that there is more "politics" in New York than in any other city. It always has been so. The spoils system took its rise here, its most dextrous and unscrupulous practitioners have been bred and trained here, and it is natural that when the system is applied to the cleaning of the streets here the streets should be less clean than those of any other city. This system has now been submitted to for half a century, and with so little remonstrance or protest that its upholders and promoters have been emboldened to the point of declaring it a valuable and purely American discovery, of the benefits of which the American people will never consent to be deprived. The truth is that it is the greatest source not simply of administrative inefficiency, but of moral rottenness, ever introduced in-

to any political community. It makes every Government office a school not of diligence, and industry, and order, and fidelity, but of intrigue and hypocrisy, shamming, shirking, and corruption. It makes constant war on the fundamental virtues of our civilization, and the more government we have to set up and work the greater pest will it become. It makes an atmosphere in which no man can maintain his manliness and his loyalty to duty. In most departments of governmental activity it is concealed from the public gaze behind stone walls, and the persons who cry out about it are called "theorists" and "grumblers." When it reaches the whole community, and is thrust under their noses and their eyes in the shape of the monstrous and ridiculous fraud called the street-cleaning of New York, and the public recognizes the source of the evil, it is something to be devoutly thankful for. It would be well if the fourteen hundred "paupers and vagabonds" whom the politicians quarter on the taxpayers under the name of street-cleaners could be paraded before every man's door, with their history and the name of their "influence" placarded on their breasts. Anything that brings home to the laborers, mechanics, doctors, lawyers, ministers, and merchants of the United States the shame and disgrace and damage which the spoils system in the nation, State, and city brings on the best interests, both moral and material, of the country is a great gain. For there are not two "spoils systems," but one. That under which the beastly spectacle now to be witnessed in the poorer quarters of this city has been created, at a cost of $2,100 a mile, is the same as that under which senators "run" custom-houses and post-offices, and drag clerks away from their duty to control primaries and caucuses. If the committee appointed the other night means business, it will not confine itself to harassing the Police Commissioners or getting the Mayor saddled with a responsibility which Mr. Grace may bear, but under which in all human probability his successor would succumb, as so many mayors have done already. It will lay the axe to the root of the tree by preaching the new political gospel that the use of the public funds for party purposes, either directly by levying on the salaries of public officers, or by appointing persons to places which they are not competent to fill, or by any diversion of public money from the service of the whole people, is theft; and that the persons engaged in it—senators, representatives, mayors, police commissioners, or scow captains—no matter who they be, are embezzlers and cheats. These are hard names, but until the public has got to the point of applying them in their plain and ordinary sense to the whole tribe who seek to pay their party debts out of the public treasury, not only will the dirt lie in the streets, but it will rise into the houses and hearts of the whole people.

THE FALLACIES OF THE ANTI-MONOPOLY LEAGUE.

WE print elsewhere a communication recently received by us from Mr. F. B. Thurber, on behalf of the Anti-Monopoly League of this city. In it he remonstrates with us in regard to the strictures in the *Nation* of March 10 on Judge Black's great statistical effort in his recent speech in this city. So far as Judge Black's figures are concerned we do not propose to say anything further about them: they speak for themselves. Mr. Thurber makes a good-natured effort to justify and excuse them, but he fails to mend the matter. When a reform association, undertaking to deal with an essentially economical question and addressing itself to the country through eminent public men like Secretary Windom and Judge Black, puts forth such deceptive and transparent fallacies as the Secretary's "$45,000,000 a year on grain alone," or the Judge's "$675,000,000 annual extortion on through-freights alone"—when, we say, anything calling itself a reform association puts forth such shallow statements as these, its representatives must not complain if they are told they discredit themselves and their cause. Mr. Thurber shows some disposition to abandon Judge Black, as a statistical and economical authority, to his fate, and to fall back on his "knowledge of constitutional law." It will be well for him to do so. Judge Black's appearance hitherto in the discussion of the railroad problem has been very little to his credit. He seems to have accepted a brief from Mr. Thurber, and to have derived his whole knowledge of the facts and principles involved from a somewhat hasty reading of that brief. He has thus far contributed absolutely nothing of value to the discussion. His November letter to the League was a mere restatement of the results arrived at through the Granger litigation; but so great was his want of knowledge of the subject that he seems absolutely to have thought that what he was saying was new. Accordingly he said it in a way which led many people, who had not followed the discussion, likewise to think it was new. His second appearance was the recent economical one, and of the copious display of ignorance—what he himself would, perhaps, more gently describe as "fractional inaccuracy"—then made by him, the less said in any serious discussion the better. It is merely to be hoped that, if Judge Black proposes to retain his brief, he will in future familiarize himself a little with the literature and principles of his case, and not again discredit, as he recently did, it, himself, and his clients.

Leaving, however, the now famous Black and Windom statistics, we have a few words to say on the present position of the Anti-Monopoly League. Mr. Thurber endeavors in his letter to state that position. He is disposed to concede to the railroads "a fair rate of profit based upon the cost of service," which in this State was fixed at "ten per cent. net upon the capital actually invested." The rest of the advantage accruing from "steam highways" should, he argues, inure to the public. Having thus stated his position, Mr. Thurber, regardless of the unhappy fate of Messrs. Black and Windom, proceeds to indulge in some Anti-Monopoly League statistics of his own. By them he shows, to his own satisfaction, that Mr. Vanderbilt has extorted $75,000,000 (the League never deals in anything less than $45,000,000) from the country, during the last twelve years, through the agency of the New York Central alone. His figures in this case are as fallacious and deceptive as those of Judge Black. They could as easily be shown to be so. However, we have not space to follow him into them. It is with his general position we now have to deal.

The statement of a fair rate of profit in railroad investments, based upon actual cost of road and service, sounds well. What does it mean? Like everything which emanates from the League, it is vague and indistinct. It shows that the subject has not been thought out. We are talking now of the railroad service of the country. The charge is that, as a whole, it is one vast system of extortion and excessive profit; that it exacts from the country, in excess of the reasonable return it ought to be content with, $45,000,000 a year on one article it carries, and $675,000,000 on a single branch of its business. What are the facts? Unfortunately, in this country we have no body of reliable railroad statistics. In the manufacture of what pass for statistics the League has it all its own way. We have no means of ascertaining what the actual cost of the railroad system, as a whole, has been. We can only approximate it. If we cite State returns, the cry of "watered stock" is at once raised; the construction account has been swelled, it is insisted, by the issue of fictitious securities. Then we are at once pushed off again into the hundreds of millions. Fortunately the League itself has pointed out one little oasis of fact in this vast desert of figments. In the report to the Board of Trade, drawn up by Mr. Thurber as chairman of the Committee on Railroads, and submitted on January 12, 1881, he states that in Massachusetts stock-watering is an indictable offence; that law and public opinion are against it; and, consequently, it is fair to infer that the statistics of Massachusetts as to the actual cost of railroads may be relied on. To the Massachusetts statistics, therefore, we appeal. Last year the average cost of an equipped railroad in that State was $63,000 per mile. We cannot assume this as the average cost per mile throughout the country for two reasons: in the first place, it would not be fair, as the cost in Massachusetts is above the average; and in the second place, the average in unwatered Massachusetts far exceeds the watered average reported elsewhere. In the United States as a whole, Poor in his 'Manual' for 1880 states the average cost at $52,000 per mile. Let us suppose that one-third of this is fictitious—an enormous allowance for "water"; this would make the average actual cost per mile $35,000—just 55 per cent. of the arid Massachusetts cost. Certainly, taking all the great lines of the country, with their enormous equipment and costly terminal facilities, into the account, no one at all familiar with the subject will find fault with this estimate on the ground that it is too large. There is no room for "water" in it. Poor also returns the mileage of the country at 85,000 miles. The rest is a simple matter of arithmetical calculation; not supposed to be, as Judge Black would say, "fractionally accurate." The railroad system of the country, as a whole, on this basis, after allowing for "water" the

absurdly enormous sum of fifteen hundred millions of dollars—on this reduced, hard-pan basis the railroad system represents at least three thousand millions of actual cost—about $250,000,000 more than the highest point of the national debt left us by the rebellion. The entire gross earnings of the system are $530,000,000, and its net earnings above expenses of operating are $220,000,000. The entire net earnings, therefore, represent but 7 per cent. on actual cost thus ascertained. If every dollar of them went annually to the owners of the property it would not, accordingly, be an excessive profit. Every dollar does not go to them, however, as on all well-managed roads a large portion of the net earnings is put into the property. Poor returns the amount actually paid out in 1879 as profit on investment at $173,000,000—being a trifle less than 6 per cent. on our desiccated estimate of actual cost. In Massachusetts during the last eight years the total net income has averaged less than 6 per cent. on the investment. Does the Anti-Monopoly League maintain that this return is excessive?

We are, however, well aware that the League and its advocates will at once reject any and all such methods of computing a reasonable profit. They mass the system only for the purpose of showing extortion by the hundreds of millions. When it comes to averaging its cost and its earnings, they deftly shift their ground. They contemptuously refuse to look at it as a whole. Each road, they insist, shall stand on its own merits. In railroad enterprises, they argue, there should be no prizes; all above a fair profit on the capital actually invested in each enterprise should inure to the public. When losses occur—that is the affair of the investors. There must, however, be no averaging here. In the eyes of the League, therefore, the building of railroads is a business absolutely *sui generis*, and those who build them are fools. That the business is a most risky and uncertain one the League itself does not deny. Yet they insist that those who embark in this risky business should never expect more than a fair profit on any single investment, even the best; and on all the bad investments they should accept the loss as a necessary incident. This position the League calmly takes.

Well, we wish to be reasonable, and so we will accept this position also. It is absurd, and in violation of every business principle; still, for argument's sake, we will accept it. Space, therefore, is to be thrown out of consideration. How is it about time? There are good years and there are bad years in the lives of railroads, as of men. Is this reasonable profit—ten per cent. in New York—accumulative? There are actually no railroads which have always been profitable. Very few pay ten per cent. dividends ever. None have always paid them. Are railroad investors entitled to arrears of unpaid profits? If they cannot average their losses over space and the entire system, may they over time in the case of the individual road? We commend this problem to Mr. Thurber in the case of the New York Central, on a basis of ten per cent. annual profit. The result, we fancy, will astonish him.

This averaging through time, however, the League cannot allow either. If they did, they would be lost. Their only tenable position is a plain one. Investments in railroads, they must say, are unlike any other investment known to men. The profit allowed to them is to be computed on the business of each particular enterprise for each particular year. In no case must it be more than a fair profit on actual cost. There must be no averaging, no accumulation of arrears, no compounding. That is "water." Well, yes, we agree: it is "water"; as the League is trying to inculcate the idea of "water" into the public mind. But, if the League will point out to us one single business ever carried on by private enterprise in any country, not as a matter of charity, where there was neither a guaranty of a moderate profit on the one side, nor a chance to offset good years by bad years, or heavy losses by unusual profits, on the other—when it points out to us one single such case, then, and not until then, will we acknowledge that in their present attitude on this subject they have some basis of reason or precedent to stand on.

They cannot do it. The subject, however, is a large one. We have hardly entered upon it, and must hereafter recur to it. We have yet something to say on the fruitful theme of discrimination.

GOETHE'S RELATIONS TO MUSIC.

GOETHE'S relations to music are discussed by W. J. von Wasielewski in No. 18 of Breitkopf & Haertel's 'Sammlung Musikalischer Vorträge.' No new facts of any importance are contained in the essay, but it is, nevertheless, interesting as a compilation from various sources of the facts recorded on the subject. We are not quite certain, however, that the author has succeeded in proving that Goethe's interest in music was of a distinctly artistic nature, like his interest in the other arts. One of Goethe's most intimate friends during more than thirty years of his life was Zelter, the composer and professor of music at the Berlin Academy of Arts, and first teacher of Mendelssohn. Their extensive correspondence fills six volumes, many pages of which are devoted to discussions of musical matters, chiefly of a theoretical nature. At Weimar Goethe formed a vocal society for weekly practice in his house, the organizing and regulating of which cost him much time and trouble. At the summer resort Berka he frequently secured the services of a skilled organist to play for him in historical order compositions by Bach, Händel, Haydn, Mozart, and Beethoven. Whenever the youthful Mendelssohn came to Weimar he was a welcome guest at the poet's house. Mozart's operas found great favor in Goethe's eyes, and one of them, the "Magic Flute," even inspired him with the plan of writing a continuation of the libretto as text for a second opera, to meet the taste of the public. This continuation remained a fragment, but he wrote, besides it, several *Singspiele*, which were intended to be set to music. These facts, with others that might be enumerated, seem to evince on his part a genuine interest in music as an art. But they do not clash with the view, which is supported by various other considerations, that his interest was more of a scientific nature. In his autobiography he gives an amusing account of some piano lessons he received, in company with his sister. It is also known that, while a student at Strassburg, he began to play on the 'cello. But in neither of these cases was his attachment to his instrument of any duration, as would have been the case if his love of music had had any depth. Whenever Mendelssohn, or any one else, played for him, his principal desire appears to have been that the pieces should be played in historical order; whereas a musician has more regard for contrast and the expression of various moods. Nor was his taste altogether unquestionable, or at least not such as would have been expected of one so far ahead of his generation in all other affairs of the mind. Beethoven seems to have been quite beyond him. He recognized his power and the "demonic" element in his work; but when Mendelssohn, after some coaxing, got permission to play to him the first movement of the C minor Symphony, he found it "*grandios*" but quite mad (*toll*), and incapable of exciting any emotion but that of astonishment. Schubert fared no better. While Zelter's commonplace settings of Goethe's poems found favor in his eyes—or ears—a letter of Schubert's, accompanied by some of his songs to words by Goethe, left him cold. Even ten years later, when he heard the famous Schroeder-Devrient sing the 'Erlking' at Weimar, he found no stronger praise for this wonderful song than that contained in the following words: "I have heard this composition on a previous occasion, when I did not like it at all; but thus interpreted the whole assumes the form of a visible picture."

Goethe's theory of the minor chord is only briefly alluded to by Wasielewski, perhaps because it affords the best grounds for the belief that the poet's interest in music was chiefly based on scientific motives, and that he used the concert-hall as a sort of laboratory. What a great interest Goethe took in the phenomena of color is well known, and attested by the thousand pages he wrote on the subject. He could not believe that white was a result of the combination of all the other colors, since they are all darker than white. His own counter theory was adopted by Hegel and Schopenhauer, but is now entirely discarded, although he considered it as epoch-making. Just as in this theory he opposed all the physicists of his day, so he did with his theory that the minor chord is as natural as the major, if not more so. The current opinion that the minor chord is less natural than the major was based on the fact that the latter is prescribed or foreshadowed by the accessory overtones (or harmonics) which are heard whenever any single musical note is struck. Goethe's reasoning to prove his own theory is weak and untenable, but it sufficed to convince his friend Zelter, while the famous musical theorist Moritz Hauptmann adopted the theory and endeavored to establish it in his work on 'Die Natur der Harmonik und Metrik'; and at the present day it would be difficult to find a practical musician who would not without the least hesitation decide the question in favor of Goethe. Nevertheless Helmholtz insists, on scientific and historical grounds, that the minor mode is in many respects inferior to the major. The minor system was developed very slowly and cautiously during the sixteenth and seventeenth centuries, the avoidance of minor chords, especially at the end of a piece, being common up to Händel, and to some extent even to Mozart; so that it would seem as if the human ear had been obliged to get gradually reconciled to minor harmonies as something foreign to its nature. The same inference seems to follow from the fact that, as Helmholtz asserts, among a hundred songs of the people but one or two are to be found in minor. Music teachers also assert that pupils of moderate endowment find much greater difficulty in striking a minor than a major third. Acoustically, the minor chord is not so pure a concord as the major, owing to its being accompanied by accessory combination-tones which are foreign to the harmony, and give it

a veiled and mystical character. These facts cannot be denied. But no more can it be denied that the most refined musical ears of to-day derive a deeper emotional enjoyment from minor than from major harmonies, and that modern composers show more and more preference for the former. This is especially true of Chopin and Wagner, the two most original and influential composers since Beethoven, with the beauty and richness of whose harmonies Bach's compositions alone can be compared. At the same time it is quite true that dance-music and popular music in general make almost exclusive use of major keys. We seem to have here contradictions and difficulties which show that the question raised by Goethe must be regarded as still open.

Perhaps the following suggestions will throw some light on the matter. It is well known that in mediæval times there were in use a larger number of modes than we have now—the so-called church modes, six in number, two of which, the Ionic and Æolic, corresponded to our major and minor. The minor mode has been described as a sort of compromise between several of the church-modes, one of which, the Phrygian, has its characteristics in an exaggerated degree, while others are intermediate between major and minor. The exclusive use of these last two modes in modern music is simply an illustration of the law of the survival of the fittest. The principle of selection in this case was the *necessity for harmonic combination and modulation*. Our two modes were capable of much greater complication and development in this direction than the others, hence they "survived." But now—and this is the point to which we wish to call attention—it would seem as if this same law of natural selection were gradually working more and more in favor of minor harmonies at the expense of major, because the former are more suited for *free and promiscuous modulation*. Helmholtz contends that the grandest result of modern harmonic music has been the establishment of the principle of tonality, by means of which a close relationship is established between all the parts of a composition and the key in which it begins and ends. This is true of the music of the past, but it would seem as if, to some extent at least, this principle of close family relationship between all the parts of a composition were destined to be modified in the direction of a freer communication of the keys with each other. Schubert has been commended for having shown that the keys of C and F sharp are first cousins; and more recent composers have shown that all the keys are sisters, chiefly by means of a judicious use of minor and chromatic harmonies. Although, as already stated, the minor triad is acoustically less pure than the major, on account of its accessory dissonant combination tones, it is well to remember that this dissonance is too faint to produce the impression of a real discord; while, on the other hand, a natural relationship is established between the three notes of a minor triad, such as C E♭ G, by the overtone g', which they all have in common. Our view is that the combination tones in the minor chord, instead of proving its inferiority, add to its beauty and interest in certain inversions of the chord. They render it piquant and rich for the same reason that refined musical ears greatly prefer the tones of a horn or violin to those of a flute, although the latter are acoustically purer, since the tones of a violin are accompanied by a large number of overtones, the highest of which give rise to beats (or discontinuous impressions), and thus produce a faint sensation of dissonance. Perhaps the explanation of this preference lies in this, that the accessory tones in the note of a violin, as well as those heard in a minor chord, faintly suggest, and, as it were, express a longing for a combination with another chord to which they harmonically belong. And it is the gratification of this longing, by means of a modulation, which so agreeably affects the mind of the hearer. If this explanation is correct, it will yield us a hint for the psychological explanation of our pleasure in music in general. The reason why in dance-music and popular music in general the major mode still prevails would then be that the people for whom such music is written have not sufficiently refined ears to discover those faintly dissonant accessory tones which call for a modulation into another key. A further discussion of this matter would be too technical for these columns.

THOMAS CARLYLE AND GEORGE ELIOT.

LONDON, February 28.

THREE months ago there were in England just four people of first-rate literary fame—Thomas Carlyle, Cardinal Newman, John Ruskin, and the lady (Mrs. Cross) who is best known as George Eliot. Of these four two, and those the two most widely familiar to the English-speaking world, have now gone from among us. The impression made by their deaths, although great, has been less than might have been expected. It may, for aught I can tell, have been greater in America than here in their own country. This is partly due to the disturbed state of public affairs in England, where not only the Parliamentary struggles with obstruction and the uneasy condition of Ireland occupy men's minds, but where there is a serious, though mostly unspoken, disquietude in recognizing the probability of the outbreak of another war in the East, which may possibly involve some of the great Powers of Europe. But it is also due to circumstances connected with these two illustrious writers themselves. Both of them had come very little before their fellow-countrymen in person. Carlyle's only public appearance, since the long-past days when he delivered his lectures on "Heroes and Hero-worship," was when, some fifteen years ago, he gave an address as Lord Rector of the University of Edinburgh. George Eliot lived in so much privacy that probably few of her readers knew what her real name was. Both, too, had in a sense come to belong rather to the past than to the present.

Dying at eighty-five years of age, Carlyle was one of the last survivors of his own generation. The words by which he stirred men's hearts were spoken more than thirty years ago. Since that time he had produced nothing except his 'History of Friedrich the Second,' which, though a powerful piece of historical work, with admirable descriptions of Frederic's campaigns and battles, and wonderful touches of humor here and there, was not a book to lay hold on minds and feelings as 'Sartor Resartus' or 'Latter Day Pamphlets' had done. It was received with more admiration than pleasure, and comparatively few of those who began the first volume persevered to the last. Thus a whole new generation had come to middle life who, if they read at all the books of his prime, which had appeared while they were children, read them as classics, read them in a critical spirit as so much literature. To the youth of England and Scotland forty years ago Carlyle was a sort of prophet, warning, counselling, appealing, stirring their souls by his own earnestness, and fascinating their imaginations by the power and poetry of his language. One meets people still who tell of their first reading of his books in terms that seem drawn from the revival experiences of Methodists. What Byron had been to the youth of England under the Regency, Carlyle was to the best, the most earnest and thoughtful of them in the earlier days of Victoria; and his influence, it need hardly be said, was of a far more ennobling kind. Since then the whole temper and mind of England and Scotland has changed. Earnestness is not much in fashion, even among the young. Prosperity has produced luxury; the condition of the poor seems a less serious matter than it did in the distressful days before the abolition of the Corn Laws. With luxury, and as one of the last results of the so-called "Romantic movement," there has come a passion for the fine arts, whose extravagances in dress and furniture provide plentiful material for our satirists. Physical science is far more largely studied, and exerts a greater influence even over the general unscientific world now than it did forty years ago; it has told, not altogether favorably, on the character of our literature and our art. Both these tendencies were repellent to Carlyle. His readers will remember the satisfaction with which he quotes the saying of an English minister, "May the devil fly away with the Fine Arts"; and the theories of modern physiology regarding the relations of man to the rest of the animal creation seemed to him, whether true or not, profoundly damaging to man's dignity and the elevation of his spirit. "If I had my way," he once observed in the writer's hearing, "they should not be allowed to speak of such things. Fifty lashes to the first one of you that mentions it." These new currents of thought, so powerful on the present generation, had indisposed them to set the old value on his teachings. They are not teachings suited to our present needs; they are not what he would himself utter were he, with his own views unchanged, addressing the youth of England now.

In the days when Carlyle was powerful, all-powerful, with his admirers, he was also feared and hated by the humdrum respectabilities of society. To believe in him was to be odd and dangerous—it was to be associated with Radicalism, or even with Chartism. People who did not know what his opinions were, supposed him to be, in a general way, what used to be called "an infidel," and regarded him with corresponding horror. As time went on and he became one of the patriarchs of our literature the hatred faded away. His oddities of style, which had been assailed with so much ferocity by Professor Aytoun and the other Tory writers of *Blackwood's Magazine*, were regarded as interesting peculiarities. The defects in his orthodoxy came to seem small compared to the bold assaults on religion of the newer scientific schools. And when, one after another, nearly all the greatest literary lights of the country—Macaulay, Thackeray, Milman, Dickens, Grote, Landor—had disappeared, he was left almost alone to receive the respect and excite the curiosity which had been once divided among them. His place was felt to be fixed; controversies were no longer waged about him; and thus he was passing into the rank of those who are considered to be so well worth reading that nobody reads them.

What has been said of Carlyle's remoteness from the feelings and ideas of the present generation cannot be said of George Eliot. On the contrary, no writer has more completely, perhaps none so completely, represented the tone of intellectual society in England during the last twenty years. She is so thoroughly of her age that one may doubt whether the next age will feel anything like the same admiration for her that we do, whose doubts and aspirations she has expressed with such subtle fidelity. As Mill worshipped a wife who was only an elegant echo of himself, so, some critic may suggest, we have thought her profound because she had so perfectly caught and eloquently expressed the views which we have all got, but cannot so clearly comprehend and set forth. There is some truth in such an observation as applied to the reflective side of her work. But in its more purely artistic side, in its deline-

ations of character, its pictures of country life among the middle and poorer classes, its power of handling a dramatic situation, it has qualities great enough to make it read and valued even after the speculative problems she deals with shall have passed into new forms. If, therefore, the sense of literary loss caused by her death is not so keen as might have been looked for, this arises rather from the feeling that her greatest work had been done, and done some time before. 'Daniel Deronda,' published about three years ago, was received with general disappointment. It did not show any failure of power, nor any such exhaustion of vein as great novelists (even Dickens, for instance) have often betrayed towards the close of their career, but rather the injurious effects of a growing tendency to look at human life not artistically but scientifically. It was hardly to be hoped that such a tendency, which had told even on the ease and grace of her style, would abate; so those who valued her earlier writings most were content to let her fame rest upon them, and did not so much desire that her pen should be always busy. In the field of romance she held a perfectly unique position. She was so distinctly the first of our living novelists that no one thought of comparing any one else's work to hers, and she exerted a moral influence through her novels such as no writer of fiction has ever—here, at least—exerted before. Several of the characters in whom her moral conceptions were embodied had become so familiar that the common problems of social life or of casuistry were constantly discussed with reference to them, just as we talk of *Hamlet* or *King Lear*.

It is interesting to know that we are to have much more of the thoughts of both these great writers. Not to speak of Carlyle's reminiscences of his wife, Edward Irving, and Lord Jeffrey, which are on the point of appearing, both he and George Eliot have left an enormous mass of correspondence, copious selections from which we are promised before long. Judging from their conversation, which in her case was singularly fascinating, full of refined and delicate thinking, and in his was like his books, "only more so," their letters are likely to prove worthy memorials of two such striking and unique figures.

Y.

MÉRIMÉE'S CORRESPONDENCE WITH PANIZZI.

PARIS, March 3, 1881.

WE have a new volume of correspondence of Prosper Mérimée. The letters were addressed to Panizzi, the librarian of the British Museum, between the years 1850 and 1870; and they are published by Mr. Fagan, Panizzi's literary executor. Mr. Fagan has given us a life of Panizzi, in two volumes, which testifies rather to his own grateful and amiable sentiments than to his literary ability. In the volume before me there is only a short preface by Mr. Fagan, and I suspect that it has been revised by a Frenchman. The whole volume consists of Mérimée's letters. In one sense it is a revelation: it shows us not Mérimée, the author of 'Colomba,' of the 'Théâtre de Clara Gazul,' but a political Mérimée—Mérimée the Bonapartist, the senator, the supporter of the Second Empire. We all know in Paris how Mérimée became a senator. He had spent his youth with the doctrinaires, with the great men of the reign of Louis Philippe; he did not choose to mix himself up with politics when his friends were in power. He was content with the modest functions of Inspector-General of the French historical monuments, and he wrote, in that character, a few volumes which give a very interesting and very intelligent account of some parts of France, from an artistic and historical point of view. He had always delighted in the society of foreigners—his original mind probably preferred the unknown to the banality of Parisian life: he became intimately acquainted with Madame de Montijo, the mother of the future Empress of the French; he knew this future Empress as a child, he saw her constantly and on the most intimate terms when she came to Paris, under Louis Napoleon. She was then in the full bloom of an astounding beauty; she became an Empress, and she made Mérimée a senator. Most people thought that Mérimée only accepted this dignity with the *désinvolture* of Marshal Saxe, when they offered to make him a member of the French Academy, and he said simply: "Cela me va comme une bague au doigt." Those who take the trouble to read his correspondence with Panizzi will see that Mérimée was not merely the senator of the Empress, he took his functions "au sérieux," and it is very surprising to find such an intensity of political passion, such a constant preoccupation of political interests in a man who always affected indifference and coldness, who never spoke unreservedly, and who was thought to be cynically sceptical. He was always an "Anglomane," and his coldness was evidently studied. His models were those English statesmen who are always unmoved, reticent, who never talk politics in public, who look upon the biggest waves of the political ocean with the calm of an old sailor, who smile in adversity and can look gloomy in prosperity, who leave Downing Street as they would a hotel—who have, in short, the hereditary coolness of an old aristocracy.

Mr. Fagan does not seem to have quite understood Mérimée. He says in his brief preface: "In short, Mérimée never was much of a Bonapartist. The Imperial régime never inspired him with much confidence." And what proof does he give of this? "The Empire," says he, "in 1862 seemed still very solid and very powerful. . . . Well! Mérimée, on March 31, 1862, wrote to Panizzi: 'We suffer, we are uneasy, and,' he added, with much finesse, 'we aspire after something which is neither the past nor the present.'" Mr. Fagan evidently labors under the same difficulty with so many of his compatriots who now sincerely believe that England never was Bonapartist; he would have it also that Mérimée was not a Bonapartist. I venture to say that perhaps there was not in France a more sincere, a more ardent, a more disinterested admirer of the Emperor Napoleon than Mérimée. Mr. Fagan says: "The most tender, the most respectful devotion to the Emperor, such was the *fonds* of Mérimée's opinions." Every letter in this volume shows that Mérimée had the same devotion to the Emperor, that he admired his political conceptions, that he suffered almost acutely when these conceptions were misunderstood, that his love of the Emperor (I use the word love, for there can be no better word in this case) was so intense that it produced in his heart a feeling of real and genuine hatred for all the enemies of Napoleon's policy. I prefer to imagine Mérimée sincere rather than to represent him as a mere courtier, and, if we only look at the documents before us, who can doubt this sincerity when we see the extraordinary trouble which Mérimée takes in this correspondence with Panizzi? He knew very well that his letters would be shown, and no accredited ambassador of the Empire probably took so much pains to reconcile foreign statesmen with the policy of their own sovereign. What makes this correspondence with Panizzi at times tedious is precisely what gives us the assurance of Mérimée's sincerity. The author of 'Colomba' was not at all likely to strike a hundred times on the same nail if he had only wished to write clever letters. He really meant to be useful to the Emperor, to reconcile Lord Palmerston and others with his projects and his sentiments.

The first volume published by Mr. Fagan may be called the epistolary history of the Italian war. This war began virtually on the 1st of January, 1859, when Napoleon III. addressed Baron von Hübner in the diplomatic circle. Mérimée went at once for war; he was an *Italianissimo*. He was angry with the French because they were not Italians. "Louis Philippe for eighteen years preached to this people the love of material interests, and our old Gallic blood is spoiled. We are incredibly cowardly. . . . Nobody thinks of glory, of humanity" (March 12). Mérimée knew that the Emperor meant war; he was in advance of the times, and already saw in his thoughts the Piedmontese in Rome. He preaches to Panizzi on the necessity of England's joining Italy:

"Suppose even that the Emperor has ambitious thoughts as regards Italy; the best way to counteract them is to associate frankly with France and with Piedmont. It is evident that if England makes common cause with us, Austria and all the *Franzosenfresser* across the Rhine will sink under the ground without firing a gun. Observe, also, that France, which is by this war brought in contact with the Revolution, runs great risks by recognizing a new country, as this recognition may some day end in her being called upon to give Corsica to *Italia una*. On the contrary, England has nothing to fear from this contact with the Revolution."

These arguments show that Mérimée well understood the temper of England. He also understood the Italians when he said: "After the war the gratitude of Italy will be divided between her two allies, and unequally divided, as England will have the better part." On the 10th of May he writes: "Alea jacta est! The Emperor left to-day. He was conducted to the railway by an immense crowd, amid frantic applause. He is now more popular than ever. I speak of the masses, of course, as the drawing-rooms are as bad French as possible." Mérimée belonged himself to what he calls the "salons"; he never broke with them, he did not even break with the famous "salon" of the Place St. Georges, where M. Thiers attacked every night for eighteen years the Imperial policy. I well remember how in that year, 1859, M. Thiers condemned the Italian war. Alas! if he may have been wrong many times during these eighteen years, he was right once when he spoke against the German war; and the French people have forgiven him all his possible mistakes for one day's lucidity. The war begins. Mérimée warns incessantly his English friends: "If England separates from us, be certain that we shall see the Russians in Constantinople." He is anxious about Prussia. "The fury of the *Franzosenfresser* in Prussia is great. The Government is more reasonable, but may be drawn in. A Russian, M. de Tourgueneff, whom I presented to you last year, arrives from Moscow. He says that the Germans want to make a mouthful of France and Russia at one time. They claim Alsace from France, and from the Russians Courland and Livonia." He is uneasy, also, about Prince Albert. "It seems that Prince Albert is terribly Austrian. Do you think that it can affect the opinion of the English in any degree"?

The peace of Villafranca was a disappointment to Mérimée. He did not believe in the Italian confederation of princes. "If Venetia remains under the actual Austrian rule the war will have produced no great result, since Austria, being admitted to the Italian Confederacy, preserves the right to meddle in the affairs of the peninsula, and we thus recognize the pretensions which she had before the war." His hostility against Rome became very

great: "We are not very wise towards Rome. We have there a devout general and an ambassador who thinks that religion is fashionable. None of them can deal properly with such a *coquin* as Antonelli. We ought to send him a Corsican; you know that Seneca accuses the Corsicans of *negare deos*. An Italian will never say to one of his compatriots the stupidities on religion which always take in a Voltairian Frenchman. My plan with the Holy See would be this: 'If your Holiness does not help us, I plant you there and will leave you to be assassinated by your subjects; I may come back afterwards to avenge you and canonize you. I only ask you not to stop the Italian movement, and never to receive the Austrian Minister in private.'" Why did the Emperor Napoleon stop so short after Solferino? Mérimée's version is that the sight of the battle-fields told upon the nerves of Napoleon, and that his feelings of humanity were wounded. Then Germany became threatening, Russia could not be trusted, the Italians themselves were too lukewarm; revolutionary movements were preparing in Hungary, in Bohemia, in Poland, and these movements might have forced Russia to declare herself against us.

Mérimée keenly enjoyed every victory of the policy which, without war, prepared the complete unity of Italy. He defended against Panizzi the annexation of Savoy to France, which was the price paid by Italy for the protection of France against Austria. "It is very absurd for England to scream so loud on this occasion, especially as she announces at the same time her intention not to see in this annexation a *casus belli*. It is even more absurd to say so loudly that an attempt has been made to find in it the occasion of forming a new coalition, and that the attempt has failed." Mérimée had a real patriotism, and his Anglomania did not affect it; he became angry with England when England became unjust to France. On the question of the temporal power of the Papacy he felt as a Voltairian even more than as an *Italianissimo*. He enjoyed every blow given to the Papacy, and he wrote to Panizzi, "Keep yourself in joy." He was very angry with Lamoricière when he took command of the little Papal army, and he called his wife Madame de Lamori*cierge*. He sided even with Garibaldi: "As for Garibaldi, I *alone* take an interest in his expedition, and I believe that it must displease the Emperor, who was preparing to evacuate Rome next month, to find himself now between the hammer and the anvil." He liked Garibaldi's expedition to Sicily, because, as he said, he liked novels and adventures. He only regretted that the expedition was made a little too soon, before the French troops had evacuated Rome. The "lover of novels and of adventures" is not always in harmony with the senator, the friend of the Emperor; the senator blames Garibaldi for his campaign in the Roman States; he enters into long explanations on the Italian complications, which have now lost much of their interest.

The first volume ends in 1863; the second volume will be very interesting, as it will contain the reflections of Mérimée on the war between Prussia and Austria, and on the Franco-German war.

Correspondence.

THE ANTI-MONOPOLY LEAGUE.

To the Editor of The Nation:

Sir: In your issue of March 10 you allude to the letters of Mr. Fink in answer to the statements of Judge Black, regarding the amount charged by the transportation companies for transportation, and conclude your remarks as follows:

"When outrageous misstatements of facts like these are circulated broadcast over the country by prominent lawyers, eminent politicians, and even by the Chamber of Commerce of this city, it is not to be wondered at that there should be an extraordinary amount of delusion on the subject."

So far as the statements of the Chamber of Commerce are concerned, as a member of the Committee on Railway Transportation of that body I may say you are in error. Our statements of fact have never been successfully controverted. Notwithstanding the flat denials of Messrs. Vanderbilt and Jewett the report of the Hepburn Committee pronounced them "fully proven," and the measures advocated by the Chamber of Commerce and other commercial bodies of New York are strictly in accordance with the principles of law and justice enunciated by the highest legal tribunal—the Supreme Court of the United States. They have been sustained by the leading papers of the United States, including the *Nation*, and I think it is hardly just to the Chamber of Commerce and the public generally that you should assume that all statements regarding the relations of railroads to the public which have been put forth by the commercial bodies of New York are equally unfounded with the off-hand statement of figures made by Judge Black, in his speech at Cooper Institute. In point of fact, these figures were suggested by a person in the audience when Judge Black mentioned the estimate of forty-five millions made by the United States' Senate Committee on transportation routes, and were not put forth at all by the Anti-Monopoly League as a part of his speech, but the reporters seized upon the figures, and it was assumed by Mr. Fink and others who were not present that the Anti-Monopoly League adopted and circulated them as a measure of the injustice done the public by the railroads.

Mr. Fink's statement is, however, nearly as far from the truth as Judge Black's. On reading it one would infer that only sixty-six million bushels out of fifteen hundred and thirty-one millions were transported by the railroads in 1873. Instead of sixty-six millions of bushels transported by rail, as given by Mr. Fink's figures in your article, there arrived by rail at Boston, New York, Philadelphia, and Baltimore one hundred and four millions, while probably three-quarters of the whole crop was, in one form or another, transported by the railroads a greater or less distance, and the estimate of forty-five million dollars, made by Senator Windom's committee at five cents per hundred pounds' increase, is not an unreasonable one. Mr. Fink may be nearer right in figures than Judge Black, but few will dispute that in knowledge of constitutional law and consideration for the public interest Judge Black will compare favorably with Mr. Fink.

The situation is bad enough, confining ourselves to facts. The original theory upon which railroad charges were fixed was that railroads were entitled to a fair rate of profit based upon the cost of service, and in this State it was considered that ten per cent. net upon the capital actually invested was a fair return, and that all the rest of the advantages accruing from steam highways should, upon the same principle as our patent law, inure to the public; but the railroads have evaded their part of the agreement by stock-watering and other kindred devices, and it was shown in a recent report to the Board of Trade that the dividends upon the watered stock which Mr. Vanderbilt put into the New York Central & Hudson River Railroad in 1867–8 had already amounted, with interest compounded annually, to over seventy-five millions of dollars. In other words, if Mr. Vanderbilt instead of watering his stock had confined his dividends to the volume of stock then outstanding, and had reduced the rates of transportation instead of watering his stock, the public would have been seventy-five millions of dollars better off, and Mr. Vanderbilt and his confrères that much poorer. Is it any wonder, under such a system, that the few grow rich while the many are kept poor? It is such abuses as these, coupled with discriminations against persons and communities, and bribery in our elections and legislatures, that make American citizens feel that something must be done to readjust the relations which exist between corporations and the public. If our railroad magnates knew it, the merchants who are working, through commercial organizations and the Anti-Monopoly League, trying to remedy these abuses, are their best friends. They are seeking, through legal and constitutional means, to remedy abuses which, if continued, must inevitably invoke an antagonism between capital and labor, which every good citizen must deprecate; and I respectfully submit that the *Nation* can more justly and profitably advocate the rights of the mass of the people rather than privileges for the few, who are profiting by the abuses which the Hepburn Committee declared to exist "so glaring in their proportions as to savor of fiction rather than of actual history."—Respectfully, etc.,

F. B. Thurber.

[Mr. Fink is correct in his statement that only sixty-six million bushels of grain out of the total movement of fifteen hundred and thirty-one million bushels were transported to New York, Boston, Philadelphia, and Baltimore by rail during the year 1873. In the report of the New York Produce Exchange for 1876–77, pages 256 to 259 inclusive, the total grain receipts at the four seaboard cities is given as follows:

At New York	73,732,174	bushels.
At Philadelphia	19,914,257	"
At Boston	8,468,658	"
At Baltimore	12,536,657	"
Total	114,651,746	"
Deduct the movement by water	48,560,045	"
Leaves balance of	66,091,701	"

Mr. Thurber has evidently included flour and meal, converted into equivalent bushels of grain, in his statement of grain arrivals at the seaboard cities. If, however, he intended to include flour and meal he ought to have distinctly said so, and should not have questioned the correctness of Mr. Fink's statement. We do not think that Mr. Fink would have had any objection to the inclusion of flour and meal, thereby making the total equivalent to one hundred and four million bushels, instead of sixty-six. This would not have affected his conclusions. There is a wide difference between one hundred millions and twenty-four hundred millions, the latter being the amount assumed by Judge Black to have been transported by rail to the seaboard.

We cannot agree with Mr. Thurber's estimate that three-fourths of

the whole grain crop in one form or another was transported by the railroads a greater or less distance, when it appears from the statistics that only one hundred and four million bushels, including flour and meal, were moved to the seaboard by rail, and forty-eight million bushels by water. This movement towards the seaboard is by far the largest of any. A large amount of the grain is consumed upon the farms on which it is raised. It is eaten up by the people and the animals on the farms and in the neighborhood, and never sees the railroads. A large proportion is used in fattening hogs and cattle, and when thus converted into meat or distilled into whiskey, or alcohol, or other articles, although a portion of it may be again transported, its bulk and weight are immensely reduced. For these reasons we are not prepared to accept Mr. Thurber's estimate that three-fourths of the whole grain crop is transported by rail, nor can we accept Senator Windom's forty-five-million-dollar estimate as "not an unreasonable one," nor can we agree with Mr. Thurber's statement that Mr. Fink's estimates are nearly as far from the truth as Judge Black's, who multiplies Senator Windom's estimate by twenty. We are rather inclined to class Mr. Thurber's estimate in the same category with those of Senator Windom and Judge Black.

Finally, we are not aware that Mr. Fink has pretended that his knowledge of constitutional law is equal to that of Judge Black, but he certainly has shown that his knowledge of railroad statistics is superior. —Ed. Nation.]

COMPETITIVE EXAMINATIONS AND TENURE OF OFFICE.

To the Editor of The Nation:

Sir: If I am correctly informed, the advocates of competitive examination, as a means of selecting candidates for appointment to the civil service, propose that measure as the sole remedy necessary to remove all the evils of the present system, to free the service from the influence of politics, to secure the highest efficiency, and to settle the question of tenure.

No minute investigation is required to reveal the fact that the greatest fault of the service, as now constituted, is not the lack of fitness in those appointed, but the lack of independence and security in their position after appointment. The power which makes of the service a political machine in the hands of the dominant party is not the power of making appointments on political grounds, but the power of making removals on political grounds. This power competitive examination cannot take away. What difference would it make to a collector of political assessments whether an employee had been appointed as a scholar or as a partisan, so long as both scholars and partisans hold their places at the pleasure of the power which levies the assessment? The percentage of the salary asked for would be the same in either case, and the punishment for refusal to pay could be enforced with equal promptness. Nothing would be easier than to continue the present system of political proscription and political activity in the service, under any plan of competitive examination whatsoever, put in operation without the support of regulations governing the power of removal.

Would it not be wise of reformers to direct more of their attention to the greater evil—to concern themselves less with the kind of material to be kept out of the service, and more with the kind of material to be kept in? The senator who recommends an incompetent man for a place cannot do more than cheat the Government in that particular case; but the secretary who removes an old and efficient officer without cause not only deprives the Government of experience gained at the public cost, but also spreads alarm throughout the service and probably ruins the career of a worthy man. Instead of prescribing tests for the ability requisite for admission, would it not be a more direct step toward reform, and one more easily accomplished, to propose regulations for the government of the service as it already exists, to define the offences which shall be punished by removal, and thus seek to retain the ability formed by special training, and to deprive politics of the power to corrupt by depriving it of the power to interfere? F. W. L.

Washington, March 18, 1881.

["The advocates of competitive examination, as a means of selecting candidates for appointment to the civil service," we think, generally hold that the motive for making removals without cause—that is, for arbitrarily dismissing competent officers—is, in ninety-nine cases out of one hundred, the desire to appoint incompetent men in their places, with a view to, or as a reward for, political service. If this be true, confining the appointments to persons presented by competitive examination would destroy this motive. No Congressman or head of department would care much about having A. turned out if he knew he could not get his man B. put in, and thus arbitrary dismissals would probably cease and the ordinary business motives take control of the Government offices. Most persons who have examined the question at all carefully feel the difficulty and delicacy of drawing up legislative restrictions on the dealings of heads of departments with their subordinates, and, therefore, are disposed to confine reform to taking away from the appointing power all temptation to "make capital" in any other way than by the faithful and efficient management of the public affairs. A collector, for instance, who knew that even if he dismissed Tom he could not appoint Dick in his place would speedily, and as the best thing within his reach, confine himself to getting all the work he could out of Tom. In other words, as long as Tom did his duty there would be no motive for dismissing him, and the Custom-house would come to be managed like a dry-goods house or banking house. There would, perhaps, be no more permanence in office in the one than in the other, but there would be as much permanence as was necessary for efficiency, and this amount of permanence always means that an honest, faithful, and capable man keeps his place as long as he maintains his character.—Ed. Nation.]

ENGLAND VERSUS IRELAND.

To the Editor of The Nation:

Sir: It is said that Mr. Parnell is coming here to ask for American subscriptions in aid of the Irish Land League, and I am told that my friend, Mr. Wendell Phillips, is (not perhaps with direct intent) preparing the way for him by repetition of his old diatribe against England. May it be not impertinent for an Englishman to say a few words on the matter, premising that, though English, I have for some forty years been in thorough and often in active sympathy with the avowed object of the Land League—the relief of the Irish tenant-farmer. I even go beyond the League in caring also for the landless peasant.

My object in writing is to deny the nationality of the question at issue. Certainly it is not a question between Ireland and England. The question lies between a landlord class (English, Scotch, *and Irish*) and the people of the three countries, all alike debarred from their common property in the soil. It is worse than nonsense to characterize this land grievance as "English oppression." Are no landlords Irishmen? Or can you divide the landlord class into good and bad—good meaning Irish, and bad being always English? Why, this very Ulster tenancy, which the League would have extended to all Ireland, was an entirely English enactment of James I., unasked for by the Irish, and not extended for Irish benefit when Ireland had its own Parliament. There is no such favorable law for the tenant in either England or Scotland. The land question is between two classes, not between two peoples.

The same may be said of other grievances, even of that so happily done away with, Catholic disability. Not at Irishmen, nor even at Catholics, *but against Papists* were the disabling acts directed. Enmity between the peoples has been how brought about? By natural causes, or as the consequence of wrongs on both sides? Has it all been "English oppression"? Was there only English wickedness when Cromwell avenged the English massacre of 1641? The Papacy rather than English hatred has been the root of our disagreement. Where but in Ireland had the Spaniard hope to make good his footing against England in Elizabeth's Protestant days? Where else could Strafford obtain an army for the subjugation of England to Charles I. and Laud, on their way to Rome? Where but in Ireland were James II. and popery again to be upheld? The ready servant of the Papacy, Ireland had to be controlled by England, or England give up her own religious freedom, and with it her national existence.

Had not Ireland an equal right to her national faith and independence? Certainly. Yet in the last arbitrament the weaker must succumb. I am not, therefore, defending wrong, from the stain of which our English escutcheon is not free, though your own Indian record might prevent at least a New-Englander from pointing at it. But for the "national quarrel" now, I say distinctly *there is none. For there is no Irish nation.* There is no more an Irish nation than there is an English, or a Scottish, or a Welsh nation. We might as well talk of reviving the Heptarchy as of breaking up the great fused nationality of the two islands. The time for mere political isolation has passed. We are outgrowing governmental severance, the crafty contrivance of monarchs; and the day has come for combined action, the combination which constitutes a nation. Proclaim the independence of Ireland to-morrow, you could not even say who are Irishmen.

Is there natural antipathy between the races? I know of none. One main cause for dislike on our side has been Irish interference with English labor. Surely they had a right to swarm into England even for lower wages than our own people, those lower wages better than what they could get at home; are not the Chinese doing the same here? And the Irish-American

as little likes the interference as the Englishman did. But this is not a *natural* or *national* antipathy.

One word more, though I fear to over-occupy your space. How much of Ireland is at the back of Mr. Parnell? He does not command a majority of Irish representatives in Parliament. Outside, has he a majority of the Irish people? Besides the tenant-farmers themselves, has he even a considerable party? If he has, he cannot need the alms of Irish-Americans (why not wholly Americans?) to maintain so popular a movement. Let him—let the League rather, make common cause with their fellow-sufferers in Britain. Any way, it is not an American question. W. J. LINTON.

Notes.

J. R. OSGOOD & CO. announce a projected 'Narrative and Critical History of America, with bibliographical and descriptive essays on its historical sources and authorities,' in eight volumes, uniform in size and appearance with the 'Memorial History of Boston' now in progress. The new work will also be co-operative, and under the editorial supervision of Mr. Justin Winsor, assisted by a committee of the Mass. Historical Society. Volume iii., "English Discoveries and Settlements in America," will be first issued, in the latter part of 1882, and then two volumes annually until the tale is completed. Each volume will consist of an historical narrative and a critical and bibliographical essay.——The second American novel admitted to the "Leisure-Hour Series" will be 'A Lazy Man's Work,' by Miss Frances Campbell Sparhawk, of Massachusetts. Henry Holt & Co. are also about to issue 'The Art of Furnishing.'——The "gems" of the sermons of the late Frederic W. Robertson have been culled by K. B. Tupper, and will be published by S. C. Griggs & Co., Chicago, together with a translation, by Prof. M. J. McMahon, of Prof. L. Bredif's 'Demosthenes and Political Eloquence in Greece.'——'The Longfellow Birthday-Book' (Houghton, Mifflin & Co.), compiled by Charlotte Fisk Bates, is a presentable little volume with, as the title indicates, verses and prose paragraphs selected from Mr. Longfellow's works for every day in the year, and occupying the left-hand pages, those opposite being blank and wholly at the disposition of the owner, except that generally one or more names of celebrated persons are printed in the spaces devoted to their natal days. In these instances, however, it is explained by the preface and apparent of itself that the verses and the names which front each other have rarely any other association.——Of a kindred nature, by the way, is the 'Diario Dantesco,' compiled from the 'Divina Commedia' by Signorina Enrichetta Capecelatro, and just published at Rome. Blank spaces are reserved for inscribing the names of friends, "after the English usage," or for recording passing events, etc.——Part 2 of Reiss and Stübel's 'Necropolis of Ancon, in Peru' (New York: Dodd, Mead & Co.), reviewed at length in No. 817 of the *Nation*, contains ten colored plates, with accompanying descriptive letter-press. The landscape is shown in No. 4, a view seaward from the necropolis across the north part of Ancon Bay, and in No. 8, a curious illustration of interment under huge earthenware. There are also drawings of three mummies in their bales and ornamental outer wrappings, one being distinguished by the richness of the latter; and a ghastly collection of mummy fragments, demonstrating the practice of tattooing among the Peruvians. A curious and most tasteful class of objects are the banner-like shafts with feathery or woollen tufts of many colors, and still more artistic are the thread-wound reeds and reedy "crosses" and sepulchral tablets, of which last the conventional woven patterns are not only a lesson in the evolution of the decorative art, but would be still esteemed if copied slavishly. The same remarks apply to a piece of tapestry with figures of warriors much resembling the knave of hearts, except that they hold each an enemy's head in their right hands. A series of necklaces and bracelets is remarkable for the variety of strung objects—shells, sticks, human teeth, spoons, the vertebræ of fish, pearls, berries, etc. One design, in mother-of-pearl on cotton cloth, is of singular beauty. The pottery in Plate 96 does not reveal itself at first glance. One vessel is ornamented with the figure of a hammer-head shark; another elegantly recalls a fruit in shape; and a third shows the mode of repair by drilling holes.——Mr. John Bellangee Cox, Secretary of the Fairmount Park Association, 524 Walnut Street, Philadelphia, and Trustee of the Meade Memorial Fund, invites from American sculptors sketch-models and estimates for a bronze equestrian statue, once and a half life-size, of Maj.-Gen. Geo. G. Meade, to be set up in the Park. The competition will be closed on Sept. 1.——The fourth annual report of the School of Drawing and Painting of the Boston Museum of Fine Arts, while showing the rare facilities (in connection with neighboring institutions) which the students enjoy, indicates that experience has shown the necessity of insisting on a rigorous discipline in draughtsmanship before painting is permitted to be taken up.——The Proceedings of the Rhode Island Historical Society, 1880-81, disclose a revolution in that hitherto dead-and-alive association which promises well for its future efficiency. Shameful neglect and systematic plundering have given way to order and restitution. It is in contemplation to publish, if the permission of Yale College can be obtained, the diary of the Rev. Ezra Stiles for the period of his sojourn in Newport and Portsmouth (1755–78). ——The annual report of Prof. Cook, the State Geologist of New Jersey, for 1880 is a document of uncommon interest, its main feature being a minute description of the glacial drift of the State, including a tracing of the terminal moraine with great topographical particularity. In connection with this a map is given of the glacial lake that once covered the upper valley of the Passaic, being dammed at Paterson, where are now the falls. A progress map of the whole State shows the new townships and railway extensions, and indicates the stations of the Geodetic Survey and meteorological recording stations. The topographical survey is well advanced, and a map of the most thickly-settled area is being engraved. Efforts are making to collect the scattered notices of New Jersey palæontology, and to prepare a list of wild plants. The sections on drainage and artesian wells are very instructive. The ore-product of the State has largely increased. Recent tests have proved that the New Jersey clays surpass all others known in refractoriness; their use also as terra-cotta for architectural purposes is widely extending.——We shall do a service to all whose lot it is to consult often alphabetical works of reference by calling their attention to Mr. C. H. Denison's so-called Reference Index, a very ingenious and complete treatment of the margins of dictionaries, etc., by which the bulkiest volume can be opened almost mechanically at the letter sought for. We can hardly imagine a greater boon for youthful students of Greek and Latin in particular.——Next month will be published by A. & C. Black, Edinburgh, twelve lectures on Biblical criticism by Prof. W. Robertson Smith, entitled, 'The Old Testament in the Jewish Church.' To the text as originally delivered a large amount of explanatory matter will be added in the form of notes.——The Texas Legislature has established a State University for both sexes.—— The Cambridge (Eng.) Senate has had the grace to admit women to receive university degrees—a logical step after the privileges of Girton and Newnham.——A translation of 'Little Women' has appeared in Paris with the title 'Les quatre filles du docteur Mash.' The *Bulletin Critique* praises it, but thinks that the American author, M. Alcotte, probably owes much to his French translator.—— The *Revue Politique et Littéraire*, which has taken this year to publishing short stories, and has been rather successful in getting good ones, says that some of its readers have protested against its including foreign stories, because these bring them in contact with manners and a tone of feeling which are unfamiliar and apparently fatiguing—a characteristically French objection. The *Revue* answers that its object always has been to introduce its readers to foreign intellectual movements, and what it has done for science and philosophy and other serious studies it now intends to do for literature.

—The Dante Society, recently organized at Cambridge, Mass., has elected the following officers: President, Henry Wadsworth Longfellow; Vice-President, James Russell Lowell; Council, Charles Eliot Norton, Justin Winsor, Philip Coombs Knapp, jr. According to the by-laws adopted by the Society "its objects shall be the encouragement of the study of the life and works of Dante. Any person desiring to become a member of the Society may do so by signifying his or her wish in writing to the secretary, and, if accepted as such by the Council, by the payment of an annual fee of five dollars." Information in regard to the Society can be had by addressing the secretary, John Woodbury, 2 Grays, Cambridge.

—Bookmen, near and far, will be interested in the third part of the catalogue of the Brinley Library, a list of about twenty-seven hundred titles of books, many of them of the first degree of rarity, to be sold on the 4th of April and following days at the auction-room of Messrs. George A. Leavitt & Co. A Gutenberg Bible, the first book printed with movable types, may very properly be regarded as the gem of the collection. In the price fetched it certainly will head the list; while, judging from a somewhat hasty glance at the pages of the catalogue, there are other works that will come pretty closely up to it. Three copies of Eliot's Indian Bible (altogether our insatiable collector possessed seven!) come into this sale, with other Bibles—the first printed in Pennsylvania, New York, and New Jersey—scarcer even than the Eliot. Books relating to the American Indians and books printed in the Indian languages fill several hundred titles. About one-half the catalogue is taken up with historical and biographical works relating to America and Americans. The arrangement of titles under the head of subjects makes an index very desirable, and we hope that with the fourth part (now in press and completing the catalogue) one will be given. In its complete form the work will be indispensable to librarians and students.

—Our readers are already aware through our advertising columns of the unfortunate controversy between two of our leading publishing houses over the 'Reminiscences of Thomas Carlyle.' The whole story has not been made public, and probably will not be. That is, to decide on *all* the points raised in the discussion, we should need all the correspondence between Mr. M. D. Conway and the Messrs. Harper, on which the latter based both their belief that the work had been assigned to them by Mr. Carlyle in his lifetime, and

their confident expectation that Mr. Froude would confirm the assignment; and, on the other hand, we should need all Mr. Froude's correspondence with the Messrs. Scribner. If, however, we set aside Carlyle's alleged share in the disposition of his book, as either not proved or as abrogated by his bestowing an absolute trust on his literary executor; and if we equally disregard (as irrelevant) the argument that Mr. Froude's choosing a different publisher from Mr. Carlyle's in England left the trade here free to compete for it, we arrive at the main question of "courtesy." This divides itself into two parts: (1) Were the Messrs. Harper the recognized publishers of Carlyle's works in this country? and (2) Is the 'Reminiscences' to be judged his work or Mr. Froude's? The Messrs. Scribner repeat Mr. Froude's opinion "that Messrs. Harper were not Mr. Carlyle's recognized publishers except for one small work [the 'Norse Kings']," and also insist that as other American publishers have issued several of Carlyle's works in this country, there can be no claim, either of authorization or of custom, to "courtesy of the trade." But it appears that 'Frederic the Great' as well as the 'Norse Kings'—in other words, Mr. Carlyle's two latest works—had been secured, for a satisfactory consideration, by the Messrs. Harper, while it has not been shown that other American publishers have paid Mr. Carlyle a royalty on his works printed by them without his consent. Finally, is the book a Carlyle book or a Froude book? The answer to this question seems to us to lie in the object for which people buy it—whether for what there is of Carlyle in it or of Mr. Froude. The latter's part, though essential to the bringing out of the book, is otherwise quite perfunctory—as much so as the proof-reader's. Nevertheless, allowing that there exists here a technical distinction which justified the action of the Messrs. Scribner in negotiating for the book, the contrary assumption of the Messrs. Harper was at least equally natural. Their proposal, however, "that the whole matter should go to a competent reference" in the trade, was rejected by the Messrs. Scribner, as being "a course pursued in cases where the matter is subject to a reasonable doubt."

—The best thing in the April *Lippincott* is an anecdote contained in a sympathetic fragmentary notice of Carlyle in "Our Monthly Gossip." The writer and Mr. Carlyle, his host on the occasion, were seated late at night on the floor at either side of the fire-place, so that the chimney should catch the smoke of their long pipes, and the conversation turning on his fall from orthodoxy, Carlyle spoke of having at that time been induced to hear a popular Methodist preacher, adding: "He preached about heaven; and I soon saw that his notion of heaven was that of a big sea of treacle, in which he and his fellows were to lie and flounder; and I thought to myself that I didn't care a daamn whether he got his treacle or not. My idea of heaven, and what I find to have been the idea of Moses and of Jesus, is that it is a rest—just a rest." "Sister Weeden's Prayer" is an unusual "short story," by Sherwood Bonner. The dialect in which it is told is remarkable for its raciness, and the character illustrated by it fits it exactly, besides being excellent in itself. Whether the writer is equal to more "sustained effort" it would be hazardous to predict, of course, but within the limits here observed his talent is plainly considerable. Mr. Matthews's "Present Tendencies of the French Drama" is the most thoughtful of his essays on the subject that we have seen, and is also an intelligent epitome of the changes through which the drama in France has passed; if every one has had too much of Zola to enjoy any further discussion of his "theories," that is a penalty which Mr. Matthews will have to pay without having justly incurred it, since a discussion of Zola lay relentlessly within his scheme. "Nineteenth Century Notes" is a story which fails to illustrate the demonstrated possibilities of the subject, and the same thing may be said of some anecdotes about Block Island folk. A new serial, "Craque-o'-Doom," is begun, but we must await another instalment at least before judging of its quality.

—The son of a Georgia planter contributes to *Scribner* for April a significant account of the transformation of the labor system on his father's estate after the war. Two plots of the same premises tell the whole story: under slavery the laborers' huts were grouped at the centre, in a "quarter" near the overseer's house; now they are scattered all over the two thousand acres, each cultivator being the tenant of a definite farm, which he works in his own way, save that he is responsible for damage to the property, and that he must plant sufficient cotton to pay the rent. Mr. Barrow's only complaint is of a want of providence on the part of these tenants. They are industrious: they honestly discharge their debts; they take good care of their children's health; they pay for schooling beyond the three months provided free by the laws of the State, and they support their own preacher. As few people are aware that there is an "Upper Hudson," Mr. Charles H. Farnham's paper on "Running the Rapids" of that part of the stream must be allowed to have a taking title. The narrative proves, however, that it is hardly more difficult to overcome the rapids themselves than to describe the process graphically and in an interesting manner. The engravings after photographs of the "Greek Terra-Cottas from Tanagra and Elsewhere" are singularly faithful, and are, perhaps, even more lifelike than the charming images themselves. Mr. Edward Strahan's article about them is not deficient in knowledge or in imagination, but it raises, without clearly deciding, a question as to their character and symbolism. The artistic attraction of this number is certainly the wood-cuts made in the competition for the *Scribner* prizes, namely, the three which won the prizes, and three which received honorable mention. They are all, considering the age and previous practice of the executants, surprising and full of good augury for the future of the art in this country. The first prize was awarded to a Boston boy of sixteen, who had had two years' practice but must be thought precocious. The other two prizes were taken by older men—one also of Boston, aged twenty-two, having had fourteen months' practice; and one of Chicago, aged twenty-four, with only six months' practice—both admirable. Four ladies came in for honorable mention, and one for "encouragement." New prizes are offered by the Art Department of *Scribner* for blocks cut during the present year (1) by those who have never yet worked for pay, (2) by those who engaged in the last competition. We hope that some day prizes will be offered for design and engraving combined, perhaps with a common subject (as landscape, figure, marine, etc.) and a uniform size of block. The two functions ought to be cultivated together as far as possible.

—The chapters of "The Portrait of a Lady" in the April *Atlantic* make it evident that the novel will be considerably the most important that Mr. James has written in his present manner. This instalment, besides introducing a new character, widens the scope of the story without, however, modifying in any degree its character. Mr. John Fiske follows his ethnological article upon the Aryans with one entitled "What We Learn from Old Aryan Words"; and there will be several others on the same subject, divided into three sections, dealing with some of the characteristics of scientific etymology, the prehistoric culture of the Aryans, and the study of myths. The present paper, like the last, is happily calculated to instruct the ignorant and interest the instructed, and the series when completed should make a valuable handbook. The other article which will repay reading is Mr. Julius H. Ward's on "The New Sunday," which is a temperate and discerning review of the change that has unmistakably taken place in our observance of Sunday within a few years, and reflections suggested by this. The paper might have been pruned a little, but only to make its excellence more effective. A plea for "the recognition of the fact that this is a large world, and that there are all sorts of persons in it," which does not neglect to insist, on the other hand, that "Life is humdrum unless its vitality springs from a spiritual source," is unusual. The subject, from Mr. Ward's point of view, may be commended to the religious press, by which we should like to see it discussed, unless esoteric reasons exist to make discussion of it improper. "The British Philistine" is Mr. Richard Grant White's contribution, and at the close of it he definitively bids farewell to "Philistia, dear motherland," observing, by the way, that while he was there, though a "Yankee of the Yankees," he "felt at times" as if he were "a Philistine of the Philistines"; and, indeed, there is nothing in the whole article at which a sensible Briton, however sensitive, would take serious offence. Miss Phelps's story of "Friends" increases in interest, considered as an anomaly. It is one of those works of art which provoke curiosity rather than admiration, but which refer the feeling from the work to the mind of the artist as instantly as if it were admiration. A specimen chapter from Mr. Parton's forthcoming 'Voltaire' is unexpectedly dull. Mr. Wm. M. Rossetti concludes his empirical investigation of the question as to the happiness of poets' married lives. He has investigated twenty-nine, or rather, as some of the men remarried, thirty-six poetic interiors, and discovered that eight are unhappy, five more or less so, fifteen happy, three probably happy, and five doubtful. "And thus," he says, "we may, I think, leave the subject at the close of our scrutiny with less gloomy views of the poetico-marital relation than," etc., etc. The genesis of the scrutiny, however, remains involved in mystery. A short poem by Cameron Mann, "The Longing of Circe," is the best magazine verse we have seen in some time. The reviews are, in the main, noticeably good, and the same may be said of the "Contributors' Club." The latter circumstance gives the number a unique flavor, and is a bid for the continuance of this "feature" under Mr. Aldrich, though if it should occur to Mr. Rossetti to make one of his historical scrutinies into the matter its fate would be sealed, we fear.

—Two more reports from the Boston Record Commissioners extend a series of rare interest and importance. One of these contains the Roxbury Land and Church Records—the first hardly to be called readable though valuable, and it is to be observed that they include records of the lands in Woodstock, Conn., a Roxbury settlement under the auspices of the Rev. John Eliot, whose record of church-members is here subjoined and is entertaining enough, as is also his record of public events, supplemented by the Rev. Samuel Danforth's. In the long tale of deaths, communions, and discipline—the casting out and the restoring of unruly or sinful members—there are frequent instances of what every student of New England church records is familiar with, namely, the formal censure of maternity out of wedlock, almost always forgiven on the woman's making public confession and repentance. Doubtless the leniency was not mistaken, as if the error were

but an involuntary publication of intention to marry. How far it could be carried in Roxbury in this class of offences is shown in the case of Hannah Newel, admitted to full communion in May, 1693, and "excommunicated for adultery most heinously circumstanced 1695. She was restored June 1708." The other volume of the Commissioners' is a collection for the first time of articles contributed to the Boston *Transcript* by the late Nathaniel I. Bowditch, "confessedly the most learned conveyancer of the day." They embrace the history of the estates lying on or around Beacon Hill, "and the proverbial dryness of antiquarian and legal discussion is relieved by anecdotes of the distinguished citizens who have lived upon this noted territory during the past two hundred years." The estate of William Blackstone, the first settler of Boston; that of the painter Copley, on which, as Mr. Bowditch says, "live, or have lived, a large proportion of those most distinguished among us for intellect and learning, or for enterprise, wealth, and public spirit"; the Hancock, Bowdoin, Allen, Bulfinch, and Phillips estates, and many others are traced in order, with curious revelations as to the origin and defects of titles, much sound legal observation, and a pervading humor. The controversy with "Z." about the decision in the Brattle Street parsonage case is instructive professional reading, as is the whole book, in fact, which might at the same time be recommended for a lawyer's relaxation. A few of the more amusing incidental remarks are worth quoting:

"And here I take occasion to remark, that invariably if a woman own a large landed estate, she is sure to keep getting married from time to time, as often as death affords an opportunity, thus making great embarrassments in tracing titles" (p. 69).

"I never met with anything to beat this, except, perhaps, a deed of a moiety of a house, where, among the privileges granted, was *an undivided half* of the right of arching over a certain passage-way" (p. 95).

"The Hancock title I should characterize exclusively by words beginning with d. Its descents, devisers, deeds, divisions, and dowers, with its doubts, difficulties, and defects, make it the very d—l. . . . The late John R. Adan, who was an eminently *practical* man, for years before his death adopted and acted upon the maxim that he would never examine a title that came through anybody named *Spear*—a rule which, from analogy of name and reason, he extended to *Spurr*. I have seen him gravely decline a retainer, alleging this ground of action, though *the* Mr. Spear in question assured him that he was not of the family of Governor Hancock, and that his title would be found extremely simple."

We should not omit to mention the indexes which the editors, Messrs. Appleton and Whitmore, have laboriously prepared for these volumes.

—Mr. Joseffy enjoys an amount of popularity in Brooklyn greater, perhaps, than in any other large city where he has been heard since his arrival. This was evident at his last appearance at the two public rehearsals and the concert of the Brooklyn Philharmonic Society. On these occasions the Academy was crowded to its utmost capacity. Mr. Joseffy played, amid the greatest enthusiasm, the Schumann Concerto, certainly one of the most poetical of musical creations, and Liszt's fantasia on Beethoven's "Ruins of Athens," a brilliant and effective work, which the artist has repeatedly performed in this city. The rest of the concert contained nothing new—a delightful symphony of Haydn's, Schubert's unfinished symphony in B minor, and four orchestral numbers from Berlioz's "Faust." These numbers were performed with such spirit and intelligence as to make the concert one of the most attractive which Mr. Thomas has given this season.

—Mr. Mapleson must have come to the conclusion that the long-suffering patience of the New York public has its limits. Even Mme. Gerster fails to exercise her wonted magnetism in the tedious repetitions of the few operas which Mr. Mapleson has produced during his three seasons. "Lucia," "Linda," "Sonnambula," *e tutti quanti*, cannot attract an audience even with the best artists in the cast. The only attempt at dramatic opera ended in a very disappointing performance of Mozart's "Don Giovanni." Not a single part, excepting Mlle. Valleria's (*Donna Elvira*), was acceptably filled. The first performance this season of Rossini's "Barbiere" was a success. Mme. Gerster is one of the best *Rosinas* that have ever been heard here, and Del Puente and Ravelli were both very satisfactory.

—The play of "Felicia; or, Woman's Love," is a dramatization of a novel not well known in the United States, called "Le Fils de Coralie." The story on which the play is founded is a very extraordinary one. *M. Mornay*, an archæologist (Mr. John Parselle), living in the south of France, has a charming daughter, *Dolores* (Miss Sara Jewett), who loves and is beloved by an artillery officer going by the somewhat incomplete name of *Captain John* (Mr. Thorne). *M. Cassagnac*, a man who has seen a great deal of the world (Mr. De Belleville), is also in love with *Dolores*, and in the first part of the play has an ally in his suit in *Eleanor Mornay*, the aunt of *Dolores*. *Mme. Dumont* (Miss Rose Eytinge) is a lady in middle life whose occupation is set down in the bill as that of "a peasant farmer." She is a lady of large means, a considerable portion of which has been judiciously invested in live stock; but it is not so much the investment as the origin of her fortune in which the other characters of the play are interested. As a matter of fact, the audience very early in the play is let into the secret that *Mme. Dumont* has been in her youth a *dame aux camélias*, and that during this portion of her career she was very well known by *M. Cassagnac*. She had been one of the most notorious characters in Paris, and it is a strong proof of the inherent excellence of her character that after such a misspent youth she should have turned her attention in mature life to so respectable and useful an occupation as stock-farming. From the pronunciation of her name adopted at the Union Square she must have been of Italian origin, though nothing is said of this in the course of the drama. *Captain John* supposes this lady to be his aunt; but she is, in fact, his mother, and has carefully concealed from him the taint which hangs over his birth, except that he has been allowed to know that he is an illegitimate child. Out of this situation the plot of the play springs. First, *Captain John* proposes for the hand of *Dolores*, and, notwithstanding his illegitimacy, is accepted not only by her but by her family (*Eleanor*, who had previously favored *Cassagnac's* suit, romantically changing sides on finding how much true sentiment there is in the Captain's love of her niece). Unfortunately, *Mme. Dumont* now appears on the scene, and black clouds begin to lower from the distance over the happy pair. Political economists and sociologists may commend the use to which the retired Parisian has put her ill-gotten money, but no respectable French *pater-familias*, even supposing that illegitimacy in itself formed no obstacle to the union, could allow his daughter to marry the acknowledged son of the notorious *Felicia*. *Cassagnac* from the outset sees through the situation and believes it his duty to make it known to the parties most interested. This he does by making *Felicia* acknowledge the truth to her son. Up to this point there seems no way out of the difficulty except a dissolution of the engagement, but at the very moment when all seems to be over, *Mme. Dumont* produces a letter from the father of *Captain John*, who turns out to be no other than the deceased brother of *M. Mornay*. *Dolores*, instead of going into a convent, marries *Captain John*, while the latter's mother is carried off by a nun who very opportunely appears amid the dismal tolling of a convent bell. This termination suggests *Don Juan* and a trap, with red fire, but of course, as the destination of the nun and *Felicia* is not infra-mundane, they go off quietly together at the wings and not through the floor. The play as a whole is rather disappointing, partly on account of the excellence of the first act, which is so well constructed as to raise hopes with regard to the remaining three which the result does not justify. Mr. Cazauran is a clever playwright, and it is to his management of the first act, and the acting of the company throughout, that the success of "Felicia" should be credited. It is easier to write a first act than a whole play, and we have never seen one better constructed for the purpose of preparing for the main action than in "Felicia." The difficulty with the development and dénouement is that the story itself is disagreeable, and that the action drags. As to Miss Eytinge's acting of *Mme. Dumont*, opinions may differ. It is rather a melodramatic interpretation of the part, but this is perhaps justified to a certain extent by the introduction of the nun and the convent bell in the fourth act. The best piece of natural acting in the part was in the scene with *M. Mornay* and *M. Ferri*, the family lawyer (Mr. Stoddart), in which she attempts to palm off a false account of the origin of her fortune upon the family of *Dolores*. The play is worth seeing, if only for the acting of Mr. Parselle, who is as nearly perfect in old men's parts as it is possible for anybody to be.

—Miss Genevieve Ward and Miss Rose Coghlan have succeeded between them in creating an interest in the play of "Forget-Me-Not" which its inherent merits hardly warrant. Stage-right is, we believe, abolished or materially modified by Mr. Field's new Civil Code, and if that remarkable body of law goes into effect it may be open to every American actress to play the part of *Stephanie*, so that, with its present popularity, we may perhaps look forward to an epidemic of "Forget-Me-Nots," similar to that of "Pinafores" a few years ago. In the present position of this play, and the litigation which has grown out of it, it has become the duty of every theatrical critic to express an opinion as to the respective merits of the performance of Miss Coghlan and Miss Ward, and for our part we have no hesitation in saying that we very much prefer Miss Coghlan. The supposed superiority of Miss Ward consists in her refinement, but as the character itself is not refined no acting can make it so. In the scene in which *Stephanie* is moved to tears and begs *Sir Horace Welby* for one chance to make herself an honest woman, Miss Ward makes her emotion real, and thereby enlists the sympathy of the audience. But this merely shows how foolish the audience is, and how little it reflects upon what it sees, because the important part of *Forget-Me-Not's* character is that which has been formed in her past life, when she was the decoy of a gambling-hell. With such a life behind her it is absolutely impossible to suppose her actuated by any very deep longing for a pure life, although she might, of course, cry over the difficulty of her getting into good society again—women being known to shed tears easily, and social recognition being very dear and important to all women, and particularly to women under a cloud. But the idea of a refined *Forget-Me-Not* is an absurdity. Miss Coghlan's great merit lay in the recognition of this fact; she made the character superficially attractive,

but fundamentally bad, coarse, and cruel. Her cruelty, indeed, to *Alice Verney* is so great that any real sympathy is out of the question, although the *Alice Verney* at the Fifth Avenue Theatre, by the tameness of her acting, makes sympathy with either party rather difficult. Miss Ward's manner of acting is artificial, and so is Miss Coghlan's ; but between the two the artificiality of the latter is more in character. Miss Coghlan's representation of physical fear in the last scene of the play was a great success ; in this Miss Ward entirely fails—it is apparently beyond her power to simulate fear of any kind. So in the cut-and-thrust repartee which so continually occurs in the dialogue the points are all made with more vivacity and effectiveness by Miss Coghlan than by Miss Ward. This, to be sure, is partly owing to the inferiority of the rest of the cast, *Sir Horace Welby* being taken at the Fifth Avenue Theatre by a gentleman who has a very faint idea of what can be made out of the part, as he also seems to have of the dress customarily worn by English gentlemen. The effect of the discovery of the Corsican, in the fourth act, by the drawing of the curtain is very much impaired at the Fifth Avenue by the fact that when discovered he is vigorously engaged in smoking a cigar, an occupation not calculated to suggest the idea of the avenger of blood. Besides all this Miss Ward looks a little too respectable for the part. Her fine, strong countenance does not suggest the adventuress and outlaw, and, instead of being held at arm's length by society, one is continually thinking that she might well enough be engaged in the management of it. It may be objected to Miss Coghlan that she looks too young for the part ; this is not the fault with Miss Ward. On the whole we cannot help saying that the interest of the dispute as to which of the two actresses plays her part best will be greatly deepened and intensified by the prolongation of the litigation over the ownership of the play. The atmosphere of injunctions and affidavits which now envelop it makes it attractive to the audiences of two hemispheres, notwithstanding that it is inherently a second-rate play.

—Janauschek has just terminated a short engagement at Booth's, where she has played a very remarkable round of characters. Her répertoire is only less varied than that of Geistinger, who plays everything in the whole range of modern and ancient characters, from *Boulotte* to *Medea*. Janauschek has never attempted opéra-bouffe, and from her acting in those plays in which we have seen her it is improbable that she would succeed in it, but it appears from her recent performances that she considers herself equal to anything in the way of tragedy ; she would not otherwise have attempted such a play as "Brunhild," a German mediæval legendary drama founded on one of the myths which Wagner has made familiar to modern audiences. There is no more curious proof of the chaotic condition in which the modern stage is plunged than the fact that so many melodramatic actresses are continually developing themselves, by the easy process of advertisement, into tragedians. There is nothing more certain than that a fairly good performer of melodrama will always be incapable of acting tragedy well. Tragic acting, to appeal to our sympathy, must be founded upon reality of emotion, while in melodrama there is always an essential falsity of sentiment. Melodrama deals in incident, in surprises, in theatrical effects ; tragedy, and particularly classical tragedy, pays no attention to any of these things, but relies entirely on the truthful representation of human passion. It is perfectly possible, therefore, for the same actress to succeed admirably in a play like the dramatization of 'Bleak House,' and fail utterly in a play like "Brunhild." Janauschek's whole system of acting is melodramatic ; it is a series of poses, of declaimed speeches, of "points," which generally require music for the purpose of marking them. Her voice, too, is monotonous, and has no range of feeling or variety of expression ; in other words, anger, jealousy, love, surprise, indignation, hatred, tenderness, are all expressed in the same tone. This need not necessarily spoil melodrama, but will not answer in tragedy. Audiences, we fancy, are beginning to find this out. The importation of actors and actresses to this country, and the creation for them here of an American reputation, on the strength of a putative European reputation, has been carried to a point at which it has become ludicrous. In Janauschek there can be no doubt that we have an actress who, were she of American origin, would have never occupied more than a respectable place upon our stage, yet within a few years she has been made a sort of German Rachel.

—A correspondent writes us as follows from Solon, Me., under date of March 18 :

"The word 'blizzard' spoken of in this week's *Nation* I have heard occasionally used in this vicinity ever since I was a boy, twenty or twenty-five years ago, more rarely of later years, and always as a part of the phrase 'Let her blizzard,' spoken to one aiming a gun or arrow and about to fire—to one awaiting a signal to throw something at something. An impatient boy will say 'Let her blizzard' to his comrade who hesitates in throwing him a ball, etc., etc.; but always in this sense. 'When I got near enough I let her blizzard and shot it dead.' From the meaning and manner of use I have supposed it a corruption of 'blaze away.' It is with us largely a boy's phrase, and is well known."

—The modern Greek is an interesting study both for its bearing on the ancient language and as the latest phase of a tongue whose history can be followed for more than 2,500 years, but the materials for its proper investigation have not yet been collected. The native scholars of Greece are barred by their prejudices from ascertaining and publishing the facts of the language, as is witnessed by the opprobrium cast by them upon Professor Sophocles for giving in his Romaic grammar an account of the real speech of the people. As an organ for this branch of study Dr. Michael Deffner has recently begun, at Athens, the publication of an *Archiv für Mittel- und Neugriechische Philologie*, or collection of monographs, memoirs, criticisms, notices, and so on, which will appear from time to time, as circumstances shall direct, at twenty-five francs for the volume of over 500 pages. The editor is well fitted for the task he has undertaken. He studied with Curtius at Leipzig ten years ago, taking for his graduating thesis a discussion of the sounds of modern Greek, afterwards published, under the name of "Neogræca," in the fourth volume of Curtius's 'Studien.' He then went at once to Greece and habilitated as *hyphegetes* in the University at Athens, with the expressed intention of writing a historical grammar of the modern language. With that end in view he has devoted himself to the study of the existing dialects, especially the Tsaconian, of which he has prepared a grammar, and respecting which he gives in these first numbers of his *Archiv* information more trustworthy and methodical than any before accessible—except, perhaps, in the valuable papers he has published in the *Sitzungsberichte* of the Berlin Academy. As the present disturbed condition of public affairs in Greece takes away the possibility of aid from the Government, Dr. Deffner appeals to scholars throughout the world to give to his undertaking the encouragement which it thoroughly deserves. It is to be hoped that American libraries and professors of Greek will be found on his list of subscribers. The contents of the first double number are partly in German and partly in modern Greek, the larger portion of them from the editor's own pen. English, French, and Italian contributions are also to be admitted. Print and paper are clear and handsome, and illustrations will be given as called for by the subjects treated.

—In 1878 the fourth International Congress of Orientalists, at Florence, empowered the executive committee of the German Oriental Society to make arrangements for the next meeting. They have accordingly determined to hold it in Berlin, from the 12th to the 17th of September, 1881. The committee of arrangements now issues, with Imperial approval, an invitation to scholars and friends of Oriental studies to take part in this Congress. All who wish to do so are requested to send their names and a remittance of ten marks to F. A. Brockhaus, of Leipzig, or to Asher & Co., No. 5 Unter den Linden, Berlin, W. This payment entitles to membership and to the publications of the Congress. Persons desiring to read papers, or to send communications or questions to the Congress, or to further its objects in any other way, may send a notice of their intention to Professor Dillmann, No. 68 Grossbeeren-strasse, Berlin, S.W. All notices and remittances should be sent in before the first of August.

MUNTZ'S LIFE OF RAPHAEL.*

So numerous are the biographies of Raphael, and so recently has Springer, in his 'Raffael und Michelangelo,' published in 1878, gathered up the results of modern learning and modern criticism concerning him, that a new life of the great painter might seem a work of supererogation. But in the present instance such is not the case. The important volumes of M. Muntz on 'Les Arts à la Cour des Papes pendant le XVe et le XVIe Siècles,' full as they are of new material derived from independent researches among the unpublished documents of the period, have given him a distinguished place among the investigators of the conditions of the arts in Italy during the Renaissance, and afford assurance of his competence, so far at least as knowledge is concerned, to treat of the life and works of any one of the chief artists of the time. It is not too much to say that his present elaborate book is in many respects superior to any preceding biography of Raphael, and that for the general reader it may well supersede them all. Some slight disappointment may be experienced by the special student at finding that the researches of the author have enabled him to add little to what was already known concerning Raphael, and that the chief interest of the book consists not so much in any novelty of fact or opinion as in the skilful compilation and abundant illustration of more or less familiar material. The volume, as its scale indicates, is more than a mere narrative of the incidents of the life of Raphael, and a description of his works ; it is, after the method of modern biography, a study of the conditions in which his life was led and his pictures painted. This larger view displays to advantage the wide and accurate information of the writer, and his sympathy with the times of which Raphael was one of the most brilliant products. But in this very attempt to set before us a picture of one of the most remarkable and interesting periods in the intellectual life of Europe the principal defect of M. Muntz's work becomes apparent.

* 'Raphaël, sa Vie, son Œuvre, et son Temps. Par Eugène Muntz, Bibliothécaire de l'Ecole Nationale des Beaux-Arts, Laureat de l'Institut.' Ouvrage contenant 155 Reproductions de Tableaux ou Fac-Similes de Dessins insérés dans le Texte et 41 Planches tirées à part. Paris : Hachette et Cie.; New York : F. W. Christern. 1881. Gr. 8vo, pp. 658.

No moment in history is more complex in its aspects than the Renaissance, none in which the opposition of conflicting forces is more intricate, in which the balance of motives is more shifting, in which the play of passion and principle in the conduct of men presents a more brilliant and phantasmagoric spectacle. It is a time of contradiction in character and action: of ideal virtue and unblushing vice, of refinement and coarseness, of purity and corruption, of tenderness and cruelty, of fidelity and treachery, of courage and cowardice. Life was not dull; the energies of men were high strung; their intelligence impassioned, their emotions ardent. They felt the need of every form of expression, and the arts were stimulated to their highest performance in response to this inward compulsion. To give a true picture of such a time would be a work of consummate genius. It has never yet been accomplished. It demands the union of the poet and the philosopher with the historian, and it is slight impeachment of the ability of M. Muntz as a biographer that he falls short of this achievement. The reader will find in his pages ample detail of fact and intelligent narrative, but he will miss the spirit that gives living form to the body of the time. Such phrases, continually recurring, as *Il est possible que, qui sait si, nul doute que, quoi de plus vraisemblable*, and the like, give evidence of a lack of that penetrating and comprehensive imagination which vivifies the past, and, seizing the truth, finds no need of guesses and suppositions. The same defect gives occasion to a tone of exaggeration in regard alike to the period in which Raphael lived and to his own works. This tone does not exclude occasional judicious and intelligent criticism, but the biography is essentially a eulogy, and its motto might be a sentence which the author quotes from "that modern artist who," as he says, "has best understood Raphael, and most passionately loved him, Ingres"—"*Il n'y a rien d'essentiel à trouver dans l'art après Phidias et après Raphaël.*"

This exaltation of the greatness of Raphael, which has been a continuous tradition from his own times to the present day, is not difficult to account for. The charm of his most popular works is like the charm, of which we are told, of his person and manners. It is the charm of unaffected grace, ease, urbanity, and openness. It appeals to all alike. The sweet simplicity of action and expression in many of his Madonnas; the virginal purity, or the maternal tenderness, or the spiritual intensity of look by which each of his representations of the Virgin and Child is individually distinguished, attract both the simple and the learned in art. The vigorous vitality of his portraits, the exquisiteness of his ornamental designs, the easy accomplishment of work of wide variety of range, the frequent grace of his composition, unite, together with more technical excellences, to give him a place of exceptional distinction. The very limitations of his genius serve to heighten the impression which it makes, especially upon the great mass of those who see his work, unacquainted as they are with the history of art, and ignorant of the capacity of painting as a mode of expression of truth. No effort is required to understand him, no special education to find pleasure in him. The repetition of the praise justly due to him from generation to generation has caused a general acceptance of his work as, in the main, above criticism. "Perfect" is a word that recurs often in M. Muntz's pages.

This exclusiveness of eulogy is a striking illustration of how small a part the art of painting holds in the culture of modern times, of how entirely it has ceased to be of importance as an art of expression of the real life of men, and how artificial are the rules by which its productions are for the most part estimated. So unfamiliar have we become with the true powers of painting in giving an image of thought and feeling for which no other mode of expression suffices, that the very faculty of appreciation of them is feeble through disuse. The reasons of the failure of the art to hold its just place among the important modes of expression are too numerous, too much involved with considerations of the moral estimates and social conditions of modern times, to be more than referred to here. But it is in great measure owing to this failure that the popular judgment of the merits of Raphael remains what it is. If we were accustomed to demand from painting a true expression of human interests, and were familiar with it as rendering, by means of line and color and light and shade, poetic imaginations and aspects of truth that cannot elsewise be conveyed; if we were to look to it, as we look to poetry, as a source

> "Of blessed consolations in distress,
> Of moral strength and intellectual power"—

if, in fine, it were to us a means for "the noble and profound application of ideas to life," we should employ a standard of judgment for the works of the painters of past and of present days very different from the uncertain, often fanciful, often false standards that are now applied. And were we to judge the more important works of Raphael by this permanent and elevated rule, the conclusion reached would be different from that now commonly held. For while allowing, with no abatement of admiration, the exceptional beauty and excellence of much of his work, especially of his most simple and unambitious productions, we should not transfer our admiration, without large reserves, to his principal and most famous compositions—to the "Stanze," the "Transfiguration," the "Madonna di San Sisto," for example. For these, while exhibiting single strokes of genius and technical merits of rare quality, are in the main cold and studied inventions of the intelligence, lacking alike the unity of poetic vision and the depth of imaginative truth.

Few of his frescos have been more eulogized than the so-called "Dispute (Discussion) of the Holy Sacrament." It is, according to M. Muntz, "rightly regarded as the highest expression of Christian painting, as the most perfect summary of the fifteen centuries of faith comprised between the frescos of the catacombs and those of the Florentine realists. The 'Dispute' is more than a *chef d'œuvre*: it marks a date in the development of humanity." And yet this work, great as it beyond question is in some purely pictorial qualities, and exhibiting in single figures not merely grace but force of characterization, and with detached passages of extreme beauty, is, as a whole, a mere artificial invention. It is built up out of separate, independent conceptions, and is devoid of that interior dramatic passion which should fuse its various elements into a complete, harmonious, and inevitable unity. The interest of the spectator is divided, his attention is not concentrated upon the essential motive of the complex scene, but is compelled to wander from group to group, from personage to personage, till it becomes wearied in the effort to bring all together in the relations that should unite them in the production of a single controlling impression. A similar criticism applies to "The School of Athens," a work, says M. Muntz, "that extends the limits of human intelligence, and forms, as it were, the final word of art." There is no failure of ability in this extraordinary work; talent has seldom gone further. It is a composition that reveals the skill of a most accomplished artist; but it *is* a composition, not a creation, a work of the understanding, and not a realized vision of the imagination. Probably no painted figures have moved more hearts than those of the "Madonna di San Sisto" and the child Saviour in her arms. In the expression and character of these figures the special genius of Raphael found its full utterance; but who can look at them and then turn to the figures of the Pope and the Virgin Saint below without revulsion of feeling at the strange incongruity of sentiment exhibited in the presentation of these subordinate personages? The want of sympathetic emotion in their faces and action, the lack of reverence, the indifference to the celestial vision, displayed in them, afford a curious revelation of the limits of the artist's own nature, of the deficiency in himself which was the source of the incomplete effect of his greatest endeavors.

The truth is, Raphael was not a great character, and he attempted work that only a man of great character could successfully perform. Whatever was not outside the limits of performance of a sweet nature, and of fine gifts of observation and perception, and of exquisite accomplishment, that he could do as few or no others. But the passions of his soul were shallow, and his insight into human nature restricted by the externality of his own disposition, so that the truthful vision of his imagination was limited to scenes in which only simple motives had part. It was the fault of circumstance in part, and in part also the result of facile powers of execution to which every task was indifferent, that he was so often employed upon work that required for its effectual performance a nature deeper and stronger than his, and to which things human and divine were more fully revealed.

Whatever may be the estimate to be formed of his works, the book of M. Muntz is an excellent source of information concerning them. The illustrations are not only numerous but well selected. Many of them are of special value as fac-similes of original drawings. The photo-lithographic copies of engravings and the woodcuts are, however, not to be classed among the best French work of their kind: some of them are positively bad. But, on the whole, both in its literary quality and in its illustrative material, the book is above the average of biographies of artists, and is of worth enough to hold a permanent position in the libraries of students, and of admirers of a painter who stands among the most conspicuous figures in the history of art.

WARD'S ENGLISH POETS.*

PRAISE of what is obviously and undeniably excellent has always a perfunctory air, and, in the midst of the general acclaim, we need not now repeat of these volumes what we said in general of the two preceding (No. 780), except to add that the promise contained in their performance has here been amply fulfilled; so that altogether it would be difficult to select four volumes of any kind better worth owning and studying than these. Volume iii. is devoted to the eighteenth century, and its critical introductions are divided as follows: W. J. Courthope—Addison, Samuel Johnson, and Crabbe; Edmund W. Gosse—Walsh, Lady Winchelsea, Ambrose Philips, Parnell, Tickell, and Somerville; Austin Dobson—Congreve, Prior, Gay, and Matthew Green; George Saintsbury—Sir Samuel Garth, Thomson, Armstrong, Blair, Young, Shenstone, and Beattie; J. Nichol—Swift; Mark Pattison—Pope; W. Minto—Ramsay, "Scotch Minor Song-Writers, Eighteenth Century," and Caroline Oliphant; Edward Dowden—Dyer, Akenside, Falconer, and Goldsmith; W. E. Henley—John Byrom; T. Arnold—Glover; Dean Stanley—John and Charles Wesley; A. C. Swinburne—Collins; Matthew Arnold—

* 'The English Poets. Edited by Thomas Humphry Ward, M.A.' Vols. iii. and iv. London and New York: Macmillan & Co. 1880.

Gray; The Editor—Whitehead, Smart, Warton, and Cowper; E. J. Payne —Churchill; W. Theodore Watts—Chatterton; John Service—Fergusson and Burns; A. Mary F. Robinson—Mrs. Barbauld; J. Comyns Carr—William Blake. The general view of the eighteenth century given by all these is consistent, and, though not flattering, clearly just, as its consistency, indeed, demonstrates. It may be taken to be final, and we shall never witness a respectable rehabilitation of the poetry and poetic standards thus definitively adjudged meagre and misconceived. So thoroughly, however, does this expert judgment accord with that now current that it is worth while to point out the exceptional excellence which leavened the Augustan production, and upheld the tradition of true poetry until Wordsworth had taken up the work of Milton and the French Revolution undone that of the English. This too is abundantly indicated here—positively by Mr. Swinburne's essay on Collins, and negatively, though with far more convincing force, by Mr. Arnold's on Gray, to mention the most conspicuous instances. Mr. Swinburne's criticism is valuable only when read in a critical spirit of the utmost watchfulness; the editor of such a cyclopædia of criticism as this must, one would think, have hesitated to commission a writer for whose pearls the reader has to pay so much in patience, temper, and mental alertness. But as soon as one is reconciled to its cost, there is undoubtedly instruction to be obtained from Mr. Swinburne; you do not trust him sufficiently to care to "feel what he means" in much of his elaborate and rhetorical breaches of the elements of criticism, and from the point of view of mere literary art much of it is detestable, but glimpses and suggestions that would escape another his quick poetic instinct now and then discloses. It is so here. When he says (pp. 278 and 279)—

"Even in his own age it was the fatally foolish and uncritical fashion to couple the name of Collins with that of Gray, as if they were poets of the same order or kind. As an elegiac poet, Gray holds for all ages to come his unassailable and sovereign station; as a lyric poet, he is simply unworthy to sit at the feet of Collins"—

the reader will err if he stops with the obvious untruth of the statement both as to Gray and as to Collins, and concludes, as surely the temptation to conclude is strong, that from this order of eloquence there is nothing to be obtained by any winnowing, however scrupulous. Taken as a whole the essay calls attention more strongly than anything written about Collins, perhaps, to his unquestionable lyric merit. The substance of Collins is of so little moment to us that this is likely to be overlooked; after reading what Mr. Swinburne says, the "Ode to Evening" acquires a fresh interest, and as to Gray, he is very well taken care of in the next essay. Mr. Arnold points out, incidentally by the way, the error of the commonplace estimate of the "Elegy"—the estimate of Mr. Swinburne—and calls attention to Gray's own just judgment of it. His consideration of the man and the poet, and his surroundings, is the most concise and vivid statement of the Augustan age in poetry that the book contains, and may be taken as a definite summary of what the other writers allude to less explicitly. Nevertheless, Gray was a genuine poet, and the key to his scanty production is found in some words of his friend, James Brown. "He never spoke out," says Brown; and he did not because of the gelid atmosphere that surrounded him. And Gray and Collins are not the only Augustan poets in whom, to a greater or less degree, genuine poetry is to be discovered. It is curious to observe the occasional anxiety of a writer to find it in his own subject "despite the artificiality of the age." Mr. Gosse says, for example, of Tickell's lament on the death of Addison, that "the famous elegy is justly ranked among the greatest masterpieces of its kind." One thinks of "Lycidas" and Tickell's

> "Blame not her silence, Warwick, but bemoan,
> And judge, oh I judge, my bosom by your own,"

and wonders at Mr. Gosse more than at Mr. Swinburne's prophecy about Gray's sovereignty "for all ages to come." Mr. Saintsbury has a better case in Thomson, and justly says that nothing can be "more exquisite than the opening stanzas of 'The Castle of Indolence' in respect of metrical proficiency," adding acutely: "Now, this excellence of form, whatever some critics may think, is a very important element in enduring popularity, because it is not liable to danger from changes of fashion"; but in order to call the first book of "The Castle of Indolence" "one of the very best things of its kind to be found either in English or in any other literature," one needs first to characterize "its kind." However, to object to Mr. Saintsbury's estimate of Thomson savors of hypercriticism, and makes against our point that there is an undergrowth of genuine eighteenth-century poetry easy to overlook. Parnell is another instance. He awoke, says Mr. Gosse in rather a heightened way, late in life "to strike a few magnificent chords on the lyre of a true poet." In Akenside's "Inscriptions" Professor Dowden finds "a marmoreal purity and permance." Mr. Ward calls Smart's "Song to David," slightly pedantic as he admits it to be, "the work of a poet." Young gets certainly all the praise he deserves from Mr. Saintsbury, who, after satisfying his conscience by saying that the "Odes" and "Imperium Pelagi" are so bad that "hardly any worse poetry has ever been written," feels free to praise portions of the "Night Thoughts" and the "Last Day" without stint. Some passages are "of the finest tragic mould," where "the grandeur of the verse" is not obscured. Mr. Saintsbury even maintains that "as a poet of moral ideas" Young "will always deserve attention," and one is tempted to add that Dr. Watts will also, both of them in this and other senses, however, as antiques. "A spark which not unfrequently rises into true and lasting poetry" is discernible to Dean Stanley in Charles Wesley, and certain associations will create in many people sympathy with such favorable judgment, which for the rest is as temperate and candid throughout this essay as its author never fails to remember to be when he is speaking of similar themes. Lady Winchelsea, however, is a far better illustration for us, and the reader owes Mr. Gosse due gratitude for what he says of her; few things similar to her "Nocturnal Reverie," in which

> ". . . silent musings urge the mind to seek
> Something too high for syllables to speak,"

were good enough to win the same complete neglect with which her age rewarded her.

The transition from the eighteenth-century poetry to the poetry of modern England has never, perhaps, been considered on so many sides as it is in the several essays at the end of this volume. Mr. Payne makes the shrewd remark of Churchill, that his "extraordinary command of common pedestrian English, and the sharp relief in which he stands out among the formal poetasters of his day," entitle him to be considered in some sense a precursor of the poetry which arose with Burns, Cowper, and Wordsworth.

> "The laurel seemed to wait on his command,
> He snatched it rudely from the Muses' hand."

Cowper himself sang of him, with admiration not too keenly qualified with discrimination. Beattie's "The Minstrel," says Mr. Saintsbury, "exactly reflected the vague and ill-instructed craving of the age for the dismissal of artificial poetry and for a return to nature, and at the same time to the romantic style." Cowper's position as a forerunner of Burns and Wordsworth is enthusiastically set forth by Mr. Ward, who, however, goes further, and contends that "in his own curious and limited way" Cowper contains both "the Byronic and the Wordsworthian element." M. Taine and Mr. Stopford Brooke are authorities for finding foreshadowed in Cowper the spirit of Byron and Shelley, but Mr. Ward does no more than they to prove this theory, which, we confess, seems rather fanciful when we consider that what it rests upon is the unconscious part of Cowper, and that it rests very slightly upon that. Cowper, however, is such a distinct return to nature after such a distinct divorce from it that almost every one who writes upon him is betrayed into saying too much. Mr. Ward calls "The Castaway" "that noble and terrible poem," and one wonders what he would find to say of "The Ancient Mariner." The forerunner of Coleridge and Keats, if not of Shelley and Byron, the real originator of the romantic movement, both in spirit and form, if we are to identify cause and precedence after the current fashion, was a very different poet from Cowper: it was Chatterton. Mr. W. Theodore Watts's essay upon Chatterton is one of the very best in the volume. It lays great, but we think not undue, stress on Chatterton's metrical inventiveness and originality of ear, and the metrical correspondences pointed out between him and Coleridge are instructive. But the spiritual correspondence between Chatterton and Keats is still more striking. Mr. Watts aptly instances the likeness between the "Ballad of Charity" and "St. Agnes' Eve," and between passages in the "Isabella" and the "Narva and Mored." And, further:

"As a youthful poet showing that power of artistic self-effacement which is generally found to be incompatible with the eager energies of poetic youth —as a producer, that is to say, of work purely artistic, and in its highest reaches unadulterated by lyric egotism—the author of the Rowley Poems (if we leave out of consideration his acknowledged pieces), however inferior to Keats in point of sheer beauty, stands alongside him in our literature, and stands with him alone."

Nothing could be better. Keats as well as Chatterton is very happily characterized.

Burns, who is exhaustively considered by a countryman, and William Blake, of whom Professor Comyns Carr writes, bring us to our own century and to the last volume of the work. We need linger over neither the Burns essay, which is handicapped by the study of Burns in the "General Introduction," nor that on Blake, except to rejoice that Mr. Swinburne did not write it. The introductions of volume iv. are divided as follows: Dean Church—Wordsworth; Sir Henry Taylor—Rogers, Southey, and Campbell; Austin Dobson—Bowles, Frere, Hood, and Praed; W. H. Pater—Coleridge; Goldwin Smith—Scott; A. Mary F. Robinson—Joanna Baillie and Felicia Hemans; W. Minto—Hogg, Tennant, and Motherwell; J. A. Symonds—Byron; E. W. Gosse—Moore, Wolfe, Peacock, Procter, Beddoes, and Emily Brontë; E. Dowden—Lamb, Hunt, Elliott, and Hartley Coleridge; F. W. H. Myers —Shelley; Matthew Arnold—Keats; Lord Houghton—Landor; Dean Stanley—Keble; The Editor—Macaulay and Clough; W. T. Arnold—Mrs. Browning; W. E. Henley—Kingsley; J. Nichol—Sydney Dobell. Eighty-eight pages are given to Wordsworth, and though it is a large number, it is too many only by the surplusage in the fifteen which the Dean of St. Paul's uses to examine his author from every point of view he can think of. Character-

istically he quotes, as an explanation of what made Wordsworth great, a part of Coleridge's 'Biographia Literaria' which might almost equally apply to all genuine poetry—"the union of deep feeling with profound thought," and so on. Mr. Symonds's Byron is also elaborate and uninspiriting, but its commonplace is more misleading because Byron is not so plain a case as Wordsworth, in some respects. It is distinctly an apology and an unhappy one—addressed to English readers instead of being "composed with the eye on the object." When Mr. Symonds says, "He cannot be called a moral poet," we anticipate his next sentence: "His collected works are not of a kind to be commended for family reading." True enough, as an explanation of certain objections to Byron, but objections of this kind need no attention in a work of this sort. In the judgments of individual poems there is just enough deflection from a true estimate to indicate the absolute want of sympathy in Mr. Symonds's appreciation. None of the Oriental tales, he says, for example, except "The Giaour," have enough "vitality or perfume of true poetry" to make their "perusal at the present day desirable." We should care less if among the selections given a line from even the "Giaour" had been considered "desirable." Mr. Arnold's Keats will undoubtedly excite sharp dissent, but is what many people have been wanting to hear. Mr. Myers's Shelley is a charming piece of championship, eloquent, graceful, contained, but, as we said recently of his 'Wordsworth,' more persuasive than convincing. The essays on Shelley, Keats, and Coleridge, who is assigned to Mr. Walter H. Pater, would of themselves be valuable in any work for the admirable examples of prose which they set. Compared with the criticism which died with Jeffrey—who, in Carlyle's estimation, left no successor—they are penetrated with qualities of which modern English letters may be prouder than of any other of its attainments—prouder even than of any poetry they have produced since Wordsworth died in 1850. If that seem extravagant to partisans of Mr. Browning or of Mr. Tennyson, or—shall we add?—of Mr. Swinburne, it must at least be admitted that from Johnson's 'Lives' to such critical writing as these four volumes here and there contain, is a stretch the compassing of which adds to the impressiveness of the poetry here collected as nothing else could.

BUSBECQ'S LIFE AND LETTERS.*

THERE is probably no writer as entertaining and trustworthy, and as useful to historians as Busbecq has been, who is so little known to English readers. As the editors of the present volumes point out, Robertson, Gibbon, Coxe, Von Hammer, Ranke, Creasy, and Motley have all drawn on him largely, though in some cases not so largely as they should have done, while in the sixteenth and seventeenth and eighteenth centuries several editions of his letters, though mostly incomplete, appeared on the Continent in Latin, German, Bohemian, French, and Spanish. Those relating to Turkey made their first appearance in English in 1694, and were reprinted in 1761. But it may be said that to the great bulk of English-speaking readers his name is only known as that of an authority cited in the foot-notes of popular histories of the Elizabethan period. The present editors have, therefore, laid this class under considerable obligation in producing the present translation, although they have some of the worst faults of the pictorial school of biographers and historians, and particularly that least defensible of all, the practice of filling up gaps in the hero's career with suppositions constructed out of odds and ends of information about his surroundings. For instance, there is (vol. i. p. 44) a long conversation reported between Busbecq, when a boy, and George Halluin, in which the latter tries to persuade the former to join Erasmus in chasing "the owls and bats" out of the Church instead of, like Luther, abandoning the premises altogether. The sole foundation for this is that George Halluin was a learned seigneur who had a fine library, and was a friend of Erasmus and a neighbor of Busbecq's father, and Busbecq probably frequented his house between his birth and the age of fourteen. He was born in 1522 and Halluin died in 1536, and the latter "must," say our authors, "have exercised the greatest influence over Busbecq's earlier years," and Busbecq "must often have been found" in Halluin's library "with his head buried in some weighty folio," and "thither, no doubt, he brought the botanical specimens he had discovered in the woods and fields of Busbecq," etc. These extraordinary hypotheses are introduced with such phrases as "one can picture to one's self," "one can imagine his saying" (and then follows a screed of doctrine of the editor's own); or, "we have no record of his life during these years, but it is easy to picture it."

Busbecq was a Flemish gentleman from the neighborhood of Lille, who entered at an early age into the diplomatic service of the Emperor Ferdinand, and, after having given some preliminary proof of ability and tact, was despatched in 1554 as ambassador to Constantinople, where, with one brief interval, he resided for eight years, in the days of Solyman the Magnificent, and wrote four "Turkish Letters" to a friend at home. These are translated here, having proved a rich source of information to all historians of the sixteenth century with regard to the social and political organization of the Turks when their power was at its height. Busbecq was not simply a man of many accomplishments—for he spoke six languages fluently—but was a genuine philosopher of the Renaissance. He was fond of "interrogating Nature" on the Baconian plan by the collection of facts. He was an eager naturalist and collector of plants, birds, beasts, fishes. He was also an ardent antiquarian, and gathered much that was valuable in coins and inscriptions. He had, too, a faculty of trained observation, which in his day was exceedingly rare, and shows in all his descriptions a cool detachment from the illusions of his time, which perhaps no other contemporary of his, except Montaigne, displayed in an equal degree. In fact, as his editors remark, his descriptions, both of strange places and great events, are the first specimens in modern literature of that simple spectator's way of looking at things with which the best class of travellers' diary and newspaper correspondence have now made us familiar. The present generation, who only know Turkey as a moribund and barbarous despotism, which all the efforts of Europe can hardly prevent going to pieces, will read Busbecq's description with amazement. It explains the great Mussulman terror which, from the capture of Constantinople down to 1700, a period of two centuries and a half, weighed on Christendom like a nightmare, and drew a line of constant blood and flame from Moscow to the Adriatic.

When Busbecq set out from Vienna nearly the whole of Hungary was Turkish territory. He struck the Turkish outposts three hours outside Komorn, and was at once taken in charge by an escort of Turkish cavalry. "I had never seen such a sight before," he says, "and I was delighted with the gay colors of their shields and spears, their jewelled scimitars, their many-colored plumes, their turbans of the purest white, their robes of purple and dark-green, their gallant steeds and superb accoutrements." At Buda he made his first acquaintance with the janissaries, the famous infantry with which the Sultan so long spread the terror of his arms through Europe. He found the great mansions of the Hungarian nobility occupied by the Turkish troops, who generally confined themselves and their horses to the ground-floor, allowing the upper part to go to ruin, partly for want of money, and partly because it is "part of the Turkish creed to avoid display in the matter of buildings. They consider that a man proves himself a conceited fellow, who utterly misunderstands his position, if he aims at having a pretentious house, for he shows thereby, according to their notion, that he expects himself and his house to last for ever." We have here a sufficient explanation of the dilapidation and disappearance of all monuments which have everywhere accompanied Turkish domination. Busbecq's mission was to complain of the raids of the Turks along the border, and, by a judicious mixture of boldness and conciliation, procure some kind of protection for the unfortunate Christian population. These raids along a line extending from the Carpathians to the sea were the daily and nightly amusement of the Turkish irregulars, and closely resembled those which the Asiatic Turcomans have down to the present day been in the habit of perpetrating on the Persians. That is, they plundered and burnt the houses, killed the men, and carried off the women and children into hopeless slavery, and drove off such of the cattle and horses as could keep up with their rapid movements, and all this in time of what was called peace. On his return trip Busbecq met, "every now and then," along the way wagon-loads of boys and girls from Hungary bound for the slave-market at Constantinople. "This," he says, "is the commonest kind of Turkish merchandise." "The men, young and old, were either driven in gangs or bound to a chain and dragged over the road in a long file, after the same fashion as we take a string of horses to a fair." He "could scarcely check his tears, so deeply did he feel the woes and humiliation of Christendom." Every soldier tried to bring back a slave or two from the wars, from the sale or ransom of which he realized a nice little sum. Busbecq himself ransomed a Spanish officer, who was completely crippled by his wounds, but from whom, nevertheless, his owner managed to make "a nice little penny" by employing him as a goose-herd in Asia Minor.

After the annexation of Hungary, Austria had to stand between Western Europe and this great danger, and did so, down to the siege of Vienna in 1683, with an abiding consciousness of military inferiority, and of the necessity of constant submissiveness and patience in dealing with the Porte. At Constantinople the ambassadors of the Christian states were regarded as hostages, and treated with the utmost insolence, and thrown into prison if the Sultan were not satisfied with the conduct of their respective sovereigns. The military inferiority of Christendom was, indeed, very marked. With the utmost exertions the Emperor could hardly put more than 30,000 ill-equipped and ill-disciplined men into the field, while Solyman was able to appear in a few weeks on the frontier with an army 200,000 strong, the greater part of it superb light cavalry, and all perfectly disciplined. After giving some account of the extreme simplicity of the fare with which the Turkish soldiers are content in the field, and the consequent lightness of their baggage on the march, Busbecq thus compares them to the troops of Christendom at that period:

* 'The Life and Letters of Ogier Ghiselin de Busbecq, Seigneur of Busbecq, Knight, Imperial Ambassador. By Charles Thornton Forster, M.A., and F. W. Blackburne Daniell, M.A.' Two vols. London: C. Kegan Paul & Co. 1881.

"From this you will see that it is the patience, self-denial, and thrift of the Turkish soldier that enable him to face the most trying circumstances and come safely out of the dangers which surround him. What a contrast to our men! Christian soldiers on a campaign refuse to put up with their ordinary food, and call for thrushes, becaficos, and such-like dainty dishes. If these are not supplied they grow mutinous and work their own ruin, and if they are supplied they are ruined all the same; for each man is his own worst enemy, and has no more deadly foe than his own intemperance, which is sure to kill him if the enemy be not quick. It makes me shudder to think what the result between two such different systems must be. One of us must prevail and the other be destroyed; at any rate, we cannot both exist in safety. On their side is the vast wealth of their empire, unimpaired resources, experience and practice in arms, a veteran soldiery, an uninterrupted series of victories, readiness to endure hardships, union, order, discipline, thrift, and watchfulness. On ours are found an empty exchequer, luxurious habits, exhausted resources, broken spirits, a raw and insubordinate soldiery, and greedy generals; there is no regard for discipline, license runs riot; the men indulge in drunkenness and debauchery, and, worst of all, the enemy are accustomed to victory, we to defeat. Can we doubt what the result must be?"

The Christian subjects of the Sultan had really no rights which a Turk was bound to respect, but, nevertheless, at that period there were apparently more pains taken for their protection by the Government than at a later day. Posts of janissaries were distributed along the leading lines of travel all over the empire whose special business was to shield Christians and Jews from oppression and robbery, though this duty was, of course, indifferently performed. Not only was the evidence of a Christian not received by the judges, but Busbecq relates that when a Christian was accused of anything, Mussulmans used to crowd forward to bear false witness against him as a sort of religious duty. Money was then as now the great motive-power among the Turks. "A man who visits Turkey had better make up his mind to open his purse as soon as he crosses their frontier, and not to close it till he quits the country." There was no other way of counteracting the Turkish dislike of the rest of the world. Busbecq's delight with the scenery around Constantinople was as great as that of any modern traveller. "What a fairyland!" he exclaims. "What a landscape for waking a poet's fancy! What a retreat for a scholar to retire to!" These reflections, too, on the fall of the unhappy country read as if they had been written by Freeman, the historian, in reference to the pending crisis at Constantinople: "I do declare that, as I have said, these spots seem to grieve and ask for Christian help and Christian care once more." And still truer are these words of Constantinople, or rather of the whole of Greece:

"That land was once most prosperous; to-day it is the subject of unnatural bondage. It seems as if the country which in ancient times discovered the fine arts and every liberal science were demanding back that civilization which it gave us, and were adjuring us by the claim of a common faith to be its champion against a savage barbarism. But it is all in vain. The princes of Christendom have other objects in view; and, after all, the Greeks are not under heavier bondage to the Turks than we are to our own vices—luxury, intemperance, sloth, lust, pride, ambition, envy, hatred, malice."

Busbecq's account of Turkish manners and customs are extremely interesting, and during his stay he sent home great stores of botanical specimens, rare animals, ancient coins, and Greek manuscripts, which would otherwise have perished.

After his return he was sent to Spain in charge of the Emperor Maximilian's sons, Rudolph and Ernest, on one of whom Philip of Spain proposed bestowing the hand of his daughter; and this mission discharged, he was appointed governor of the four remaining archdukes. He was then sent to France in 1570 as an officer in the household of the Archduchess Elizabeth, who married Charles IX. of France, the hero of St. Bartholomew, but appears to have remained only a short time. Charles died in 1574, and Busbecq was sent to escort the widow home, and subsequently remained in France for several years, taking charge of the estate which was assigned to her in lieu of her dower. During this period he wrote the series of letters which fill the second volume, in which he describes the state of affairs in France on the eve of the Wars of the League, and in the Low Countries on the eve of the great struggle there. But here he traverses ground with which modern historians have made us tolerably familiar. In 1592 his mistress, the Queen, died, and he was already seventy years old and in need of rest, and asked for leave of absence, it is supposed for the purpose of revisiting his old home at Busbecq, which he had not seen for forty years, and for which in all his wanderings he had never ceased to long. In spite of the brilliant success of his career, the atmosphere of courts had never been agreeable to him, and in the last of the Turkish letters he exclaims to his friend: "To be able to live for one's self and literature, and to grow old in some quiet country nook, with a few honest friends, is indeed an enviable lot. If there be any true life to be found in this earthly pilgrimage, surely it is this. Far too often in a court is a buffoon of rank valued more highly than a man of merit; indeed, a picture of an ass among monkeys gives an excellent notion of the position of an honest man among courtiers." He was, however, not destined to enjoy the retirement he sought. On his way home through Normandy he was captured by some marauders and roughly handled, and did not get over the shock. He died near Rouen in 1592.

Guide to the Study of Political Economy. By Dr. Luigi Cossa, Professor of Political Economy in the University of Pavia. Translated from the second Italian edition, with a preface by W. Stanley Jevons, F.R.S. (London and New York: Macmillan & Co. 1880.)—This small volume of 227 pages supplies a want long felt by even professional economists—perhaps more by them than by amateurs—viz., a survey of the progress of the science from the earliest times to the present day, extending to all the countries in which it has found any systematic cultivation. Professor Cossa has a Briarean grasp of his theme. His perceptions of what is true and what is false in doctrine, and his estimate of the comparative value of the works of different thinkers, are not less commendable than the range of learning which he brings to his task, and which apparently embraces all that has been written in the English, French, German, Dutch, Spanish, Hungarian, Italian, and Scandinavian tongues. So great a service has seldom been rendered to the laborers in any intellectual field, and in that of political economy never. Professor Cossa was once a pupil of Roscher. His knowledge of the science may not be wider than that of his teacher, but his talent for communicating it to others is decidedly superior. Indeed, nothing can be more felicitous than the dexterity with which he winnows the kernels out of the harvest of any given school or author and disposes of the chaff. Bringing so large a mass of literature within so small a compass requires that many of his judgments should be pronounced *ex cathedrâ*. His tone, nevertheless, is as far as possible removed from arrogance or dictation, being rather that of familiar conversation, and so lucid as to bring his discourse within the range of any order of intelligence sufficiently advanced to deal with political economy at all. It is interesting to know that a writer so superior to prejudice regards Adam Smith as "undoubtedly the greatest economist the world has ever seen." He esteems J. S. Mill's treatise the best in the English language, and he places Rau and Roscher at the head of German writers. He thinks that the professors of the "historical school" in Germany have done valuable work, but that they have overestimated their own importance and underestimated that of the preceding and contemporary English and French schools. His chapter on the physiocratic school is very able. Of American writers he has little to say; these will perhaps be discussed in a future edition. He regards Carey as a "meritorious" writer, but holds that his and Bastiat's theory of rent is untenable and misleading. An index of authors quoted in the text, appended to the volume, adds greatly to the convenience of Professor Cossa's work.

Fyffe's History of Modern Europe.
Vol. I. Large 12mo, $2 50.

Sister Augustine: An Old Catholic.
12mo, $1 75.

Brooklyn Library
Analytical and Classed Catalogue.

This Catalogue of a library of 60,000 volumes contains more than 80,000 author and subject entries; 50,000 are subject-entries, of which 25,000 are specific references to selected essays and magazine articles, more especially those of a biographical and critical character. The principal *Contents* of "collected works" and "miscellaneous writings" are uniformly displayed under the authors' names, and in "Philosophy" and "Political Economy" and "Shakspere" the *Contents* of systematic treatises are a principal feature. The development of *Contents* is a characteristic feature of the Catalogue.

The price of the work in half mor., 1,120 pages, double-column, royal 8vo, is $7; in cloth, $6.

Specimen pages sent on application. Address S. B. NOYES, Librarian, Brooklyn Library, Brooklyn, N. Y.

UNMOUNTED PHOTOGRAPHS
Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architectural subjects, etc. Price, cabinet size, $1 50 per doz. Send stamp for catalogue of 1,600 subjects. JOHN P. SOULE, Publisher, 338 Washington Street, Boston, Mass.

Kissena Nurseries.
PARSONS & SONS CO.
(LIMITED),
FLUSHING, N. Y. (NEAR NEW YORK CITY).
Send three 3-cent stamps for large new Descriptive Catalogue.

17 Astor Place, Eighth Street, New York,
DEALER IN NEW AND OLD BOOKS.
PRICED CATALOGUES, containing valuable standard literature, as well as rare, curious, and out-of-the-way books, are issued from time to time, and will be forwarded to any address.

The Nation.

NEW YORK, THURSDAY, MARCH 31, 1881.

The Week.

WHAT was the object of calling an extra session of the Senate? According to the Democrats, whose course has been perfectly consistent, it was to confirm the Executive appointments and ratify certain pending treaties. According to the Republicans, it was to arrange the committees with a Republican preponderance, and to oust certain Democratic officers of the Senate, and until this last is accomplished they say no other business shall be done except at their good pleasure. The result has been a week of Democratic filibustering in the interest of executive sessions not at all requiring the filling of the offices in question, and a series of adjournments when Democratic endurance has worn out Republican patience. In the meantime, the President has given notice, by his appointments, of numerous and important changes, affecting a large circle of office-holders, with their families and dependents; the Supreme Court has been more than once prevented from sitting by lack of a quorum; the District of Columbia is without a marshal, and the treaties are laid upon the shelf. It seems incredible that party allegiance, or caucus allegiance, should hold *all* the Republicans to a course which has not a shadow of excuse, which is so detrimental to the interests of the country, and which tends to increase the popular contempt for Congress and the public dread of extra sessions. The explanation of it is, of course, the bargain which (with the help of the Vice-President's casting vote) gave the Republicans the majority whose right to have things its own way they solemnly declaim about. But in this bargain with General Mahone the main consideration on the part of the Republicans is the appointment of Riddleberger to be Sergeant-at-Arms—in other words, the rewarding of a "worker" who has never lifted a finger for the success of the Republican party, and who is notorious for having introduced in the Virginia Legislature the repudiating measure which was barely averted by the Governor's veto.

When Senator David Davis voted with the Democrats to arrange the Senate committees, he justified himself by alleging the Democratic complexion of the vote which gave him his seat. No justification would have been necessary but for his mysterious endeavors for four years to act the part of an Independent—a part either wholly inconsistent with his doctrine of loyalty to his constituents, or not affected by the particular question calling for his vote. Senator Mahone's course, however, so far from shocking Judge Davis, encouraged him to resume his independence, and to side with the Republican majority, built on disloyalty, in the issue about filling the executive offices of the Senate with Republicans. His apology for refusing to oppose the turning out of the present incumbents was that the "constitutional majority" was "fairly entitled" to make the sweep if it chose, and that the change of officers "naturally" accompanied the reorganization of the committees. This is, however, so unnatural that the two things have never gone together in the history of the Senate, and if they had done so, it is only by a miserable confusion of ideas that one could pretend there was any necessary connection between clerical duties and the work for which legislative committees are carefully selected. The latter are, of course, made up with a view to party responsibility for the government of the country; but a sergeant-at-arms, who preserves order and keeps members' accounts, or a secretary or chief clerk, whose duties pertain to the regular despatch of business, or a chaplain, who prays for the whole body if he is not an impertinence, has no more concern with the political sentiment of the majority than have the pages or the conductor of the elevator or the telegraph operator, or any other of the scores of petty employees dependent on the officers whose patronage is now sought to be recovered by the Republicans.

The debates to kill time have been amusing from the inability of the Democrats to set up a perfect defence, and from the Republican reliance upon a precedent which they resisted with all their might two years ago. Each side, therefore, has improved the opportunity to have the clerk read the "record" of its opponents in 1879. Mr. Butler, in conformity with our suggestion last week, spread again upon the minutes Mr. Conkling's fervid rhetoric about partisan cupidity and voracity, and Mr. Anthony's more elaborate and touching appeal against change in a Senate which never dies. Mr. Anthony was neatly pinned, for in 1879 Mr. Hill had prophetically enquired: "If the Senate should become Republican in two years from now, will he [the Senator from Rhode Island] oppose a change of the officers then?" To which Mr. Anthony replied, after some futile fencing: "It will depend upon the manner in which they fulfil the duties of their offices. . . . I do not think I shall ever be found advocating the removal of officers of this body who have performed their duties with fidelity, with honesty, and with intelligence." Now, there has not been a pretence that the present officers are in any way inefficient, and when Senator Logan was asked directly whether any such charge had been brought against them, he frankly replied, No, adding: "That is not the question. The question is, Have we the power to change them? If we have, we have the right. That is all there is in it." Mr. Saulsbury's advocacy of this policy when his bull was doing the goring afforded equal merriment when read by Republican request, and there was a deal of cheerful banter over the civil-service "humbug," as Brown of Georgia called it, though he thought the majority ought to be bound by it, considering how much two of their Presidents had had to say about the theory and about competitive examinations.

The most pitiful figure has been cut by the Massachusetts Senators. Mr. Dawes has been flattered with the leadership in enforcing the decree of the caucus, and has consequently had to suppress his immature sympathy with civil-service reform, and to explain his willingness to approve a repudiator. His success has been very indifferent. He tolerated Riddleberger, he said, because, in spite of his financial heresies, he was a Southerner in favor of a full and free ballot. Mr. Beck then proceeded to make things uncomfortable by showing that Riddleberger had, some years ago, on being opposed by a colored member of the Virginia Legislature, named Moss, who favored the State's honest payment of its debts, moved his expulsion as a nuisance. Had the victim's name been Big Snake, there is no telling what would have been the effect of this reminiscence on Mr. Dawes's sensibilities, but as it was it left him dumb. Mr. Hoar, whose scent for treason is confessedly unsurpassed, rose to the full height of the occasion when Senator Brown announced the minority's resolve to invite the majority "to go back to the business for which you were called together by your President," and to "continue that operation" until June, or even till December if necessary. He regarded "that declaration as containing the essence of revolution and treason to the institutions of this country"; the reason being that it involved the substitution of the will of the minority for that of the majority. This new view of the alarming nature of filibustering—in other words, using the rules of the Senate to accomplish a negative end—was exposed with a light touch by Senator Brown, who convicted Mr. Hoar of having filibustered at the close of the last session, and of even refusing to vote when sitting in his place. Mr. Hoar said it was a "very little one": he had only been treasonable once or twice, and filibustering was sometimes lawful. But he was unable, when called upon, to draw the line between what Mr. Brown magnanimously allowed to be his "petty treason" and the unmitigated crime against the existence of the Government with which he had charged the Senator from Georgia. Mr. Logan came to his rescue by making a new and startling issue, that their oath to the Constitution required the minority to permit the majority to do everything in their own time, while Senator Johnston, of Virginia, put Mr. Hoar and his colleagues in the revolutionary category by pointing out the grave public inconvenience arising from their unnecessary obstruction of business.

The latest Washington news makes it probable that the "harmony"

which was apparently the object of the recent Federal appointments will remain the same impalpable vision as ever, and just as difficult to realize by the method of compromise. The history of the nominations shows, nevertheless, that no pains were spared to render the slate unimpeachable, if not unobjectionable to all hands. The first batch, containing the names of Woodford and Tenney for District-Attorneys, Payn and McDougall for Marshals, and Tyler for Collector at Buffalo, was entirely acceptable to the New York representatives in the Senate; and since Mr. Hayes had just pointedly ignored the "claims" of Woodford, it was at once assumed that the President was disposed to "conciliate" Senator Conkling in the most harmonious spirit. This was, however, followed by the transfer of Collector Merritt to the consulate-general at London, the appointment in his place of State Senator Robertson, and that of William E. Chandler as Solicitor-General. Considering the prominence of Chandler and Robertson as supporters of Mr. Blaine in the recent canvass, it was at once felt that the latter's influence had been allowed as much weight as it was entitled to in view of the ticklish state of harmony at present, and, moreover, Judge Robertson had never purged himself of the contempt involved in his action at Chicago, where he incurred Senator Conkling's direct displeasure. The sending of General Badeau to Denmark, where it appears now he does not wish to go, was also hardly to be regarded as an offset to the appointment of Mr. William Walter Phelps as Minister to Austria, and in general the outlook became more inharmonious than ever. After all, to render the award of prizes perfectly just it is necessary that they should be of equal size as well as generally distributed, and not only had Mr. Conkling not got a fair share but it was Mr. Blaine who had got far more.

Still, it was at first suspected that Mr. Conkling would accept the situation, since the President had "recognized his claims" to a considerable extent instead of "antagonizing" him, as Mr. Hayes had so inharmoniously done. The *Tribune*, naturally in high spirits and wholly recovered from the defeat of Mr. Skinner for the Assembly Speakership, denounced all expressions of dissent in the strongest terms, viz., as "silly talk" current among people "too stupid to understand the plain, frank, and openly-declared purpose of the Administration"; and the Democrats at Albany, with uncommon astuteness, got resolutions unanimously passed in both branches of the Legislature requesting Judge Robertson's confirmation by the Senate. However, the "silly talk" increased, and it became known that Senator Conkling was growing less and less harmoniously disposed, and that the President had not only unduly favored his rival but had treated him in a perfidious as well as discourteous manner. According to some "secret history" disclosed by the *Times*, the President sent for him before the nominations and had "a very interesting and altogether friendly interview" of several hours with him. Although, says the *Times*, it is well known that the Senator "never makes demands on such occasions," and contented himself with requesting a consultation whenever the President wished to approach the subject of the New York appointments (to which the President gave what he considered "a cordial and hearty acquiescence"), nevertheless the former avoided seeing him again before sending in even the Woodford batch of nominations. Difficult as it seemed to undo the hasty action of the New York Legislature, the friends of the deceived Senator did not shrink from the work, and rumors became current in Washington that besides the New York Senators and the Vice-President, many other members of the Senate were opposed to Judge Robertson's confirmation, and even that Postmaster-General James was about to resign. Attorney-General MacVeagh was also said to be sufficiently disgusted with the nomination of Chandler to be upon the point of withdrawal. We have seen no excuse offered anywhere for the real cause of offence, so far as the public is concerned, in the President's action. The harmony plea has proved ludicrously absurd as a defence of his violation, in the removal of Collector Merritt, whose term does not expire for two years yet, of his own rule of fixity of tenure during the term for which an appointment is made.

After mature deliberation President Garfield has decided not to call an extra session of Congress; and this decision meets with the hearty approval of the business community, although it is a disappointment to the politicians who wanted to scour the South for political material for the autumn campaign, to the jobbers and lobbyists who infest Washington, and to the hotel and boarding-house keepers of that city. The only good reason for an extra session was to secure legislation to facilitate refunding of the maturing debt; but this disappeared when it was found that existing laws can be used so as to provide money with which to pay all the 6 per cent. bonds which mature this year, and a good part of the 5 per cents. It is even thought probable that more of the debt can be provided for than if the Refunding Bill of the last session had become a law, as it was very doubtful whether much could have been done under that bill; and it is certainly better to use the existing means for taking care of the maturing bonds than to trust to an extra session, which might be spun out into midsummer and be taken up until near the close with matters foreign to refunding. All that remains now to be known about the Treasury finances which intimately concern the money market is the plan of action of the new Secretary of the Treasury; and this is promised in a few days.

The effect of the decision against an extra session was to cause what the Wall Street brokers call a "good feeling" in all the markets, and prices at the Stock Exchange advanced. Usually the money market is active at this season of the year, but it is not so now, the uncertainty as to the extra session having paralyzed all manner of enterprises, which, of course, lessened the demand for money. The Treasury has begun the prepayment of the April interest—about $7,000,000; and besides, a good deal of gold has arrived from Europe—about $4,000,000—in the last seven days. The gold imports since the beginning of the calendar year are nearly four times as large as a year ago, and foreign exchange still warrants bringing gold here. A good part of the $82,000,000 of gold which has been brought here from Europe since last August was drawn from France, and during the week the Bank of France again stopped payments of gold, unless those demanding it would agree that it should not be exported from the country. The working of "bimetallism" in France has reduced the stock of gold in this Bank to a very low amount, which explains the anxiety of France for an international arrangement to increase the use of silver. The price of silver bullion in London advanced during the week to $52\frac{1}{8}d.$ to $52\frac{3}{16}d.$ per ounce. The bullion value here of the "buzzard dollar" at the close of the week was about 87 cents.

The Rev. I. M. Kalloch, who shot and killed Charles De Young nearly a year ago for attempting the same thing on Kalloch senior, has been acquitted amid popular rejoicing. A disagreement of the jury would have caused less surprise, but there do not appear to have been any grounds for expecting conviction. The lawlessness of the two factions involved in this case has been such as betokens a community where the administration of justice is uncertain, the officers of government are corrupt, and public sentiment is content to let "personal difficulties" settle themselves by Corsican methods, without the trouble of hiring a lawyer and going before a court. One of the results of such a state of things is that the courts come to be more and more distrusted as a means of procuring punishment, until the habit of satisfying private vengeance outside of them gets to be a sort of higher law. De Young was on bail (as he had failed to kill his victim), and was to have been tried in the course of ten days, when young Kalloch made sure of a verdict according to his own judgment of the law and the facts, and a death sentence, by taking him off with a pistol. It is now in order for the De Young party to settle their account by a fresh assassination, when another acquittal may be looked for and a fresh "ovation" (Kalloch's friends and parishioners took the horses from his carriage and drew it themselves a distance of three miles). The whole affair has an aspect which we are accustomed to call Southern, though it is pure accident that there is really a Southern element in it, the De Youngs being from Louisiana.

Gen. Grant's departure for Mexico and his resignation of the Presidency of the World's Fair Commission have generally been considered a sign that the bottom has dropped out of that enterprise. It has been

argued that the General would not lightly have taken a step by which his prestige must suffer, but we think it will be found on examination that in all the critical periods of his career he has cared less for prestige than for the attainment of his immediate object. It was so when he gave up the generalship of the Army to become President, and when he consented to run for a third term with the consequences of defeat plainly to be estimated in advance. A man who misconceives his own powers and aptitudes runs the risk of constantly forfeiting his prestige by embarking in undertakings for which he has neither experience nor natural qualification. In the case of the World's Fair General Grant's service was simply that of a figure-head, and it remains to be seen whether his railroad presidency in Mexico will be valuable beyond the use of his name. His place on the Commission has been offered to President Jewett, of the Erie Railroad, who has, however, prudently declined it, having something to lose by mistake of judgment; and since funds, managers, a site, and local enthusiasm are all wanting, it is to be hoped that the end of this ill-considered scheme is not far off.

The confession of Buchanan, the Philadelphia doctor who did a flourishing business in the issue of bogus medical diplomas, shows a curious state of affairs. There seems to be very little protection in most parts of the United States against the humbugging of communities by pretended physicians armed with certificates of graduation from schools which have a charter but no scruples, and often no objective existence. His revelations of the number of such institutions all over the country accustomed to enrich themselves by the nefarious practice of selling diplomas ought certainly to be put in the hands of every State legislator, to the end of convincing them that nothing can kill such enterprises but stringent State action. The practice is by no means common to this country, for, though Buchanan has been concerned in the sale of some 20,000 certificates here, he speaks of 40,000 current abroad; nor is it a new thing; but it is entirely possible for each community to protect itself. Probably one result of these disclosures will be the annulling of the charters of the various institutions mentioned by them, but only a satisfactory medical act in each State can prevent a resumption of so inexpensive and profitable an industry. Buchanan gives incidentally much other information that is interesting, and should be made valuable—viz., the names of many quacks of all varieties from simple humbugs to criminal and dangerous practitioners, and a description of their different modes of following their several trades. In short, his confession lays out considerable work for grand-juries and detectives as well as for courts.

The Gladstone Ministry have been pressed harder on the question of retaining Kandahar than on any other of those bequeathed to them by their predecessors. Everything else acquired in the Afghan war has been given up, it is true; but Kandahar was a sort of outpost by which the abandoned "scientific frontier" could, if need were, be restored on a pinch, and to surrender it would be, the Tories said, to confess defeat to the Afghans, to encourage Russia to come to Herat, and to destroy British prestige in India. Besides all the old arguments with which they defended the invasion, they have brought into play the defeat at Maimund by Ayub Khan, and Skobeleff's victory at Gök Tepe, both of which, they maintain, make the retention of Kandahar more imperative than ever. To this the Liberals made answer that the war has already cost $100,000,000, and has left the finances of India in a condition which makes Kandahar a luxury which the treasury cannot afford; that its retention would cost about $5,000,000 a year; that in the opinion of the best military authorities it would in British hands be a source not of strength but of weakness; that the readier and more willing the Afghans or Russians may be to give trouble to the British, the more desirable it is that the British should not, by going to meet them, save them any part of the toil and danger of a march through Afghanistan, which will necessarily be as formidable to them as to the British; and, finally, that, the whole of the late war having been a mistake, it is useless to acknowledge it only in part: it must be acknowledged *in toto*. A resolution, moved by Lord Lytton, condemning the evacuation of the place, was carried in the House of Lords a short time ago, by a majority of 89; but the Liberals do not mind what the House of Lords says. Last week Mr. Stanhope introduced a similar resolution into the House of Commons, and after a long debate it was defeated in a very full house by 336 to 246. This puts an end to the Afghan tragedy, which has cost, all told, probably $125,000,000, fifty thousand lives, and the desolation of large tracts of country; has sown afresh in Afghanistan the seeds of deadly hatred to the English name, and thrown the Indian finances into confusion. The news of a successful insurrection against Ayub Khan, which will probably enable Abdurrahman Khan to take possession of Herat without much trouble, will do a good deal to justify the Liberal policy.

The wretched war with the Boers has been brought to an end by a display of firmness on the part of Mr. Gladstone such as, it is safe to say, none of his predecessors has ever shown. Sir George Colley, it is now admitted, occupied the fatal hill while terms of peace were under consideration by the Boers. He was led into this rash act, with a small and wholly inadequate force, though heavy reinforcements were on their way to him, probably by a strong and not unnatural desire to retrieve his reputation, which had been seriously damaged in two previous engagements. He perhaps argued that if he succeeded the Boers would be much readier to treat, and that if he failed he would be no worse off than he was. Failure at worst, he doubtless thought, would consist in nothing more than inability to drive the Boers from their position; that they would drive him from his, never, perhaps, entered into his head. As a matter of fact, however, his defeat created a new and formidable obstacle to concluding peace, not because, as many feared would be the case, the Boers raised their demands in consequence of their victory, but because the public in England raised the old cry that peace could not be made after a reverse without the complete submission of the "rebels." The "prestige" of the British army, it was said, would have to be restored and the "honor of the flag" vindicated by a great victory, and then the negotiations might be reopened. In fact, the old arguments which kept George III. from making peace with the American colonists until the surrender at Yorktown were brought out and paraded in many of the leading newspapers. Happily the Government paid no attention to them. They refused to believe that it was necessary to "crush" eight thousand farmers to show that the British Empire was strong. So they again offered the Boers the terms which Sir George Colley had in his pocket when he was killed—viz., autonomy, with British suzerainty and British jurisdiction over all foreign relations, and a commission to settle boundaries, and a complete amnesty for all offences. These terms the Boers accepted, and broke up their camp at Laing's Nek and dispersed to their homes. They have by their short and brilliant resistance made themselves so respectable in the eyes of the English authorities that probably no trouble with them will ever again occur. They will not again be threatened with insolence, as Sir Bartle Frere and Sir Garnet Wolseley threatened them.

A week ago the ambassadors at Constantinople had apparently given up all hope of adequate concessions from the Porte, which seemed to change its mind every day, and was steady in nothing except in preparations for war. At this writing fresh proposals are reported to have been submitted on behalf of the Sultan which appear to hold out some hope of a settlement. It is said to consist in the offer of substantially the line of the Berlin Conference, without Janina, and the ambassadors are reported to be disposed to advise Greece to accept it. If Greece does accept it, however, it is pretty certain that the arrangement will be but temporary, as Janina is not only Greek, but is considered a Greek capital, and will continue to be, under Turkish rule, a hotbed of intrigue and revolt, in which outbreaks will be planned with the view of provoking another crisis in the relations of Turkey and Greece. The odds against the Greeks from a military point of view appear to have been increased by some sort of reconciliation between the Porte and the Albanians, which will in case of hostilities bring the latter into the field on the Turkish side. The proposal to throw Crete into the scale is no longer mentioned, and it would have been all the more unsatisfactory to Greece, in exchange for the coveted expansion on the mainland, because hopes (or illusions) are still cherished of a final successful insurrection in that island. The state of things there is, in fact, little short of war, and the preliminary killing of Turks and retaliatory killing of Christians have already begun.

THE PRESIDENT'S NEW YORK APPOINTMENTS.

THE subordinate appointments made thus far by the new Administration have been exciting a good deal of interest, not unmixed, so far as the friends of reform are concerned, with alarm. It must be remembered, however, that they are neither better nor worse than the President's letter of acceptance and inaugural address led us to expect. The proper time for disappointment with his position towards the public service was last July. The letter of acceptance fell far short of his utterances in Congress and in some addresses and articles on civil-service reform. It was, consequently, a heavy blow to those who were ready to see in him a champion of a new régime, who was to finish without stumbling the work which Mr. Hayes had begun. But it was perfectly plain notice to all the world that he aspired to no such rôle, and did not mean to try for it; that he meant to secure his election, if it could be done, by conciliation and concession, and that after it was secured he would do as well as he could without taking any very strong, much less extreme ground. It is but justice to him to say that he has thus far done, on the whole, better than he promised. The Cabinet is not an ideal one, but is far better than the "Cabinet rumors" of the newspapers led us to expect. To any one who complains that it is not filled with first-rate men, there is the perfectly good answer that, as far as knowledge of public questions and experience of public business go, no President since the younger Adams has been so well prepared to get along with second-rate men as Mr. Garfield. He does not, like Lincoln or Grant or Hayes, need Cabinet officers to teach him, or "keep him straight," on any point whatever. There is not one of the Departments of which he is not himself fully competent to take charge. He would have nothing to learn from any man in public life whom he could possibly put at the head of any one of them. He could, therefore, afford, if we may use the phrase, to be governed in a much greater degree than any of his immediate predecessors by political considerations. He has evidently tried to make the Cabinet a representative body, which, for reasons we gave four weeks ago, it ought not to be, and probably would not be if the President were a less well-equipped man, and determined on any vigorous line of action. He has tried by its composition to disarm as much hostility as possible, to give all the Bosses something to be thankful for, and to satisfy every section of the Republican party that its expectations will be kept in mind in the use made of the patronage.

In the first batch of the subordinate appointments somewhat the same course has been pursued. They have evidently been made with the view of postponing a quarrel with the Bosses as long as possible. Those in New York, of course, attract the largest share of attention. Not only is New York the State which places the largest number of offices at the disposal of the Government, but it is the State in which "the spoils system" has been brought to greatest perfection. The Boss who presides or used to preside over its enormous Custom-house and Post-office is naturally the greatest of all the Bosses, and the most exacting. He needs more "recognition" than any other two Bosses, and has to be twice as much "consulted" as any other one Boss. New York is, therefore, the point at which President Garfield's real attitude towards "the spoils system" will be most thoroughly tested. The Cabinet appointments have by long usage been set aside as the President's *peculium*. He is expected to exhibit in them his feelings about various men and things, but no one expects to dictate them to him. Consequently, as long as he keeps within the party lines in making them, his choice is not liable to open or hostile criticism. But when he begins to fill subordinate places he comes at once face to face with a senator or two who claim *condominium*, as the Germans say, with him in disposing of them, and has to say sooner or later how much or how little of this joint ownership he means to recognize. He has apparently reached that point in this State, though he has been slow in reaching it. The selection of Mr. James for the Cabinet was one to which "the senior Senator" could not take exception—first, because, as we have said, the President is by usage left in the matter of Cabinet-making considerable freedom of choice within the party, and, secondly, because Mr. James was not only originally Mr. Conkling's "man" but is now, even after his (from the Machine point of view) most repulsive management of the Post-office, a man whom he would not venture to disown. The renomination of Mr. Woodford as District-Attorney was apparently a gratifying acknowledgment of the Senator's continued ascendency, because it was not clouded over by any doubt as to whether Mr. Woodford's retention was not due, as in Mr. James's case, to a desire to keep in the place the man best fitted for it. We do not think we do Mr. Woodford any injustice in saying that he is not considered, either by the bar or the bench, equal to the very onerous duties of the office, and consequently his continuance in it may fairly be considered due wholly to political considerations. This triumph of the senior Senator was, however, shortlived. Mr. Pearson, who was promptly promoted to the postmastership, has been enough of a politician, we believe, to have made it possible for Mr. Conkling to claim him as "his man" if he had been consulted about his promotion The failure to consult him, and Mr. Pearson's entire acceptability to the civil-service reformers, made it impossible to claim him as a "man," and, of course, made the Senator's relations with the Executive increasingly delicate, so delicate that it is not improbable that in the nomination of Mr. Robertson for the Collectorship of the Custom-house we have reached the critical stage in the dealings of the President with the spoils system.

As Mr. Robertson voted in the State Senate for the election of Mr. Platt to the United States Senate, and as there appeared no reasonable doubt that Platt was then, if he is not now, "Conkling's man," there was a certain plausibility in the story that Mr. Robertson's nomination had Mr. Conkling's approval, if it was not made at his instigation, and was the result of a "bargain" made with the Anti-Machinists during the contest in the State Senate, under which, however, Mr. Robertson was, when put in charge of the Custom-house, to throw aside the rules of appointment and promotion in force during Mr. Hayes's Administration—or the "Schoolmarm drill," as "the workers" call it—and use the office freely, as of old, for the payment of party debts and the maintenance of the party machine. No such theory, however, could apply to the other appointments made simultaneously with Judge Robertson's, and which clearly betray the hand of Mr. Blaine. Meantime, the unlucky Assemblymen at Albany, who thought it less improbable that the President should restore the Custom-house to the Machine than that he should venture to disregard the Boss in determining the control of it, and who hastened to join the other branch in a resolution begging the Senate to confirm Judge Robertson, have with even greater alacrity recalled their approval, and it is no longer a secret that the Boss is in high dudgeon at the trespass on his preserves, and that he will resist the nominations if not withdrawn. The President must, therefore, on the very threshold of his Administration, lay aside all ambiguity and define his exact dependence on the Senators and Representatives whom, in his letter of acceptance, he declared it necessary for a President to consult in making appointments. If he takes the ground that his immediate Constitutional advisers have precedence over Congressmen, he must make it clear that Mr. Blaine was giving advice as a Secretary, and not as the head of a faction which he has no intention of letting dissolve because his seat is in the Cabinet and no longer in the Senate. The only way in which Mr. Garfield can prove this is by pledging his nominee to maintain in the New York Custom-house the system of appointment and promotion which has been in use there for the last four years, the success of which has been amply proved, and the abolition of which would of itself be probably a greater humiliation, considering his past utterances on this subject, than any President has ever voluntarily undergone. He might find some excuse for not setting such a system on foot, but none for undoing the work of his predecessor; nor, degrading as would be the spectacle of the administration of the Custom-house under the spoils system by Mr. Robertson for the benefit of a Boss whom he has for years resisted and defied, is there anything to prefer in its administration for the benefit of a rival Boss.

The situation is at best full of danger and difficulty, but, as we have often pointed out, reformers have nothing to fear from a rupture among the politicians who rule the Republican party, but much from their cordial understanding. The great good that may flow from the present imbroglio is that the President will discover how idle it is to trim to catch every breeze, and that he can preserve his own manliness and win popular support only by defining in unmistakable terms his plans and his motives, so that, whether he succeeds or fails, the country may know

where to look for him and what to think of him. For the present, however much Judge Robertson's nomination may be due to Mr. Blaine's selfishness, and in spite of the wholly unexpected removal of Collector Merritt, we do not yet believe that the President is prepared to make a mockery of the reform sentiment of the country.

THE "FIELD" CODE FOR NEW YORK.

THE Bar Association of this city has appointed a committee to go to Albany for the purpose of opposing the passage of the so-called "Field" Code by the Legislature, and has published a report of another committee, which shows the grounds of its opposition. These are mainly that the new Code would introduce important changes into the existing law, many of which are, to say the least, of doubtful utility, and that it changes the established phraseology of the law and unsettles the meaning of words whose precise signification has been determined by a long course of judicial decision. That these objections, if founded in fact, are serious, no one who has given any attention to the subject will be disposed to deny, and they are objections which admit of easy proof. It requires a very cursory examination of the proposed body of law to see that it introduces at every page alterations in the law, and uses novel terms in the statement of legal principles. That these innovations are of doubtful utility is shown by the fact that there is an active dispute going on about it, the friends of the Field Code insisting that the changes are necessary for the perfection of the legal system of the State, its opponents (embracing at least as many eminent lawyers as have appeared on the other side) warmly insisting that they are not only not necessary but profoundly pernicious. Into the details of this dispute we do not propose to enter, as it involves technical considerations which cannot be properly or thoroughly canvassed in the press. To take part in it requires a special professional preparation—a complete knowledge of the existing law as well as of the effect upon it of the proposed enactment. All that the press can effectively do under such circumstances is to call attention to certain general arguments which bear upon the question of codification, and especially of codification at Albany.

The present condition of things with regard to this proposed Code is unprecedented, so far as we know, in the history of any civilized modern state. The Code has been in existence, in its original or its modified form, for nearly a generation; it has passed one legislature, and been vetoed by the governor of the State; it has already passed to a third reading in the present Assembly; and yet the discussion of its provisions by the Bar Association showed that hardly any members of that body had as yet examined its provisions. There is absolutely no public pressure for its passage, either in the press or out of it, and the belief at Albany among well-informed politicians is that the efficient cause of the present interest in the subject is a bargain or "deal" made a year or two since between the friends of the new Code of Practice and those of the Field Code, by which the latter was to be allowed to pass if the former went through. The bargain having been carried out on one side by the passage of Mr. Throop's Code, it is unfair, so it is said, to oppose any longer the Field Code. Whether any such bargain was ever made we have not the least idea; but there is no doubt that it is believed in by the politicians, and the belief is used as an argument for the passage of the new Code. Everybody knows that with the ordinary politician the shame of "going back on his friends" is the strongest argument that can be possibly addressed to his mind, and there is no reason to suppose that his mind will be affected a whit the less by it because it concerns the vital interests of the administration of justice, instead of involving a police commissionership or a street-cleaning contract.

The most singular feature of the present situation is the hitherto complete apathy of the Bar. If the Bar Association is right in its criticism of the Code, and we have at least as much reason to assume this as to assume the opposite, the proposed *corpus juris* threatens the administration of the law in the chief commercial State of the Union with a temporary chaos. "Whatever may be the theoretical advantages of a general codification of our law," the Bar Association Committee says, "no lawyer will deny that the immediate results, at least, of such a transformation must be disastrous, that the volume as well as the uncertainty of litigation will be largely increased, and that much valuable time will be expended in judicial efforts to bridge over the gulf between the system under which we have always lived and the one proposed as a substitute." One would suppose that the mere danger of such consequences as these would have long since roused the eager interest of the Bar of a State like New York, and have led to a very general investigation of the proposed changes, and a unanimity of sentiment with regard to them among the profession as a whole. That instead of this the matter should have to be taken up by a private association, however respectable, upon a hurried examination and with imperfect preparation, is as strong a proof as any that has been given of recent years of the indifference of the Bar as a profession to those public interests which are theoretically supposed to be specially in its keeping. It is curious to observe that the newspapers, in noticing the avowed ignorance of the lawyers with regard to the provisions of the Code, seem to think that this is a reason for enacting it, and they have made a good deal of fun out of the Bar Association's opposition to a scheme of law reform the details of which its members do not profess to know. But, strongly as this reflects upon the condition of the Bar, it certainly has nothing to do with the question of codification. If all the lawyers of the State were to profess utter ignorance as to every statute introduced into the Legislature at Albany, this would have no bearing upon the wisdom of the statutes. Another fallacy, which seems to have got an extraordinary currency, is that the lawyers as a body are opposed to codification because it tends to simplify the law, and therefore diminish their business. If there were any truth in this it would be somewhat remarkable that the objections brought forward by lawyers are chiefly that it does not simplify the law, and that the changes introduced will tend to increase litigation. If the objections of the Bar Association to the proposed Code are sound, there can be no doubt that the passage of the Field Code will result in a plentiful harvest of law-suits which will never arise if the law is allowed to remain in its present condition. Probably all lawyers who have been long engaged in practice under any existing system of law are prejudiced against alterations in the system. The Bar is the most conservative of all professions, and all change is distasteful to it; but at this time we do not suppose any lawyer of standing in the United States is short-sighted enough to rest an argument against codification upon the abstract superiority of the common law, or upon the impossibility of improving upon its wisdom. All the old arguments against codification which have come down to us from the time of Bentham and Austin have been rendered obsolete by the discovery, as a practical matter, that legislation may introduce enormous beneficial changes into the body of the law. The law of this State and of England exists half in the form of statutory enactments, and there is no difference between legislating and codifying except the difference between genus and species. It has been over and over again shown —as, for instance, by Sir James Stephen in his 'Digest of the Law of Evidence'—that there is no inherent impossibility in stating in a concise form the collected result of a given number of decided cases. The only question as to a code now is, Whether it is a good code, whether the work is well done, whether it does really state the law as it exists, or whether it merely confuses it?

The vitality of error could hardly be better illustrated than in the existence of the belief among the friends of this Code, as shown by newspaper discussions, that its adoption will make the law intelligible and accessible to every man, so that he will be able to provide himself with his own jurisprudence. Apart from the difficulty of providing beforehand for every single case which may arise, the position accorded to precedent in our system of law makes this hope a mere dream. The adoption of a code, like the passage of any other statute, is merely a starting-point for a series of decisions interpreting, defining, and limiting the meaning of its terms, and these decisions become just as much part of the statute as if they were themselves enacted by the legislature. Whether in the course of time any means may be found to prevent this, or to make the letter of the law itself the ultimate test, it is impossible to say; but the probabilities are against it. The Anglo-Saxon respect for precedent has its roots very deeply laid in the character of the race, and, amid all the changes introduced by reforms in English and American jurisprudence within the last fifty years, the binding authority of case-law alone has remained entirely unshaken.

It seems to us that these considerations, general as they are, are amply sufficient to warrant the conclusion that the new Code should not at the present time be made law. It has, as we have said, received no serious consideration from the class which is alone capable of passing an intelligent judgment upon its merits; in fact, the interest of that class has only just been awakened. And much as this fact may reflect upon the apathy of the legal profession, the want of public spirit among lawyers is certainly no reason for making hasty and ill-considered changes in the law. The long period which has elapsed since the original Code was introduced at Albany would undoubtedly furnish an argument for its present passage if the legislature were a different body from what we know it to be. But when we have seen every year, in the recent modifications of existing laws, the grossest incompetency displayed both in the substance and form of legislation, it is a little too much to ask us to assume that the body which annually assembles at Albany is competent to deal intelligently with the whole body of law affecting property and contracts and personal rights in the State. The want of public interest is not a reason for passing the Code, but rather for doing nothing about it, as it furnishes a presumption that the existing law serves well enough the adjustment of the rights and duties of everyday life.

Correspondence.

FEDERAL PATRONAGE AND REPUDIATION IN VIRGINIA.

To the Editor of The Nation:

Sir: Is it too late to ask the Republican party, and especially the present Administration, not to weaken the hands and the courage of the Virginians who are trying to save the State from the disgrace of repudiation? The outlook for the State in point of material development has not been so hopeful at any time since the war. The race-troubles, never great, are all settling so amicably that even the *Tribune* correspondent, who has just passed through the State on a tour of inspection, can see little to find fault with. It is known that the decent men of both the Republican and Democratic parties have striven earnestly to effect a settlement of the debt that would be honorable to the State and just to the creditors. It is equally well known that General Mahone has organized the ignorant and unscrupulous of both parties, and led them in a shameful crusade upon the honor and credit of the State. "D—n honor! it won't buy a breakfast," one of their cherished and applauded sentiments, will illustrate, better than anything I can say, the character of this coalition. Does General Garfield propose to strengthen it by giving it the patronage of the State?

As a Bayard Democrat, and a constant reader of the *Nation*, I have been disposed, much oftener than I have had the opportunity, to welcome any liberal tendency in the Democratic party. But to speak of such a thing in connection with General Mahone sounds to me like the baldest sort of a farce. Any one who will take the trouble to enquire, will find that when he was president of the A. M. & O. R. R. it was worth the position of an employee to vote contrary to the general's wishes. He is, I would not say a born leader but a born Boss. Defeated in the Democratic party, he formed his coalition and was finally successful, but the division of parties last November showed him that without the alliance of the Republicans his readjuster faction was a hopeless minority. Hence his present position.

It is of no concern to us what is done with the patronage of the State. We simply ask that it shall not be used to help fix upon us the stigma of repudiation.—Yours truly,

Debt-Payer.

POLITICAL HERO-WORSHIP.

To the Editor of The Nation:

Sir: Democracies are said to lack the picturesque element of society; and it must be admitted, I think, that as a people we are not addicted to hero-worship, or, if we are, that our hero-type is meagre, if not crude and commonplace. A few weeks ago, when your interesting article on the "Disappearance of Great Men from Public Life" was under discussion, I had expected that attention would be drawn to the more seated, general decline of which the disappearance of great men is but the final expression. I refer to a *decay in the popular ideal of greatness*, as shown more especially by the typical President which both parties have sought and chosen during the last forty or fifty years.

It would seem fair to presume that the ideal President, the man whom the people delight to honor, should be pre-eminently a representative American, some rare impersonation of all that is best in our American civilization. And in accordance with this view our earlier Presidents certainly did present a personal type of which no American had need to be ashamed. Not only were they incorruptible patriots, possessing the sterling traits common to the mass of their countrymen, but they were also distinguishable as statesmen, scholars, and gentlemen, or at least were thought to be so; but since their day it is undeniable that we have had Presidents wanting in one or another, if not all three, of those distinguishing qualifications. Some of them have been mere soldiers, wholly without political experience; others have had no proper training whatever, either civil or military, to say nothing of general culture. And such grave defects, instead of being extenuated, have been openly vaunted as prerequisites for the office, essential in an available or eligible candidate, and what the average voter will insist upon having in the man of his choice.

It is certainly a wonderful result of our political system that a citizen who begins life as an uneducated laborer should at length become President of the United States and receive the homage of his countrymen as their highest ideal of greatness. But, after all, is there any reason why such an exceptional career should be made usual and typical and held up to the admiration of American youth? Are early disadvantages, illiteracy, and coarseness in themselves admirable, virtuous, and heroic? Can they even be included in the richest and purest type of character? Do they specially qualify any one for high office or grave state-emergencies? If we could have as good a President without them, should we lose anything? If we could have something else in their place, more useful and noble, might we not gain a great deal? Other things being equal, given the same essential personal qualities, would it not be better to have those qualities improved by suitable training, and even heightened by all the adventitious aids of fortunate birth and culture? And, in fact, have not both parties been forced to withdraw such great men "unwept, unhonored, and unsung"?

I cannot, therefore, believe that the degradation of our chief type of greatness is directly due to the politicians: they only supply candidates according to the taste of the people. Nor is it wholly due to the levelling tendency of free institutions: it did not prevail in the purer days of the Republic as intensely as at the present time. It is rather due to the enormous increase of the uneducated suffrage, with its consequent popular conceit and intolerance. The sovereign masses would seem no longer willing to allow anything superior to themselves in their chief public servant. They prefer an equal, a plain man of the people, one of themselves, to the most highly-endowed and best-qualified candidate that our statesmanship and civilization can produce; and the cultured few are swept with them in the tide of ignorance and prejudice.

As a remedy for such evils, I once heard a distinguished statesman in private conversation seriously advocate the choosing of a President by lot from the members of the Senate. He maintained that such a method would tend to elevate the personal character of both the executive and the legislative branches of the Government. Each Senator would be carefully chosen by the legislature of his State as a possible President; the President, becoming free of party trammels, could have no other ambition than that of making his own administration pure and renowned; and the country would be spared the national convulsions which every four years bring it seemingly to the verge of ruin.

Spectator.

THE STORY OF TROY.

To the Editor of The Nation:

Sir: In the discussion which has lately been carried on in your columns between the believers and disbelievers in the reality of a siege and sack of Troy by the Greeks, one important argument in favor of the substantial truth of the story has been overlooked. Gladstone states it in his 'Juventus Mundi,' but in such a scattering way as greatly to weaken its force.

It is this: In historic times, as far back as the oldest authentic writers, and as far back as the First Olympiad (776 B.C.), the ruling races of the Greek world were the Ionians (*Ionες*, *Iaones*, or *Iavones*) and the Dorians, the former of whom claimed Athens as their metropolis, the latter Sparta and Argos as their chief seats. A third, and somewhat less important, place was held by the Æolic tribe, whose most important city was Thebes. But in the 'Iliad' the *Ἰάονες* are mentioned only once, and then as cowards, the Doric tribe never, though possibly once in the 'Odyssey,' 19, 177, in the reference to the *Δωριέες* of Crete, and Thebes is not prominent either. The common name for the Greeks fighting under Agamemnon is *Achaioi*. Now, it is not to be supposed that the oldest Greek poets, the authors of the so-called Homeric poems (if there was not one Homer), were antiquarians. If, in their own time, the Achæans had sunk to the low estate which they occupied ever after the Doric conquest of the Peloponnesus, and if Athens and Sparta—Ionians and Dorians—had already been the rulers of Greece, and formed the bulk of its fighting manhood, the simple-minded singers of the Homeric rhapsodies would not out of their historic

learning have recurred steadily to the half-forgotten and despised Achæic tribe, and belittled the ruling tribes of their own day. If the legend of a siege of Troy had arisen when the Ionic cities, such as Miletus and Smyrna, were fighting for their existence with the Asiatic natives, and had then been cast in poetic garb, as an encouragement and incentive to deeds of gallantry worthy of the ancestors who had in bygone ages conquered Asia, the supposed ancestors of the Ionian colonists (that is, the Athenians) must have played a greater figure in the war of Troy than that which the 'Iliad' assigns them. But the Attic contingent is hardly ever mentioned in the many battles in the Scæan plain.

It follows, at least to my mind, that the story of the Trojan war is very old, older than the Doric conquest of the Peloponnesus, older than the settlement of the Ionic colonies near the Troad, that it is nearly as old as the times which it professes to commemorate, and that for this reason, if for no other, it must be substantially true. L. N. D.

Louisville, Ky., March 13, 1881.

THE BACONIAN THEORY OF SHAKSPERE.

To the Editor of The Nation:

Sir: For a learned review the *North American* seems to admit a good deal of loose writing into its pages. In the February issue of this year, in an article entitled "Did William Shakespeare write Lord Bacon's Works?" is the following passage:

"This theory was first publicly maintained by Miss Delia Bacon in 1857. It had been before, in 1856, asserted by an Englishman—William Henry Smith—but only in a thin volume printed for private circulation" (p. 162).

Now, if the writer of that article had taken the trouble to consult a library he would have found that Miss Bacon's paper appeared in *Putnam's Monthly* for January, 1856, and consequently must have been written in 1855; that Mr. William Henry Smith's "Letter to Lord Ellesmere" (the "thin volume printed for private circulation") was dated August, 1856; that Miss Bacon's *book* was published in London in 1857, and in the preface, written by Hawthorne, was contained the first and only charge ever made that Mr. Smith had appropriated Miss Bacon's theory—a charge which Mr. Smith repelled by claiming that at the time he wrote his "Letter to Lord Ellesmere" he had never seen Miss Bacon's paper in *Putnam's;* that this is *all* Mr. Smith *himself* ever claimed—see his own book, 'Bacon and Shakespeare' (London: John Russell Smith. 1857. Preface).

So, again, if the writer had opened Judge Holmes's 'The Authorship of Shakespeare,' the third edition of which has appeared within only five years, he would never have made the assertion that the Baconian theory is founded on the parallelisms of expression in Bacon and Shakspere, and on the improbability of Shakspere's having the requisite knowledge and learning to write the plays, etc. (p. 164). It is strange, too, for this writer speaks of Judge Holmes's book in high terms, although he can never have opened it.

Henry L. Frazer.

34 West Nineteenth Street, March, 1881.

Notes.

A FRESH issue, from the stereotype plates, of Michaud's standard work, 'The History of the Crusades,' has been made in three volumes by A. C. Armstrong & Son, at a low price. The cloth binding is simple and tasteful.——A certain number of our readers, to whom German is more familiar than English, may be glad to know of a German translation of Vincent and Dickson's 'Handbook to Modern Greek' noticed in No. 776 of the *Nation*. This has been made by the eminent lexicographer, Professor Dr. Daniel Sanders, who, to the grammar portion, has added numerous examples drawn from the works of the Messrs. Rangabé ('A Greek Officer's Recollections of the Franco-German War of 1870–71,' and a version of Lessing's 'Nathan the Wise'). The publishers are Breitkopf & Härtel, Leipzig.——Parts 7 and 8 of Ebers's fascinating work on 'Egypt' (New York: Cassell, Petter, Galpin & Co.) conclude the story of Memphis and the Pyramids, and begin the description of Cairo and its vicinity. The illustrations continue to be numerous and beautiful. The same publishers have brought out for the actual (fifty-sixth) exhibition of the National Academy of Design "American Academy Notes," a selection, with illustrations, from the principal pictures or from some of them. The "Notes," for which Mr. Charles M. Kurtz is responsible, are doubtless not critical, as is alleged, but it would be idle to say they express no judgment.——Pollard & Moss, 47 John Street, have begun the publication of Thackeray's works in a uniform imperial octavo edition of some pretentiousness, the first volume of which contains 'Vanity Fair,' 'The Four Georges,' 'English Humorists,' 'Catherine,' and 'The Ravenswing.' The illustrations include Thackeray's own.——Professor T. F. Crane has in the *Popular Science Monthly* for April a review of Harris's 'Uncle Remus,' which gives the best conspectus yet printed of the animal fables, of various lands and tongues, which find their counterpart at the South. Prof. Crane favors the view that the latter, as well as those current among the Indians of South America, are of African origin.——Mrs. Harriet Prescott Spofford's early tales, the "Amber Gods" and "Azarian," are to be republished in the Leisure-Hour Series of Henry Holt & Co.——We are informed that a homœopathic medical department has been in operation for three years at the Iowa State University, and that its dean has been twice called to fill the chair of Materia Medica at Ann Arbor.——The Minnesota Historical Society, which was lodged in the State capitol, was involved in the loss attendant upon the burning of that building on March 1. Happily the principal collections were saved, and the insurance will make good nearly all that was destroyed.——An exhibition of American etchings will be held by the trustees of the Boston Museum of Fine Arts on April 11–May 9. The curator will receive contributions (limited to ten individually) up to April 6. ——The text of the *American Art Review* for March is mainly devoted to current reviews, though there are also articles on the Indian painter, Carl Wimar, and the discoveries at Pergamus. Of the illustrations an etching by a pupil of Unger's, from a picture by Van Goyen, though without any brilliancy as etching, fairly interprets that painter's charm of clear aerial effects and far-away distance.——According to the *Athenæum*, the well-known publisher, Mr. H. G. Bohn, contemplates an autobiography, with the aid of letters received by him from notable persons during his long life.——In the *Cornhill* for March is an interesting paper by Mr. E. W. Gosse on "Sir George Etheredge, a neglected chapter of English Literature." Hitherto Etheredge has been the most shadowy of all the Restoration dramatists, and seemingly of the least importance. Mr. Gosse has got together a mass of material which puts a new face on the matter. Besides correcting the current account of Etheredge's career, he is able to show that Etheredge's first play, the "Comical Revenge," was originally printed in 1664, and that he was therefore the first English dramatist to forsake the comedy of Ben Jonson (with its wearisome "humors") and to take for his model the fresh and frank comedy of Molière. Thus, as Mr. Gosse says, "Etheredge virtually founded English comedy as it was successively understood by Congreve, Goldsmith, and Sheridan."——Mr. Blades's little vellum-paper covered volume on the "Enemies of Books" (London: Trübner; New York: Scribner & Welford) has already passed to a third edition, while the substance of it has been translated into French for successive numbers of *Le Livre*. He considers the enemies of books under the heads of fire, water, gas and heat, dust and neglect, ignorance, the bookworm and other vermin, bookbinders and collectors. Among his illustrations is a two-page woodburytype of a Caxton eaten abundantly by book-worms.——There is yet time to import before the Harvard performance, which promises to be very impressive, 'La Légende d'Œdipe étudiée dans l'Antiquité, au Moyen-Âge, et dans les temps modernes, en particulier dans le Roman de Thèbes,' by L. Constans (Paris: Maisonneuve), a review of which will be found in No. 166 of the *Rassegna Settimanale*.——From the publisher, F. A. Brockhaus, Leipzig, we have received the first three *Lieferungen* of Nordenskjöld's 'Die Umseglung Asiens und Europas auf der *Vega*, 1878–1880,' the authorized German edition of the navigator's own work, now being published in several languages. It will be completed in about twenty *Lieferungen* (two volumes), at one mark each, and will contain a detailed account of the whole voyage, including descriptions of the elaborate preparations and an historical review of the most important voyages of discovery along the northern shores of the Old World which have been undertaken by the different countries. To this will be added descriptions of arctic scenery, climate, animal and plant life, and of the polar races, the whole illustrated by a large number of woodcuts and maps.

—Mr. Spofford's 'American Almanac' for 1881 (New York: American News Co.) presents its usual store of industrial, commercial, financial, and political statistics, including the results of the census of 1880. Its helpfulness is known to all who have ever resorted to it for information. The addition of select indexes to the previous volumes, referring to tables, etc., not repeated or brought down to date in the current volume, would cost but little, and would enhance considerably the value of the series. We must express our surprise at a note on p. 70 with regard to the refunding of the public debt at 4 per cent. After speaking in an obscure way of the real advantage of the change from 6 to 4 per cent., namely, the saving of interest to taxpayers, the note continues thus:

"But the other great advantage of refunding is, that nearly the whole debt will be changed from securities held abroad to a loan held and owned by the people of the United States. The calling in of the 6 per cent. bonds, the high rate of interest on which, and the security, caused them to be sought for in Europe, saves the annual drain of specie to pay the interest. This has already reversed the balance of exchanges in the precious metals, the United States becoming an importer of gold and silver instead of an exporter. The interest on the debt stays at home, fructifying all the channels of our national commerce and industry."

The insertion of such a fundamentally absurd statement in a careful com-

pilation of statistics is a greater proof of widespread ignorance of finance than the late debates in Congress on the bill for refunding the public debt at 3 per cent., or even than the resolutions of Mr. Voorhees in censure of the national banks. According to this note, the transfer of native capital to national but unproductive securities is in itself a benefit, whether the transfer be from other unproductive securities or from productive business; and, further, an undeveloped country like this is in a peculiarly healthful state if its capitalists are glad to invest at 4 per cent.

—We have received a number of communications relative to the derivation and widespread use of the word "blizzard," as follows. The first is from Baltimore:

"The statement made by you on page 184, that the word *blizzard* was in use over fifty years ago in a sense different from that now sought to be affixed to the word, leads me to suppose that its etymology may be traced by some one having the leisure. In this locality and the adjoining counties, it is a surname of a numerous family, and our land records will show, I think, numerous transfers to and from the name, probably dating back over a century. In a sketch of one of the name, born in 1832, in the 'Biographical Cyclopædia of Maryland,' it is stated that the father was born in this locality in 1801, and that the grandfather, Isaiah Blizzard, who lived here long before that time, was of French Huguenot descent."

The next is from New Bloomfield, Perry Co., Pennsylvania, and confirms in part our Maine correspondent of last week:

"I agree with you that the etymology of the word 'blizzard' must be sought elsewhere than in the *patois* of the French-Canadian voyageurs. There has been an extensive use of the word in Pennsylvania for many years, as witness the following: (1) *A drink of any intoxicant, generally applied to whiskey.* Synonymous with the slang 'a slug,' 'a smile,' 'a jigger,' 'a bumper.' Example: 'Let's take a *blizzard*.' The word has been used in this sense for upwards of sixty years. (2) *Let it be done.* A companion phrase with 'Let her rip,' 'Let her fly.' Example: A creditor threatens to bring suit against a debtor who believes he has a defence to the claim, and replies, 'Let her *blizzard*; I owe you nothing.' Used for upwards of thirty years, certainly. (3) *To shoot; generally applied to shot-gun.* Example: 'I raised my gun and let *blizzard*.' Used for like period as last. (4) *A sudden or unexpected storm.* This use was in existence as early as 1836 in this part of the State. Charcoal-burners, watching their pits, would fear a *blizzard*. The word in (1), (2), and (3) sense is still in use. In the (4) it has died out for many years. It was introduced here with charcoal-furnaces about the date above mentioned."

"E. T. H." writes from Iowa City:

"One of our 'old settlers' tells me that in the winter of 1839–1840 he drove from Iowa City to Dubuque. Eighteen miles of the road lay due north. The wind was N.W., driving the snow in their faces. He could not see the horses. He held with outstretched hands a buffalo robe so as to make a screen to shield the face of the driver. He says that storm was called a 'blizzard' at that time, as were similar storms."

And "S. M. C.," from Keokuk, Iowa:

"For nearly forty years I have heard the word 'blizzard' quite commonly used in this part of the West, as by Crockett in your note in No. 820. It has never meant 'a poser' in this Western use, as defined by Bartlett, but some such tremendous discharge as the old-fashioned American musket made. I do not know, but I believe the word meant, in the West, a discharge by the enormous old 'Revolutionary' and '1812' musket, and in time came to be applied to our sweeping Western storms of mingled snow and hail, with the accompanying driving wind."

—Two of the most sumptuous of the French holiday books were written by the vivacious Arsène Houssaye. The first is 'Molière, sa Femme et sa Fille' (Paris: Dentu; New York: J. W. Bouton), a superb atlas folio of nearly two hundred pages, with the amplest margins, rough edges, Dutch paper, rubricated titles, clean and clear typography, and lavish pictorial adornment. The other is 'La Comédie-Française, 1680–1880' (Paris: Ludovic Baschet; New York: J. W. Bouton), another atlas folio of corresponding size, although a little less elaborate in type and paper. Chief among the illustrations of the latter are thirty-two full-page photogravures by the Goupil process. Twenty-eight of these are portraits in costume from life, each plate measuring twelve inches by ten. The other four comprise a portrait of Samson, the teacher of Rachel; a reproduction of the fine portrait of Molière painted by his friend Mignard, and owned by the Comédie-Française, and copies of the two groups of the Associates of the Comédie-Française painted by the actor Geoffroy, in 1841 and in 1863–4, in the first of which Mlles. Mars and Rachel are the central figures, and in the second, Mme. Arnould-Plessy and Mlle. Favart—each group being provided with an outline key to the persons in the picture. The twenty-eight full-length portraits of the living Associates are of varying value; that of Mlle. Sarah Bernhardt in "L'Étrangère" is admirable; that of M. Coquelin shows him in the revolutionary costume of the young hero of "Jean Dacier." Besides these photogravures there are, scattered through the text, some two score other illustrations reproduced by process from old maps, plans, and engravings, full-page portraits of Mlle. Mars, of Mlle. Clairon, of Baron Molière's favorite pupil, and of Rotrou, Corneille, Racine, and so on. The tail-piece at the end of the book is a view of the interior of the Théâtre-Français in 1822, and the vignette at the beginning shows four views of the theatre as it is now, inside and out. The embellishment of the volume on Molière is even more elaborate. Besides eighteen "process" illustrations, mostly portraits of Molière and scenes from his plays, and nine steel engravings, there are no fewer than forty-two etchings of all sorts and sizes, good, bad, and indifferent; some printed in the text as vignettes, others printed two and three on a page, and others again taking up a whole page. One is by M. Houssaye himself; another is by M. Flameng; most are by M. Hanriot. Perhaps the best is the full-page etching which serves as a frontispiece, and which reproduces the group of all the chief characters of Molière's plays, painted by M. Geoffroy for the Comédie-Française.

—The literary merit of these books is far inferior to the decorative. One of the disadvantages of the French system of personal journalism is its tendency to treat everything gingerly, and this tendency must be held responsible for the circumstance that M. Houssaye's 'Molière, sa Femme et sa Fille,' has not been picked to pieces by the competent French critics. Even the *Moliériste* has handled him very gently. The fact is that his book is trashy in substance and tawdry in style. It swarms with blunders and contradictions. M. Houssaye's method of biography is a cheerful compound of the cock-sure and the happy-go-lucky. He hazards a suggestion in one chapter, repeats it in another, asserts it without qualification in a third, and in a fourth argues from it as though it were an incontrovertible fact. Thus, the impression in red wax on the back of the bastard title, just beneath the number printed on each of the five hundred copies to which the issue of the book is limited, is here boldly announced as the seal of Molière. But at the end of the volume we find that this seal is "said to have been Gassendi's, but why should not Molière have kept this memento of his master?" The same facility of fragile conjecture disfigures the book on the Comédie-Française, but it has not run riot to anything like the same extent; and as this is the only sketch which traces at length and with fulness the career of the theatre from its origin to its recent bi-centenary, it may serve in default of a better.

—Every help to a better understanding of an eminent writer is acceptable, and in this general spirit of good-will we can commend Stigand's 'Life, Works, and Opinions of Heinrich Heine' (J. W. Bouton) without committing ourselves unreservedly to the author's guidance. Mr. Stigand's reading is more extensive and sympathetic than accurate. No one, surely, can estimate Heine who is not equally familiar with French and German ways, and ready to do them justice. The gravest objection that we have to the author is that his liking for France is excessive. We have not the space nor the desire to correct one by one his misrepresentations of German politics and German life. When Heine himself lets loose his arrows against Prussian bureaucracy and Teutonic Philistinism, we admire his poetic grace and inexhaustible wit; but such attacks from Mr. Stigand are too often mere abuse, as unreasoning as it is out of place. Besides, we strongly suspect that he is not perfectly strong either in the French or the German language. Some of the blunders that disfigure the work may be laid upon that universal scape-goat, the proof-reader, but many of them the author himself must shoulder. Thus, we can scarcely imagine a good German scholar rendering Heine's sneer, *Anweisungen auf den Himmel*, by "assignments to heaven." It means "drafts on heaven." There is less of critical acumen in these two volumes than in the short but incisive article by Charles Grant in the *Contemporary Review* for October, 1880. The chief value of the present work, in our eyes, lies in its broad, rich background. The poet was the sad-at-heart jester of the world's fair; and if Mr. Stigand has not quite drawn the jester, he has at least made a very good sketch of the fair.

—'Englische Philologie' is the title of an introduction to the study of the English language by Professor Johan Storm, of the University of Christiania, edited from the original by the author for the use of German students (Heilbronn: Gebr. Henninger). The first part of the work refers almost entirely to the language as it now exists, "die lebende Sprache," including the Shaksperian era, and that heart-stirring English used by the early translators of the Vulgate. Freeing himself from the trammels of philology, pure and simple, with a view to render the study more palatable to his readers, Professor Storm quotes largely from English and American authors, more especially from the grammars or dictionaries which have lately appeared. Phonological students are furnished with extracts from works bearing mostly on their special branch, and orthoëpists likewise will find much valuable information, copious extracts being taken from Mr. Henry Sweet's 'Handbook of Phonetics.' Useful as the 'Englische Philologie' must of necessity be to German or Norwegian students, we cannot help thinking that too much importance has been attached to "Slang" and "Americanisms." These do not deserve the prominence given them, and we should pity any student at the University of Christiania who might be compelled to render the sense of a joke levelled by *Punch* at a cockney cabby or "'Arry." From the opening sentences of the chapter on "Americanisms" we infer that the professor has never visited this country.

"The relation of the American language to English is in a certain degree that of Norwegian to Danish. No Norwegian can or will write pure Danish." This statement is rather startling, and we may safely aver does not convey the exact meaning which is intended, nor does the sentence immediately following tend to help in the elucidation of so bold an assertion. "Das Ideal ist noch immer das reine Englisch, aber nur wenige Puristen sprechen diese Sprache." The study of Schele de Vere's 'Americanisms' has, however, evidently had much to do with Professor Storm's erroneous opinion, and we advise him to consider this untrustworthy production in the light of a "Slang Dictionary," referring him to Emerson, Hawthorne, Longfellow, and other classical authors for a better appreciation of the so-called American language. This work deserves on the whole a high rank among the philological studies which have lately appeared, the author having approached his subject with due regard for its importance, and with an interest which testifies to his capacity for carrying out his undertaking.

—The pass to which foreigners may be led by mistaking so-called Americanisms for the normal and habitual speech of the country is well shown in the following edifying paragraph from Karl Faulmann's 'Illustrirte Culturgeschichte,' vol. i. p. 184, as furnished us by a correspondent in Baltimore. The column headed "*Amerikanisch*" is given in all earnestness as a specimen of the English spoken in America, while opposite is placed what the author considers the correct English equivalent. The italics are ours:

Amerikanisch.	*Englisch.*
I haf von funny leedle poy	I have *one* funny litle boy
Vot gomes schust to my knee,	*What games* just to my knee,
Der queerest schap, der createst rogue,	The queerest *shape*, the greatest rogue,
As efer you dit see;	*As* ever you did see;
He runs and schumps and schmasches dings	He runs and jumps and smashes things
In all barts off der hause—	In all parts of the house,
But vot off dot? he vas my son,	But what of that? he *was* my son,
Mine leedle Yawcob Strauss.	My little Jacob Strauss.

—The story of the Wandering Jew is generally supposed to be a mediæval legend as widespread as other myths of that period. That it is later than the Reformation, of Protestant origin, and restricted to Germany, Scandinavia, the Netherlands, and France, has been very clearly shown by Gaston Paris in a recent monograph, 'Le Juif Errant' (Paris. 1880). The sources of the later legend are to be found in a story given by Matthew Paris, and in an Italian legend of the second half of the sixteenth century. The former ('Historia major Anglorum,' London, 1571, p. 470) relates that in 1228 an Armenian archbishop came to England, and, among other wonders which he told of his country, spoke of "that Joseph who was present at the Lord's Passion, spoke to him, and still lives to testify to the truth of our faith." The archbishop asserted that he knew this Joseph, who had eaten at his table just before his departure, and whose story was as follows: At the time of Christ's condemnation he was Pontius Pilate's porter. When Christ left the prætorium the porter, then called Cartaphilus, struck him in the back and urged him on. Jesus answered: "I go, but thou shalt wait until I come." Cartaphilus was at that time about thirty, and lived on until he reached a hundred, then became ill and fell into a sort of trance, and when he recovered was of the same age as when he saw Christ. This process was repeated whenever he reached the age of one hundred. The archbishop went to Cologne and there retold his story, which we find in the rhymed 'Chronique' of Philippe Mousket, who wrote at Tournay about 1243. The other legend, probably of Italian origin, relates how a Jew named Malchus gave Jesus a blow with an iron gauntlet. He was condemned to live in an underground abode, always walking around a column, against which he dashes his head but cannot kill himself, for he is doomed to suffer until the Last Judgment. The Wandering Jew as we know him first appears in a work dated August 1, 1613, written by a certain Dudulæus, of Westphalia, who, however, puts his story into the mouth of Paul von Eitzen, a friend of Melanchthon, and who died in 1598. Gaston Paris considers the story of Cartaphilus a transition, or, rather, a compromise between the legend of St. John's immortality and the story of the punishment of Malchus. The writer has presented very clearly and briefly (20 pp.) the sources and development of the legend, one of the motives of which he deems the desire of opposing to "tradition," of which the Catholics boasted, a much more authentic testimony, that of a contemporary of Christ. As a supplement to this monograph the student should consult a review by Professor A. D'Ancona in the *Nuova Antologia*, October, 1880 ("La Leggenda dell' Ebreo Errante"). D'Ancona proves the Italian origin of the legend of Malchus, and shows that, although the story of the Wandering Jew is known in Italy, it has never been popular there.

—The Berlin *Gegenwart* of March 5 announces Julius W. Braun's forthcoming collection of contemporaneous newspaper criticism of the works of Schiller, Goethe, and Lessing ('Schiller, Goethe, und Lessing beurtheilt von ihren Zeitgenossen, Kritiken über sie aus den Jahren 1746–1833'), the latest result of that assiduity which indefatigably adds to the already vast store of material for the proper study of Germany's great literary triumvirate. The *Gegenwart* publishes as a specimen a review of Schiller's 'Kabale und Liebe' from the *Tagebuch der Mainzer Schaubühne* of 1788, which will awaken a desire to hear more of these voices of the past. It is an excellent piece of criticism, not unworthy of the famous *Hamburgische Dramaturgie*, whose influence it clearly betrays; and it is somewhat surprising to see so good a literary judge as the editor of the *Gegenwart* introducing it simply with the remark that this critique "may be reckoned among the more lenient ones." But as the entire collection is pronounced full of instruction and "consolation" for living writers, it is plain that this is not the judgment of the critic, but rather of the author, Lindau, whose latest dramas, notably the "Verschämte Arbeit," were rather severely dealt with by the press. The same number contains an instalment of Professor von Holtzendorff's admirable "Political and Unpolitical Notes" (*Politische und unpolitische Zeitglossen*), which from time to time appear in the *Gegenwart*.

—The public sanitary arrangements in ancient Rome form the subject of No. 357 of Virchow and Holtzendorff's "Gemeinverständliche wissenschaftliche Vorträge" (by Dr. J. Uffelmann). It is instructive to see facts, even if not new ones, thus grouped. The sanitary arrangements of Rome were not placed under a single department of administration, as is the case in modern times; but attention was given—in most cases efficiently—to the water-supply, drainage and sewerage, public baths and parks, inspection of food, regulation of building, paving, public latrines, the medical treatment of the poor (not until the middle of the second century A.D.), burial, and the enrolment of prostitutes. We miss from the list certain things, as a system of abattoirs, water-closets, disinfection, the prevention of contagious disease, registration in its modern sense, school-hygiene, government inspection of manufactories, limitation of hours of labor—but the mere mention of these may serve to remind us how very recent and imperfect our own additions to the Roman system are. The almost entire absence of humane charities forms the point of most striking contrast between the old and the new system. Yet in one respect at least (see the *Nation*, No. 818) the advantage was on the side of the ancients; and we may well remind ourselves at this time that Rome was supplied not by one but by fourteen aqueducts, which delivered, towards the close of the first century A.D., 750 litres per day and head, or about 200 gallons of water.

—Our literature of proverbs has just been enriched by a very acceptable addition, viz., 'A Collection of Gaelic Proverbs and Familiar Phrases,' by Alexander Nicolson, M.A., LL.D. (Edinburgh: Maclachan & Stewart. 1881). The work is based upon a much earlier collection, published by MacIntosh in 1785. After MacIntosh's death a second edition was brought out by Alexander Campbell, in 1819. But Campbell's additions and corrections were anything but improvements. The present is practically a new work; it not only contains three times as many proverbs, but it bears throughout evidences of great care and of enlightened scholarship. It is the first really adequate compilation in Gaelic. It is also more complete than any one, to our knowledge, in Breton. The English translation of each proverb is given under the Gaelic, and many proverbs are illustrated by references to kindred ones in other languages. The general features of Gaelic proverbs are summed up succinctly in the preface. Four thousand proverbs and sayings are treated in four hundred pages, and the appendix embodies some very interesting remarks on Highland beliefs and personages, with a sketch of MacIntosh's life. Many of the proverbs, of course, are old friends in a Highland garb. But some of them are quite novel; they reflect the peculiar Keltic way of looking at things. Every now and then a perfect jewel turns up. Thus, one might look long and vainly for a proverb more suggestive than this: "Choose your wife as you wish your children to be." Our only objection to the work is its arrangement in alphabetical order by the initial Gaelic words. Such an arrangement would scarcely be happy in any language, but least of all in one like the Gaelic, which is so apt to begin a proposition with the verb "to be." We count in the present work 84 pages of proverbs beginning with *is* (=Latin *est*). The reader has only to imagine a collection of French proverbs in *C'est*. Dr. Nicolson, we think, would have facilitated materially the use of his book by grouping his proverbs in the body of the text as he has done in the preface. But as it is, we congratulate him sincerely upon his good work.

—Dr. Anthony van der Linde is a native of Holland whose scholarly researches into the invention of the art of printing and victorious refutation of the bogus claims of L. Coster, of Haarlem, against Gutenberg mark an epoch in the literature of that great event. Other competent authors, like Mr. Theo. L. De Vinne, of New York, have profited by the results at which Dr. van der Linde arrived, and have cheerfully borne testimony to his indefatigable industry, his acute perception, and the correctness of his conclusions. His countrymen, however, considering these conclusions a "crimen læsæ," drove him to Germany, where the Prussian Government appointed him chief librarian in Wiesbaden. In the quiet retirement of his present office he has fallen back upon his first love, and in addition to his former works on the game of chess, 'History and Literature of the Game of Chess,' two vols., and 'The Game of Chess in the Sixteenth Century' (Berlin: Springer, 1874), he has just published 'The First Millennium of the Literature of the Game of Chess from 350 to 1880,'

and 'Studies from the Original Sources relating to the History of the Game of Chess' (New York: Westermann). As this noble game is not confined to a single nation, but belongs to the thinking people of the whole world, a short synopsis of Van der Linde's new works will certainly be welcome to our readers. The first of the last-mentioned books, for the period named, contains in 3,362 numbers the titles of all works and periodicals on the "royal game," published in all countries, including Chinese and Japanese, and even Hebrew. It is a catalogue of which no other branch of literature can boast, and is indispensable to any student of the development of chess. The second work, the publication of which was promoted by the Royal Academy of Berlin, is, in spite of its acknowledged scientific importance, of a more general interest, and forms a most important contribution to the history of civilization in general, particularly in respect to the dissemination of Arabic culture during the Middle Ages. The Arabic authorities are given in the original, and also as translated by scientific men like Dozy, Gies, Gildemeister, Sachau, and Schröder, etc.; and thus for the first time have been made accessible the works of such classic authors on the game of chess as Aladlî, Alcûlî, Allajlâj, etc. A history of Japanese chess-playing, drawn from original and hitherto unknown sources, was expressly written for this book by the late Professor Hofmann, of Leyden. Besides the Spanish work of King Alfonso X. (1283), the Latin work of Bonus Socius, an Anglo-Norman codex taken from the British Museum, etc., are fully published with German translations. In all, about fifty oriental and occidental documents, the very names of which have been hitherto partly unknown, have been thoroughly sifted. The part treating especially of chess-playing is illustrated by more than six hundred diagrams, with perfectly new chess problems expressly prepared for this book, with which there are very few German publications that can compete in the taste and elegance displayed in its manufacture.

LIFE OF LORD CAMPBELL.—I.*

LORD CAMPBELL was born in 1779, the son of a Scotch minister whose yearly stipend did not exceed £80. He died in 1861 a wealthy man and Lord Chancellor of England. Before he attained the highest object of legal ambition he had been successively Solicitor-General, Attorney-General, Chancellor of Ireland, Chancellor of the Duchy of Lancaster, and Lord Chief-Justice of England. In spite of constant professional labor, he found time to produce books which entitle him to a fair second-class in the ranks of literature. He was, in short, the most successful man of his day. His success was exactly of that kind to which thousands of poor, raw, and able Scotch students aspire. Hundreds of them have tried, and hundreds more will try, to follow the steps of Campbell. His career has exerted and will exert an immense influence on one of the most vigorous portions of British society. It becomes, therefore, a matter of something more than mere personal curiosity to ascertain by what means his miraculous success was achieved, and what manner of man this "prize Scotchman," if one may so call him, really was. His life, which is, in fact, an autobiography, gives all the information that intelligent readers require. A study of its pages tells every critic who knows how to read between the lines why Campbell succeeded and what was the price of his success.

John, Lord Campbell—plain John, as he once ill-advisedly dubbed himself—was not a man of rare or out-of-the-way talents. Of imagination, of originality of genius, of any one of the splendid gifts which made and which also marred the fortunes of Erskine, of Lyndhurst, or of Brougham, plain John had nothing. But he was endowed by fortune with powers which, if not exceptional in kind, were exceptional in degree, and are far more useful in the battle of life than is any kind of genius or originality. He might aptly be described as a Scotchman of Scotchmen, who possessed in an extraordinary degree all those useful virtues, and one must fairly add useful vices, which are to be found in all the pushing, respectable, prosperous sons of North Britain who have risen high in every department of public or private business throughout the length and breadth of the British Empire. Whenever the inhabitants of Coketown, as Charles Dickens tells us, spoke of manly independence crowned by honest success, it was tacitly understood that they referred to Mr. Bounderby. Whenever Scotch speakers or preachers urge on their audience the well-worn but never-exhausted theme of Scotch manliness and the success with which it is rewarded, one may, we suspect, in nine cases out of ten, understand that they have in their eye Lord Campbell and men like unto him. Whatever may be said against him, it must fairly be admitted that his success was in one point of view thoroughly deserved. He intended to get on; he had the powers required by a man who intends to get on; he used these powers to their very utmost, and his honors were the appropriate reward of applying the right means to the attainment of a definite end. The very basis of his character was energy, strength, and self-reliance. The child of nine years old, who walked twelve miles and more to see Melrose, was only the father of the man who, half-lame with fatigue, dragged himself by sheer force of will over twenty or thirty miles of road rather than be foiled in the object of getting a sight of Brighton.

He possessed, moreover, a quality in which many energetic and pushing men are deficient. It is a little difficult to know by what name the quality we have in our minds should be termed. We are inclined to call it veracity of the lowest type. That Campbell was never a specially truthful man, that he constantly tried to humbug others, and that he not unfrequently humbugged himself, is obvious in every page of his biography. He seems occasionally to have thought or said that he suffered from diffidence. We have, therefore, the full measure of his lack either of insight or of honesty. But, for all this, he was a man who, in a narrow way, could see the truth when it concerned him to do so. He was, he himself almost admits, conceited; he had a high, though not an undeserved, opinion of his own powers; but it is observable that in the main he knew what his powers really were. He knew he was not eloquent, he knew that he was not suited to shine in society; but he also knew that a hard head, a strong body, cool feelings, and an infinite capacity for work almost ensured his success at the bar, and on this conviction he had from his youth up the manliness and the good sense to act. He avoided the church, though his father longed to see him a minister. He avoided society, though his brother urged him to become a man of fashion. He liked enjoyment well enough (especially when not too expensive), he was even not averse to a good "booze"; but he knew that his path to success lay through Tidd's office and the law-courts, and to the pleader's chambers and the courts he clung with all the tenacity of his nature. Once, indeed, he set himself with laborious method to learn to dance, and daily through the long vacation sneaked to some cheap academy in terror lest he should meet his clerk or a client. For once Campbell was absurd, but we must in justice remember that he either was in love, or, to speak more accurately, had made up his mind that it was time for him to fall in love. Even special pleaders are men, and must be allowed to share human weaknesses.

Energy and the capacity of looking facts in the face were combined in Campbell's case with another Scotch trait which gives the one touch of lovableness to his character. Of his affection for his father and his brother, indeed for all those closely connected with him by ties of family or relationship, there cannot be the least doubt. The life-long correspondence with the old minister in Scotland and with his brother in India has in it something which in any case is touching, and might but for one circumstance be termed pathetic. The correspondence, further, is merely the outward sign of the constant care and affection of the Campbell family for each other. That an Indian surgeon, himself a mere youth, should, starting with nothing, have in twenty years earned a fortune, is a circumstance which excites some speculations as to the conditions of Anglo-Indian society at the beginning of the century. But that this struggling surgeon should have with lavish liberality supported his younger brother in London during the earlier stages of his legal career, is a trait as noble as we fear it is rare in any country but Scotland. When the causes of Scotch success are analyzed, it would be as unjust as it would be foolish to leave out of account the prodigious effects produced by the vigor and endurance of family sentiment.

The affection which bound the Campbell family together would, as we have said, be simply pathetic and admirable but for one circumstance. The fact which checks one's admiration is that the Campbells formed a joint-stock company for the promotion of family success. It was a company of limited means but of unlimited ambition. One of plain John's earliest recollections was that his father pointed out to him the motto of Diomede, which both to parent and son conveyed the one lesson that to "push to the front" was the one aim of life. His brother writes to him from India to "push on," and the lesson, whether in Greek or in English, was thoroughly burnt into Campbell's soul. "To push and again to push, and endlessly to push," was to this typical Scotchman and to his relatives the one guide of life. Campbell's family affection is, as has been pointed out, past a doubt, yet it mingles oddly enough, and all but becomes identified, with the passion for success. When not, if we remember right, twenty, he receives a seal from his sisters. Over this seal he is prepared to drop tears of "fraternal affection." But the seal calls to his mind the more important "seals" which he may hope to gain later in life. His very attachment to his father is colored by his ruling passion. "I really think," he writes, "that in a situation where there was any stimulus to ambition our father would have made a very great figure. Considering where and with whom he has lived it is quite astonishing to find him so much a man of letters as to his politeness, his gentlemanly manners, his knowledge of the world; they exact my warmest admiration. I not only love my father but I am proud of him." The kind of love that is based on pride has its weak side. When the time for George Campbell's return approached, John appears to have been much tormented by the dread that he might not be able to feel "proud" of his brother. He adjures George to get rid of the Scotch accent which "grates" on John's Anglicized ear. He trembles lest the Anglo-Indian should be too much of a Radical, and is urgent in advising or approving the sedulous reading of Shakspere and other

* 'Life of John, Lord Campbell, Lord High Chancellor of Great Britain. Edited by his daughter, the Hon. Mrs. Hardcastle.' In 2 vols. London: John Murray.

works, the knowledge of which was, in John's opinion, conducive to success in good London society. That such a man should choose as his wife a woman that would do him credit, was of course certain. What is a little funny is that so shrewd a fellow as Campbell should, even to his intimates, have poured out with so much *naïveté* the ups and downs of his businesslike courtship, and have let it appear both in his autobiography and his letters how keen was his enjoyment of the credit which both the beauty and the position of his wife brought him. In marriage, as in everything else, he succeeded. His family was part of himself. He made an excellent husband, and, if a little too fond of parading his family affections, was an excellent and kindly father.

Ordinary Scotch virtues—energy, an eye to facts, family affection—are good things in their way, but their exchangeable value in the market of life is increased by mixture with a good alloy of ordinary Scotch vices. Jealousy, for example, is not a condition of mind commended by moralists, and Campbell was by his own confession a constant prey to jealousy. But this unpleasing passion added a constant spur to his untiring energy. To speak of a man as you find him, to be open in all things, to do nothing of which you are ashamed, and to show no shame on account of any honest thing which you do, are the very commonplaces of high-toned social morality; and the man who indulges in petty pretences, who flatters patrons whom he does not respect, who tries to appear something which he is not, and who is ashamed of earning an honest livelihood in an honest way, is not generally considered an admirable or heroic personage. Yet our excellent plain John, in the affairs of social life, violated all the precepts which in one form or another forbid the practice of pretences. He was, in fact, an adept in humbug, who humbugged even himself, and his little pretences brought him no small advantage. It takes no very sharp eye to see that Campbell flattered most people from whom he hoped to get anything. He thrust himself on Tidd, the special pleader; he made friends with the young gentlemen of fashion who came to Tidd's chambers to idle and not to work; and one cannot doubt that half his spite against Brougham and Lyndhurst is the rancor of a man who hates the patrons whom he was at one time compelled to adulate. Nothing was more respectable in Campbell than the vigor with which he supported himself by writing in the press, and nothing was more characteristic than his terror lest his friends in chambers should discover that he was a newspaper hack. His virtue of virtues was his indomitable industry. When he went to Tidd's (at his brother's expense) he rightly resolved to do his utmost to "get a *pennyworth*," and no doubt kept his emphasized resolution. But industry itself was subordinated to the desire to keep up appearances. "I should work much harder, but I can get no one to keep me in countenance, and I should not like to become proverbial as a *fagger*."

To a tendency to jealousy, to a strong dash of honest Pecksniffianism (for Campbell knew how to air a fine sentiment after the manner of Dr. Johnson's famous butcher, such as "I could laugh at my own distresses, but I confess that I cannot look at the state of public affairs without the utmost dismay"), and to the passion for "pushing on," are to be attributed two unpleasing features in Campbell's career, which deprived him both of friendship and of that real respect which his talents and energy had otherwise secured. He was a dangerous companion. His desire to conciliate could hardly conceal his innate truculence. A small trait in his correspondence betrays the whole man. The rising lawyer who, on finding that reform was the winning card, suddenly became a Whig official was, we may be perfectly certain, the ostentatious adulator of Lord Grey. Yet no sooner is Campbell introduced to high political life than his lordship becomes in Campbell's private correspondence "Gaffer Grey," and even the "Gaffer." But if Campbell was a dangerous friend, he was soon found to be a fatal rival. By something like a fatality, at each step of his rise there was at any rate an appearance of his acting with indelicacy towards the men whose places he took. Horne, Plunkett, Denman, Cranworth, and probably Lord Westbury, had each cause to accuse Campbell of something which looked like want of delicacy, and which foes might perhaps call by a harsher name. Campbell has in every case an explanation or a defence. His apologies were, we doubt not, more or less valid. The unpleasant thing is that at almost every step in advance his excellent motives and praiseworthy conduct stood somehow in need of an apology. After all, no elaborate excuses are needed. The man who pushes his way through life must elbow his neighbors and tread on their corns. To complain of him for following his nature is futile. All one can say is that such a nature is not specially lovable. Still, one should not be unjust to Campbell. When he became a judge he wrote in his journal: "I confess I most of all rejoice in the thought of being able to give a place to my old clerk. I have great pleasure likewise in thinking that I may do something for my butler, who has long served me and been much attached to me." This is amiability. One only wonders why a lawyer who had been for many years in receipt of thousands should have deferred so long the indulgence in the "luxury of doing good" to his dependents. Nor let it be supposed that Campbell could not at times show genuine and undoubted emotion. He once, at least, burst into undoubted tears. The occasion was the loss of his election at Stafford. One might say something of the moral of his career. It is not exactly the lesson which most young Scotchmen will draw from it; but, after all, what moral should be drawn from a man's life is a matter which is all but included in the well-known maxim "de gustibus." When *Bob Stubbs* of the "Fatal Boots" was told by his biographer that his adventures were moral, he replies: "I am blessed if I can see anything moral in them."

D'ALBERTIS'S NEW GUINEA.*

SIGNOR D'ALBERTIS represents himself, with considerable naïveté, as having believed in New Guinea "as a land of ever-verdant primeval forests, a region of perpetual ecstasy—where I should find man the unspoiled son of nature, the free savage in his primitive state." This idea had "so fired my imagination that even the few minutes requisite for the steamer to leave the harbor seemed an eternity." The harbor was Genoa; and it was Italy, in that rivalry of hardihood which is confined at the present time to no one race or nation, that sent this explorer forth. It does not seem necessary, even upon very slight reading, that the author should have had such a misconception. No writers, from Captain Cook, in 1770, down, have found it incumbent on them to represent either New Guinea or its people in an attractive light. The records are one, little relieved, tissue of disagreeable incidents and traits. The very intelligent commander of the Dutch expedition, in 1828, is found speaking of the inhabitants as having "offensive manners, their skins bespattered with mud, and of very ill savor, their bodies often covered with sores or sheets of scales. . . . An ugly and repulsive people." Captain Moresby, to select only an item here and there, found the very trees so swarming with ants, yellow, green, and "several brown sorts," when his men landed to cut firewood, that the attempts had sometimes to be abandoned. McFarlane, missionary and explorer, considering the subject of a proposed colonization, writes of the paucity of resources for sustaining such an enterprise, and the poverty of the natives themselves, who demand an axe for a couple of cocoa-nuts. All complain of the deadly malarial fevers. Captain Moresby, at the close of his expedition, in 1874, meets the Russian, Miklukho-Maclay—apparently a most thorough and adventurous explorer, whose reports, as yet buried in the bulletins of the Russian Geographical Society, it is hoped may see the light in more accessible form—"in a deplorable state, and not expected to survive" the virulence of the climate.

Of all this, and infinitely more, in the way of trouble, Signor D'Albertis had, in his five several expeditions, extending over the years from 1871 to 1877, a share which gives his case a pathetic aspect, and must have been peculiarly grievous to one expecting things so very different. It may fairly be said, however, that out of his difficulties arose the most interesting side of his book, which might otherwise have been quite extinguished in a tameness of which it has enough and to spare. This voyager has displayed, to the general reader, much more himself than New Guinea. He appears to have gone out, though with liberal resources for a private person, without Government backing to enable him to operate on a scale on which his efforts might have been crowned with better success. It is a record, as it now stands, of heroic attempts, obstinately renewed, defeated rather by the impediments arising out of the conditions of the search itself than by even the formidable difficulties of the country. The red and blue lines respectively of the discoverer's routes, as traced on his excellent map, give the appearance somewhat of a military demonstration, on received principles. He strikes the great, irregular *terra incognita* on both flanks, and then attacks it in the centre. He penetrates to Mount Arfak, in the extreme northwestern peninsula, and touches at Yule Island and Orangerie Bay, in the extreme southeast. His first day on shore is a rude disillusionment about the forest primeval. Thorns tear his clothing; webs, full of spiders, cling to his face and neck; and trailing vines throw him down, gun in hand. The natives begin cunning and perverse tricks of all sorts; he falls ill of fever, and then of dropsy, and the natives cut off his supplies, so that he is near starving to death. He is sustained chiefly, it would seem, by extraordinary ardor in the pursuits of a naturalist. He shoots strange, uncouth birds, which recall in their novel appellations and ways of conducting themselves those fantastic creations, the jubjub and the bandersnatch. He is consoled for many ills by the skin of (principal treasure of the island) a single bird of paradise.

The most original feat, and in its result the Waterloo, as it were, of this whole notable campaign, is the ascent of the river Fly, a stream named, no doubt, from the British frigate *Fly*, which surveyed its mouth in 1842, and running out of the very most deadly and inhospitable part of the country, north of Torres Strait. He procures a steam-launch of light draught, and twice ascends this river. The first time he is stopped by shoal water, lack of food, and the illness of all on board; the second by these, with murderous mutiny added. His crews were of a mongrel description—West Indian negroes, Chinamen, natives of Fiji, the Philippines, and the Sandwich Islands, with an English engineer and assistant—and, in the time when fortitude was

* 'New Guinea: What I did and what I saw. By L. M. D'Albertis, Officer of the Crown of Italy, etc., etc.' In two volumes. Boston: Houghton, Mifflin & Co. 1881.

demanded, proved to be beyond control by any inducements. He advanced far enough to sight a great range of mountains, called patriotically on his map Victor Emmanuel, and at this tantalizing point, when the interior seemed fairly opening before him, was obliged to turn back. Even the prospect of gold, which, like many another ingenious discoverer, he dangled artfully before them, had no effect, in their unendurable hardships, on these rude minds. On the shores are mangrove forests, growing, with knotted roots, in a black and muddy soil, and emitting pestiferous odors. Hostile savages, shooting arrows, or bare tracts all but devoid of sustenance for human life, alternate with these. The plucky explorer himself (it is true that he has the making of this chronicle in his own hands) is down, "not with fever only, but with such atrocious rheumatic pains in my arms and legs as almost to drive me mad. . . . Palmer, and especially the cook, are, I hear, very bad, and the others are all on the sick-list. . . . Nevertheless, I gave orders to proceed as usual, and we started at eight A.M." A large part of his time throughout is employed in striking awe into his friends the aborigines, by explosions of dynamite cartridges and the like, in which he appears to take a kind of childish pleasure.

One would say, from the experience here presented, that not the private initiative but a disciplined Government force, with plenty of supplies, was the auspices under which proceedings so ambitious and so fraught with difficulty should be undertaken. The results of Signor D'Albertis are very episodic and partial. He has been to New Guinea and brought us away a handful of random curiosities from the midst of it, rather than a general concept of the island. He is not a master of literary style in his narrative—which is in the diary form ; nor gifted with the dramatic faculty ; nor at all profound in his numerous personal reflections—as on his birth-day, the expiring gasps of a bird, and the like. On the other hand, he is of a very conscientious intent. He is fond of exposing the absurd inventions of former travellers, and not open to the suspicion of adding to them. His facts have an impressive air of verity, if as much cannot be said for his theories. He has taken pains to reproduce, in two of the handsomest volumes of travel seen in a long time—the bindings especially, in grey linen, stamped with a simple pattern of birds in colors and gilt, are to be commended—by engravings of extreme accuracy, the multifarious objects of ethnological and scientific interest secured by him. Among the rest occur a number of excellently colored plates of the choicest varieties of birds of paradise. Signor D'Albertis has added the survey of the Fly River to the map ; a considerable vocabulary of words to those drawn out by his predecessors ; and an extensive list of new animals and plants to the collections of the naturalists. It is in professedly technical quarters that his book is likely to meet with most appreciation. What with the spectacle of such a piece of pluck and persistence inspired by scientific ardor, and the number of persons of many nationalities, as referred to, who have been moved, nearly all at the same time, in these last years to employ their energies in the same direction, we may expect that Papua, the last refuge of mystery in Oceanica—strangely enough for an island of such enormous size, next in rank to Australia—will remain unknown but little longer.

GEORG BÜCHNER.*

GEORG BÜCHNER'S writings were so fragmentary and his life was so short that he is comparatively little known even in Germany. Nearly half a century after his death this first complete critical edition of his works appears, together with a biography by Karl Emil Franzos, a sufficient indication that the events of Büchner's life and his few literary productions are presumed to have an interest for a considerable number of people even at the present day. This interest arises undoubtedly from the fact that his brief activity was intimately connected with the popular movement in Germany, which received its first impulse from the July Revolution.

Büchner was born October 17, 1813, in Goddelau, a village near Darmstadt. The intense patriotism of his mother saw a good omen in the fact that her son was born on one of the days of the battle of Leipzig, which delivered Germany. This mother, a noble and lovely woman, was her son's first teacher. His father, a highly respected physician in Darmstadt, was a devoted student of the natural sciences. Notwithstanding great diversity of character and taste the wedded life of Büchner's parents was a happy one, and among the children with which it was blessed were three, in addition to Georg, who became eminent in literature—Luise, the author of 'Die Frauen und ihr Beruf' ; Ludwig, the author of 'Kraft und Stoff' ; and Alexander, now a professor in Caen, the writer of several important books in German and in French. Georg attended the gymnasium in Darmstadt from his tenth to his eighteenth year. The sad political condition of Germany and the revolution in France made a deep impression on the mind of the rapidly-maturing boy, and his school compositions at this time show a remarkable originality and logical development of thought. At the age of eighteen he went to Strasbourg, where he studied zoölogy and anatomy, and attended lectures on chemistry, physics, physiology, and materia medica ; the latter to please his father. The wonderful old town, with its beautiful cathedral and its gay and noisy people, disclosed a new life to him. Here he won the affection of Minna Jäglé, the charming daughter of a German Protestant minister. In one respect Strasbourg had changed much since Goethe's time. It was now the very hotbed of French revolutionary ideas. Büchner, imbued with the spirit of his time, watched from this point of view with intense interest the progress of events in Germany. The movement in Paris had roused the German people at last from their political lethargy. A cry for liberty and justice rang through the air. The nation that had given to the world some of the greatest reformers in art, science, literature, and religion had not yet had her political Luther. The reigning princes, instead of adopting conciliatory measures and acceding to just demands, united, under the leadership of Prussia and Austria, in systematic opposition and oppression. Discontent and excitement prevailed everywhere. Büchner, fiery and compassionate at once, was moved to rage and indignation. The law of his own petty grand-duchy did not permit a student to spend more than four terms at a foreign university, and Büchner was therefore obliged to finish his studies at Giessen. He submitted to the arbitrary decision of his father in directing his studies toward practical medicine as a profession, although it was almost unendurable to his poetic mind to be brought into daily contact with nature in a diseased and abnormal condition. Like another Boethius, he sought compensation and consolation in philosophy, and studied one speculative system after another in feverish haste, without finding the object of his quest. His imagination painted everything in sombre colors. In history he saw nothing but blind, irresistible fate. At this period his mental suffering was intense ; violent fevers and headaches made his condition often intolerable, and it is therefore no wonder that, philosophy having failed him, he plunged into politics.

His first effort in this direction was a pamphlet, entitled 'Der Hessische Landbote,' which he had secretly printed and distributed—a violent diatribe against the governmental oppression of the poor, bearing the inflammatory motto : "Peace to cottages ; war against palaces !" Naturally enough he became a dangerous subject in the eyes of the authorities, and was suspiciously watched. His parents thought it advisable for him to complete his studies at home rather than at the University. There, within a few weeks, he wrote his first drama, "Danton's Tod." To escape criminal prosecution and probable imprisonment, in consequence of his 'Landbote,' he fled to Strasbourg. Here, though repudiated and cast off by his father, he settled down to work amid old friends, among them his faithful fiancée, and began to recover from his unnatural excitement. He relinquished the study of medicine and devoted himself with passionate ardor to the natural sciences. We find him returning also to the study of philosophy, and even engaged in the preparation of a course of lectures on "German philosophical systems since Descartes and Spinoza." In a poetical direction also his genius impelled him to great activity. He at this time published translations of Victor Hugo's "Marie Tudor" and "Lucrèce Borgia," and wrote an original comedy entitled "Leonce und Lena." His studies in comparative anatomy had led him to certain discoveries which he embodied in a dissertation, "Sur le système nerveux du barbeau," written during the winter of 1835–6, for the purpose of obtaining the degree of doctor of physiology and the *venia docendi* in the University of Zürich. It is not surprising that his mother and sister found him tired and pale when they visited him in the summer following his flight from home. Not only his own labors, but his sympathy with the sufferings of his political colleagues, had told severely upon his physical condition.

In October, 1836, after having been elected a corresponding member of the Society of Naturalists in Strasbourg, he removed to Zürich, where he hoped to find a permanent home, and where he was certainly treated with great distinction from the very beginning. It is evident from his letters that he could have been happy here had it not been for the thought of the cruel fate of his companions, who were wasting away in the dungeons of Darmstadt. He began his lectures with great success, and those who knew him thought him entering upon a long career of usefulness. He himself, however, seems to have had a foreboding of the end. Already in the beginning of February, 1837, the hand of death was upon him. After an illness of seventeen days, and in spite of all that could be done for him by the skill of physicians and the care of friends, his heartbroken betrothed closed the eyes from which the light of life had departed. A large number of the best and most cultivated citizens followed his remains to the churchyard on the Zeltweg, where they reposed for thirty-eight years. In 1875 a movement originated at the anniversary of the German Students' Society of Zürich which resulted in the transfer of the remains to a lovely spot on the Zürichberg, overlooking the lake and commanding the wonderful panorama of the Alps in the distance. Here a monument was erected, which was dedicated in the presence of an immense concourse of people amid pathetic demonstrations of enthusiasm and veneration.

It remains to say a few words concerning Büchner's writings. Such of

* 'Georg Büchner's sämmtliche Werke und handschriftlicher Nachlass. Erste kritische Gesammtausgabe, eingeleitet und herausgegeben von K. E. Franzos.' Frankfort : T. D. Sauerländer's Verlag ; New York : Westermann. 1879. 8vo, clxxx.-472 pp.

these as have been preserved must be acknowledged to occupy a subordinate position, either with reference to himself as a man or to any very high standard of literary accomplishment. His first drama, "Danton's Death," was produced in feverish haste under the most trying circumstances, and is decidedly lacking in artistic finish and form, though the portrayal of the characters is exceedingly vivid and real. Events and persons are painted with realistic fidelity by the aid of the most repulsive cynicism. Some critics have attributed this to coarseness in the moral fibre of the author. To us it appears to be merely the result of artistic immaturity, of the want of sufficiently refined artistic taste. We are even somewhat reconciled to his excess of realism by the entire absence of that morbid sentimentalism which exhales like a miasma from the works of many poets contemporary with him, preachers of what they conceived to be a lofty idealism, but which was in reality only the evaporation of very common terrestrial mud. In Büchner's "Danton" his gloomy and pessimistic conception of history is poured forth with great intensity and vehemence. Though the subject can scarcely be called dramatic in its nature, the play is full of life and passion, and in spite of all its imperfections it bears the stamp of a powerful creative mind.

In the fragment of the novel entitled 'Lenz' we find an entirely different manifestation of Büchner's poetic gift. It is a masterly delineation of the mental sufferings of the unhappy young poet of whom Goethe saw much during his residence in Strasbourg. Lenz fell in love with Goethe's Frederica, and became insane when he found that his love was not returned. The descriptions of nature in this fragment are truly poetical, and it is to be regretted that the work remained unfinished. "Leonce and Lena" is full of brilliant wit and drollery, while in "Wozzeck," a fragmentary tragedy, the author dwells upon the dark and painful side of human nature, though the grotesque and the heroic are brought into close proximity. Büchner's strictly scientific and philosophical writings, highly spoken of at the time of their appearance, were bright indications of possible success in the severer departments of knowledge. Altogether, these works, few and fragmentary as they are, give abundant evidence of the many-sided genius of the man. Cut off at the very beginning of his career, at the age of twenty-three, what he actually accomplished can scarcely be regarded as more than a promise of future greatness.

RECENT NOVELS. *

IT was for a long time the custom in Norway (and not alone there, witness Hawthorne's apology for 'The Marble Faun') to look upon Italy as *par excellence* the home of poetry and romance. Before a Norwegian author had made the prescribed pilgrimage to Rome his claim to the title of *Digter* was not universally recognized. Björnson therefore caused something of a revolution in the feelings of his countrymen when he opened their eyes to the poetry which lay neglected at their very doors; and after he had set the fashion, the peasant novel enjoyed an extraordinary popularity and powerfully stimulated the national sentiment among the Norsemen. But according to recent indications the peasant novel has had its day, and the excessively defiant and rhetorical patriotism which sprouted in its track has become the object of legitimate satire. The Norwegians have always been in the habit of congratulating themselves on their remoteness from the great and wicked world, where the most dreadful vice and corruption flourish. In their snug little corner, up under the North Pole, they contrive to remain moderately virtuous, keeping only a small supply of diminutive vices for home consumption. Their merchants are moderately honest, their judges moderately just, and their priests moderately pious. The function of these latter officials is to wage war against what is called "the spirit of the age," to keep the people spiritually in leading-strings, and from their pulpits to hurl forth weekly anathemas against Darwin and the other pioneers of thought to whose labor the nineteenth century owes its greatness. For the faithful performance of this duty they are paid liberal salaries. This is saying, in a blunt way, what Mr. Kielland wittily hints at in his gentle and carefully-veiled satire.

'Garman og Worse' is the story of a mercantile house on the western coast of Norway. Of two brothers who, in spite of their differences of taste and temperament, have a lurking fondness for each other, the younger goes abroad and returns penniless with a presumably illegitimate daughter and much dearly-bought experience, while the elder remains at home, labors heroically, and repairs the shattered fortunes of the family. But, of course, Christian Frederic, or the consul, as he is called, is, when compared to his elegant scapegrace of a brother, a home-bred cockney and a narrow-minded provincial. His respect for tradition, his sturdy conservatism, the measured regularity of his habits and emotions are all, we would not say described, but studied with a conscientious minuteness of detail which neglects no possible *nuance* of the character. The result is a remarkably vivid personality, which engraves itself indelibly upon the reader's memory. Richard Garman, the younger brother, is also a fine piece of portraiture, but his self-indulgence and amiable cynicism have a less national coloring than the more circumscribed and therefore more characteristic individuality of the consul.

The Garman mansion, which is closely identified with the family history, is the gathering-place of all the gentility of the coast. Its hospitable doors are always flung wide open, and its *salons* afford an admirable opportunity for the author to study the various types of official dignitaries, commercial magnates, and miscellaneous nondescripts who make up the so-called polite society of the western districts of Norway. An intrigue of the forbidden sort, and a matrimonial chase in which there is very little love expended, serve to set these various groups in motion and to show them in expressive attitudes. A young clergyman and widower, named Martens, persuades himself that he is in love with Richard Garman's daughter Madeleine, and by his soothing, protecting, and fatherly manner gets the better of her in a moment of excitement, and with ungenerous haste publishes his engagement in and outside of the family. A jurist of frivolous turn, named Delphin, is also feebly enamored of the same young lady, but having convinced himself that the beautiful Mrs. Garman, the wife of the consul's son, Morten, is not absolutely unconquerable, resolves to enter for the fairer prize. It is needless to say that, though he accomplishes his object, the result is disastrous. A young and talented theologian, who has a fearless and striking way of speaking, well-nigh gains the heart of Rachel, the consul's daughter, and is inspired by her to be wholly faithful in word and deed to his deepest convictions; he doubts, and he is resolved to hoist his true colors. But before the decisive day comes when he is to proclaim from the pulpit his apostasy, he calls upon his superior, Dean Sparre, who gently and deliciously swathes his conscience in eider-down and lulls it to sleep. The dean's argument, and in fact his whole personality, from his white and venerable head to the tips of his soft fingers and his polished boots, are so admirable that we do not marvel in the least that the young man concludes to keep his true colors in his pocket. The episode shows that Mr. Kielland has a keen insight into the methods by which the Norwegian clergy succeed so persistently in smothering all free thought and every initiative to decisive and untraditional action; and if he had taken off his gloves and given more point to his satire, he would have conferred an inestimable benefit upon his country. As it is, you see that he is more amused than indignant, and, although he makes some sharp reflections and harbors some bitter feelings occasionally, he is altogether too polite to say anything that might hurt somebody's feelings. It is only fair to admit, however, that by his moderation and self-restraint his book gains artistically what it loses in moral weight.

'Loukis Laras' tells in autobiographic form the experience of a Chiote merchant's family during the opening years of the Greek revolution. There is no attempt to give a history of the war in general, but the historical facts referred to in the narrative are related in notes at the end. Like the Erckmann-Chatrian stories, of which it continually reminds one, it ignores all the glory and display of war and sets before us simply the action of it upon the lives and fortunes of humble people. It seems marvellous that a Greek could so divest himself of the perfervid enthusiasm of his race, apt to manifest itself especially in talking or writing of their past glories, as to conceive and execute a picture such as this. Nothing is more remarkable in the book than the studiously quiet, subdued tone of it. There is no hero and no heroine. The narrator expressly disclaims for himself any courage or adroitness, is rescued by others from dangers, and hardly ever acts of his own motion except in going to recover his father's buried treasure, and in starting a business to maintain his family in their exile and poverty. Yet the story is full of interest and leaves on the mind a vivid impression of its scene and events. The writer has been able to identify himself completely with the fictitious narrator, and has introduced many trifling incidents, such as one remembers from moments of excitement, which give a singular naturalness to the story. The episode of Adriana, the deathbed of the father, the interview with Negris, which determined Laras to make an effort to educate himself, illustrate the power of the homely realism of the book. The translation, too, has occasionally a touch of quaintness which rather adds to the effect. It is doing the author no injustice to suppose that the book, originally published in 1879, was intended to have an influence on the present effort of Greece to secure a more favorable boundary from Turkey. It has been translated into four other languages, and this English version will delight the bookbuyer as much by its clear, delicate type, choice paper, and ragged edges as the story will please the reader.

'An Egyptian Princess' is, we believe, the first of Professor Ebers's Egyptian romances. It is, at any rate, the worst. 'The Sisters' is but half as long, and 'Uarda' is not half as prolix. Nevertheless, the work is not without merit and is worth reading. At the second volume it grows interesting, and both are instructive. The story is of the time of Cambyses and concerns that

* 'Garman og Worse: Roman af Alexander L. Kielland.' Copenhagen: Gyldendalske Boghandels Forlag. 1880.

'Loukis Laras. Reminiscences of a Chiote Merchant during the War of Independence. By D. Bikelas. Translated from the Greek by J. Gennadius.' London and New York: Macmillan & Co. 1881.

'An Egyptian Princess. From the German of Georg Ebers.' New York: William Gottsberger & Co. 1880.

monarch's conquest of Egypt, the causes which led to it, and the events which immediately followed. Nearly all the characters are historical, and the archæology is elaborately minute, and of course trustworthy. If the interest of the narrative were at all quick—as, except in the first part of the second volume, it is far from being—the reader would feel impatience at the notes and be tempted to skip them. It is distracting when the heroine tears off a bracelet in the heat of passion, or begs her husband on her deathbed to have her body embalmed, to be enticed from the text to dissertations upon personal ornaments and mummies; but in the main we have found the notes the most entertaining portion of the work. The scene alternates between Egypt and Babylon. Among the personages are Cambyses, Hystaspes, Darius, Bartja, Amasis, Crœsus, and sundry Greeks, and the historical rehabilitation is not ineffective. Readers ignorant of Herodotus and all subsequent historians of the period will undoubtedly be enabled to get a fair working notion of the manners, customs, religion, views of life and art, the roads, ships, palaces, and costumes of Persia and Egypt in the fifth century B.C., and others may have their knowledge freshened and extended by the reading of a novel which is not a bad one as novels go. But we spoke so highly of 'Uarda' when the translation of that work appeared that we feel bound to say that this book is romantically greatly inferior. The novelist had evidently not got his archæology into a state of sufficient pliability when he wrote it, so that much of the text might advantageously be incorporated in the foot-notes, and much more, since he was new to the business of novel-writing, be omitted altogether. Not only is the erudition so clumsily managed as to suggest Bulwer's (which was said to have been furnished him by less distinguished but better-informed students, by the way), but the story is of the old-fashioned, long-winded intricacy, and full of the transparent devices of the yellow-covered historical novel a grade below Harrison Ainsworth's. For example, at the pinch of the plot, where Cambyses falls into the meshes of the diabolical eunuch Boges, and has his wife, his brother, and half his court under sentence of death, and all innocent, instead of letting the matter clear itself up as it can hardly be held from doing, the author brings in a *deus ex machinâ* in the shape of a clear-headed young Greek to set things to rights. The rapid good sense of the Greek is much dwelt upon, and the reader has it impressed upon him that this is a national trait. But though it wants but a short time before the unhappy innocents are to be strangled, this alert and straightforward Greek, instead of explaining his secret in three words, takes something like three thousand to do it in; he proves, in point of fact, the most Teutonic Hellene that the Attic race ever produced. There are various similar paradoxes, due to the causes mentioned.

'Ploughed Under' purports to be told by an Indian chief, who embellishes the recital of the wrongs his tribe has suffered by the collection of those outrages against the life and property of the oppressed "wards of the nation" with which he has become acquainted, all duly attested to be actual occurrences by frequent foot-notes and by the introduction, which is contributed by Inshta Theamba, the Bright Eyes of recent fame. Bright Eyes says in this, amid much eloquence, that the Indian has been regarded by the whites either from what we may call the Fenimore Cooper point of view or from that of the Colorado settler, whereas he should be viewed as a potential citizen. We are bound to say that Bright Eyes or some pale-faced philanthropist has struggled vigorously with the sagamore who tells the story to restrain him from upsetting this view, but with only partial success. He says nothing, indeed, which justifies the conception of the frontiersman, but he does much to confirm the romantic conception. He thinks agriculture is squaw work, and pale-face civilization evidently seems a humdrum affair to him. In his boyhood, during which he seems to have belonged to the Lake school of nature worship, it is his constant puzzle that to love Wakanda (God) and nature and beauty rather than "narrow ways" and "shut-up houses" is regarded by civilized persons as a mark of savagery. His early experiences with the whites do nothing towards solving this. The tribe of his betrothed has been exterminated because they could not catch and deliver up one of their number who had killed a white settler in a drunken brawl, although they did their best by killing one of their prominent men and offering his body as a substitute. Prairie Flower and her father are the sole survivors, and they join the tribe of Eagle Wing; but Prairie Flower is stolen away by the dissolute son of the agent, who kills his own mother for trying to rescue her. She escapes, but is arrested for being off the reservation and transported to the Indian Territory. Eagle Wing's tribe is immediately after transported thither also, and then follows the Ponca story. The lovers escape and return to their old home, and the hero writes there this story of his life. His style is exceedingly uneven. In descriptions of nature and Indian customs, and in not infrequent phrases like "while the maiden wept for harrowed gentleness," it has a cadence that suggests pale-face culture of no mean order. But the narrative of the Indian's dealings with the whites is marked occasionally by a simplicity that may be racy. In general, however, there is an attempt at satire indicative rather of the simplicity of the commonplace mind more or less familiar with the literature of the Indian question. The work is injured by this composite character, which will, we fear, only excite sneers and harden hearts west of the Mississippi. For example, an Irish servant of the agent engaged in chaffing an Indian girl refers insultingly to the proposed statue of Liberty in New York harbor welcoming immigration—"And you red-skins is a-goin'. That's all there is about it." The brave little maiden answered:

". . . The torch you speak of may welcome your countrymen; we do not complain of that. But I think some of its light might shine towards the red-man, who owns the land you are pushing him out of.

"'Ha! ha!' said the milkman.

"'Ho! ho!' said the gardener.

"'He! he!' said the speckled-nosed cowboy.

"Then the three profound statesmen stepped aside and allowed the Indian girl to pass."

A foot-note says "the attentive reader will discover that this scene in the garden is simply a short-hand report of one of the recent debates in Congress (somewhat condensed)." This, it will be noticed, is in a wholly different vein from the funeral address at the burial of the braves who fell in the battle with the Sioux, and the two display a range of style that is incredible in any Indian chief hitherto known in literature, and would itself be the best plea for citizenship the story contains if we could quite depend on the implication of Bright Eyes that there is nothing disingenuous about the book.

Mr. Townsend is by nature and disposition a poet, and his journeys into Bohemia are prefaced by a sonnet and interspersed with one or two other poems. The first two stories relate to American life in Paris; in the last one, which he calls "The Deaf Man of Kensington," the scene is laid in Pennsylvania. The best of the three is the second, "Married Abroad." It is not precisely a tale for boys and maidens, but it has a touch of reality and pathos which the others lack. The difficulty with all of them is that Mr. Townsend has not patience and is not willing to do himself and his cleverness justice; he has too many of the superstitions of Bohemia; he believes Bohemia to be a great place, the country of great minds, a "wayward realm," as he calls it, where

> "Convivial round the gate
> Of Letters have the masters and the young
> Loitered away their enterprises great,
> Since Spenser revelled in the halls of state,
> And at his tavern rarest Jonson sung."

Of course, in the long run all literary work is judged by its own merits, and not by the surroundings of the persons who produce it, but at the same time there is nothing in the climate of Bohemia which of itself tends to the production of great literary work, as Mr. Townsend seems to suppose.

'Roy and Viola' deals with the French novel's situation tempered by English decorum. Viola makes a *mariage de convenance* in Paris with the aid of her match-making young friend, Netta de Ferias, who has herself done the same thing, and, having chosen an aged millionaire, has strength of mind to keep her poor English lord of a lover at a proper distance till she may happen to be free. Viola, after her marriage, goes to England, where the slight romance that a heroine must have even when mercenary does not outlast the honeymoon. She accordingly becomes one of those icy women with a strong sense of duty, and her husband, finding it dull at home, seeks questionable amusement outside. Her coldness and his vulgarity repel society till the author rewards her heroine with Sir Douglass Roy and his mother. The former, of course, as the title promises, falls in love with Viola, and, like the noble man he is, devotes himself to trying to make her husband less of a cad without letting her suspect his motive. It is a hopeless job, however. The cad grows worse, and through his obstinacy costs the life of his boy. To recover from this shock Viola goes to visit Lady Roy, where she meets her rival in a young widow and former flame of Roy's. The sight of her opens Viola's eyes to her heart's unsuspected wandering, and she returns home "strengthened," to nurse her husband to the fatal end of a tedious paralysis. After a decent interval she is united to Roy, and simultaneously in Paris Netta de Ferias receives the reward of patience in her husband's money and her English lord. The moral is the danger of marrying rich old men who have excellent constitutions.

In 'All Alone' Theuriet treats a somewhat similar subject, but the motive of the book is the necessity of a French divorce law. The provincial heroine is married by her mother to a Paris adventurer, from whom she is finally obliged to separate. The curé, who has been unable to prevent the separation, takes the young wife under his charge, and finds employment and a home for her. Quite casually she meets a young provincial studying music in the capital, and their equally lonely condition becomes a bond between them which is strengthened by frequent meetings in the course of business. At last he is no longer able to conceal his love from her, and she thereupon begs him to return home, forget her if possible, and marry. He obeys, but

'Ploughed Under. The Story of an Indian Chief, Told by Himself.' New York: Fords, Howard & Hulbert. 1881.

'Bohemian Days: Three American Tales. By Geo. Alfred Townsend ("Gath").' The Author's Private Issue. New York.

'Roy and Viola. By Mrs. Forrester.' Philadelphia: J. B. Lippincott & Co. 1881.

'All Alone. From the French of André Theuriet.' [Handy-Volume Series.] New York: D. Appleton & Co. 1881.

sends her a letter which she does not answer, as at that moment her husband is seized with paralysis and to do so would seem like treachery to a dying man. She nurses him for three months in the hospital, and after his death suddenly meets her lover, who has taken her advice and got married. Divorce, it will be seen, would have made two despairing people happy and probably saved the life of a third—the paralysis being only necessary to the story.

'Poverina' is a story of Italian peasant life of no unusual merit but agreeably told. Poverina is a waif supposed to be under the influence of the *jettatura*. She is befriended by a wise old peasant, who finally marries her happily to her eldest son.

'The Black Venus,' considered as a novel, is absurd enough. It is necessary at the outset to admit the preposterousness of its situation; but this once done, there is much skill displayed in making what follows sufficiently consistent to be interesting. The story is simply a series of spectacular scenes for which a journey through Africa furnishes the connecting thread. These are very well done, and the book, which reads like a libretto, was perhaps worth translating.

'Self' contains a well-told story and a wholesome lesson in life inculcated with simple directness. The preface declares that the purpose of the author is to enforce the moral that selfishness is the cause of most domestic infelicity. It is generally safe to avoid a book provided with such a preface; but in this case the form of selfishness studied is in some degree peculiar, and, though the characters are either vague or wooden, the motives that govern their conduct are discussed with considerable insight. The domestic unhappiness in question is caused by the sensitive pride of a loving and self-sacrificing woman and the masculine arrogance of a careless and light-hearted man, and the point to be remarked is the possible selfishness of two people whom all their friends would unite in pronouncing extremely unselfish.

The following extract "samples" very fairly the nightmare transcript of all previous sensational novels which the author calls 'Beaulieu': "Love Madeleine? Yes, I do, very tenderly, with a passionless, heatless, lunar love; but you, Dagmar—you I love to madness."

History of Bristol, R. I. The Story of the Mount Hope Lands, from the Visit of the Northmen to the Present Time. By Wilfred H. Munro. Illustrated. (Providence: J. A. & R. A. Reid. 1880.)—From foreign commerce to manufactures, from violence and adventure to peaceful industrial routine, from dishonest to honest gains—such, in fine, is the story of the pleasant peninsula which Massachusetts ceded to Rhode Island in January, 1746–7. On the shores of Mount Hope Bay a rock still bears an inscription referrible to the Northmen. At the foot of Mount Hope, King Philip ended with his life the war which so nearly nipped in the bud the New England of 1676, while his conqueror, Capt. Benjamin Church, became one of the fathers of the infant settlement which now bears the name of Bristol. From this town, on the 9th of June, 1772, proceeded the boat expedition which destroyed the British armed schooner *Gaspee*, engaged in enforcing those restrictions on colonial commerce which made smuggling honorable and the Revolution possible. In 1775 another British vessel bombarded the place; in 1778 a British force burnt it. It took its revenge in 1812 by fitting out privateers, of which the famous *Yankee* alone "captured British property amounting in value to almost a million of pounds, and she had sent into Bristol a round million of dollars as the *profit* from her six cruises' (p. 310). This was not the first privateering from Bristol. In the French wars Captain Simeon Potter had taken his *Prince Charles of Lorraine* "among the islands to the leeward of Cayenne," and plundered a Jesuit station at Oyapoc. Father Fauque noticed that on Sunday "the captain took out a book of devotion," and "during this day and the following Sunday he occasionally looked at it." When the test of true piety came Capt. Potter was found wanting. Five Indians were a part of the loot. "'I represented to Capt. Potter,' says the missionary, 'that, as the Indians were free among us, he ought not to take them prisoners. But he answered me, "that this kind of people were used for slaves in Rodelan, and that he should take them thither in spite of all that I could say."'" Some of the silver thus obtained at Oyapoc is still in the possession of Capt. Potter's descendants, who would probably not care to be held answerable for the captives.

There has been no trade between Bristol and the West Indies for eight years, but those islands were the town's source of supply for slave labor as early (or as late) as 1718, not long after which date the establishment of distilleries led to slave-trading on the coast of Africa, and this did not cease till the clause in the Constitution prohibiting it became operative in 1808. The vicious circle is thus described (p. 349):

"Nearly all the owners of the distilleries also owned many vessels. From Cuba a cargo of molasses was procured and quickly converted into New England rum. From the distillery the great casks went straight to the hold of a schooner or sloop lying at the neighboring wharf. Some light goods, suited to the barbaric tastes of the natives of the coast, were also placed on board, and the vessel was cleared for the coast of Africa. . . . One by one the hogsheads of rum would be bartered for slaves, until the desired number was obtained, and then the captain would sail for Cuba, or one of the neighboring islands, where he was always sure of a ready market for his cargo. There he would load with molasses for Bristol, and so the round would be completed."

In this infamous traffic Bristol, true to its British namesake, was only second to Newport. There are several reasons why the local historian is unable to picture the full extent of it. In the first place, there is a natural regard for the feelings of the posterity of the chief slave-traders, one name in particular being as prominent now for wealth as it was formerly for the means by which riches were acquired. Another is, that public records have been tampered with, even to the mutilating of printed files in historical libraries. A third is the reluctance of those who still preserve private documentary evidence or family traditions to communicate them. Mr. Munro gives no intimation that public sentiment in Bristol ever regarded the great slave-trader with aversion. One who was a lad when Captain James De Wolf was about exchanging slave-trading for privateering, and who was caught killing birds on his broad estate, has told us how, at a safe distance, he retorted the reproach, "Cruel boy!" by allusion to some horror of the middle passage popularly associated with the retired trader. Such memories are perhaps well buried, at least in works like the present. In the process of that evolution which from real as well as from seeming evil still educes good, the historian of Bristol can record a public library founded three years ago by one of the slave-trading family, and dedicated in an oration by the humane and gifted grandson of one of James De Wolf's captains, who left Anamaboe for St. Thomas in January, 1796, with eighty slaves on board.

Studies in Deductive Logic. By W. Stanley Jevons, LL.D. (London and New York: Macmillan & Co. 1880.)—Some forty years ago the two mathematicians, De Morgan and Boole, commenced a reform of formal logic. Their researches were continued by a number of other excellent thinkers (Mr. Jevons among them) in different countries, and the work is now so far advanced that the new logic is beginning to take its place in the curriculum of the universities, while many persons have imagined that some almost magical power of drawing conclusions from premises was to be looked for, and that logic would prove as fertile in new discoveries as mathematics. Concerning such hopes Professor Sylvester says: "It seems to me absurd to suppose that there exists in the science of pure logic anything which bears a resemblance to the infinitely developable and interminable heuristic processes of mathematical science." "To such a remark," replies the author of the book under notice, in his preface, "this volume is perhaps the best possible answer." A more exaggerated pretension never was made. The book is a convenient manual of exercises in elementary logic, tinctured with the author's peculiar views, of which there will be different opinions, but, at any rate, sufficiently sound to be useful in the class-room. But if Professor Jevons were to penetrate only a little ways into the heuretic world of the mathematicians—an excursion quite worth the while of a logician—were to learn what discoveries are there made every month, and what sort of a stamp a proposition must bear to be considered, in that field, as really new, it is to be hoped that he would feel something different from self-satisfaction at recollecting that he had set up anything in this little volume as worthy to be compared with the triumphs of a Sylvester. Logic, inductive and deductive, is an important discipline, probably more important than the higher mathematics, just as the multiplication-table is more important than the calculus; but very, very few are the new problems which have ever been solved by the regular application of any system of logic. That part of logic which can best compete with mathematics in the discovery of new truths is the complicated theory of relative terms. But even there the comparison would be very unequal between what is only a branch of mathematics and the whole body of mathematics together. The solution of problems used to be considered as the glory and touchstone of the mathematician; in our time, the aim is rather at the discovery of methods, and we might perhaps look to the logician to produce a *method* of discovering methods. But the main advantages which we have to expect from logical studies are rather, first, clear disentanglements of reasoning which is felt to be cogent without our precisely knowing wherein the elenchus lies—such, for instance, as the reasoning of elementary geometry; and, second, broad and philosophical *aperçus* covering several sciences, by which we are made to see how the methods used in one science may be made to apply to another. Such are really the chief advantages of the new systems of formal logic, much more than any facilities they afford for drawing difficult conclusions; and it is evident that if logic is to make any useful progress in the future, we must set out with some more or less accurate notion of what sort of advantages we are to seek for.

Madame de Staël. A Study of her Life and Times, etc. By Abel Stevens, LL.D. (New York: Harper & Brothers. 1881.)—Madame de Staël was the most celebrated woman of her day. She had birth, fortune, social and diplomatic position, extraordinary powers of conversation and a great literary reputation. One of the petty weaknesses of Napoleon was his dislike of her: she was ordered not to come within forty leagues of Paris. This persecution of the Emperor, as Mme. de Staël liked to call it, was in itself no small distinction. She did her best to increase it by assiduously reminding him of her existence and of her opposition principles. As a writer, Mme. de Staël was essentially of her period; there was a good deal of the pamphleteer about her. The subjects she dealt with have ceased to interest, and tastes have changed. 'Corinne' was read longer than any of her books. Few travellers in Italy were without it when Mrs. Starke was the only guide. Murray and Baedeker have entirely superseded both. Full information about Mme. de Staël's life, sayings, and doings can be found in Mme. Necker de Saussure's 'Notice,' in a well-written summary in the 'Biographie Universelle,' and in a critical sketch by Sainte-Beuve; and this is probably the reason why "no French *littérateur* has dared to attempt" a biography of her, as Dr. Stevens points out in his preface. The doctor had more courage, and after much research has written two volumes, in which no new fact relating to her is given, and one of some interest is suppressed—viz., that her illness and death were probably caused by habitual indulgence in opium. Nevertheless, if a book had to be written, here was a good opportunity. Mme. de Staël lived in three most interesting and sharply contrasted epochs. She grew up and was married in the last years of the *ancien régime*. French society was never more brilliant than under Louis XVI. The old noblesse may have been "pampered, infatuated parasites of power," as Dr. Stevens calls them, but they had polished manners and wit, and their taste was perfect in dress and in household decoration. *Salons et petits soupers*, playing in comedies and dancing in masques, went on to the end. Then came the crash, the downfall of everything, the bloody scenes of the Terror. The Empire followed with its military glitter and its military coarseness, and all Europe under the foot of Napoleon—a chance for three interesting pictures, if an author could make them.

Dr. Stevens has not done so, although we infer from his preface that he meant to attempt it. His passionate admiration for "my heroine" is almost a curiosity of literature. If it were possible to imagine Dr. Stevens tempted like Dr. Faustus, he would ask Mephistopheles for Mme. de Staël instead of Helen of Troy. X. Doudan says that the tone of enthusiasm that pervades Mme. de Staël's 'Delphine' is too high by two or three notes. Dr. Stevens has pitched his key so high that his rhetoric fails him when he speaks of his idol. He can only exclaim in superlatives, like very young ladies whose exuberant feelings exceed a limited vocabulary—"the profoundest of ethical thinkers," "the oracle of the first minds of her times," "the greatest woman in literature," "the greatest woman yet produced by Europe," "the greatest of her age, if not of any age," "her superabundant genius," "her marvellous genius," "her splendid generalizations," "her magnificent descriptions," "her transcendent qualities," "a superb intellect," "a superb historic apparition," "a superb woman." When the Doctor drops rhapsody his narrative is largely made up of quotations—testimonials from distinguished people to Mme. de Staël's greatness and goodness, of little more interest to the reader than the certificates of "prominent" clergymen to the cure-all efficacy of a patent medicine. One can get a better idea of Mme. de Staël from two or three paragraphs in Crabb Robinson's first volume of 'Reminiscences.' The first requisite for a good biography is certainly that an author should be in sympathy with his subject, but a second requisite is that he should not write such sentences as these:

"From time to time Mme. de Staël left her feudal home and transplanted all her noble *cortége* to Geneva."

"There she could gather *élite* minds and hold high discussion on the noblest themes."

"Had the American Revolution failed, Washington's own character as well as his fame would have been different in the judgment of the world."

"But the sense of duty, however noble in the less intimate relations of life, becomes almost ignoble when in the relations of a mother to her child it takes the place of maternal instinct."

With such monographs as have been published recently, the taste of readers has become critical for this kind of work.

The Aryan Village in India and Ceylon. By Sir John B. Phear. (London and New York: Macmillan & Co. 1880.)—We have read this book with considerable interest, and in so far as its author describes what he has seen (and the book is mainly descriptive) we have nothing but praise to speak in regard to it. It is very well printed, and, as many Indian words are used, a glossary is added at the end. In the first part we have a charming account of deltaic Bengal—the level alluvial plain with green fields of waving rice and vistas broken by jungle, with many waters and quaint craft floating upon them. In this sort of landscape Sir John Phear finds his "Aryan village." Of this he gives a seemingly accurate and very interesting account. "The principal features can be summed up as follows: At the bottom is the great mass of hereditary cultivators of the village lands (ryots); at the top the superior lord entitled to rents and dues from these cultivators (zamindar). . . ." We are told what is meant by the term "hereditary cultivators." Brothers are by law entitled to equal shares of the land which their father cultivated, and co-heirs have a right at any time to compel a partition. As a rule, however, the land is not divided for several generations. The family forms a corporation "in which the individual members have no proprietary rights distinct from those of the whole body, except the right on the part of each co-sharer to separate at any moment and have his aliquot share of the common property divided off and given to him." We are reminded of the maxim of the Roman law, *Nemo in communione potest invitus detineri*. "Instances occur in Calcutta, and even in the Mofussil, of families comprehending as many as three hundred or four hundred individuals, including servants, living in one house." The branches of such a family "settle themselves *per stirpes*, so to speak, in separate parts of the house." This fact will interest Mr. Morgan in connection with his study of the houses of American aborigines. The village community of Ceylon, to which the second part of Sir John Phear's book is devoted (the author resided in Ceylon for two years as Chief-Justice of the Supreme Court), resembles that of Bengal in almost all respects. The right of the individual cultivator to his land is even more strictly hereditary and absolute. In Bengal his tenure, although hereditary, "does not rise above a right of occupation, with a liability to variation of rent." In Ceylon it is "subject only to the rendering of a special service to the lord."

Now, what strikes us as peculiar in all this is, that there is no trace of what can be properly described as communism. There is no more communism in the Bengal and Ceylon villages than there is in one of our joint-stock land-companies. Not so much indeed, for in our joint-stock company the share of the individual is, and often must remain, an undivided share. In the Bengal or Ceylon community, however, the individual can separate his property from that of his associates whenever he pleases. He can turn an undivided share into a share in severalty at any time. This leads us to enquire how the Bengal or Ceylon community can be adduced to support the theory of "primitive," or, as it is often called, "natural communism." Sir John Phear evidently believes—indeed, he declares—that in describing the Bengal and Ceylon communities he is contributing facts to support that theory. He does not apparently see any difference between those communities and the Russian *mir*, which he describes as "an instance of the like institution." Yet in the Russian *mir* we have pure communism. Now, as Mr. Wallace tells us that the communism in the Russian *mir* dates only from the beginning of the seventeenth century, while Sir John Phear fails to show that there is any element of communism in the villages of Bengal and Ceylon (and in this he falls in with Dr. Hunter, who is our leading authority), the theory of "primitive" or "natural communism" is apparently not so strongly supported as we have thought it to be. It is so easy to mistake a partnership with a shareholding according to a law of inheritance (individual inheritances being represented by undivided shares) for a communistic partnership (we see how Sir John Phear has confounded them), that it is desirable that the evidence in support of the theory of "primitive communism" should be reviewed and examined carefully. It is conceivable that this evidence is not so plentiful nor so good as has been maintained.

Summerland Sketches; or, Rambles in the Backwoods of Mexico and Central America. By Felix L. Oswald. (Philadelphia: J. B. Lippincott & Co. 12mo, pp. 425.)—For eight years the author of this handsome volume travelled for the benefit of his health through the highlands of Jalisco, Oaxaca, Colima, and Vera Paz, in Mexico, and through Yucatan and the backwoods of Guatemala; and his rambles in that *terra* comparatively *incognita* are here noted down with the enthusiasm of one who has a keen perception of the scenic charms of nature. The author, who is a doctor in medicine, thinks that the Mexican *alturas* visited by him offer an excellent sanitarium for *marasmus* and other diseases. At Llanos Ventosos, in the valley of Oaxaca, pulmonary complaints are quite unknown, and the beautiful village of San Miguel, formerly a Swiss colony, is specially recommended for Northern invalids. The price of living is very cheap, the cost of an unfurnished cottage being about $15 per year, that of a pound of mutton 6 cents, and that of a whole turkey 18 cents, everything else being proportionately cheap. While game is plentiful, there are only four or five venomous varieties of snakes, which are well known and easily avoided. Dr. Oswald has had with the dreaded insects of the tropics the same experience recorded by the late professors Hartt and Orton in Brazil—that is to say, he found that the virulence of the attacks of the larger insects has been grossly exaggerated. "I doubt," he says, "if the sting of twenty tarantulas could cause the death of a healthy child." Among the many wonders of vegetation in Oaxaca the author calls attention to the cypress forests on the southeastern slopes of the mountains.

The largest of these trees, which Humboldt called "the oldest vegetable monument of our globe," is the Maria del Tule, which has a diameter of forty-two feet, and a circumference of one hundred and thirty-six feet near the ground.

In spite of the genuine enjoyment this book affords, it is altogether too sketchy to serve its purpose as a "guide-book to one of the few regions of earth which may give us an idea of the tree-land eastward in Eden." No map of any kind aids the reader to follow Dr. Oswald from 28 degrees down to about 14 degrees N., through Mexico, Yucatan, and the forests of Guatemala. The first chapter takes one through Sonora, the northernmost state of Mexico on the Gulf of California; in the second chapter one is already about four hundred miles south, with no indication of the leap. It is to be regretted that these papers (they first appeared in *Lippincott's Magazine*), showing so much character and vigor, are not supplemented by such general description of the region visited as to make them more enjoyable to those who wish to accompany the author intelligently in his rambles. But as isolated sketches they are very interesting; and the reader, borrowing some of Dr. Oswald's enthusiasm, feels also like visiting those sierras with their strange wonders of vegetation and generous climate. The book is illustrated by H. F. Farny and H. Faber, and their work is good.

The Servant-Girl Question. By Harriet Prescott Spofford. (Boston: Houghton, Mifflin & Co.)—*What Girls Can Do.* By Phillis Brown. (London and New York: Cassell, Petter, Galpin & Co.)—Mrs. Spofford discusses the familiar subject with a clever force which never degenerates into smartness. Our own observation would have inclined us to think some of the articles a little belated. The author herself seems to have some such sense, for in her plea of "Mistress versus Maid" the defendant is literally a *Doppelgänger*, appearing now as "the poor maid, just transferred from her sheiling," "with her wild traditions, her outlandish custom of wakes and ulalus," and now as "the servant with airs of gentility, with assumption of equality in dress and full knowledge of equality before the law." But it only proves, what we think the book hardly recognizes with sufficient distinctness, that time has wrought the same changes in this question that it does in all. The forty years, almost, since the famine have divided it: it is not one but three. If it be altogether an affair of the well-to-do, the cities, the smaller towns, the country present so different aspects of it that no picture of the one is true of the others. The novelty of the book is the making the case tripartite by the explicit arraignment of the master. Space fails here for more than a hint in his defence. There is surely a word to be said on his side; but no woman can say it who does not know what it is to have business engagements, absolutely regular, peremptory, and vitally important for reputation as well as purse. The author's hopes of relief for the mistress are threefold—"the lady help," the Chinaman, and the better training of the daughters by the mothers. It may be that the shadows of the first two are already upon the kitchen threshold. As to the third, how much long, patient painstaking is to be expected of a generation of women to whom has come the great increase of wealth of the last fifteen years?

The mother who looks for help to 'What Girls Can Do' will be disappointed. It includes our old acquaintances, 'The Girls' Own Book' and 'Art Recreations,' plus dress-reform, china-painting, university examinations, etc., etc. It is less than patchwork, for that is fitted and sewed together. This is only a collection of—we had almost said—tatters, strung on a thread of titles of fine moral intention, but which there is nothing in the plan or the tone of the book to justify. If it touches every subject, from rubbing tins to Girton College, there is none upon which the special or technical hand-book now so common should not be preferred. The English is careless, and the high-flown phrases are no help to thought or style. For instance, no girl may trust herself to trim a hat "who has not the consciousness of genius." But it is not merely the literary faculty that is wanting.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Barbou (A.), Victor Hugo	(S. C. Griggs & Co.) $1 00
Benedict (Sir J.), Weber	(Scribner & Welford) 1 00
Biddle (H. P.), Elements of Knowledge	(Robert Clarke & Co.) 1 50
Bikelas (D.), Loukis Laras: a Tale	(Macmillan & Co.) 2 25
Carlyle (T.), Reminiscences, swd	(Harper & Bros.) 15
Cheney (Mrs. E. D.), Gleanings from the Fields of Art	(Lee & Shepard)
Clarke (Prof. H. A.), Harmony on the Inductive Method	(Lee & Walker)
Craik (Mrs. D. M.), His Little Mother, and Other Tales, swd	(Harper & Bros.) 10
Ebers (Prof. G.), Egypt, Descriptive, Historical, and Picturesque, Parts 7, 8, swd	(Cassell, Petter, Galpin & Co.) 75
Fitzgerald (P.), Life of George IV., 2 parts, swd	(Harper & Bros.) 40
Fothergill (Dr. J. M.), Aids to Diagnosis, Parts 1, 2, swd	(G. P. Putnam's Sons)
George (H.), The Irish Land Question, swd	(D. Appleton & Co.)
Hall (G. S.), Aspects of German Culture	(J. R. Osgood & Co.) 1 50
Hay (Mary C.), Into the Shade, and Other Stories, swd	(Harper & Bros.) 15
Holmes (O. W., Jr.), The Common Law	(Little, Brown & Co.)
Hunt (Mrs. John), The Wards of Plotinus, swd	(Harper & Bros.) 20
Littlejohn (Rev. A. N.), Individualism: its Growth and Tendencies	(T. Whittaker)
Michaud (J. F.), The History of the Crusades, 3 vols	(A. C. Armstrong & Son) 3 75
Mollett (J. W.), Sir David Wilkie	(Scribner & Welford)
Morrow (A. C.), Bible Student's Cyclopædia	(N. Tibbals & Sons) 1 50
Munger (Rev. T. T.), On the Threshold	(Houghton, Mifflin & Co.)
Perry (A.), The Schoolmaster's Trial	(Chas. Scribner's Sons) 1 00
Ploughed Under: a Tale	(Fords, Howard & Hulbert) 1 00
Preston (Harriet W.), Georgics of Vergil, translated into English Verse	(J. R. Osgood & Co.)
Redhouse (J. W.), The Meznevi, translated with versification	(Trübner & Co.)
Swing (Rev. D.), Club Essays	(Jansen, McClurg & Co.) 1 00

Worcester's Dictionary of the English Language, Unabridged, with Supplement	(J. B. Lippincott & Co.) 10 00

Fine Arts.

FIFTY-SIXTH ANNUAL EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.—I.

THERE are 752 numbers in the catalogue this year, and an unusual number of large canvases, so that the walls of all the galleries are covered below the line as well as above, the corridor overflows the staircase, and a room on the first floor is made the limbo of crayon drawings, water-colors, and most of the sculpture. The portraits make the most interesting part of the display, as they did last year. Miss Kate Field sends one of herself by Mr. F. D. Millet (No. 413), which arrests the eye of the visitor, as he enters the main room, with great peremptoriness. In a strictly popular sense it is the "swell" picture of the Exhibition. The lady is seated sidewise on a low sofa, her feet resting upon a hassock at the left, so that the figure is nearly in profile; the head being turned to the observer and supported lightly by the right arm, which rests upon an upright cushion, while the left arm reclines decorously in the lap. The canvas is five feet high by six long. The colors are old-gold, black, and cardinal, the first blazing from the plush upholstery, a brocade background, and a brass pot containing some peacock feathers which balances the ottoman, and the other two contrasting vigorously in the sitter's dress, the train of which is swept round in front with the double object of exposing its richness and showing the brazen vessel it could not but partly conceal if more naturally disposed. The dress is high-necked and sleeveless, with a black lace *fichu* which falls over the shoulder a little way and yellow gloves of many buttons complete the costume. This omits nothing, we believe, and should not, since a description is here almost a characterization. The reader will see that the composition is somewhat meagre rather than simple; the color alone forbids the idea of simplicity, and we suspect that the efforts of the artist to solve a difficult problem ended in compromise. As in most compromises of this sort the result is curiously incongruous. The surroundings are almost Levantine, and the figure is unmistakably Occidental; the tiny slippered feet and cardinal stockings peep coquettishly from beneath the dress, but the face and bearing contradict the impression of coquettishness, and speak of graver things; the whole attitude, indeed, seems to suggest a sprite-like frivolity suddenly checked and aborted by a sobriety approaching primness, and one is at a loss to determine whether the painter has displayed just too much or just too little gallantry—gallantry having clearly been the kernel of his difficulty. Such difficulties have, however, been overcome—witness the luxuriousness infused by Clairin into his familiar portrait of Sarah Bernhardt, in spite of the exclusively linear elements which he had to treat, and which may be set off against Mr. Millet's psychological obstacles, unless we are to assume that the latter ought not to have attempted at all what he plainly has attempted in this work. A good deal of excellent painting that it contains is thus obscured by its mistake in point of art.

Mr. Eastman Johnson's "Funding Bill" (No. 216) is an even larger canvas, though in every other respect it is a complete contrast. Two gentlemen are discussing the subject indicated by the title, and the point about the picture is its thorough-paced reality. The figures are portraits, and the scene is the room of a modern New York house. It is evident, moreover, that the conversation is of that practical order which rules in similar interiors, and with which we are all acquainted; the topic must be either business or politics, and the title is as needless as it is apt. In this way the picture is a masterpiece; it is the perfection of that kind of painting so often urged upon unpatriotic American artists who repair to Venice and Brittany for inspiration, and neglect the possibilities with which our own life and land teem, and which are never touched without awakening a sympathetic popular echo. Artistically, too, it combines portraiture with *genre*; and whenever this is done with any success one wonders afresh why the expedient, old as it is, is not oftener resorted to. After you have looked at the faces and figures you have still the surroundings to examine, and always the literary side of the picture to fall back upon. Like most of Mr. Johnson's best work, like the portrait of a little boy in the South room (No. 401), it has corresponding technical merits. A painter would say that, whether or no the hands were well painted, they are too much nearer the spectator than the faces to be less carefully treated, and make similar objections. But objections of this sort have always seemed to us trivial to make in the case of Mr. Johnson; in his case, certainly, to find positive blemishes in technique is as hypercritical as to seek positive defects in his art. If his shortcomings were as little felt as his defects, his pictures would be as impressive as they are irreproachable. As it is, this "Funding Bill" repeats on a large scale the familiar absence of those qualities, both technical and artistic, which give vivacity and endurance to

works of the imagination. In neither its design nor its treatment is there anything imaginative to be recognized. A prolonged inspection of it leaves the feeling that its obvious excellences and irrelevant blemishes are unpleasantly insufficient compensation for the absence of this, and are, indeed, so many positive assurances that in time interest in the work must cease altogether, or else give way to an irritated desire to change the furniture about and give the discussion that is going on so persistently a new turn.

In feeling the need of imagination in fine-art no subscription to the "ideal" theories of the days of classicism is, of course, implied, and it is a trite remark to say that such a painter as Mr. Johnson would be all the more real for a little imaginativeness. Neither would he in that event lose any of the beauty of homeliness. The strictest constructionist could not ask anything less sophisticated by ideality in the cant sense than Mr. J. Alden Weir's "Peggy" (No. 170), on the adjoining wall; and in this Exhibition certainly we could not select an example which so well illustrates the imaginative and suggestive possibilities of pure portraiture. There is evidently no *ab-extra* assistance from *genre* needed to enforce the reality of this charming young face, which is, on the other hand, as free from conventional lines of beauty as it is full of character. One may say that such a face could not well be "imagined," and could not be so sympathetically rendered without imagination; and this, we take it, is what is meant by portraiture of a high order. As a bit of pure painting it is equally striking. A black background, brown beaver hat, black dress (the head and shoulders only appear), and a bunch of light hair are, besides the face, the sole elements of a perfectly simple composition; and in color it is rich and grave. There is in the flesh a peculiar juiciness and soft pliancy which alone would stamp it as remarkable work, and give it a pictorial interest that no merely decorative composition could have; in fact, such handling as it shows is the essence of decorativeness in the best sense. With the whole effect of the portrait in this respect compare that of Mr. Porter's (No. 414) in the main room, in which it is impossible not to observe how the drawing and the painting of the drapery are cheapened by the hard and superficial way in which the flesh is rendered. Not that, flesh-painting aside, Mr. Porter would be interesting this year any more than last, millinery having obtained too strong a hold upon him for a satisfactory treatment even of drapery; but this portrait seems a distinct retrogression in that, except so far as drapery is concerned, it indicates an abandonment of color in which at one time he appeared to take a sensuous delight. How many removes is it, one asks himself, from this to the art of Mr. Huntington, as displayed in the "Portrait of a Lady" (No. 419) on the same wall?

Mr. Huntington, we may mention, is also represented by a portrait of Senator Sherman (No. 398), sent by the Chamber of Commerce. Mr. Le Clear sends one of the late Sandford R. Gifford (No. 433), in which he is at his best. He has the faculty of "catching likenesses," as it is called; and having been particularly successful in characterization here, it matters less that the face is not more solidly painted. A similar faculty is evinced by Mr. Vinton, as one may see without acquaintance with the original of his portrait (No. 488) of an elderly gentleman characterized with evident felicity. Next to Mr. Weir's, it is, perhaps, the most interesting portrait of the Exhibition in point of painting also. The background is neither strong nor especially pleasing, but is unpretending and in keeping with the tone of the picture, and only strikes the attention because the treatment of it as explicitly and merely a background, instead of as a pictorial element, is so conventional as to contrast with the spontaneity which marks the rest of the work. Mr. Maynard has a rather photographic full-length of Mr. Millet in his war correspondent's costume (No. 465), and next it is the figure of a young lady (No. 464) drawing on her gloves preparatory to a "Morning Promenade," by Mr. E. J. Bissell, which seems to have technical merit, though it is hung so high that any judgment of it is largely speculative. Mrs. Anna Lea Merritt sends two, a head and shoulders (No. 443) and a two-thirds length (No. 416), of which the latter is the more attractive on account of the pretty stuff of which the young lady's skirt is made. Above the former is one of a gentleman (No. 442), by Mr. J. H. Witt, which looks, so far as the naked eye can discover, as if an exchange of places with either of the young ladies by the same hand that are on the line would be to Mr. Witt's advantage, since it is apparently more serious if not as superficially clever work. A small head (No. 326) below the line in the East room, by Mr. Hovenden, has too much vivacity to be justly overlooked, as it is likely to be. Of Mr. Anderson's young lady in purple (No. 301) in the same room the reverse may be said, unless one associates vivacity with qualities usually described as "stunning," but really rather galvanic than inspiriting. Over the east door of the main gallery is "A Portrait" (No. 497), by Miss Rosina Emmett, to which size and ambitiousness, perhaps, lend more importance than other characteristics. It is undeniably clever and pretty, but it is also undeniably the work of an amateur. The composition is clearly artificial, and the figure and surroundings fit each other ill, being, indeed, so different in tone and painted with so different a motive as to suggest two distinct pictures inaptly combined. The care expended upon the burnished brass globe in the centre, which is capitally rendered in itself, forms a conspicuous contrast with the fragility with which the figure is endued, besides emphasizing the wrong thing. The drapery, too, in itself is delicately done and happily chosen to suit the individuality it decorates, but it is just enough out of key with the rest to indicate that the work is a study in composition rather than a single conception. In this respect, as, in fact, in most others, we like the same painter's portrait of an attractive youngster of some three summers, we should judge, in the North gallery (No. 202). This is very charming in character as well as pictorially, and all of a piece in either view. The hair is rather wig-like and hardly grows out of the head it covers, but the face is noticeably well painted, and the light key of color, nowhere fading into paleness, very agreeably preserved. Miss Dora Wheeler's "Portrait Sketch" (No. 137) deserves mention for the way in which the manner of the typical American school-boy of the upper classes is caught, and Mr. Shirlaw's portrait in the corridor (No. 91) mainly because it is his and he has done more interesting things. From either it is a considerable stretch to Mr. George Butler's "Italian Peasant Girl" (No. 138) and "Italian Knitting Girl" (No. 660), Mr. Fuller's "Winifred Dysart" (No. 424) and Mr. Eakins's "Study" (No. 459), which, though strictly to be classed as figure-pieces, have in part the interest of portraiture. Mr. Butler's have a tender and pensive charm, and are painted with agreeable solidity and a sureness that is very refreshing in the midst of so much erratic experimenting as even the Academy Exhibition has come to contain. The way the jug and hands are treated in the first is a little trying—both are earthenware, but the jug alone is flexible—but there is no drawback in the second, which, indeed, has something the interest a similar work by Page, who no longer exhibits, unhappily, would have. The contrast between it and "The Page" (No. 668) which hangs hard by is full of reproof to the painter of the latter, if she would heed it, but we fear it is too late. Mr. Fuller's picture suggests nothing that his charming art does not always suggest, unless it be surprise that his persistent vagueness does not become wearisome; it is certainly his medium, and regret that he essays no other is, perhaps, as unreasonable as it evidently would be vain. Regret, however, is plainly justifiable in the case of Mr. Eakins's "study" of a model in a low-neck white dress, whom he has painted with such precision of fidelity as to have seemingly begrudged her the slight and evanescent beauty she might have disclosed to less searching eyes. It is a characteristic picture; nothing here is more powerful, more admirable in a dozen ways—or more irritating.

The Election Frauds of New York City,

AND THEIR PREVENTION.

By JOHN I. DAVENPORT,

U. S. Commissioner and Chief Supervisor of Elections.

This volume presents in narrative and historical form a record of the Election Frauds in New York from 1860 to 1870, inclusive. Also, the registration of the city, both by Wards and Assembly Districts, to date; the vote from 1840 to 1880, in both Wards and Assembly Districts; and the census of the city, both State and National, by Wards, from 1790 to 1880; with much other statistical matter never before published. There will also be found a full history of the great Naturalization Frauds of 1868.

Octavo, 350 pages, $1 50.

The Nation.

NEW YORK, THURSDAY, APRIL 7, 1881.

The Week.

THIS has been a great week for "politics." In fact, we can recall no week for several years containing so much naked, unadorned "politics." In other words, both here and in Washington, there has been a stoppage of the most pressing public business in order that the persons charged with the conduct of it might have a good long tussle over "offices." The Committee of Twenty-One, appointed at the indignation meeting of which we spoke a fortnight ago, procured the passage of a bill in the State Senate putting the whole street-cleaning business into the hands of the Mayor. By the time it reached the Assembly the Republican politicians had roused themselves, and, perceiving that this would give the Mayor a number of offices of which the Republicans have hitherto had the control, got it amended in committee so as to put the business into the hands of Professor Chandler, the President of the Board of Health. Professor Chandler promptly announced that he would under no circumstances accept it, and, as no one else offers who can be conveniently substituted for the wicked and designing Democratic Mayor, the bill is at this moment hanging fire in the Assembly, in spite of the general indignation of the people who live on the streets to be cleaned. Among its opponents at Albany has appeared Mr. George Bliss, our old reforming friend, who evidently thinks that dirty streets can never present a spectacle so dreadful as streets cleaned by Democrats. The chances are, however, that the bill will eventually be passed as it came from the Senate. The whole affair is an excellent illustration not simply of "politics," but of the way in which the possession of the State Legislature by one party and of the city government by another makes good municipal administration impossible. There is no cure for it but the insertion of the city charter, or the leading provisions of it, in the State constitution, giving the city government to the people of the city. The politicians of both parties are demented about offices, and have actually lost all notion of office as a trust for the benefit of the whole population. They think of it simply as a means of giving "workers" the spending of some money, and have now got to the point of avowing this view with the simplicity of savages or insane persons who go about naked without shame.

The Mayor has, however, turned "politics" into business by summoning the Police Commissioners for trial before him on a long string of charges brought against them as street-cleaners. The principal one is, of course, that they did not clean the streets, and this they cannot deny, but simply confess and avoid. The others are that they allowed garbage and rubbish to be illegally mixed; that they have made false returns of the work actually done by them; that they allowed the public scows to be used for the transportation of private rubbish; that they employed unfit men and horses; that they kept on the pay-rolls the names of men who did no work for the city; that they allowed ash and garbage men to extort payment for their services from private citizens, and foremen and inspectors to extort payment from laborers for making false returns of the time spent in the municipal service; that they have cheated grossly in their charge for horse-feed; that they have permitted garbage and manure to be emptied into the river instead of being taken out to sea, and so on. On the very same day the Grand Jury presented the Commissioners also for having made appointments in the street-cleaning service "from political considerations, and without regard to the personal fitness of the appointees"; for hiring scows at an extravagant price, and then allowing them to be employed in transporting private dirt, and the inspectors to receive payment for the same, and so on. In fact, the charges against the Commissioners are that they are "politicians" engaged actively in the practice of "politics." If these charges are true, they have been simply doing in a grosser and more mischievous way what all the Federal officers are and have been doing. They have been carrying on what a good many people, like ex-Governor Rice, of Massachusetts, call "the American system" of administration, and what others call "rotation in office," and others "the spoils system." There is a good deal of it in Congress, in all the departments, and in all the custom-houses and post-offices. In these it keeps up an appearance of decency, but of course when it is applied to New York street-cleaning it throws off all disguise and becomes coarse and repulsive. If the Commissioners were wise they would reply boldly that the daily and continuous cleaning of streets by able-bodied men was a monarchical practice; that the objection to heaps of garbage at the front door was a piece of aristocratic fastidiousness; that the confinement of the scows to the city service was opposed to American habits and traditions, and that in allowing the scavengers to blackmail the householders, and the foremen to blackmail the scavengers, they were carrying out the great American system of "assessments," without which no true and healthy political activity would exist.

The United States Senate pegs away at "politics" with as much naïveté as Mr. George Bliss. The President, too, is having plenty of "politics" in trying to fill the offices. The plan of satisfying everybody with something—or, in other words, of treating the administration of the Government as a sort of Christmas-tree, with bon-bons for all his little friends hanging on the branches—is not succeeding. He has not adhered to the good rule which apparently guided him in making Mr. James's appointment, viz., that the efficient conduct of the Government business should be his main consideration, and that "politics" should come afterwards. His troubles, curiously enough, have not come from the Cabinet appointments, where vacancies *had* to be filled, but —and we commend this to those who think that it will be easy to secure permanence in office without imposing any restrictions on the manner of appointment—from subordinate appointments to vacancies deliberately, and apparently unnecessarily, created by himself in order to make a little excitement for the politicians. In the solicitor-generalship there was an able and competent lawyer, Mr. Phillips—of such standing as to be talked of for the bench of the Supreme Court. He has been dismissed, as far as one can see, solely for the purpose of making way for Mr. William E. Chandler, to oblige Mr. Blaine. Mr. Chandler is only a lawyer in name. He is really a claim-agent and lobbyist, and a notorious intriguer and wirepuller. Moreover, he was nominated to the place without the knowledge or consent of his superior, the Attorney-General, Mr. Wayne MacVeagh, who is naturally so much chagrined, first by Chandler *per se*, and then by the manner of Chandler's selection, that he will resign if he is confirmed. So here there is a world of—humanly speaking—wholly unnecessary trouble created by making a vacancy in an important legal office to accommodate a man who has no professional standing.

Judge Robertson's appointment to the Collectorship at this port is another illustration of the same thing. Whatever his merits or character may be—and we have nothing to say against either—his nomination was pure "politics." It has had no reference to the Government service. The causes are obscure, but it is plain enough that improvement in the administration is not among the number. A vacancy was made for Judge Robertson by dismissing Mr. Merritt from the Collectorship before the expiration of his term, evidently without any fault having been found with him, for he has been transferred to a different branch of the service. Now, one would have imagined from President Garfield's inaugural address that the great civil-service abuse was the arbitrary removal of officers before the term for which they were appointed had expired, and that nothing would prevent this but legislation. But here he has himself removed an officer in the middle of his term without charges. No act of Congress compelled him to do so, and we need hardly say that no act of Congress was necessary to restrain him from doing so. In fact, a better illustration of the emptiness, or, to use a Carlylism, of the "putrescent cant," of most of the

talk of the Presidential helplessness towards civil-service abuses, could hardly have been supplied. It is said in some quarters that Mr. Robertson's appointment means "war" on Conkling. Now, we are in favor of "war" on Conkling, but we do not think it ought to be carried on at the expense of the public business, or with Conkling's own weapons. Conkling cannot be beaten at his own game, any more than the devil can be successfully fought with fire. The thing the devil really fears and flies from is not fire but holy water, and the thing that Conkling fears, and which will finally ruin his trade and, if it comes in his lifetime, drive him out of politics, is the inflexible adherence of the Administration to business principles in the management of the various Federal offices in this State.

The Washington correspondents during the week thought they saw a gleam of repentance on the part of the Senate Republicans, but it was smothered in caucus, and, as the Democratic patience seems equal to their perversity, the session promises to be indefinitely prolonged. We have had, according to the principal orator, a Mahone day, a Hill day, a Kellogg day, a Lamar day, with the Massachusetts Senators filling in the interstices. General Mahone's speech fell flat. The best of all, and one of uncommon frankness, sobriety, and true perspective, was that delivered by Mr. Hill, who bore all interruptions meekly and dodged nothing. Messrs. Hoar and Dawes raked up the old stories of outrage at the South and waved them aloft once more, the latter telling the sad story of a Northern settler just returning from Mississippi a refugee after fifteen years of struggle and persecution, an "old, grey-headed man." Senator George, of Mississippi, called for the name of this man, whose "factories were burned, his employees murdered, and his enterprises thwarted at every step"; but Mr. Dawes rebuked him with great severity for such unseemly curiosity, telling him plainly that that was "the old way of meeting this thing, to call for names." He did not "intend to furnish an opportunity for further persecution and further destruction of property." Mr. George said he had never heard of a factory in Mississippi burned, and that there were but two or three in the State, so that a burning was something of a circumstance; nor had he ever "heard of any man's factory hands having been interfered with, much less murdered." He ended by shocking the Senate with his belief that "there is not a single particle of truth in the relation which the Senator [Dawes] received from his informant."

We were not at all surprised to see Mr. Dawes, in the course of the debate last week, figuring as the champion not only of the principle of majority rule but of civil-service reform. "I assure the Senator," he said to Mr. Pendleton, apropos of the Democratic "clean sweep" of two years ago, "that just as soon as we can recover from that unwise departure on the part of the then majority in the Senate, we shall adhere with all the persistency that a majority is authorized by the Constitution to adhere, to the very sound doctrines that the Senator has promulgated to-day." This was a tolerably impudent pledge on behalf of a majority known to be hostile to reform, and the joke about beginning the reform with a batch of partisan appointments whose permanence was to be insured hereafter by an appeal to the "very sound doctrines" which Mr. Dawes has as much at heart as Mr. Pendleton, was stupendous. The drunkard's last debauch before signing the pledge, or the gambler's last use of loaded dice before settling down to fair play, hardly excites a smile in comparison. Mr. Dawes, however, had given himself away, for being asked by Mr. Maxey, of Texas, why, if he was bent on restoring the *status quo*, he did not restore Sergeant-at-Arms French, he found it convenient to dodge on the first day, and on the next to answer that Mr. French was "now engaged in such responsible and arduous duties as render it impossible to take him from them without damage to the public service." Mr. Maxey unfeelingly asked whether Mr. French had been consulted about this, but Mr. Dawes replied that "the public good was consulted." So it seems that poetic justice is sometimes to be tempered by general considerations of the public good. One cannot help reflecting how much vituperation Mr. Dawes might have foregone if he had allowed this principle in the case of Mr. Schurz and the Poncas.

Mr. Pearson has signalized his accession to the postmastership in this city by making numerous changes—consolidations, removals, promotions, and transfers—as well as by enlarging his force with forty-five new clerks. No outside observer is competent to criticise these arrangements, and there is every reason for taking Mr. Pearson at his word when he says that they were made with an eye single to the efficiency of his administration. He has addressed to his employees an excellent and business-like circular, insisting that the reputation of the office acquired under Mr. James must be maintained, and conveying his assurance that he proposes no departure from the principles which governed his predecessor in respect to appointments, promotions, and removals. On the following day, in fact, the new clerks were obliged to pass the civil-service examinations, and to undergo medical inspection, besides offering the usual recommendations as to character. It appears, therefore, that Mr. Pearson's public declarations are all right, and that, so far as can be judged, his acts are in strict conformity with them. It is impossible to overrate the importance of preserving intact the successful example of the application, in the first post-office of the country, of principles fundamentally opposed to the spoils system, and consequently to the traditions and practices of the country for the past fifty years. The public is little affected by references to the ante-Jacksonian views of the civil service, but it cannot overlook or explain away so conspicuous an embodiment of them as Mr. James has afforded, and Mr. Pearson aims to afford it. The value of the illustration, too, is doubled by its semi-Federal, semi-municipal aspect, so that in time we ought to see our committees of Seventy and of One Hundred and of Twenty-One resolved on effecting the elimination of politics from every department of city government.

Foreign specie continues to pour into New York, the arrivals during the week having been about $4,000,000. From January 1 to April 1 the arrivals amounted to about $14,000,000 against $2,650,000 last year; and since last August about $86,000,000 has arrived here against about $81,000,000 a year ago. The rates for foreign exchange are still favorable for further specie imports, and the Custom-house returns of merchandise, imports and exports, show that while the imports in the last four months have fallen off 15 per cent. as compared with last year, the exports have increased about 12½ per cent.; in figures what is called the trade-balance is, for the last four months reported, $70,000,000 more in favor of the United States than a year ago. The movement of securities between this country and Europe is not recorded either at the Custom-house or elsewhere, but it is safe to say that for the four months the export of securities much exceeds the import. There is accordingly strong reason why specie imports should show an increase, although it is likely that the leading European banks, notably the Bank of France, will resist more actively than a year ago the movement of specie to this country. Secretary Windom visited New York during the week to hear suggestions as to what the Treasury should do respecting the maturing debt of the Government. He was waited upon by many representative business men, from whom he is said to have obtained suggestions which he values. He has not yet made known precisely what he will do, although it is understood that he will depend upon the sale of the $105,000,000 4 or 4½ per cent. bonds and upon surplus revenues, which together should give him about $200,000,000 of cash this year with which to pay off maturing bonds. The remaining bonds, it is now expected, will be extended at a lower rate of interest. At the Stock Exchange it was a dull week, and general trade is also backward on account of the weather.

The failure of the lower House of the Austrian Reichsrath to join in the manifestations of sympathy which the tragic end of Alexander II. has evoked from the other parliamentary bodies of Europe has been construed into an anti-Russian demonstration on the part of Cisleithan Austria, for which some of her philo-Russian journals have loudly, though somewhat illogically, demanded the resignation of the Austro-Hungarian Minister of Foreign Affairs, Baron Haymerle. In reality, however, this negative action of the Reichsrath is not even expressive of the sentiments of the majority of its own members with regard to the death of the Czar, but simply the result of the endless party strifes and jealousies which abound in the parliamentary life of Austria to such an extent as almost to constitute it. Of the three principal elements of the Reichsrath, the German, Czech, and Polish, the last consistently opposed

any manifestation of sympathy with the Romanoffs, threatening its withdrawal from the sitting if the question were put to the vote, and by its firmness overawed the apparently harmonious sentiments of the Germans and Czechs. No sooner, however, had the club of the *Verfassungspartei*—the German constitutionalists—adopted resolutions of condolence than the ardor of the Czechs, which had been longing for utterance in the Reichsrath, perceptibly cooled, slavish imitation of German precepts being, of course, out of the question. Their indignation at the attitude of the Poles meanwhile had not abated, and found vent in vigorous denunciation of the principal leader of the Poles, Dr. Smolka, who, on the day following the assassination of the Czar, succeeded the German Constitutionalist, Count Coronini, as President of the Reichsrath. Nor were German voices wanting which regretted that Dr. Smolka, in his new capacity, did not see fit to sink the Polish patriot in the Austrian statesman. The *Neue Freie Presse*, the most eloquent organ of the *Verfassungspartei*, could easily put up with Smolka's anti-Russian proclivities, were it only inclined to tolerate Smolka himself. For the party whose spokesman it is finds at present Polish aggression from within more intolerable than Russian aggression from without; and the election of a Pole as President of the Reichsrath, together with that of the Czech feudalist, Prince Lobkowitz, and the Slovene, Baron Gödel-Lannoy, as Vice-Presidents, has reduced the once all-powerful *Verfassungspartei* to a momentarily impotent minority. However opinion may differ as to the wisdom of Count Taaffe's federalistic experiments and the Slavic preponderance in his Cabinet, the old *Verfassungspartei*, by its uncompromising opposition to all Slavic claims, has probably for ever forfeited its claim to reign exclusively in the councils of Cisleithan Austria.

The new Czar has made a sort of beginning of representative government by the creation of a council of twenty-five householders, elected by householders, to assist the military commandant in managing the city of St. Petersburg. The process of election was a novel one. It was arranged that the police should go about from house to house on a certain day and collect the votes, and a proclamation was issued requesting the voters to stay at home to receive them and record their votes. The inhabitants in many of the poorer quarters, however, are reported to have looked on the whole thing as a trick of some kind, and concluded that the police would seize the opportunity of searching the houses while collecting the ballots. So large numbers abandoned their homes for the day and declined to exercise the new franchise, while many others made no secret of their indifference to the whole thing. The Council has, however, been elected, and has entered on its duties, some of which seem odd for a deliberative body. The members have agreed, for instance, to undertake in turn to watch the streets through which the Emperor is to pass when he goes abroad, which is very much as if our Board of Aldermen were to form themselves into fatigue parties to see to the cleaning of the streets. A proposal of the commandant to put up barriers on all the roads round St. Petersburg, so that everybody who enters can be narrowly examined, has also been heartily accepted by them and is now in operation. It is most likely that the council will do nothing in the way of initiative. It will confine itself to adopting the commandant's suggestions, but even the shadow of participation in the work of government will probably after a while beget political habits and a sense of political responsibility. The great difficulty which a despot experiences in bestowing free institutions lies in the unreadiness of the people to believe that he really means it, and that their participation in the work of Government will amount to anything in practice. It is said that if the new system is successful it will be extended to other cities, and it may in time prove the germ of a real parliament. The Nihilists, in the meantime, do not seem to be cowed, and boldly announce that if the man and woman awaiting trial for the late assassination are executed the reigning Czar will be sentenced to death. It remains to be seen whether he has nerve enough for the contest.

Lord Beaconsfield is ill, and, owing to his advanced age, probably very seriously ill, and the Tories are casting about for a successor for him. Lord Cairns, the late Lord Chancellor, and by far the ablest man now in their ranks, a North-of-Ireland lawyer, whose attack on the Disturbance Bill was the heaviest blow the Gladstone Ministry has received in debate, has been trying to show in the Lords that the party will lose nothing by the present chief's absence, by a very bitter arraignment of the Government's peace with the Boers. One good point he has certainly made. The Queen's speech announced in the most positive manner that force would be used to compel the Boers to "submit" before anything would be done to redress their grievances. In the teeth of this, however, peace has been made with them substantially on their own terms, not only before their submission, but after their successful resistance to the royal forces in the field. There is only one answer to this, and that is that when the Ministry drew up the Queen's speech they did not know how earnest and determined the Boers were, and what the cost of subjugating them would probably be. It is to be said, too, that negotiations were in progress before Sir George Colley's reverse at Majuba Hill, and were only interrupted through his deplorable rashness, and it is the resumption of these negotiations which has resulted in peace. The fierceness of the Boer resistance is important as making it clear that, even if defeated, they would probably not remain in the Transvaal, but would abandon their farms and once more "trek" northward into the wilderness, leaving a solitude to the victors.

Mr. Gladstone has at last reached his budget, in presenting which he is once more in a congenial field where wars and rumors of wars do not trouble him, and apparently he is not to be troubled by obstruction in getting it through. There are signs of an alliance, in fact, between the Tories and the Parnellites, and obstruction does not form part of the plan of operations of the coalition. He shows a slight increase of revenue—about $2,000,000. The number of new features in his programme is small and none of them is important. He returns to his old idea of the need of providing for the reduction of the debt, which he proposes to accomplish by means of annuities, to the extent of $300,000,000 in twenty-five years—in the presence of the American example this does not seem much—and the other changes, including the reduction of a penny per pound in the income-tax, are slight. He promises a surplus next year of about $1,500,000. There was, as usual, no opposition to his scheme at this stage, and most probably will be none. The Tories have no one capable of attacking his finance.

Last week it seemed as if the Turco-Greek trouble was brought near its end by the acceptance by the ambassadors of the Turkish proposals, which, it is said, they are about to recommend to the Greeks by an identical note. But now comes the news from Athens that neither Coumoundouros nor any other Minister will dare to accept anything short of the Berlin award, and must fight if anything less is offered. In other words, the volunteers will not go back to their homes without trying to get what they came out for. The Turks evidently believe this, for they are continuing their military preparations and despatching every man they can muster to Thessaly and Epirus. The Porte is doubtless encouraged by the internal troubles both of England and Russia, the only two Powers which were likely to give the Greeks material assistance, and believes that if it is allowed to tackle the Greeks alone it can so sicken them of war as to secure peace and quiet for ten years at least, which to a Turk is as good as a century.

It seems most likely, if not certain, that England will not be represented at the approaching Monetary Conference in Paris. The invitation was so worded as to make it difficult for any mono-metallic Power to take part in the proceedings, as it announces that the Conference will meet "to examine and adopt, with the view of submitting for acceptance by the Governments represented at this Conference, a plan or system for the establishment of the use of gold and silver as bi-metallic money," etc. In other words, the Conference is to be committed at the outset to the view that bi-metallism is a desirable and attainable thing. The German Government has also announced that, though it will be represented at the Conference, it does not look to any union with other Powers about the coinage. All this makes it certain that the Conference will not succeed in accomplishing, at best, anything more than the bringing the United States into the Latin Union. It is gratifying to know, however, that Mr. Dana Horton has gone out with the Commission as secretary, as he is thoroughly master of the subject.

THE REPUBLICAN ALLIANCE WITH SOUTHERN REPUDIATORS.

THE President called the Senate together in extra session on the fourth day of March, for the purpose of submitting a large number of nominations for confirmation. At this writing, therefore, it has been sitting for more than a month, but has done almost no business whatever. The reason of this is that the Republicans wish to expel from office a miscellaneous crowd of ushers and clerks, in receipt of small salaries, and put Republicans in their places. It is not pretended that these offices are not at present sufficiently well filled, or that the business of the Senate has not been and cannot be carried on through them. It is not pretended that the removal of the present incumbents is in the smallest degree necessary to the transaction of the particular business for which the President has called the extra session. Besides this, the leading Republicans, in opposing the removal of Republican officers when they lost their majority in the Senate in 1879, committed themselves boldly to the doctrine that changes in the minor offices of the Senate when a new party came into the majority were objectionable and unreasonable. They took this ground when the Democrats had obtained the majority in the ordinary course of election by the State legislatures of enough Senators of their party to make a majority. Among the persons who took it was Senator Conkling, who declared "that the usage and propriety of the Senate" had decided "that those offices ought not to be put up in a political raffle and made rewards for party services, but that those who held them should be allowed to retain them on their merits." "Able and conscientious officers," said he, "proficient in all their duties, were to be removed at the behest of party managers, that the offices might be subject to the voracity and hunger of those who were supposed to be entitled to reward." Other leading Republican Senators supported this view, and it is a view which does credit "to the usage and propriety of the Senate," if Senator Conkling's account of it be correct. The Republicans, however, are apparently not disposed to act on it one minute longer than they can help, or to be very particular as to the means by which they evade it. They have secured a majority by "a bargain" with General Mahone, of Virginia, who has reached the Senate as "a readjuster," or, in other words, as a supporter of the repudiation of a considerable proportion of the State debt on a pretext which will not bear a moment's examination in the forum of morals, and which the Republicans vigorously denounced in the late Presidential campaign. An alliance with such a man would be objectionable and discreditable under any circumstances, for precisely the same reasons which made the Democratic alliance with the Greenbackers in Maine discreditable, and which made it so injurious to General Hancock to telegraph congratulations to Governor Plaisted after his election. The alliance with Mahone, however, is not simply an acceptance of his support in fighting a common enemy without regard to his opinions on certain questions which the Republicans consider of prime importance. It is an alliance based on an ordinary Tammany "dicker," by which Mahone gets the place of sergeant-at-arms for one of his henchmen, and a noted repudiator, a certain Riddleberger. Mahone's vote is, however, not sufficient under the rules of the Senate to give the Republicans their way in spite of Democratic filibustering, and consequently the Senate has now for four weeks presented the world with the spectacle of a deadlock which hardly differs in any respect from that with which the Board of Aldermen every year makes New-Yorkers familiar. The causes are the same, the procedure is the same; the debates by which the time is whiled away reach about the same level. Mahone as a renegade Democrat and repudiator might be tolerable, but Mahone purchased by "a bargain" cannot be a decent addition to any party. We do not say that the Democrats in the Senate are not quite capable of everything the Republicans are now doing, but we do say that in resisting the execution of this bargain, no matter from what motive they are acting, they are rendering the country a valuable service.

An attempt has been made, both on the floor of the Senate and in other quarters, to give some touch of dignity and respectability to this wretched squabble, by the argument that, by encouraging or magnifying Mahone, the Republicans are helping to break up the "Bourbon" Democracy at the South, and bring into existence a new white party with which the negroes can act. This may prove, in the long run, a good thing for the State of Virginia, but if it is to be a party based on repudiation, it would be a great calamity to have it called or considered a branch of the Republican party. The misfortune of the Republican party at the South hitherto has been that it has been composed in the main of a few very disreputable white men and a large body of very ignorant blacks. To make it really a force at the South by winning recruits among the better class of Southern whites, and especially the large class whose convictions, or prejudices if one pleases to call them so, are dearer to them than their interests, it must make some pretence to morality and respectability. This would be true even if the Southern whites were as bad as their worst enemies have ever described them. There is no civilized community which does not require that anybody who seeks to influence it by public means shall give it credit for the possession of a fair moral standard. It may be capable of electing a thief, for instance, to high office, but it will not elect him if he is openly presented to it as a thief. It will insist on having him nominated as an honest man, or a man trying to be honest under adverse circumstances. A division at the South, such as the Republicans in the Senate are trying to foster, will not consist in the adhesion to the Republican party of honest and intelligent men who are now arrayed in opposition to it by the unwholesome traditions of slavery and the war. It will consist in the formation of a new party made up of the ignorant, unscrupulous, and dishonest, led by ambitious political adventurers, who will reinforce the Northern inflationists, corruptionists, and jobbers, and whose influence on the public credit and political morality would be very likely in a few years to make the most besotted Bourbons of to-day seem by comparison enlightened and patriotic men. There is nothing from which Republicans ought at this juncture to shrink with more dread than encouraging the growth at the South of an organization whose first act consists in an attempt to bring about a breach of the public faith. That such an organization can ever be of much service to any interest the Republican party professes to care for, is something which all experience forbids us to expect. We must not be deluded on this point by Mahone's cant about a "free ballot and a fair count." When we hear men clamoring for a "free ballot and a fair count," we have to consider a little, before joining forces with them, what they propose to do with the "free ballot and fair count." Let them be never so much entitled to both, we should be careful lest, in our manner of supporting their rights, we seem to give countenance to aims which we know to be bad.

We confess, however, that we do not really believe the alliance with Mahone in the Senate to be as serious as it seems. It does not really mean a want of proper concern about the violation of public faith on the part of Republican politicians. It is in the main an expression of that passionate interest in "spoils" which seems to be rapidly destroying, in the minds of public men, all deep and abiding care for the public business. No such unblushing display of it has ever before been presented to the American people as this deadlock in the Senate. The tide of office-jobbing has been rising for many years, and it now appears as if it had submerged even the Senate's regard for its own dignity. Most readers of the newspapers will have remarked the absence in the press, ever since the discussion of "appointments" began, six months ago, of nearly all mention of the question of fitness for the place as a reason why any candidate was or was not likely to be nominated. We venture to assert that hardly a line can be produced from any party newspaper since Nov. 1, 1880, which would lead a foreigner unfamiliar with American politics to suppose that the offices Mr. Garfield has to bestow were not honorary distinctions, like European decorations, intended to gratify the recipients and their friends, but not to impose any duties or obligations. The distribution has constantly been talked of as if it were a mere act of largesse on the part of a sovereign to followers who had befriended him when exiled from his dominions by a usurper. Of "claims," of "recognition," of services in the nominating convention, of services on the stump, of heavy contributions to the party treasury there has been endless babble, but hardly a word about the requirements of the vast and solemn trust called the government of this great nation. That anything is due to the millions of taxpayers who did *not* vote for General Garfield seems to be no more remembered in political circles than if the revenues were the baggage-train of a defeated army. This is all bad enough as it appears in the hoarse wranglings of the Bosses,

the Henchmen, the Workers, and the Organs, but we doubt if the most disgusted pessimist was prepared for the spectacle of a month's suspension of the public business in the United States Senate in order to fight over the patronage of the office of sergeant-at-arms.

THE TORY PROSPECTS IN ENGLAND.

THE illness of Lord Beaconsfield seems to be generally accepted in England as the close of his political leadership. It is not likely that at his age he will, even under the most favorable circumstances, recover sufficiently to make any active participation in politics again possible. His retirement, however, has now but little significance, so completely has his policy during the later years of his career been discredited by events. Nearly everything the Liberals said in denunciation of it on the stump during the late canvass has been proved, and the principal misfortunes of the Gladstone Ministry have resulted from failures to cut loose from it when they came into power. But the loss of their leader, nevertheless, is likely to cause some inconvenience to the Tories, in that it compels them, if only for form's sake, to find some one to fill his place, which promises to be no easy task. Lord Salisbury seemed in 1874 plainly marked out for the succession, but the figure he cut in the Turco-Russian trouble has made him an impossible candidate. His disingenuousness about the negotiations with Russia made a painful impression even on the Jingoes, and the tergiversations of which he was guilty in discussing the designs of Russia were a kind of thing for which no public man but Lord Beaconsfield seems able to obtain forgiveness. *He* has always been so cheerful and droll when found out, that the country got into the way long ago of treating his untruthfulness as in a certain sense professional, or, at all events, something which he could not help and did not mean any harm by. It was put in the same category with his blunders about history and geography and political economy—as the constitutional weakness of a romance-writer and an amusing and effective debater. Lord Salisbury, however, cannot laugh things off, and is not an entertaining novelist, and was justly held to have degraded himself by the part he played in the Disraeli comedy. It offended the English sense of propriety to see a real peer acting as second fiddle to the extraordinary performance by which Lord Beaconsfield sought to remodel the empire on the plan laid down in his earlier novels. Lord Cairns, the despatches say, has been bidding for the succession by a furious attack on the Gladstone concession to the Boers, and he may for the moment serve their purpose. He is old, but he is very able and invariably knows what he is talking about, which will to the Tories be a novelty in a leader, as they have not seen it since Peel deserted them. The late Lord Derby was nearly as loose in his statements as the author of 'Vivian Grey.'

The objection to Lord Cairns, that he is of humble origin, which some of the correspondents say is likely to have weight with the Tories, is an absurd one. His birth is not so humble as Disraeli's or Lord Eldon's. In fact, the Tories have always been more tolerant of the defects in origin or social standing of their chiefs than the Whigs have ever been. The probabilities are now that they will drift on with such mild rule as they get from Sir Stafford Northcote in the Commons, and such masterly defences of the established order as Lord Cairns can supply in the Lords, until the real tug of war comes in the shape of a Liberal attempt to make the three great changes which are now looming in the horizon: a reform in the land laws; the assimilation of the borough and county franchise, which would give votes to the agricultural laborers; and, though last not least, the disestablishment of the Church. It is over these that the great historic parties of English politics will probably fight their last fight; for it is not likely that the Conservative party as now organized would survive the defeat in which the fight is pretty sure to result. The change in the land laws and the enfranchisement of the agricultural laborers would deprive what is now called the "landed interest" of its remaining influence in politics, and would probably cause the rapid disappearance of the squires from the House of Commons, menace the privileges of the House of Lords, and would, there is some reason to fear, convert the Tory magnates into secluded pessimists of the type of the French Legitimists, mourning in the clubs and country-seats over the ruin of their nation, and discovering every day fresh proofs of Radical wickedness. In this final struggle, however, it is not likely that Mr. Gladstone will live to take part. Its burden will come on younger men, on whose imagination the England created by the great Whig Revolution has less hold.

The present conflicts over questions of foreign and colonial policy are really mere skirmishes, and are the sequelæ of the Jingo attempts to reproduce the glories of the Elizabethan period. They give little indication of the condition of parties even in the near future. The Irish and Boer disturbances are, however, proving useful, probably in a degree which few persons two years ago would have thought possible, in calling the attention of the English democracy to the danger and discredit which lie in the incapacity of the English mind for entering into the state of feeling of men of different origin, or manners, or order of thought. We have frequently, in discussing the Irish question, spoken of the curious necessity under which the Irish have labored ever since Englishmen began to feel any responsibility for the condition of Ireland at all—that is, since the Union—of resorting to violence and disorder to convince Englishmen that they had any real grievances and to procure redress of them. Simple talk has never produced the slightest effect on English opinion. The Boers, as our London correspondent remarks, have discovered that this necessity was not peculiar to Irishmen. They have agitated and remonstrated against annexation for three years, not only without furthering their object but with a steady increase of English contempt for them and indifference to their claims. As soon as they took arms and began to kill people, and make a great noise, their cause found powerful defenders and underwent thorough discussion, and now, after three small fights, they find not only that nearly everything they claim is conceded to them, but that a deep respect for them has sprung up in the English mind.

The Irish experience has been very similar, except that, owing to their nearness to England, their attempts at resistance have been less fortunate. They have thoroughly learnt the lesson that when they seek any grave changes in legislation they must arm themselves, utter the most horrible threats, and indulge in assassination and arson on a great scale. The American colonies and Canada learnt the same lesson, but turned it to better account. The exceeding inconvenience as well as discredit of having the wishes of dependencies communicated to the Government in this way seems to be now for the first time brought home to the English voters, and it has apparently been flashing some new light on passages of English history of which the mass of the people have until now had little knowledge or comprehension. This, for the first time in English history, holds out some hope of a *modus vivendi* with Ireland. If, as seems likely, the Radicals once accept the doctrine that Ireland does not exist for the benefit of England, but for her own benefit, and that what Irishmen have to say about the conditions of their own existence deserves careful consideration, there can hardly be a doubt that terms of accommodation and even of friendship between the two countries will speedily be reached.

The fact is that in their attitude towards Ireland the Tories are now "fighting for position"—that is, making preparation for the still greater struggle over the English land question. Curiously enough, too, there can hardly be a doubt that the prosperity of France is exerting through the Irish land question a powerful influence on the English land question. There is nothing in the English economical creed which has acted more prejudicially against the claims of the Irish tenantry than the belief that small farms were a wasteful division of the soil, and should be discouraged by legislation. To this was added a firm belief in the innate disposition of the Irish to subdivide infinitesimally, if the landlord let go his control in ever so slight a degree. Moreover, nothing was more firmly rooted in the English economical creed. It has, however, received a blow, which is undoubtedly affecting the imagination of the English constituencies, by what has been occurring in France during the past ten years, and particularly during the last two months. In 1823 McCulloch, the well-known economist, predicted that under the law of descent established by the Revolution, combined with the French passion for land, France would, in fifty years from that date, be the "greatest pauper warren" ever seen, and would supply "hewers of wood and drawers of water to every other country in Europe." The prediction met with general acceptance in England, and the supposed horrors of French subdivision have had great influence ever since in preventing a hearing for any proposition for

giving the Irish peasant more control of the soil. The fifty years have, however, elapsed. The French peasant, in spite of the absence of schools, in spite of numerous wars and revolutions, of a devastating invasion, followed by an enormous ransom, has prospered as no other peasantry in Europe has prospered during the same period. He has not subdivided the land to an injurious extent, has not converted France into a pauper warren, and supplies fewer hewers of wood and drawers of water to foreign nations than any country in Europe. Finally, he has shown, by the success of the late loan, which was taken up by Frenchmen at least ten times over, that his habits, prejudices, and passions are all highly conducive to a wonderful accumulation of national wealth and comfort, and to a very high degree of national credit. Nothing could do more to strip the Irish small farmer doomed to divide up his land into little patches for his enormous family, the result of absurdly early marriage (the statistics show that he marries considerably later than the Englishman or Scotchman), of the odious associations which have hitherto surrounded him in the English economical mind.

ENGLISH VIEWS OF INTERNATIONAL COPYRIGHT.

LONDON, March 18, 1881.

FORTY-TWO years ago Lord Palmerston offered to enter into a copyright convention between this country and the United States. Other attempts have been made in the same direction, but nothing has yet been accomplished. The complete failure of overtures made by Lord Granville in 1872 to the Government at Washington caused a general feeling here that the case was hopeless. It was, then, with as great surprise as satisfaction that British authors recently learned that the United States Minister had placed a draft of a proposed copyright treaty before their Government. Though it was intimated that this had been done in such a way as not to bind the United States Government to take further steps, yet the overture itself was welcomed as indicating at least a disposition to do something. Authors and publishers have met together and discussed the draft of the proposed treaty, and set forth the changes which they consider desirable.

I have been present at many of the meetings which have been held, and I have conversed with many of the persons whose interests are involved. What has struck me the most is the comparative indifference with which the result is regarded. Eight years ago when meetings of the same persons took place for the purpose of urging Lord Granville to deal with the matter the expectation was much stronger that the words spoken would not be wasted. Messrs. Appleton and other publishers of note were understood to be energetically working in the United States to bring about international copyright, and it was not supposed that they would be utterly defeated in their object. The power and determination of the Messrs. Harper to hinder copyright in the United States being granted to British authors were not adequately appreciated in 1872. It is believed that the Messrs. Harper have changed their opinions and their tone now, and that they are as anxious to profit by international copyright as they once were to profit by its absence. Whether they will be as powerful as allies as they were when enemies remains to be proved; meantime, there is a notion that there will be no lack of vigorous and unscrupulous opponents at Washington of any scheme of international copyright.

What contributes to increase the feeling of despondency is the alteration which has occurred in the relation between authors on this side of the Atlantic and publishers on the other. These have become quite different from what they were a few years ago. Till a recent date the want of international copyright was growing of less consequence. Publishers in the United States had made arrangements which almost compensated for copyright to the British authors whose books were deemed worth reprinting, these authors being paid a fair remuneration. Sometimes, indeed, an author received his first payment, not from the publisher of his work in England, but from the publisher who had reprinted it in the United States. Carlyle records that such was his experience in the case of 'Sartor Resartus' and his 'French Revolution,' and Mr. Spedding, another deceased man of letters, made the avowal in a pamphlet on publishing that, till he received a sum of money from a publisher in the United States, he had never realized the fact that authors received anything but the credit of producing useful books. If the "courtesy of the trade" which has enabled your publishers to live together in amity, while accumulating fortunes, and also to share a part of their gains with the authors whose works they reproduced, still prevailed in the United States, there would be little call or need for international copyright. If British authors did not get all they desired, so long as the "courtesy of the trade" had the force of an unwritten law they at least got something worth having, and they showed no disposition to complain. Now that the "courtesy of the trade" has ceased to be generally observed, the case of these authors is such that almost any change would be a benefit to them. One of the most popular of our novelists told me yesterday that he does not receive £10 where formerly he used to receive £100 from the United States reprinter, and that he expects soon to see his books reprinted without any return being made to him. In these circumstances the British author is not disposed to be too exacting when called upon for his opinion as to the draft treaty now under the consideration of the British Government.

I assume that your readers are acquainted with the terms of that treaty; they have been stated and commented on in your columns. The two main points are, that a work by a British author which is to have the protection of copyright must be registered, printed, and published in the United States, and that these conditions must be fulfilled within three months after its publication in England. In a memorial signed by the leading authors of this country, and sent to Lord Granville in 1872, it was intimated that if international copyright can be had only on condition that British authors arrange with United States publishers for the reproduction of their books, the condition would be accepted. A like feeling prevails now. But strong objections are entertained as to the condition of limiting the time for making arrangements to three months. At an influential meeting which I attended, and of which no adequate report has appeared, an author read an extract from the *Nation* approving of the suggestion of Messrs. Robert Clarke & Co., that the period should not be three months but a year. When the deputation appointed to wait upon the President of the Board of Trade had an interview with him this alteration in the terms was found to have his approval. A suggestion made by the Board of Trade, to the effect that whereas the importation of English books into the United States was forbidden, the importation of editions published in the United States of copyright books should be permitted in England, was opposed by authors and publishers as alike uncalled for and unfair. It is a suggestion supposed to emanate from Mr. Farrar, the permanent secretary to the Board and a declared enemy of copyright in any form. The president intimated that he would abandon the suggestion in deference to the views of authors and publishers.

While authors and publishers have been discussing and disputing over the terms they ought to accept, it would appear as if they had been disquieting themselves in vain. An article in the form of a letter from a correspondent, which appears in the *Times* to-day, seems to prove conclusively that no treaty can be negotiated which will be worth more than the parchment whereon it is engrossed. In that article the whole subject is reviewed and the doings of United States publishers are explained. The writer points out that if some of the latter are favoring a copyright treaty now, it is because they find that they will be the gainers by it; but he declines to criticise the draft of the proposed treaty, on the ground that, if the treaty were negotiated, it would be invalid. His argument is based on the fact that the Constitution specifically empowers Congress "to promote the progress of science and the useful arts by securing, for limited times, to authors and inventors the exclusive right to their respective writings and discoveries." Now, Congress has exercised this power in both of these cases. In the case of copyright, a section of an act of Congress expressly denies copyright to aliens unless they are residents in the country; which means unless their permanent place of abode is the United States. A treaty which should profess to grant what an act of Congress distinctly denies would be even more worthless than the convention relating to trade-marks, which was concluded under the sanction of an act of Congress.* Unless this argument be upset, it is clear that it is to Congressional legislation and not to negotiation that we must look for international copyright. The writer of the article states that in the analogous case of patent law the alien inventor has received the justice at the hands of Congress for which the alien author now waits. There was a time when an alien inventor was punished in purse for the misfortune of his origin. Whilst a citizen of the United States paid a fee of thirty dollars for a patent, "a subject of the sovereign of Great Britain" paid five hundred dollars, and "any other foreigner" paid three hundred dollars. This distinction was removed in 1870. It is argued that if Congress should give as candid a consideration to the position of the alien author as has been given to that of the alien inventor, the result will be as satisfactory in the former case as it has been in the latter.

Such are the views which prevail here on the subject of international copyright, and such are the hopes which are cherished in some sanguine breasts. I entertain a belief that the people of the United States have hitherto been misled by the representations of publishers who were averse to any legislation which should interfere with the reprinting of English books. When the people learn that the price of the books which they place on library shelves would not be any higher than it was when the "courtesy of the trade" was in general operation, they may be of opinion that Congress should legislate and please both native publishers and British authors. R.

ENGLISH MODERATION TOWARDS THE BOERS.

LONDON, March 27, 1881.

ENGLAND has been passing through a singular moral crisis, of a kind which could hardly arise in any other Old-World country. She is divided between the anger and desire for revenge which is natural in a people

* The Supreme Court has ruled against this view.—ED. NATION.

whose army has been defeated, and a sense of the folly of fighting merely for revenge if no other sufficient ground can be shown for the war. Some five years ago, when the Tory Government was in power, the territory called the Transvaal, as large as France, was annexed to British South Africa by a British Commissioner who had been sent up to examine its condition. It was inhabited by a large mixed population of blacks and by a few Dutch farmers, numbering, perhaps, five or six thousand families, who had migrated northwards from the Cape to get away from the British. They had established here a republic which ruled the natives, and, unless they are much maligned, they had maintained under the name of apprenticeship a species of negro slavery. According to one account they resisted the annexation, according to another they were practically well pleased with it, because at that moment unable without British help to defend themselves from the attacks of the Zulus. What is certain is, that during the last three years they have continued to complain of vexatious treatment at the hands of the colonial authorities, and to demand their independence back again. When the Liberals came into power their hopes rose, but no change followed. It was thought in London that, though the annexation might have been a mistake, to undo it would be a worse mistake. The Government was misled by its agents on the spot into thinking that the agitation was unreal. The Dutch began to perceive (as the Irish have perceived also) that unless they made a tremendous noise and began to kill people they would not be listened to. So in last December they rebelled, or declared war, whichever one is to call it, and being in serious earnest, strong fellows with plenty of courage, and excellent marksmen, they have proved themselves formidable enemies. An attempt of the valiant but rash general who commanded the British to force the strong position they had taken up was repulsed, and a few days after he was killed and his forces defeated in the attack on Majuba Hill, of which you have all heard.

The news produced a double effect in England. There was a sense of shame at the disaster, even though the troops do not seem to have behaved badly, and a natural desire to retrieve it by a speedy victory. The Tory newspapers cried out that now surely even this craven government of Mr. Gladstone would not think of peace until the honor of our arms had been asserted by inflicting condign punishment on the Dutch rebels. Others argued that it would be a serious thing for British prestige all the world over if it should become known in India, for instance, that, after having been defeated, we had yielded to the demands of our enemies. But at the same time there arose a strong sense of respect for men, not trained soldiers but mere farmers, who had fought so well, and a conviction that nothing less than substantial grievances and a deep passion for independence would have induced them to embark in a struggle against our infinitely superior power. Thus people were led to ask more earnestly the question whether there was anything to be gained by keeping the Boers in subjection; whether, if it were not our own case, we should not be sympathizing with men fighting in the name of freedom, and whether, if there was no really valuable end to be attained, we were justified in continuing the war merely to vindicate our dignity and honor. What is the use, it was said, of being a great nation if you cannot also afford to be a magnanimous nation? Can the prestige of England really require to be vindicated by victories over a people who have not eight thousand fighting men all told? The parallel with the conduct of George III. and his ministers at the beginning of the struggle with the American colonies of course suggested itself. Meetings have been held in London and some other large towns in which the cause of the Boers is openly advocated, and advocated not the less heartily because their Government is republican, for we have in England a good deal of quiet republicanism among the working classes. The Ministry is being plied in the House of Commons with questions from both sides, the Tories anxious to convict it of pusillanimity in treating with victorious rebels; the Radicals endeavoring to extort something like a pledge that the war will be stopped forthwith. In the country at large there has been little excitement, because everybody knows that Mr. Gladstone and Mr. Bright are for the moment omnipotent, and that they have the strongest possible desire to settle the dispute promptly. The latest advices seem to indicate that there is a fair probability that this will be done. Should the Boers obtain the substance of their demands, the Tory opposition will, of course, make capital against the Government out of what they have already begun to call "peace with dishonor," and no doubt contemptuous reflections will be made upon English want of spirit by German newspapers. We shall be told that in abandoning our conquests in Afghanistan and our annexations in South Africa we are confessing ourselves an enfeebled and declining power. However, the ordinary Englishman has sufficient national pride not to care what foreigners may say about him. Though he likes to think that his country is great, active, and respected, he has also a shrewd sense that while some things are worth fighting for and paying for, other things are not; and he conceives, whether he be Tory or Liberal, that there is neither glory nor gain to be had out of crushing a few Dutch farmers into unwilling submission, and holding a large and poor region ill-suited for British colonization, likely to produce nothing but another crop of native difficulties. Still more significant is the strong moral feeling which the whole question has evoked. Neither in Germany nor in France, possibly not in any part of the European Continent, would a matter like this be treated so distinctly on a moral basis as it has been treated in England. Nor would the conscience even of England have been so sensitive on the point but for the shock which the language and conduct of the late Government, especially of Lord Beaconsfield and Lord Salisbury, as regards English policy in the East and in Afghanistan, gave to the religious feelings of the Nonconformists and the humanitarian feelings of the working classes.

Another and a more painful lesson of these South-African difficulties which has forcibly impressed itself on men's minds, a lesson that may become significant to you also, should the policy of annexation be ever resumed by the United States, is the extreme difficulty which any state, and especially a free state, where power changes hands from one party to another, finds in governing distant dependencies. The intentions of the British Government at home, both under the Tories and under Mr. Gladstone, towards the Boers and the natives, have been honest and humane. But the colonial authorities, partly from their tyrannical spirit, partly from mere stupidity and clumsiness, have managed to mislead the Home Government, to conceal the truth from it, to exasperate the Boers, and involve us in perfectly unjust and needless wars with the natives. Giving free representative local institutions to a colony does not mend the matter; for it is the constitutional government at the Cape, with its Parliament, that brought about the war with the Basutos which goes smouldering on in spite of constant efforts made from England to have it extinguished. We are beginning to judge the behavior of the Russians in Turkestan and of the French in Algeria—even, perhaps, the darker misdeeds of the Spanish conquerors of America—more leniently when we perceive from our own experience how hard it is to govern justly colonies of mixed population, even with the help of steam and the telegraph.

In domestic affairs there is, for the moment, a lull. Obstruction in the House of Commons is suspended, though no one can tell how soon it may break out afresh. The two bills for restoring order in Ireland, that which suspended habeas corpus and that which prohibits the possession of arms in certain districts, have come into operation without producing any outbreak. The arrests made have been mostly of obscure persons, and have caused no considerable stir. Ireland is so much accustomed to extraordinary remedies that they do not cause the same disgust and indignation as they would in England. What is most to be feared is that a few fiery spirits, driven from Ireland by the activity of the police, under the large powers they now enjoy there, may harass England herself by plots similar to those which marked the Fenian movement fifteen years ago. The assassination of the Emperor of Russia, which has produced an unparalleled impression of terror all over Europe, making sovereigns and statesmen feel that they hold their lives at the mercy of conspirators, so great are the facilities which modern science affords to murderous designs, may stimulate the use of explosives against public buildings as well as against individuals. In the Middle Ages the habit of poisoning sometimes passed into a kind of epidemic; and safe as England appears to be from such acts of violence when compared even with Germany, one cannot say that here and there men may not be found whose imagination will be fired by the ultimate success of the Social Democrats of Russia in their long campaign against the Czar.

Regarding the new Sovereign of Russia and his policy very little is known here, although he has been more than once in England, and has married the sister of the Princess of Wales. As he was the second son, and had come to manhood before his elder brother's death, he was not educated for the throne, but rather for a military career, and is believed to be distinctively a soldier in habits and ideas, a man blunter than his father and with less pleasing manners, but apparently with some force of will and tenacity of purpose. The Germans are, of course, very apprehensive that he may prove no friend to them. It is felt that a new element of danger has been added to the already perilous situation. Y.

VIENNESE LOCAL COLOR.

VIENNA, March 20, 1881.

RECENT census returns show that the increase of population in Vienna during the last decade has not been so rapid as in most of the leading Continental cities. The population of Vienna, including the suburbs, is now 1,085,455, while in 1869 it was 832,617. The rate of increase during the last five years has been 8.4 per cent., while the figures for Berlin are 16.4, Hamburg 17.7, Munich 15.3, Hanover 28.9, Leipzig 16.8, Stuttgart 9.1, and Dresden only 1.4. The local papers attribute the more rapid growth of Berlin to the advantages that city gained by becoming the centre of the German Empire, Vienna having, on the other hand, lost these advantages by the decentralizing tendencies of the present Government, owing to which some of its importance and attractions have been transferred to Buda-Pesth. In the outer districts and the suburbs the increase in population has been larger than in the city proper, where the taxes

imposed on buildings are outrageously high. According to the comic papers, everything connected with a house is now taxed except the windows and the bricks; and even these are now being counted by the officials. It seems that those who live within the lines have to pay a special duty even on their victuals. Officials are stationed at all the principal streets coming from the railway stations; and it makes a strange impression on a foreigner, who has travelled perhaps all day on Austrian soil, to be stopped once more at the city lines and have his trunk or valise re-examined to see if it does not contain a dead rabbit or a head of cabbage. The "city" proper is, in the case of Vienna, only a small portion—about one-twelfth—of the whole city, and is still the nucleus of the whole, containing as it does the principal hotels, the finest shops and cafés, the theatres and aristocratic residences. It is easily accessible to all, on account not only of its central position but of the peculiar plan on which the whole city is built. A comparative anatomist would class Vienna not among the bilateral cities, divided by a broad central street into two equal halves, but with one of the types known as *radiata*—perhaps among the star-fish—for this reason: The whole of the central city is enclosed by the wide and handsome Ring-Strasse, which has almost the shape indicated by its name. Outside the Ring-Strasse lies the main body of the city, divided into nine districts bearing different names, each district having as a main artery a large street which radiates from the Ring-Strasse to another outer circle, the Gürtel-Ring, inside of which lie the suburbs. Communication between the several parts of the city is well provided for by an extensive network of tramways, public carriages, and omnibuses. The latter, however, are the most torturing and bone-shaking contrivances imaginable, as the greater part of the town is roughly plastered with stones; and the tramways are so slow that a good walker can almost keep up with them. Both the street-cars and omnibuses are divided into compartments for smokers and non-smokers, an arrangement which is here almost a necessity, as in consequence of the high tax on tobacco the quality consumed by the average smoker is so nauseating that it becomes simply intolerable to ladies and to those men who cannot protect their nostrils by lighting a decent cigar of their own.

In its general outward appearance Vienna is gradually becoming one of the most imposing of modern cities. While the central part may for many years yet retain its mediæval characteristics—its narrow streets, crowded houses, and mysterious short passages leading through inner yards and connecting adjoining streets—the Ring-Strasse will be of strikingly handsome appearance as soon as the scaffolding has been removed from the various large buildings now approaching their completion. The new opera-house was finished some years ago; and although its exterior gave rise to adverse criticism in some quarters, its interior, with its ingenious contrivance for regulating the temperature, is a model of elegance and comfort. The hints afforded by the builder of the Opéra are doubtless being utilized in the construction of the new royal Burg-Theater for comedy and tragedy, which has long been felt as a necessity, the old house being so small and clumsy that an opportunity to get a decent seat, unless ordered a week ahead, has been for some time the exception rather than the rule. The new University, for which a capital site has been chosen near the lovely Votive-Church, will be, by all odds, the handsomest structure of the kind on the Continent, and will doubtless exert some influence in attracting students, and thus raising the other departments of the University to the popularity and fame now enjoyed by the medical department alone. The new Rath-Haus or Court-house, the interior of which will be decorated by several famous artists, including Makart, is, as far as I can judge in its present stage of completion, the finest specimen of modern architecture I have seen, although I do not pretend to be an authority in such matters. These buildings, together with some others that might be mentioned, Prof. Lübke doubtless had in his mind among other things when he asserted in a lecture the other day that within the last few years Vienna has attained a rapid growth in art unequalled anywhere since the days of the Renaissance. The effect of these new buildings is enhanced by the fact that most of them not only have the advantage of the wide space offered by the Ring-Strasse but are surrounded on several sides by open grounds and gardens. The Viennese magistrates have been wise in time and saved from the ravages of the architects large tracts of park and breathing grounds, so necessary for the health and pleasure of the inhabitants of the inner city.

Of the private new buildings which are being erected in various parts of the city the majority seem to be cafés, in spite of the fact that Vienna is said to have already some four hundred of them. It is by these cafés, more than by anything else, that the local color of Vienna is determined. In Berlin there seem to be but a few dozen cafés, and, with the exception of those near the centre of the city, they appear to be doing a poor business. In Munich the cafés play a more important rôle, but not by any means as important as here. The Viennese feel a certain pride in having been the first to introduce them in Europe, and feel bound to keep ahead of other cities, both in quantity and quality. It is not only the good coffee and bread that attract everybody to them. They are such comfortable loafing places that few who have a drop of "Bohemian" blood in their veins can resist their charms. Even the smaller ones present a neat appearance, while some of those lately opened are furnished in a most luxurious fashion. The most handsome article of furniture is usually a pretty young girl, who sits behind the counter and seems to be generally engaged in *dolce far niente* when she is not flirting with some officer or student; although once in a while she pretends to read a newspaper. Her ostensible duty is to put into little trays the lumps of sugar which go with the coffee, and keep account of how many cups each waiter has taken away. But it is evident that this is merely a clever dodge, and that in reality she is there for the purpose of attracting the young men by her beauty and smiles. Etiquette prescribes a bow to this charming creature on entering and leaving a café, while the wholesale greetings of the waiters are usually ignored. There is considerable competition in this matter of "cash-girls" among the different *cafetiers*, and, as pretty girls are not at all rare in Vienna, the result is often admirable. Female waiters, on the other hand, are rarely seen in a Viennese café or restaurant, the reason being that the male waiters are so good that they have acquired a European reputation, and are in demand all over the Continent. They are not so slow as the Italians and not so insolent and conceited as the Germans. In Berlin the swallow-tailed waiter is so overbearing that a comic paper could hardly be accused of exaggeration when it made a tourist admonish one of these august individuals not to be *too* stuck up, for in these uncertain times a reverse of fortune might easily take place and reduce him to the humble position of a guest, and then he would be sorry for his former conduct. Another fault of the Berlin waiter is that he is apt to be too literary, and to monopolize the papers which people want to read.

As regards newspapers, the variety and quantity of them kept in Viennese cafés is astonishing. All languages are represented, and of the local papers from half-a-dozen to a dozen copies are often kept, so that no one needs to wait on those people who read all the advertisements. Of the local papers the *Neue Freie Presse* is, all things considered, the best daily paper published in the German language. It is anti-governmental, and, like most of its contemporaries, is frequently confiscated for offences often so slight that it requires great insight and profound research to discover them. However, confiscated papers are always to be had by a private understanding with the head waiter, who usually succeeds in concealing a few copies before the police make their appearance. The latter, to stop this proceeding, recently endeavored to enact that a list of the number of all papers kept must be supplied them by each *cafetier*. But their legal right to make such a demand was questioned by the papers, and so, I believe, the matter was dropped. Confiscated papers usually appear in a second edition, omitting the objectionable article; and the fact of a number having been confiscated being announced by the publishers in conspicuous posters at the street-corners serves as a good advertisement in the eyes of liberal readers. Whether the tax of two kreuzers charged on every foreign political newspaper received here by mail is intended also as a measure to prevent the introduction of heretical opinions relating to the Government, or merely one of the innumerable petty devices for replenishing the exchequer of an "effete monarchy," I do not know.

All things considered the Wiener-café must be regarded as an admirable institution. If our temperance societies would endeavor to introduce it into American cities, with its good coffee, abundant newspapers, and smiling maidens, they would have better success in weaning men from bar-rooms than can ever attend their present attempts to suppress personal liberty. Of course these cafés are not all of the same physiognomy, but vary considerably in the character of their habitués. Many of them are open at all hours, day and night, although there are certain hours when they are more crowded than at others. At about half-past nine there is a sudden emptying of all the cafés and restaurants (excepting those near the theatres and the night-cafés), the cause of which is the desire to avoid paying the *Sperrkreuzer*. This is a ridiculous sort of personal tax which has grown out of the apparently mediæval custom of closing the portals of all houses precisely at ten o'clock. Any one who gets home after ten has to pay the portier ten kreuzers when he opens the door, while those arriving after twelve give him twenty. Ten kreuzers are only five cents, but when you add them together for a whole year they make up a neat little sum which few Germans are willing to throw away. Hence the emptying of the cafés, and hence also the unusual haste of pedestrians on the street just before the fatal hour. Indeed, the influence which the portier exercises on the habits of life here is quite extraordinary, for it is doubtless in deference to the wishes of the people to avoid paying the door-tax that the theatres all begin as early as seven, and mostly end at half-past nine. As each house, according to Continental custom, contains some dozens of families, the door-tax seems to be a sort of dodge on the part of the house-owners to make the portier a self-supporting institution. The health of these poor creatures always suffers from the continual interruption of their sleep; but when one has occasionally to wait for them ten or fifteen minutes in a bitter cold night all pity for them vanishes. That the custom is an absurd one for a million-city is generally admitted, and there is now an agitation having for its object the introduction of the custom in vogue in Berlin, where the doors are also closed at ten, but where

everybody has his own night-key. The present fashion must be all the more disagreeable because there is a general desire among the Viennese to postpone supper till after the theatre. After supper many of those extravagant individuals who have made up their mind to pay their *Sperrkreuzer* proceed to one of the night-cafés and partake of a cup of black coffee. There is usually music in these cafés from ten till three in the morning. "Damen-Capellen," or feminine orchestras, are just now the fashion in Vienna. They consist of six or more performers on violins, 'cello, bass, flute, and usually a piano and an organ besides, which, added to a peculiar feminine intensity of tone, gives these bands a quite distinctive and peculiar character. Like all the Viennese bands, from Strauss's down to the ordinary beer-house band, they play dance-music with that wild enthusiasm of which those who have never visited the *Kaiserstadt* can form no conception. It is the most sensuous and exciting music imaginable, and when Ed. Strauss plays at a masked-ball or a promenade concert, one has but to close his eyes to feel himself at once whirling about the hall with his arm around a fair maiden's waist. The Romans cried for *panem et circenses;* the Viennese for a Strauss waltz. Accordingly, whether one goes to the ballet at the Opéra, to an aristocratic soirée, to a masked-ball or to a private *Kränzchen* in a suburb, the majority of those present will always be found graceful and indefatigable dancers.

Gaiety in every form and at all times, and an unlimited capacity for amusement, seem to constitute the principal difference between the Austrian and his cousin, the full-blooded German. Vienna has the best theatre of all German cities, the Burg-Theater being equalled only by the Comédie-Française; operetta flourishes here as nowhere else; the opera, as a whole, has no superior; concerts are less frequent than in Berlin, but more liberal and cosmopolitan in character; and minor species of amusement exist in great variety. But to the young folks these entertainments serve but as a first course, to be followed, at least during the carnival, by a dessert in the shape of a dance. At all their entertainments the Viennese are exceedingly liberal in the bestowal of applause, and they always seem to succeed in amusing themselves, which is more than can be said of their northern neighbor and of some other nations. The pessimistic temperament and *Weltschmerz* do not flourish here. The cause of the Austrian cheerfulness may lie partly in climatic influences, partly in the free consumption of good wine and light Pilsner, in place of the dark, heavy German beer. A special word has been coined by the Viennese to express their favorite temperament or character—the word *fesch*, the exact meaning of which it is as difficult to give as that of *gemüthlich*, although jolly, good-natured, bright, and *chic* seem to enter into its composition. To say of a girl that she is "*ein fesches Mädchen*" is equivalent to saying she is "simply charming"; and such girls are not rare here. Moreover, outside of America there is not a city where female beauty is so common an article as here, the cause being probably the same in both cases—the mixture of nationalities. Thanks to Hungarian and Italian influences, the prevailing type here is brunette. The typical Viennese girl is lively and graceful, and in social demeanor she takes an intermediate position between the quiet and prudish German maiden and the often too Daisy-Millerish American girl. The natural cunning of woman is beautifully illustrated in the matter of feet. German women are not noted for small and neat feet, and accordingly they wear long dresses. Viennese women have the neatest feet imaginable, so, of course, short dresses are the fashion with them. In intellectual training the average Austrian woman is not on a par with the German, although in æsthetic accomplishment she is hardly her inferior. Those who believe in the theory that men and women should stand to each other in the relation of prose and poetry will be likely, therefore, to prefer the Austrian, all the more as the education of German girls is, after all, rather more domestic than intellectual, as with us. The Austrian men, on the other hand, do not make as good a show as the Germans. At least there is no question that, aside from the more elegant and tasteful uniform of the Prussian military classes, one meets more handsome men in Berlin than here. It may be an odd fancy of mine, but my experience goes to show that a similar difference in the average physical beauty of the sexes prevails in some other countries that might be mentioned.

Correspondence.

POLITICAL COALITIONS.

To the Editor of The Nation:

Sir: The debate in the Senate upon the alliance of the Republicans with Mr. Mahone presents little that is pleasing either to Democrats or Republicans, and it is not a matter of surprise that its defence should be largely confided to such Senators as Mr. Logan and Mr. Hoar. The general obtuseness of the one upon questions of political ethics and the intense partisan bitterness of the other qualify each of these Senators to lead in such a movement, and having committed themselves to the advocacy of this alliance with all it implies, it is to be expected that brazen effrontery should be exhibited, especially when staggering under the weight of evidence which the Democrats are accumulating in proof of the bargain. Senator Hoar especially has shown himself to be utterly shameless, in citing as a precedent for this bargain the fusion which made Charles Sumner a senator from Massachusetts and Mr. Boutwell the governor of that State. As reported in the *Congressional Record* of March 26, Mr. Hoar said:

"Mr. Boutwell was elected to the office of governor of Massachusetts by the united votes of the Democrats and Freesoil party, and Mr. Sumner was sent to the Senate. Mr. Chase was elected from Ohio in the same way, and John P. Hale from New Hampshire. What American, what lover of liberty, what lover of an honest and fair vote in the length and breadth of this land would wipe out of the political history of this country the election of Salmon P. Chase, of John P. Hale, of Charles Sumner?"

Now, if there is a page in the political history of the United States which every lover of his country should wish to have obliterated, this is that page; a record in which two great parties—one already identified with the progress and glory of the country, the other just struggling into existence, but destined at no distant day to control the Government during a quarter of a century—deliberately threw their political principles to the dogs and corruptly parcelled out between them political power. This leaf from the history of Massachusetts, which Mr. Hoar as a native of that State took occasion to glorify, has been held up to the scorn and reprobation of all men by another native of Massachusetts, in comparison with whom Mr. Hoar intellectually and morally is as darkness to light. Judge Curtis, in the address prepared by him to the people of Massachusetts on this "coalition," said:

"A compact to elect a man for governor in whom the one party does not confide, in consideration of electing a man for senator in whom the other party does not confide, *is not a coalition, but a factious conspiracy*, and when such compact is made between those who have merely a delegated authority, held in trust to be used under the sanction of an oath to place in office only those in whom the trustees do confide, this is a factious conspiracy to violate a public trust, and as such *criminal*—not only in *morals* but in the *law of the land.*"

It matters not to me as a Democrat that the Democratic party must bear its full share in the disgrace of this transaction. I would not revive its memory needlessly; but when it is revived by others for the purpose of glorifying the actors and beneficiaries I would remind those who read Mr. Hoar's eulogy how the transaction was regarded by one of the purest and wisest citizens of Massachusetts, who was a member of the legislature that did the deed, and who in speaking for himself spoke also for the great party with which he acted. It was defended then, as now, upon the ground of precedent, and while it may not be agreeable to Mr. Hoar it may be profitable to others to remember how Judge Curtis met this defence. He said:

"Another ground upon which this bargain is defended is that such arrangements are common and to be expected in legislative assemblies. If this be so, it is time you (the people) knew it. But the assertion is a libel on the honesty of the State, and no man will make it who does not take his own conscious wickedness as the standard by which to measure other men's honor."

Mr. Hoar does not seem to agree with Judge Curtis "that public morals are essential to public order; that absolute fidelity to public trust is the only secure basis of republican government; that it is not lawful to do evil that good may come; that there is not one rule of right in the capitol and another by the fireside; that the crooked paths of intriguers and schemers are not safe ways for honest men to travel." Cannot Massachusetts, when she is next called to make her contribution to the Senate of the United States, find some Republican faithful to the principles of his party, and zealous in maintaining them, but who does know all these things which Mr. Hoar seems not to know, and who will not put his State to open shame by boasting of her dishonor in the past?—Yours respectfully, J. A. Pearce.

Chestertown, Md., March 31, 1881.

THE MAHONE LIBERAL MOVEMENT.

To the Editor of The Nation:

Sir: It seems as if the Republican leaders were making another mistake in their effort to build up their party in the South. One of their first acts after the war was to compel a repudiation of all State war-debts. Their next was an appeal to the ignorance and non-property-holders of the South for support. They thus made it impossible for intelligent and patriotic men there to join them. After it had been demonstrated that their effort was an utter failure, there was gradually growing up a feeling that it might become necessary for property and intelligence to unite with them for the protection of public credit. Many men all over the South, impressed with the necessity of preserving the public faith inviolate and the justice of the payment of debts, have been turning more and more towards the party which arrogated to itself that special duty. The prevalence of the repudiation heresy threatened to blight every interest of the South for years, and they tended to look towards the Republican party for protection and assistance.

This was especially so in Virginia. A few Republicans here have been

conspicuous for their fidelity to sound principles in this particular. But the recent alliance between the Republican Administration and Senate and Senator Mahone has driven every one of property and intelligence from thoughts of future sympathy with their party. It is an open coalition with and appeal to the most corrupt elements of Southern society to array themselves against intelligence, virtue, and property on the side of the Republican party. That organization is woefully deceived if it believes that the Mahone movement is the forerunner of any liberal thought or policy in the South. The staple argument of repudiation in Virginia has been, and is, that the debt was created on the credit of slave and other property; that the Northern people destroyed that property; that they hold the bonds, and are therefore not entitled to be paid. This argument, presented on every hustings in Virginia, has had more influence in promoting repudiation than all others combined.

Again, the pretence is set up that the new movement is intended to protect the negroes from the unjust disfranchisement and ignominious punishments imposed by the "Bourbons." The special grievances are that a constitutional amendment adopted in 1875–77 disfranchised all persons convicted of petit larceny, and required prepayment of a poll-tax as a qualification for voting; and also that an act of Assembly passed in 1877–78 imposed the penalty of stripes for petit larceny. It is charged that this disfranchisement and punishment does operate, and was intended to operate, mainly on the negroes. They were voted for by the leading Readjusters in the Legislature when they were adopted. B. W. Lacey, Readjuster Speaker of the House of Delegates 1879–80, and now Readjuster Circuit Judge; and John E. Massey, Readjuster Auditor of Public Accounts, now their prominent candidate for Governor, voted for them in 1874. (*House Journal* 1874–75, p. 218.) Riddleberger, the Republican caucus candidate for Sergeant-at-Arms of the United States Senate, who was a member of the House, did not vote, but he did not oppose them. Massey again voted for them in 1875. (*House Journal* 1875–76, p. 296) The law imposing the punishment of stripes for petit larceny was voted for by Massey, and by Fulkerson and Paul, Readjuster members of Congress (*Senate Journal* 1877–78, p. 405), and Paul was a member of the Committee which reported the bill.

These are the sort of Liberals and this the kind of Liberal movement the Republican party have adopted and are promoting in Virginia.

A Debt-Payer.

MEANS AND ENDS.

To the Editor of The Nation:

Sir: In the *Nation* of the 24th inst. are these words: "The joy with which Senator Mahone has been received into the Republican ranks in the Senate seems, considering that he is a repudiator, or 'Readjuster,' as it is euphemistically called, of the State debt, a little scandalous in view of the horror caused in the best Republican minds by the alliance of the Democrats with the Greenbackers." And then in regard to the "very ingenious excuse for Mahone," that the "Readjuster" movement is a revolt against Bourbonism, you say: "It is quite right to make this explanation, *because nobody would ever have guessed what he was about.*"

And yet, in the *Nation* of October 28, 1880, after stating the charges and countercharges of the two Democratic factions in Virginia, you say: "This is what renders it doubtful, at least to people who have no intimate interest in the honor of Virginia, whether Mahone is not performing a public service in exploding the nonsense and antiquity of Bourbon notions, *even at the expense of cheating the creditors of the State.*" And again, on the 2d of December, 1880, in your comment on the election of Governor Brown, of Georgia, to the Senate, you say:

"If there exists in Georgia a Bourbonism indissolubly wedded to the *status quo* and unreconciled and unreconcilable to the Constitutional Amendments, and on this account chiefly opposed to Mr. Brown, we cannot for our part doubt that, though the hand which guides it may be selfish, the driving deep of the share is for the immediate and ultimate good of the State. *We have felt the same thing* in regard to *General Mahone in Virginia.*"

It seems, then, that somebody has "guessed" what General Mahone was about before he took his seat in the Senate.—Respectfully,

S. Watson.

Nashville, Tenn., March 27, 1881.

[We have had but one opinion about Democratic dissensions at the South, namely, as cited above, that they were for the ultimate good of that section, and of the country, irrespective of the immediate cause of them. By Bourbonism there we understand not only blindness to accomplished facts and stupid resistance to the inevitable, but a censorship of thought and utterance such as prevailed in the days of slavery. It is, by direct descent, the enemy of free speech, and skilled in the employment of political and social ostracism—and, if need be, of violence—to suppress it. In this sense we have never had any doubt what General Mahone was about. We do not, however, allow him or Senator Brown to vindicate his character or opinions by reference to the incidental effect of conduct in itself unscrupulous and selfish, nor do we interpret the Republican joy over Mahone's accession in accordance with Mr. Hoar's or Mr. Dawes's sonorous phrases about the sanctity of the ballot-box. We can, with our philosophy of Southern renovation, regard the activity and even successes of the Browns and Mahones with composure, but we shall form our own judgment of their motives. Our attitude towards them, and the like of them, is expressed in the saying—"The Lord often makes use of instrumentalities that I wouldn't touch with a forty-foot pole."—Ed. Nation.]

A NEW GROUND OF COMPLAINT.

To the Editor of The Nation:

Sir: I send you the subscription for the *Nation* for the current year, and at the same time request you *not* to send it to me after this year expires *unless* I before that time order it continued. I don't wish to read a paper which has not *opinions* and the courage due to them. I am often in doubt upon which side of a question discussed in its columns the *Nation* really is. If this is due to my obtuseness, I must read what I can understand; if due to a desire not to avow opinions lest offence be given, then I don't want my time wasted reading timidity. There is one all-important question now on trial by this Union, and upon its correct decision depends more than on any other one question the future welfare and progress of the people of this nation. It affects also materially and directly the whole human race, inasmuch as it involves the capacity of the most advanced of the race to maintain a system of *self-government* springing from and administered by the people. It is the question whether our system of government, by which the national Government or national Union is organized, consecrated, and pledged to the maintenance of self-government in and by the people of the several States, under and obediently to a common Constitution, is to be *maintained;* or whether it is to be revolutionized into a *centralized* government, which leaves to the people of the States only those powers and rights which the central government does not choose to assume.

I don't think any paper which attempts to be on both sides of this question is or can be of any use in the work this *generation has to do.*

Respectfully yours,

O. B. Potter.

26 Lafayette Place, New York, March 30, 1881.

[This is all very fine; but by what species of "self-government" was Mr. Potter nominated for Congress as a Kelly candidate in this city in 1878?—Ed. Nation.]

ARMY DRUNKENNESS.

To the Editor of The Nation:

Sir: I have just seen the very grave charge, in the shape of a question for information, brought by your correspondent "F. E. R." in your issue of 3d instant against the good name of some army officer holding command. As one much interested in the reputation of the service, I beg to represent that if such a rumor is without foundation it should not be circulated, by implication or otherwise; while if there is any reasonable ground for believing it, it is the duty of a good citizen to present the report, with the data on which it rests, to the Secretary of War, who will undoubtedly cause the truth to appear and justice to be awarded.

W.

March 12, 1881.

[This letter refers to a belief that Victorio's prolonged raid, ended only by his death, in New Mexico, "was caused by a drunken army officer ordering his men to fire on that chief and his warriors at Ojo Caliente."—Ed. Nation.]

POLITICAL HERO-WORSHIP.

To the Editor of The Nation:

Sir: A communication which appeared in your issue of March 31, entitled "Political Hero-worship," has seemed to me so manifestly unjust toward our new President, so wantonly oblivious of well-known facts in his character and career, that I am tempted to ask for a brief space in your columns to put the facts, if I can, in their true light.

The premises upon which your correspondent founds his argument I think no one will deny. That the man whom the people "delight to honor," the "ideal President," should be a "representative American," an "imper-

sonation of all that is best in our American civilization"; that our early Presidents were "statesmen, scholars, and gentlemen"; that "early disadvantages, illiteracy, and coarseness" are not in themselves "admirable, virtuous, or heroic," are almost self-evident truths. But by what perversion of logic can these premises be made to warrant the conclusion that the election of James A. Garfield to the Presidency means "a decay in the popular ideal of greatness," or that he is unworthy to be held up as a model for the emulation of our American youth?

To those who know the man, or have watched with any degree of attention the successive steps of his development, President Garfield seems, in a most emphatic sense, to represent what is "best in our American civilization." That he is "a statesman and a scholar," I suppose not even "Spectator" himself would deny. Whether he may also be called a "gentleman" must depend, of course, upon the significance attached to the term; but in the opinion of those as well qualified, perhaps, by education and social advantages as your correspondent to give an intelligent judgment in the case, President Garfield *is* a "gentleman" according to every standard but one utterly conventional and un-American. He was "born to the purple" in a truer sense than was any Roman Emperor. Finally, though there is nothing intrinsically grand or heroic in "early disadvantages, illiteracy, or coarseness" (the latter of which, in General Garfield's case, never existed), is there not something grand, something admirable, something heroic in the man who has conquered all these disabilities, has attained, in spite of them, an exceptional degree of culture, and has fitted himself to participate with honor in the councils of his State and nation? And is there not something lamentably lacking in the nature which, in such a career as his, refuses to recognize these qualities?

It may be true, as your correspondent quotes, that "democracies lack the picturesque element," yet it seems to me that nothing could well be more "picturesque" than the circumstances of General Garfield's career. How he will acquit himself in his present high office is yet to be seen, but surely he should be granted a "fair field," if "no favor," without prejudice, either in one direction or the other, from anything in the facts of his previous history.

A Faithful Reader of The Nation.

RAILROAD STOCK-WATERING AND EXTORTION.

To the Editor of The Nation:

Sir: Referring to the editorial in the *Nation* of March 24, entitled "The Fallacies of the Anti-Monopoly League," I desire to ask your consideration of certain points. The position taken in the editorial is that railroads must be judged by the same rules which apply to private business, and admitting that your logic is good from that standpoint, I ask you to look at the other side of the question and see if there is not some reason in the view which has been taken of it by many persons, including the highest judicial authority in the United States.

Starting from the point that the State was the original owner of all highways, and that the legislation which authorized, first improved turnpike roads and then the railroad, proceeded on the assumption that the charges on these improved highways must be reasonable and alike to all, the controlling motive in originating the construction of these modern highways has, as a rule, been the improvement of property by obtaining a better outlet to the great markets, and the general improvement of business resulting therefrom. Government aid—national, State, county, and municipal—has been largely extended, and the cases are very few where capital was originally put on these enterprises as a primary investment. It was only after railroads had demonstrated their capacity to be used as a machinery to tax the public that such men as Messrs. Vanderbilt, Gould, and others appeared upon the scene, and inaugurated the state of things of which the public now complain.

In judging this question we must, therefore, take the legal view of it—that railroads perform a public function—that of furnishing highways; that their charges must be uniform and based upon the cost of the service, with a fair profit added thereto. In defining what is a fair profit the Legislatures in several of the States have fixed upon ten per cent. above the cost of operation. I do not wish to discuss the question of whether this is or is not a reasonable compensation; I only mention it as having been, at a time when the rate of interest was much higher than at present, so considered by legislators. If it is not sufficient compensation, I, for one, am quite willing to concede any figure in reason in excess of ten per cent., but I contend that the rights of the railroads and of the public should be defined, so that all cause for controversy may be removed.

That there is a lack of statistics upon which to base conclusions regarding railroad business is surely not the fault of the public; the railroads have fought every attempt made to provide them, and at this very time the New York Central road is opposing with all its power the establishment of a Board of Railroad Commissioners in this State similar to that of Massachusetts. The practice of watering stock seems to me wholly indefensible. You state that there are actually no railroads which have always been profitable. Take the New York Central, for instance: I happen to know that the original stockholders in the Syracuse and Utica, one of the links consolidated into the New York Central road in 1853, had received two dollars for one that they ever actually put in up to the time of said consolidation, and that it was watered fifty per cent. at the time of that consolidation, and that at the same time the other links constituting the New York Central road were put in at from seventeen to fifty-five per cent. premium. The Mohawk Valley road existed only on paper, and yet it was put into this consolidation at fifty-five per cent. premium, and since that time the whole has been twice watered—once eighty per cent. and again twenty-seven per cent. This was not done upon any pretence that the property had not been remunerative in times past, but was done simply as a means of evading the plainly expressed intention of the statutes creating these roads. This was worse than the practice of capitalizing surplus earnings, and this is condemned in the strongest terms in the reports of the Massachusetts Railway Commissioners, when Mr. Charles Francis Adams, jr., was chairman of that board. The injustice of this practice is set forth in plain terms by the Legislative Committee which investigated the coal combination in this State three years since. Their report says (p. 8):

"During the receipt of these enormous profits many of the coal corporations, as was the case with the railroads not engaged in the coal-carrying trade, unable under their charters or for other reasons to declare dividends upon their stock that would absorb their unexpended surplus, issued additional stock to the stockholders, for which they paid nothing, inaugurated what is commonly known as stock-watering, or a capitalization of surplus earnings, which is in substance exacting money from the people, creating an indebtedness representing the same, and making this the basis for for ever asking the public to pay interest on their own money so exacted."

It has been the practice of railroad companies in the past to put stealings, even, in the capital account; this has been done to the extent of several millions of dollars in the Erie road; and on the New Haven road I am informed that rates have been charged which have yielded, not only ten per cent. upon the original cost, but also upon considerable amounts of water, besides the Schuyler defalcation, which nearly doubled the liabilities of that road. One would think that the stockholders ought to have been liable for a breach of trust in their own service, and that they should have put their hands in their pockets and made up the defalcation, instead of putting it upon the public by issuing additional stock and keeping their rates high enough to pay ten per cent. dividends upon the whole mass.

It would be just as equitable should a merchant meet a loss by the failure of a customer, to charge the amount pro rata to all his paying customers; but the case of the railroad is much worse than this, for the reason that when the amount lost by the failure was once paid by the merchants, that would end it, but in the case of the railroad the obligation in the shape of stock remains a tax upon the patrons of the road for ever.

The frauds of the Crédit-Mobilier and the Finance and Construction Company of the Union and Central Pacific roads will remain a tax upon the production and commerce of the country for all time to come. The rates charged for transportation on these roads are simply enormous, and after paying dividends upon the present grossly fictitious cost of these roads, the surplus is invested in improvements which in due course will be further capitalized and form an excuse for taxing the public unduly for transportation services. Why should these men, simply because they have the power, be permitted to go on indefinitely doing such things? The principle of our patent law is that the inventor shall be fairly rewarded, but that after that the benefit of his invention must inure to the public. Why should a few men be permitted to monopolize the invention of steam transportation on land because the law of competition does not work here as it does on the ocean?

So much for the general principles involved in the relations of railroads to the public. Now let us glance at the discriminations practised both as between individuals and communities. These have been absolutely denied by the leading railroad men of the country; Messrs. Vanderbilt and Jewett denied that they existed, over their own signatures to the Hepburn Committee, and yet this committee pronounced the abuses "*fully proven.*" President Stanford of the Central Pacific, in his answer to the questions propounded by a committee of the Chamber of Commerce, of which I am a member, stated that no such discriminations existed in the management of roads with which he was connected, and yet Representative Daggett showed recently on the floor of the House of Representatives at Washington that the people of Nevada were obliged to pay the through rate from New York to San Francisco and the local rate from San Francisco back again to Nevada, and it made no difference whether the work was done or not. For instance, the through rate from New York to San Francisco on a car-load of candles is three hundred dollars. The local rate from San Francisco back to Palisade, 587 miles, is four hundred and eighty dollars. If a merchant at Palisade orders candles from New York, they will stop the car and deliver him the goods at Palisade without taking them through to San Francisco and back again to Palisade, but the charge (notwithstanding the work is not done) is seven hundred and eighty dollars.

As an instance of the discrimination between individuals, the resolutions submitted by Mr. Daggett stated that the freight on eggs from Ogden to Toano cost one man three dollars and thirty-five cents per box, and the same number of eggs in the same sized box, of the same weight, carried the same distance, cost another man sixty-five cents, the only reason being that one shipper has a special contract while the other has none. I could duplicate these instances indefinitely; they exist in a greater or less degree all over the United States. They are rapidly redistributing the wealth of the nation, concentrating it in a few hands and building up a moneyed aristocracy such as the world has never seen.

The Standard Oil Company is a case in point. Mr. Lloyd's article in the March *Atlantic* shows that every gallon of coal-oil pays a tax to the Standard Oil Company of eight and three-quarter cents per gallon—nearly eighty per cent. There were two hundred and twenty millions of gallons consumed in this country last year, and he estimates that the Standard pays dividends of one million dollars per month. Referring to the practice of favoritism in rates for transportation, a report submitted to the New York Chamber of Commerce by Charles S. Smith, Jackson S. Schultz, Benj. B. Sherman, Benj. G. Arnold, Jacob Wendell, Charles C. Dodge, and myself, stated:

"What has happened in the case of the Standard Oil Company may happen in other lines of business. . . . With the favor of the managers of the trunk lines, what is to prevent commerce in the rest of the great staples being monopolized in the same manner? Already it is taking this course; one or two firms in Baltimore, Philadelphia, New York, and Boston, with their branch houses in the West, are by the favor of the railroads fast monopolizing the export trade in wheat, corn, cattle, and provisions, driving their competitors to the wall with absolute certainty, breaking down and crushing out the energy and enterprise of the many for the benefit of the favored few."

I might go on indefinitely, but space forbids. I did not think when I began dictating this letter to trouble you with so long a communication, but the importance of the subject and the great interest I feel in it must be my excuse. I do not ask you to print this letter—it is too long; but I do ask you to look into this question, to examine the official report of the Hepburn Committee, the decisions of the Supreme Court of the United States, and I will then trust your own sense of right and wrong, and of what should be public policy, to do justice to this question. Railroad managers may not be altogether to blame for this state of things; I know some of them who are honorable, high-toned, fair-minded men. I think Mr. Fink is one of these, but Mr. Fink does not know all that is going on in the railroad companies under his control. I know of one case where a director in one of the roads in the pool is a silent partner of a shipper who gets a private rebate which gives him an advantage over all other men in that line of business, and until it is made an offence against the law to do such things they will undoubtedly go on, and perhaps even afterward. But with such things prohibited, and with an executive power to see the laws executed, we may reasonably hope that such offences against society will be fewer than they are now. Again apologizing for troubling you at such length, I remain,

Very respectfully yours, F. B. THURBER.

NEW YORK, March 28, 1881.

[We print the above at some inconvenience. Its length prevents our making any comments on it now, but we shall next week say what "our sense of right and wrong, and of what should be public policy," suggests as "justice to this question."—ED. NATION.]

Notes.

HENRY HOLT & CO. have in press Fedor Dostoyeffsky's Siberian narrative, entitled 'Buried Alive'; 'Germany, Past and Present,' by S. Baring-Gould; 'The Young Folks' Astronomy' and 'The Young Folks' History of the War for the Union,' by John D. Champlin, jr.; Sir G. W. Cox's 'Science of Mythology and Folk-lore'; and 'Butterflies: Their Structure, Changes, and Life Histories,' by Samuel H. Scudder.——Other spring announcements are as follows: D. Appleton & Co.:—Jefferson Davis's 'Rise and Fall of the Confederate Government'; the second and third volumes of General Badeau's 'Military History of Ulysses S. Grant'; 'Selections from Arguments, Addresses, and Miscellaneous Papers of David Dudley Field'; Prof. W. Robertson Smith's 'The Old Testament in the Jewish Church'; and the Greek novel, 'Loukis Laras.' Harper & Bros.:—The concluding volume of M'Clintock & Strong's 'Cyclopædia of Biblical Literature'; and a 'Short History of English Colonies in America,' by Henry Cabot Lodge. G. P. Putnam's Sons (who, by the way, will remove this month to more commodious quarters at Nos. 27 and 29 West Twenty-third Street):—'Spain and the Spaniards,' by Edmondo de Amicis; a 'Memoir of Count Gasparin,' from the French, by Major-General O. O. Howard; and Rochefort's 'Mlle. de Bismarck.' Charles Scribner's Sons:—'Turkish Life in War Time,' by Henry O. Dwight; a fifth volume of Max Müller's 'Chips'; Rawlinson's 'Origin of the Nations'; Mivart's 'The Cat'; and the correspondence between Talleyrand and Louis XVIII. during the Congress of Vienna, lately found in the French archives. Dodd, Mead & Co.:—'A Short History of Art,' based on Lübke, by Miss De Forrest. Cassell, Petter, Galpin & Co.:—'English and Irish Land Questions,' a collection of essays by Mr. Shaw-Lefevre, M.P. George H. Ellis, Boston:—A new edition of 'Man's Origin and Destiny,' by J. P. Lesley, State Geologist of Pennsylvania. Lee & Shepard:—'Nez-Percé Joseph,' by General O. O. Howard, 'A Handbook of Punctuation,' by Marshall T. Bigelow, of the University Press; and 'New England Bird-Life,' by Winfrid A. Stearns, edited by Dr. Elliott Coues. Lockwood, Brooks & Co.:—Haskell & Laing's 'Dictionary of the Anonymous and Pseudonymous Literature of Great Britain.' J. R. Osgood & Co.:—Mrs. Burnett's 'A Fair Barbarian,' and a 'Life of President Garfield' (which seems either very late or very premature), by Captain F. Mason. Roberts Bros.:—'Massachusetts in the Woman's Suffrage Movement,' by Mrs. Harriet H. Robinson. Jansen, McClurg & Co., Chicago:—'Shadows of Shasta' and 'The Danites of the Sierras,' prose works by Joaquin Miller; and the 'Student's Dream,' a philosophical production "in a somewhat novel form."——The March number of the *Harvard Register* bears the unwelcome tidings that this enterprising periodical is to be definitively suspended after one more issue, partly for want of sufficient support, and partly to make way for a projected *Bulletin of the University*, which is to be an official organ of original information, and something more. This new publication will take the place also of the *Literary Bulletin*, beginning with this month's issue. The *Register*, meantime, maintains itself well on the literary and pictorial side, and promises a final April number of great attractiveness. On p. 176 we find the details of the organization of a University Club, embracing the Corporation, the Board of Overseers, the Academic Council, and the leading representatives of the Library and the Peabody Museum. It will hold quarterly meetings. ——The April number of the *Magazine of American History* opens with a good article on the "First Settlement in Ohio," by Maria Cone. It is based on a MS. autobiography of Gen. Rufus Putnam, whose map of Ohio is given in fac-simile. Mr. J. C. Stockbridge enumerates some of the more interesting of the Revolutionary pamphlets in the large collection of the John Carter Brown library, in Providence.——"William Diodate and his Italian Ancestry" forms the subject of the most noteworthy paper in the April issue of the *New-England Historical and Genealogical Register*. It is from the pen of Prof. Edward E. Salisbury, of New Haven.——A new collection of Old-English Legends, with an introduction and notes by C. Horstmann, appears from the press of Henninger Brothers (Heilbronn. 1881). It contains about sixty legends, thirty-six North-English and Scottish, making 536 pages large 8vo, fine print, mostly in double columns. Besides this, the introduction, giving a historical exposition of the church service in connection with the reading of the *acta sanctorum*, or legends, and giving also the bibliography, is a volume by itself. The texts are very carefully prepared with various readings and other apparatus for study, and are of great interest to students of language and explorers of our early literature.——From B. Westermann & Co. we have received Theodor Ackermann's remarkable 'Catalogue of Faust Literature, 1494–1880' (Munich). Of the stock herein described and offered for sale the gem is a unique copy of the 'Historia von Doct. Johan Fausti, des auszbündigen Zauberers und Schwartzkünstlers Teufflicher Verschreibung, Unchristlichem Leben und Wandel,' etc. (1596), with which is bound up an "unknown edition" of the Wagner book of 1594, in which "beschrieben ist Christophori Wagners, des Fausti gewesenen Discipels auffgerichter Pact, so er mit dem Teuffel gemacht," etc.——Another volume of criticism has been put forth by Zola and yet another is promised. For a collection of the dramatic criticisms which he has written during the past five years in the *Bien Public* and the *Voltaire* he has borrowed the title of an earlier essay already reviewed at length in these columns. 'Le Naturalisme au Théâtre: Les Théories et les Exemples' (Paris: Charpentier; New York: F. W. Christern) contains those of his critical articles of which the victims were minor authors. The essays in which he demolishes the chief French dramatists of the nineteenth century are to appear shortly in a second volume, 'Nos auteurs dramatiques.' They will be lively reading in spite of their ponderous style. ——A new monthly *Revue Internationale de l'Enseignement* was begun in Paris on Jan. 15, under the auspices of the Société de l'Enseignement, and the editorship of M. Edmond Dreyfus-Brisac (Paris: G. Masson). MM. Masson, Pasteur, Bréal, Fustel de Coulanges, P. Janet, Laboulaye, Monod, and Taine are among the editorial committee. The first number has articles on "Reforms in the Secondary Instruction in France" (the Editor); "Instruction in Diplomatic History" (Albert Sorel); "Girls' High-Schools in Germany" (Dr. W. Noeldeke); and "Harvard University" (Prof. Jacquinot). There is a department of retrospective review of works on education, beginning with D'Alembert's article *College* in the 'Encyclopædia'; international correspondence; official documents and information and general news (as, the anti-Jewish agitation in the German schools). The *Revue* promises to be a substantial addition to educational agencies.

—We are informed that the late Thomas Carlyle left by his will all the works collected in the preparation of his 'Cromwell's Letters and Speeches' and the 'Life of Frederic the Great' to the library of Harvard College, in token of his good-will towards this country; a change of mind which, from a foot-note of Mr. Froude's in the 'Reminiscences,' it might be inferred had been brought about by his reading the 'Harvard Memorial Biographies.'

—A project has been formed of presenting to the University of Aberdeen a portrait of Prof. Alexander Bain, as a memorial of his twenty years' services in that institution, just concluded, and also to found a Bain medal to be given annually to the best scholar in philosophy and logic at Aberdeen. It is thought that from £600 to £700 will be required for this joint purpose. Mr. Daniel G. Thompson, 29 William Street, New York City, will gladly receive any American subscriptions to the memorial.

—A contribution to military hygiene has recently been made by Brigadier-General Ord, commanding the Department of Texas. Certain officers having complained of the insufficiency of the army ration for troops in active service, a circular letter from department headquarters was addressed to post-commanders and surgeons requesting their views as to the necessity of an increase in the food supply. The answers to this letter form the basis for an interesting report upon the whole subject by Dr. Jos. R. Smith, Medical Director of the Department. The officers consulted express the opinion with great unanimity that some increase in the ration is desirable for troops in active service, one post-commander going so far as to assert "that all soldiers in the field or on fatigue-duty are constantly hungry." To throw light upon the causes of this deficiency of food, so generally recognized, Dr. Smith publishes tables showing the amounts accruing during a period of seventeen months to the various company funds from the sale of articles of food comprised in the ration, and also the amounts expended by the companies for articles of food, and for articles other than food. From these tables it appears that the whole amount received into the funds was $39,141 56; the amount expended, $36,101 36; and the amount "remaining in the hands of the company commanders available for food, if, in the judgment of these commanders, it was necessary or desirable so to use it," was $5,983. The same tables also show that $3,124 64 was spent for articles other than food, and that all the companies, save four, report expenditures of this sort, the largest amount thus expended by any one company being $337 56. From another table it appears that the so-called "bake-house savings" at the various posts, which really represent the difference in value between the bread issued to the soldier and the flour allowed him by law, amounted to $12,965 52.

—A consideration of these facts leads Dr. Smith to the conclusion that it is not so much the insufficiency as the injudicious management of the army ration which causes the difficulties complained of. He calculates that "if the soldiers had received three whole rations, or the money value thereof, in the shape of food, all the troops in the field in this department, for seventeen months, could have received the extra issue of flour and beef or bacon recommended and considered sufficient, and have still available for the purchase of food $8,123 20"; and he accordingly makes recommendations intended to secure this result. The defects of the present system of supplying food to the Army have frequently been pointed out, the deficiency of the bread supply being the most common cause of complaint. Before the war of the Rebellion 18 oz. of "bread or flour" were issued to the soldier. During the war the ration was raised to 22 oz., and since the war restored to its former amount. Army medical officers appear to be generally of the opinion that this smaller amount, when still further diminished by the deduction of the "bake-house savings," is insufficient for troops in active service. Thus, we find in Circular No. 8 of the War Department, published May 1, 1875, that Dr. J. S. Billings, in his report on the Hygiene of the United States Army, endorses the recommendation of Surgeon Glover Perin, Medical Director Department of the Missouri, that the bread ration be raised to 22 oz. of flour or soft bread, except for troops on fatigue duty, who should receive 24 oz. This opinion derives support from the fact that an increase of the bread ration was found to be necessary during the war, and that the War Department has, by General Orders No. 42, March 25, 1875, allowed department commanders to issue 22 instead of 18 oz. of bread at posts where fresh vegetables cannot be raised. It would seem as if the difficulties complained of could be met by an extension of this discretionary power so as to allow department commanders to increase the bread ration whenever in their opinion the necessities of the troops require it.

—Mr. William Beach Lawrence, who died in this city on March 26 after a lingering illness, was a man of unusual attainments. As a public character he belonged, both from his advanced age and his temperament, in the last generation. He was born here in 1800, graduated in Columbia College at an early age, and after three years at law went abroad for further study, carrying with him letters which introduced him to the acquaintance of foreign scholars and statesmen. In 1823 he returned and began the practice of his profession. Three years later he went to London as Secretary of Legation, where, upon the resignation of Albert Gallatin, he discharged the duties of American Minister in several delicate and difficult matters in such a manner as to win the warm commendation of Monroe and Clay, then Secretary of State. At this time he formed the acquaintance of Bentham, Grote, Sir John Bowring, and others, and interested himself in the economic and political struggle then in progress in Great Britain. Relieved of his official duties by Jackson, he betook himself to Paris and literary studies, and at the house of Marbois, whose work on Louisiana he translated, met Guizot, Villemain, and Cousin, and was a constant attendant at the lectures of the Sorbonne. In 1829 he again returned to America, lectured on political economy at Columbia College, and contributed to the *North American* and other reviews articles upon law, literature, art, and diplomacy. Subsequently he formed a partnership with Hamilton Fish, earned a reputation for arguing questions involving abstruse principles of jurisprudence, and interested himself in public enterprises and improvements, the Erie Railway and High Bridge among others owing much to his zealous activity. In 1850 he removed to Newport, where he resided thereafter, was elected by the Democratic party Lieutenant-Governor of Rhode Island and soon after became Governor. The next year he was a defeated candidate for the latter position, and never afterwards held public office, though he was more or less active in the political counsels of his party, and did more than any one else to confer dignity upon its hopeless numerical inferiority in his adopted State. His main title to remembrance, however, is not at all political, but rests upon his authority as a student and expositor of international law. In this branch of his profession he had no contemporary superior in this country, and the results of his labors in its different ramifications are embodied in treatises on 'Visitation and Search' and on 'Disabilities of American Women Married Abroad' among various others, his editions of Wheaton's 'Elements of International Law,' his annotations to the second of which greatly exceeded the original publication, and an exhaustive work of his own on the same subject in French, the third volume of which has appeared, but which his death probably leaves incomplete. His arguments before the Joint Commission appointed by the Treaty of Washington and a course of lectures delivered at the Columbian University in Washington, where he had distinguished audiences, were the most important of his recent labors.

—A recent issue of the Bulletin of the Census Office shows approximately the distribution of the population of the United States, according to elevation above sea-level, in 1870 and 1880. The following is the portion of the table which relates to the present population of the country:

Grades of Elevation. Feet.	Area—Square Miles.	Population.	Pop. per Sq. M.	Percentage of total.	Percentage below each Grade.
0 to 100	181,000	9,152,003	50.3	18.25	18.25
100 to 500	410,000	10,775,250	26.3	21.48	39.73
500 to 1,000	554,300	19,025,617	34.7	37.93	77.66
1,000 to 1,500	367,400	7,903,811	21.5	15.76	93.42
1,500 to 2,000	180,000	1,876,885	10.4	3.74	97.16
2,000 to 3,000	293,500	664,851	2.2	1.33	98.49
3,000 to 4,000	234,000	128,348	0.5	0.26	98.75
4,000 to 5,000	282,400	166,545	0.6	0.34	99.09
5,000 to 6,000	200,000	271,321	1.4	0.54	99.63
6,000 to 7,000	153,000	94,989	0.6	0.19	99.82
7,000 to 8,000	78,000	15,053	0.2	0.03	99.85
8,000 to 9,000	43,000	24,947	0.6	0.05	99.90
9,000 to 10,000	24,000	26,846	0.9	0.05	99.95
Above 10,000	25,000	26,400	1.3	0.05	100.00

From this table it appears that nearly one-fifth of the population of the country lives at 100 feet or less above sea-level. This includes most of our sea-coast towns and cities, and the immediate sea-board of the northeastern States, with the low coast and the swamp regions of the middle and south Atlantic and the Gulf States, as well as most of the alluvial regions of Louisiana, nearly all of Florida and Delaware, and the Eastern Shore of Maryland. In the next grade, 100 to 500 feet, is comprised rather more than one-fifth of the population. It includes the greater part of the population of the Atlantic and Gulf States, excepting those on the immediate sea-board. In the South the proportion within this grade is decidedly greater than in the North. Besides the remainder of Florida, Mississippi, and Louisiana, this grade comprises all of Alabama and Georgia excepting the mountainous sections. It covers a broad belt in Texas and nearly all of Arkansas, while Western Kentucky and Tennessee, Southern Ohio, Indiana and Illinois, and Southeastern Missouri also contribute to it. Excepting the population on the immediate sea-coast, it comprises the principal part of the population of California and Oregon. Nearly all of the cotton, sugar, and rice-belt of the South is comprised in this and the preceding grades. Between 500 and 1,000 feet are found upwards of 19,000,000, or more than one-third of the population, making altogether more than three-fourths of

the people of the country who are living below 1,000 feet. The contour at 1,500 feet above the sea is practically the upper limit of population in that part of the country east of the 98th meridian. The great prairie region of the Mississippi valley and the Northwest, which produces the greater part of the grain product of the country, lies between 500 and 1,500 feet above the sea. No less than 97 per cent. of the total population live below 2,000 feet, while only 56 per cent. of the national area is thus involved. The area between 2,000 and 3,000 feet corresponds generally with the debatable ground between the arid region of the Cordilleran plateau on the west and the fertile valley of the Mississippi on the east. It forms a barrier beyond which dense settlement will never pass. Of the three per cent. of population remaining above this grade, nearly one-half is in this debatable land, where, during some seasons, irrigation is required for maturing crops, in others not. Beyond 3,000 feet the mass of the population is between the contours of 4,000 and 6,000, which include most of the plains and valleys—*i.e.*, the inhabitable portions—of the Cordilleran plateau. Within these grades is the line of settlements along the eastern base of the Rocky Mountains, and the Mormon settlements in the great basin. The small bodies of population at still greater elevations are entirely composed of mining settlements, and are located mainly in Colorado, New Mexico, Nevada, and California.

—The density of population is naturally greatest in the lowest grade, where there is, in the Northern and Middle Atlantic States, a very large urban population. The next greatest density is between 500 and 1,000 feet, in which are situated the large cities of the prairie States. Since 1870 there has been, of course, an increase of population in all the grades, while the movement has been slightly toward the greater elevations. The first three grades have not held their own proportionally, as the others have gained at their expense. The percentages of absolute increase are as follows:

0 to 100	.27 per cent.	4,000 to 5,000	.98 per cent.
100 to 500	.25 "	5,000 to 6,000	1.00 "
500 to 1,000	.26 "	6,000 to 7,000	.62 "
1,000 to 1,500	.41 "	7,000 to 8,000	1.39 "
1,500 to 2,000	.58 "	8,000 to 9,000	2.37 "
2,000 to 3,000	.84 "	9,000 to 10,000	37.35 "
3,000 to 4,000	.62 "	Above 10,000	49.57 "

Between 1,000 and 3,000 the increase is mainly from immigration to the new and heretofore unsettled regions of Texas, Kansas, Nebraska, and Dakota, while the increase in the higher grades is due almost entirely to the newly-awakened interest in mining in the States and Territories of the Cordilleran plateau. A computation based upon the rather insufficient data at hand shows that the mean elevation of the population of the United States is about 700 feet, while the mean elevation of the surface is approximately 2,600 feet.

—Dr. Damrosch has brought the third season of the Symphony Society to a very satisfactory conclusion. The sixth and last concert, which took place on Saturday, was, both as regards the arrangement of the programme and the performance, by far the best which has been given by the Society this winter. The opening number was Wagner's overture to the "Flying Dutchman," a composition which in length and character resembles rather a symphonic poem than an orchestral introduction to an opera. Signor Galassi followed with a scene from the same opera, which he rendered with exquisite taste. The novelty of the performance was Berlioz's setting of Béranger's celebrated ode on the death of Napoleon, "Le Cinq Mai," which, on its first performance in France, at the time when the Emperor's remains were brought from St. Helena, caused a profound sensation. The composition is long and of a somewhat monotonously gloomy character. Signor Galassi undertook the vocal part, with the assistance of a chorus of male voices, but the work nevertheless failed to produce a favorable impression on the attentive audience. A brilliant performance of Berlioz's "Carnaval Romain" and of Beethoven's Seventh Symphony terminated the concert.

—The Charleston *News and Courier* professes to have seen "a sample of the letter-paper used by a prominent lawyer" of South Carolina, "in his general correspondence," with the following imprint:

"OFFICE OF ——— ———,
———, S. C., 188 .

"*To Colonel* ——— ———:
"DEAR COLONEL:—"

The editor infers from this that a clear majority of the male population of the State must be colonels, and from an historical retrospect of the growth of military titles in this country—from the "leftenant" of the Revolution to the grade recognized in the letter-sheet—concludes that the time is not far off when invention must supply "an easy American word indicative of a higher military rank than any we now possess." Those who remember the era of captains and majors know by experience that there has been a real progress as described, but in South Carolina it appears to have been less rapid than in the newer region of the Northwest. Has the *News* never heard the story of the puzzled foreigner, travelling eastward from the Pacific coast, who found himself at every stage accosted by an inferior title, until at Chicago he was simply a Colonel? His curiosity to learn whether his appearance justified a military appellation was rewarded by the reply: "No, you don't look much like a General, but I allow you might be a Judge."

—A work entitled 'Grundriss der Neuisländischen Grammatik,' by William H. Carpenter (Leipzig: Bernhard Schlicke), is, we believe, the first grammar of modern Icelandic ever composed in a tongue foreign to the author's own, and also deserves notice as the work of a young American scholar who has mastered both Icelandic and German. The most eminent Icelandic scholars in Germany have paid high compliments to Mr. Carpenter, both for the accuracy of his work and for the classical German in which it is written. Mr. Carpenter is, we understand, only twenty-seven years old; he graduated from the Utica (N. Y.) Free Academy in 1871, went to Cornell University in 1877, where his attention was drawn to the Norse languages by Professor Fiske; and to Europe in 1878, where he still remains, dividing his time between Germany and Iceland. The work contains an introduction of 14 pages, a grammar of 94 pages, and an appendix of 36 pages, containing a few lessons in reading and a vocabulary. The grammar is based on Wimmer's 'Grammar of Old Norse,' with merely such changes as the circumstances required, thus forming an excellent appendix to Dr. Wimmer's able work.

LIFE OF LORD CAMPBELL.—II.*

LORD CAMPBELL'S memoirs are an important contribution to the understanding of history. To our direct knowledge, indeed, either of the public course of political events or of the private springs of political action, his letters and his autobiography contribute nothing. He was a canny Scotchman, and perhaps never committed to paper all that he knew. His life is published within twenty years of his death, and his editors have probably kept back much that he committed to paper. Whatever be the cause, the Life does not reveal a single fact of importance not already known to the whole world. Yet for all this the book adds a good deal to our comprehension of the age in which Campbell lived. The difficulty in the intelligent study of the past is to seize and understand alterations in opinion, in modes of thought. To enable us to overcome this difficulty there is nothing on earth so valuable as biography. But of all kinds of biography the most valuable is autobiography, and of all species of autobiography the most valuable is the unconscious autobiography of an assiduous letter-writer. For the purpose, further, of entering into the spirit of by-gone years the letters of a commonplace man are of more importance than the letters of a person of originality. Genius, it has been constantly said, is of all times. The converse has been scarcely sufficiently remarked—that genius is of no particular time. To know an age is to understand the feelings of a crowd of ordinary men, who think the ordinary thoughts, who express themselves in the common forms of their generation. It is to the writings of every-day men, to the "Paston Letters" (so to speak) of a period, that critics turn with the greatest avidity. Campbell was, as we have already pointed out, an ordinary man of extraordinary vigor. His letters and autobiography are, therefore, exactly the productions which historical investigators often sigh for in vain. Not only professed students, but any educated reader who cares really to understand the past, will find in what Campbell says, and even in what he does not say, a key to much that perplexes every one who wishes in a measure to solve the perpetual problem, Wherein was it that consist the strange likeness and the equally strange unlikeness between the age of Pitt, during which Campbell passed his youth, and the age of Palmerston, in which he died?

One homely truth, for example, which all persons are constantly forgetting, is forced by Campbell's memoirs on the most inattentive reader: great events do not make great men. If ever there was an era which appears at a distance like an heroic age, it is the time when the whole strength of England was pitted in a struggle for life and death against the power of revolutionary and imperial France. It is difficult not to imagine that men were then of an heroic mould, and that even the run of mankind were lifted for a moment out of the well-worn ruts of commonplace existence. All such pleasing illusions are dispelled by the biography of the Scotch lawyer. He was not careless of public affairs; he enlisted among the volunteers; he thought it possible at one moment that he might be called into active service. But of the statesmanship and of the statesmen of his day he has little to tell save that their aims and their capacity were equally below the need of a gigantic national crisis. Take this passage at random from his correspondence; it is written in 1803:

"There is nothing stirring in the political world. Addington becomes more popular. Pitt continues in ignominious retirement. Fox is making ineffectual attempts to force his wife into company. Parties are in a sad state. I see no chance of war being speedily renewed, notwithstanding the vaporing on both sides."

In 1803, in short, as at most other times, mediocrity and pettiness rule

* 'Life of John, Lord Campbell, Lord High Chancellor of Great Britain. Edited by his daughter, the Hon. Mrs. Hardcastle.' In 2 vols. London: John Murray.

the world. A little later we find that "Pitt still clings to place with a convulsive grasp. Old Harry Dundas has got into a confounded hobble by the tenth report. No one is so pleased with it as the King. . . . It clearly appears that Dundas, in violation of a positive statute, allowed Trotter to play with the public money to a most monstrous amount and shared in the profits." So much for an age of heroes. A fancy, however, lingers in one's mind that the revolutionary leaders of France—the men whose deeds made the world turn pale—had, to compensate for their vices, a certain kind of fiendish greatness. Impressed with this idea, one scans with intense curiosity Campbell's account of his visit to France in 1802. The guillotine had, after all, not destroyed the whole of the revolutionists. Scores of them were still to be seen at Paris, and Campbell was just the man to thrust himself into any society a sight of which might gratify his curiosity. This is what he saw:

"Our visit to Tallien was a very curious one. We talked very coolly with him concerning the massacres of September, but nothing astonished me so much as the conversation that took place concerning his wife. You know she divorced him, and has since lived with a variety of other men. Yet he talked of her beauty, of her wit, of her amiable manners, of having been calling upon her, and of doing her the pleasure to introduce me to her acquaintance. There are many things here to make a Scotsman stare."

Meanwhile, what were the interests of our particular Scotchman, whose ordinary existence might, one imagines, be elevated by the influences of a memorable time? Is his mind filled with concern for the public welfare? Not at all. His thoughts are centred on the all-important question of entering the office of Tidd, the conveyancer. His chief regret at the renewal of war is that it deprives him of a projected tour on the Continent. In this instance we have no quarrel with Campbell. Ordinary life is made up of ordinary things. No national crisis really diverts, or can divert, the majority of mankind from the matters which concern them—that is, from their personal affairs.

Moreover, the time for political enthusiasm in England was not the period of the struggle with France, but the crisis in which Englishmen carried through in their own way that pacific English revolution which is known by the name of the Reform Bill. The acutest of modern political critics has pointed out that the present generation hardly understand the sentiments of 1832. There are certainly few things in history harder fully to grasp than the sudden enthusiasm for reform which surprised both reformers and the nation itself. The truth, perhaps, is that the rule of Toryism was itself a deviation from the natural course of English progress, and that the outburst of zeal for innovation was really not so much a desire for change as satisfaction at a return to the ideas which were beginning to prevail throughout the country before the outbreak of the French war. It is also probable that the very force of Tory sentiment had allowed abuses to accumulate to an absolutely unbearable extent, and that the ardor with which the nation longed for a new order of things is a pretty fair measure of the force with which every effort at political improvement had been suppressed for forty years. However this may be, it is quite certain that at the reform crisis people's political sentiments changed with a rapidity which surprised those who themselves experienced the process of conversion. Campbell's letters supply a curious proof of a change which must have gone on in the minds of many other persons. He was what would now be called a very moderate Liberal. Though connected by his work in the press with the Whig party, he does not seem, till a year or two before the Reform Bill, to have enrolled himself regularly amongst the Opposition. On February 27, 1831, Campbell writes to his brother:

"You are much too Radical for me. Anything which amounts to the formation of a new constitution I shall oppose, as I hold the formation of a new constitution to be an impossibility, and there has as yet been no instance of it in the world. A constitution may be modified and improved, but it must spring from time and accident, and not from design."

The dogma that in politics chance is a better guide than foresight is a curious piece of Eldonian philosophy, but no one can suppose that the writer who propounds it was ripe for Radical innovations. On March 1 the Reform Bill is introduced; on March 2 Campbell still writes as a stanch Tory: "You must be Radical indeed if the Ministers have not satisfied you. We are quite appalled. There is not the remotest chance of such a bill being carried by this or any House of Commons." A day later: "The general belief is that the bill must be thrown out on the second reading. I expect Ministers will then resign and anarchy begin. I feel inclined, as a choice of evils, to support and even to speak in favor of the bill." Campbell did support the bill; he did speak in favor of it. He became the law officer of the reformed Cabinet. In less than a week he was transformed from a Tory into a modern Liberal. Are we to put the change down simply to interest? We are no admirers of Campbell, but we doubt whether the most obvious explanation of his conduct is the true one. He had plenty of foes and rivals; he lived in a time of vehement party spirit; but he was not held guilty of ratting. The truth seems to be that Campbell's interests jumped with a genuine change of sentiment. What happened to him happened to thousands of other men. Almost unconsciously the whole of a generation had changed their political tone. Respect for Eldon had been changed into admiration for Brougham. Men desired a new era. The Conservative reaction produced by the French Revolution was at an end. The Reform Bill startled the House of Commons, but it was hailed with satisfaction by the nation, and persons who had scarcely dared to breathe to themselves their own desire for changes in church and state suddenly spoke out when they found that thousands shared their wishes.

The Reform Bill and the welcome it met with were rather the sign than the cause of a revolution. If hard-headed men like Campbell were converted in a week, the cause of the phenomenon lies partly in the gradual sapping of the Tory creed which had gone on for fifteen or twenty years, partly in the contagious effect of general enthusiasm. Englishmen of 1880 hardly understand the men of 1832, because the pacific Whig revolution has swept away the evils hatred to which generated something like revolutionary fervor. It is probable, indeed, that the aggregate capacity for enthusiasm is about equal in different ages. It is quite certain, however, that different generations are excited to interest or enthusiasm by different topics. Throughout Lord Campbell's life one may trace the existence, even in the mind of a very cool-headed and unenthusiastic man, of sentiments which hardly exert much influence on even enthusiastic Englishmen of the present day. But one should carefully note, on the other hand, that the generation of which Campbell was the commonplace representative certainly did not share in some moral and intellectual interests which tell with irresistible force on modern Englishmen or Americans. From the beginning to the end of Lord Campbell's life you will find scarcely an allusion to religious or to theological speculation. He probably shared the opinions of his father-in-law, who, after having spent his life in bamboozling juries, solemnly records the obviously sincere conviction that the truths of Christianity were established on grounds so clear that they could not fail to commend themselves to the judgment of twelve unbiassed jurymen. Lord Abinger was, in his way, a very able man indeed. Campbell, though without a touch of genius, possessed an amount of hard common sense of which few men can boast. It is highly probable that in any case such men might be little inclined to theological speculation or scepticism. What, however, is worth noting is that they both took up quite naturally an attitude towards religious scepticism which could hardly be occupied in the present day by two men of equal force of character. Here, as elsewhere, one learns the one essential lesson to be gathered from biographical history, that not so much definite opinions as the whole attitude of mankind towards political, scientific, or theological doctrines will be found to differ from age to age, and may change fundamentally within the lifetime of one individual.

MARTIN'S 'THE CHINESE.'*

THIS volume contains fifteen papers intimately connected with the intellectual condition and political prospects of the Chinese. Those who are interested in learning some of the mental features of this great and active mass of people, now rapidly advancing in their knowledge of science and religion, will sincerely thank Dr. Martin for thus rendering them accessible. Fifty years ago the French orientalist, M. Abel Rémusat, collected a second series of his own papers upon topics relating to Eastern lands, which he called 'Mélanges Asiatiques,' the four volumes together making a worthy monument of the learning, accuracy, and good sense of their author. The contrast in the position of China now and when those papers were issued ought to convince the most sceptical as to the possibility of her advance in everything which makes a nation great. Another equally suggestive contrast, indicating the altered state of the Eastern world, is to be found in the circumstances which have called forth Mr. George F. Seward's work on 'Chinese Immigration,' designed to show the impolicy and injustice of the opposition to the Chinese coming to or remaining in this country. Its author was recently the representative of American diplomacy at Peking; while Dr. Martin, at the head of the college at the same time, illustrated the learning and philanthropy of his native country.

This volume is appropriately dedicated to Prof. William D. Whitney, and in a prefatory note its author informs him that most of the essays have been already published in China under the title of 'Hanlin Papers,' and are now "offered to you and the public only as a bundle of *Beiträge*—a small contribution towards the better understanding of China and the Chinese." Out of the seventeen papers four are likely to attract the most attention in this country, though all will be valuable to students in China itself. These are "Competitive Examinations in China," "The Ethical Philosophy of the Chinese," "The Renaissance in China," and "The Worship of Ancestors in China." In all of them the remarkable versatility of their author attracts attention, and his manner of weaving in references to European and classical literature by quotation, illustration, and argument gives picturesqueness to the style and suggests new trains of thought. It is now more than thirty years since he reached China as a missionary in the employ of the American

* 'The Chinese: their Education, Philosophy, and Letters. By W. A. P. Martin, D.D., LL.D., President of the Tungwen College, Peking.' New York: Harper & Brothers. 1881. 8vo, pp. 320.

Presbyterian Board of Foreign Missions. This church had established a large and active mission at Ningpo as early as 1845, and already had schools, a hospital, chapel, printing-office, and foundry in successful operation. Here Dr. Martin remained about ten years in connection with it, and then moved to Peking in 1863 to open a new mission, in which he was ere long joined by associates, who still carry it on. In 1869 he was invited by the Chinese Foreign Office to take entire charge of the *Tungwen Kwan*, or College of United Literature, which had been founded about five years before, but had languished and somewhat discouraged its patrons for want of a suitable head. He soon revived it, and has since made it an institution useful to its supporters and creditable to its faculty. He refers to its formation on page 95, and describes the neat way in which the serious opposition to it, as a dangerous innovation of foreign origin, was neutralized by the Emperor requiring its critics to do better, and giving their leader, Wo-jin, at that time the Prime Minister, a *carte-blanche* to carry out their wishes. They had neither inclination nor ability to take up the gauntlet thrown down to them.

Such are Dr. Martin's antecedents. His title to a hearing on the subjects he has taken in hand is indisputable. We shall not, however, be expected to discuss the merits of these essays, and we limit ourselves to noticing a few points. The analysis, in that on "Ethical Philosophy," of a chart prepared by a native scholar to give his disciples a synopsis of the entire range of human obligations, opens to our view a singular effort of an inquisitive mind to classify knowledge. It naturally touches such a wide range of subjects in the effort to follow out the plan of the chart that his pupils must have been more wearied than instructed. In explaining its scope Dr. Martin gives the following summary :

"On this chart we have a projection of the national mind. It indicates the high grade in the scale of civilization attained by the people among whom it originated, exhibiting all the elements of an elaborate socialism. Political ethics are skilfully connected with private morals, and the virtues and vices are marshalled in a vast array, which required an advanced state of society for their development.

"The accuracy with which these various traits of character are noted implies the same thing; and the correctness of the moral judgments here recorded infers something more than culture—it discloses a grand fact of our nature, that, whatever may be thought of innate ideas, it contains inherent principles which produce the same fruits in all climates. . . .

"It would be superfluous to vindicate the Chinese from the charge of mental inferiority in the presence of that immense social and political organization which has held together so many millions of people for so many thousands of years: and especially of arts, now dropping their golden fruits into the lap of our own civilization, whose roots can be traced to the soil of that ancient empire. But a strange defect must be admitted in the national mind. We think, however, that it is more in its development than in its constitution, and may be accounted for by the influence of education. If we include in that term all the influences that affect the mind, the first place is due to language; and a language whose primary idea is the representation of the objects of sense, and which is so imperfect a vehicle of abstract thought that it is incapable of expressing by single words such ideas as space, quality, relation, etc., must have seriously obstructed the exercise of the intellect in that direction. A servile reverence for antiquity, which makes it sacrilege to alter the crude systems of the ancients, increased the difficulty; and the Government brought it to the last degree of aggravation by admitting, in the public-service examinations, a very limited number of authors, with their expositors, to whose opinions conformity is encouraged by honors, and from whom dissent is punished by disgrace. These fetters can only be stricken off by the hand of Christianity; and we are not extravagant in predicting that a stupendous intellectual revolution will attend its progress" (pp. 145–148).

This extract exhibits an instance of rather careless reasoning which is not unique in these papers. For, if the Chinese mind has been hampered to such a degree by the language it has been obliged to employ to develop its ideas, that it has no words to express some ideas, while the result of the ideas it has developed has been the immense organization which has held together for so many thousands of years, how could the Government, whose members were trained only in this language and its ideas, adopt other texts and other authors than those familiar to its people? Would Dr. Martin have their examiners take authors they had never heard of, and which were written in languages they could not read? He seems to expect results without adequate causes.

In his paper on ancestral worship we find much that is suggestive respecting the position of this important feature of the national faith, its influence on the national character, and its relation to Christian doctrine. His inclination to explain away its subtle and deep opposition to the demands of the Bible, by making it merely the ceremonial of filial duty, is like that of Ricci and other missionaries of the Roman Catholic Church. Every one conversant with their discussions will recognize the same views that the Jesuits upheld, and which have found advocates ever since. Dr. Martin thus refers to its favorable results upon the social life of the Chinese :

"The worship of ancestors strengthens the ties of kinship, and binds together those family and tribal groups on which the Government so much relies for the control of its individual subjects. The family temple serves for a church, theatre, school-house, council-room, and indeed for all the varied objects required by the exigencies of a village community. Domains attached to it for the maintenance of the sacrifices are held as common property, and glebe-lands are often appended which are devoted to the support of needy members of the widely-extended connection. I have seen a town of twenty-five thousand people all belonging to the same clan and bearing the same family name. A conspicuous edifice near the centre bore the name of *Shetsu Miao—i.e.*, temple of our First Ancestor. Here the divergent branches of the family-tree met in a common root, and all the citizens, under the cloud of incense arising from a common sacrifice, were led to feel the oneness of their origin, though separated it might be by half a millennium. Such a village represents the growth of a banyan-tree—the most distant column in the living arcade, though resting on a root of its own, still maintaining a vital connection with the parent stock.

"Aside from its social and economic relations, this form of worship exerts a religious and moral influence beyond any other system of doctrine hitherto known to the Chinese Empire. In a sceptical world, and through ages not favored with that revelation which has 'brought life and immortality to light,' it has kept alive the faith in a future life. The orthodox son of Han regards himself as living and acting in the sight of his ancestors. He refers his conduct to their supposed judgment, and the comfort of his dying hour is largely determined by the view he takes of the kind of welcome he is likely to receive when he meets the shades of his forefathers. 'How could I look my ancestors in the face if I should consent to such a proposition?' is a reply which many an officer has given to a temptation to betray his trust. A motive which has such power to deter from baseness may also be potent as a stimulus to good; indeed, in respect to moral efficacy it would appear to be only second to that of faith in the presence of an all-seeing Deity" (pp. 266, 267).

After these utterances we are quite prepared to hear the writer's conclusion that "when the higher classes come to embrace Christianity in great numbers, they will readily leave behind them their Buddhism and their Taoism; but the worship of ancestors they will never consent to abandon, though they may submit to some such modifications as those which I have endeavored to indicate."

There is one negative feature of these essays which has attracted our attention. Considering that their author went to China as a missionary, and has been engaged in proselyting and educational labors for thirty years, he here shows much less faith in the transforming power of Christianity than we should have expected. His trust appears to lie in a different direction. "The doctrine of the balance of power, formerly limited in its application to the map of Europe, is now transferred to Eastern Asia, and it is under the shield of this principle alone that either China or Japan can hope to maintain her independence, or to go forward in that career of progress on which both have so auspiciously entered." We might also have looked for some references to the enormous difficulties to be overcome by the government and people of the Middle Kingdom in their attempts to elevate themselves to the standing he desires. A word of consideration would have come naturally for their disadvantages in the struggle, arising from ignorance, bad and weak government, and heathenism at home; as well as the overmastering power of outer nations which has forced from them the principle of exterritoriality that tends to interfere in everything in the internal administration. A careful and encouraging summary of what China has attempted during the last twelve years is added to the paper on the Renaissance; and its record is answer enough to the foreigners who clamor for rapid material progress chiefly in order that they may profit by carrying it out.

THE LAW OF RAILROADS.*

THE law of railroads is of comparatively recent growth. The editor of a digest has to go back only fifty years to cover all the cases upon a subject which now constitutes a well-defined body of law. Against 23 miles of railroad in the United States in 1830 there are now 85,000 miles. Within the ten years from 1870 to 1880 the average annual increase in lines of road was about 4,000 miles, to which it had steadily risen, the number of miles laid in 1879 exceeding that of any previous year since the "railroad years" of 1870–3. Of course such an enormous growth in the subject and nucleus of possible litigation caused, both in England and the United States, a corresponding increase in the number of railroad statutes and decisions. One railway alone (the London and Northwestern) has required for its regulation no less than two hundred acts, while the railroad cases are numbered by thousands.

Mr. Pierce's book, though entitled a "treatise," is, for the most part, an abridged digest, or, as stated in his preface, "a compact statement of the law of railroads." Some parts of the work are of especial interest and usefulness to the business public, notably the chapters on "Municipal Subscriptions" (pp. 87–109) and "The Capital Stock" (pp. 110–129). For some years it has been the custom of railroad companies to procure, under legislative authority, corporate subscriptions to their stock from the different counties through which the proposed line was to run. The proposition would be submitted to popular vote, and in sparsely-settled districts the inhabitants were easily induced, under the belief that great advantages would accrue to them,

* 'A Treatise on the Law of Railroads. By Edward L. Pierce.' Boston: Little, Brown & Co 1881.

from the locating and working of a railroad in their vicinity, to pledge the credit of their county for hundreds of thousands of dollars, the subscription being paid for by an issue of county bonds to the amount subscribed. These bonds were often put upon the market by the county authorities at rates much below their face-value, the proceeds going to the railroad companies, who were thus provided with the ready money necessary to push their schemes. All went well until the people began to feel the weight of the special tax imposed to pay off the interest coupons, and were led to reflect that this would be terribly increased when the bonds ran out and the principal fell due. Straightway counties which had rashly incurred liabilities amounting to thousands set to work to find pretexts for avoiding payment of the hundreds due as interest. All sorts of technical defences were raised, and in some States judges owed their elevation to the bench mainly to the popular belief that they entertained opinions adverse to the validity of the bonds. In the Circuit Courts of the United States, however, men like Judges Woods and Wallace promptly suppressed such "indecent defences," and declared that where the legislature had given a county power to make such subscriptions, and bonds had been issued in payment, containing upon their face a recital, signed by a duly-authorized official, to the effect that the conditions necessary to their issue had been complied with, the good faith essential to all commercial transactions forbade the counties to go behind such a certificate and prove latent defects in their issue against parties who had purchased the securities for value, relying upon the good faith of the counties which had issued them. This sound and honest conclusion was upheld by the Supreme Court of the United States. It has been left for the highest appellate court of this State to put forth, in a case decided a few weeks ago, a contrary doctrine. What effect this decision will have upon an important class of negotiable securities it is impossible accurately to foretell; but investors should be warned that Virginia is not the only State where a doctrine of repudiation has secured judicial encouragement. If this opinion had been published a month earlier it would doubtless have led Mr. Pierce to modify the statements in his paragraph on "Conclusive Acts and Certificates" at p. 104.

In the chapter upon "Eminent Domain," treating of the remedy afforded a land-owner whose property has been "injuriously affected" by the "operation" of a railroad, the author states accurately the law as it obtains in this country, but fails to note certain interesting distinctions between the statutory remedy in the United States and in England, such as we should have expected to find appended to the three pages which he devotes to the "Land Clauses Consolidation Act" and the "Railway Clauses Consolidation Act," passed by Parliament in 1845. As one would naturally infer from the temper of that body, the land-owner's rights, as against the corporation, are far more jealously guarded by the elaborate provisions of those statutes than by any similar enactments in this country. For example, although the statement undoubtedly holds good here, it is certainly incorrect to say that in England a land-owner can recover no compensation for the loss of business and good-will without any of his land being taken (p. 209). For the English courts have held that where, in the construction of a railway, the approach to a shop has been made inconvenient the owner could recover compensation for the falling-off of his trade.

On the other hand, when we come to decisions relating to personal injuries caused by railway accidents we find that the leaning has been the other way; and in our earlier "injury" cases complaints which in England would have been promptly dismissed by the court were allowed to go to the jury, at whose hands a verdict against the company was pretty sure to carry a round sum by way of damages. So marked became this probability that the corporations—which the plaintiff's attorney invariably took pains to stigmatize as "soulless harpies," "fleshless, bloodless, intangible creations"—were forced to secure the passage of acts limiting their liability in cases of death by accident. So that, whilst in England under a similar statute (Lord Campbell's Act) the surviving widow and children may obtain damages, computed with reference to the rank and wealth of the deceased husband and father, in this State the law will not admit the interest in the life of a Vanderbilt to be worth to his widow or child more than $5,000. Ex-Judge Porter wittily characterized this tendency to favor the individual as against the corporation in one of his arguments for the Elevated Railroad, where he said that matters had come to such a pass that "to *be* a corporation was negligence *per se!*" This excessive leaning on the part of juries against the railroad, in actions for personal injuries, doubtless developed to an extreme degree the defence of "contributory" negligence; and the reaction in the courts of England, Massachusetts, and perhaps New York, against the rigid application of that doctrine, without attempting the confusing method, which prevails in some of the Western States, of trying to balance off the different degrees of negligence, bids fair to modify within reasonable limits what seemed likely to become the inflexible rule, that any act on the part of the plaintiff which contributed in the slightest degree to cause the accident would suffice to defeat his recovery. This reactionary tendency can be plainly seen in the judgments delivered by Lord Penzance and his colleagues in the late case of Radley *vs.* The London and Northwestern Railway, to which Mr. Pierce refers in his margin (p. 324), but without noticing the important deduction to be drawn from it.

Again, as Mr. Pierce remarks (p. 279), the doctrine once obtained that the company could not be held liable for the wilful wrong of their servants—a rule which involved much uncertainty and led to embarrassing conflicts of judicial opinion. A clear definition of the liability of railroad companies for the conduct of conductors, brakemen, and the like, whose employment brought them into direct contact, and often into conflict, with the public, was found to be absolutely necessary. It was soon seen that employees frequently performed their duties in an aggressive, overbearing, and injurious manner, and sometimes even took the opportunity to vent personal spite under the guise of official acts. So that early in the history of railroad law it became necessary for the protection of travellers to demand of the company that it should exercise such care in the selection of its servants, and supervise them so watchfully, that the latter would not perform their duties to the injury of the passenger. It has thus become the rule to hold the company responsible for wilful injuries done by employees under the pretence of performing a duty or carrying out orders. It requires no trained mind to perceive at once the necessity and soundness of such a rule.

We have failed to find in Mr. Pierce's work any allusion to the recent decisions relating to "palace-cars" and "sleeping-cars"—cases of importance to travellers in this country, accustomed to "cross-continent" journeys, and, since the introduction of the "Pullman coach" in England, of interest to travellers on some of the lines of railway there. It is well to bear in mind the peculiar arrangement under which this class of cars is run, the company who own them paying a fixed tariff to the railroad company, and employing their own conductors, porters, etc., and yet being subject to the general management and control of the train-conductor and the servants of the railroad company. Thus, whilst the latter is liable for accidents to the passengers resulting from negligence in managing and running the trains, it is not bound to watch over the luggage which the traveller takes into such cars with him. At the same time the traveller's chances of recovery for the loss of valuables so carried, in an action against the "sleeping-car" company, are slight. Its liability is not that of a "common carrier" nor an "innkeeper." So that the common practice of hanging one's clothing upon a hook at the head of the berth would seem to be at the owner's peril.

A Popular History of the United States: From the first discovery of the Western Hemisphere by the Northmen to the end of the Civil War. Preceded by a sketch of the prehistoric period and the age of the Mound-Builders. By William Cullen Bryant and Sydney Howard Gay. Vol. iv. (New York: Charles Scribner's Sons. 1881.)—In reviewing the first volume of this history (see the *Nation*, No. 592) we expressed the expectation that "Mr. Bryant's own recollections of the anti-slavery contest" would be "the most valuable and characteristic feature of the entire work." Mr. Bryant's regretted death has, of course, disappointed this expectation; nevertheless, we were not without hope that he had put upon record some of these recollections, and left them as materials in the composition of the present volume. This, however, appears not to have been the case. But it is a real occasion for surprise and regret that this part of the history, which we expected to be freshest and most instructive, is precisely the most meagre and least satisfactory of the whole. The want of proportion in the composition of the book, of which we complained at the first, has made it necessary to crowd into this volume the events of eighty-five years, and to put us off with a bare sketch where we needed the fullest and most graphic narration. No political contest in history can compare in importance and in picturesque interest with those which led to the Civil War, except the Fall of the Roman Republic and the English Civil War of the seventeenth century; but the ten years before the war are dismissed in little over thirty pages, in which two so important events as the Ostend Manifesto and the Personal Liberty Bills are not even mentioned. When a German historian promises to complete a work in four volumes, all the world knows that the four volumes will hardly contain his introduction, and that he will go lumbering along, adding new volumes as long as he lives. We do not like this method; but as little do we like an original plan so persistently followed as to destroy all proportion in the work and injure some parts of it by hurried and incomplete work. One is struck throughout the volume with the embarrassment experienced by the editor in the endeavor to make use of his new and interesting material without overrunning his limits; so that, while the volume as a whole is rather a sketch than a history, certain portions give almost the effect of elaborate monographs upon special points. A very interesting example of this is the account (p. 140) of the intrigues with Miranda in 1799, and the contemplated attack upon New Orleans, then in the possession of Spain. This episode is barely mentioned by Hildreth—and that without any comprehension of its real character—and appears from a note on page 143 to be essentially a new piece of information.

The haste of composition, or rather the oppressive sense of the need of brevity, is noticeable in very many details. On page 280, in speaking of the election of President by the House of Representatives in 1825, it is

said that "a choice was to be made between the three highest candidates, Jackson, Adams, and Crawford"; but why no further mention is made of Crawford, and why the choice was in the end only between Jackson and Adams, does not appear. In the controversy between the State of Georgia and the Cherokees (p. 289) it is said that the Cherokees, as a foreign state, "could not bring a case before the Federal courts." Why? Art. iii. section 2 of the Constitution provides explicitly for controversies between a State and foreign states; and the eleventh amendment only excludes "citizens or subjects of any foreign state." We are left wholly in the dark as to the real ground of the plea, and also as to the decision of the court in the matter. The faction which nominated Mr. Douglas in 1860 is said (p. 432) to have "been satisfied with the platform of four years before, while the Southern delegates insisted," etc., but we can find no statement of what the platform was four years before. A question of constitutional law is tacitly decided (p. 345) in the words, "the acting President, Vice-President Tyler." But it appears to us clear that Mr. Tyler was constitutionally President. The Constitution says (Art. ii. section 6) "the same shall devolve on the Vice-President," *same* evidently referring to *office;* while below it says that in case of removal, etc., "both of the President and Vice-President" Congress shall determine "what officer shall then *act* as President."

One more criticism, and we are through with fault-finding. We are not of those who would have a historian devoid of human sympathies, or who believe that it is impossible to preserve impartiality side by side with a hearty sympathy for a cause or a principle. We would not have the great contest of slavery and freedom told without expressions of admiration, indignation, and rejoicing, where events call for them. Neither would we insist overmuch on the "dignity of history." But we must say that this narrative shows an occasional petulance and narrowness befitting the newspaper or the pamphlet rather than the deliberately expressed judgment of the historian. Is it true (393) that the Southern aristocracy were "an ill-born, ill-bred, uneducated, and brutal handful of slaveholders"? Is it worth while to suggest (p. 415) that President Pierce's tears at the news of the sack of Lawrence were "possibly maudlin tears"? Is it fair to say (p. 449) that the "War Democrats" joined the Republicans, while "the party they abandoned preserved its name, its organization, and its sympathies with slaveholders and rebels"? or to speak (p. 511) of "McClellan's friends, the 'Copperhead' party of the North"? Surely a man who exposed his life for the Union has a right to be called a "War Democrat."

As we remarked of the last volume, the military point is perhaps the best. The war of the Rebellion is fully and very clearly and graphically narrated. So it is with the Mexican War, the War of 1812, and the closing years of the Revolutionary War—of so many widely separated wars does this volume give the history. The intervening periods are but sketches—excellent in the main, although defective in some details. Now that Mr. Gay has completed his task, and finished Mr. Bryant's history within the limits originally set, we hope he will go on with an independent work, and give us a history of the United States from the formation of the Constitution to the present time. There is not in existence a book which covers this ground satisfactorily. We have an abundance of colonial histories, and the Revolutionary period has been fully and adequately treated. But the most important part of our history is that in regard to which it is hardest to get information. We hoped that this volume would fill the gap, but this was impossible from the nature of things. Mr. Gay has shown that he possesses the qualifications, and he has his materials collected. He could not do a better service to his country and to literature than to undertake this task with no other conditions than to make a thoroughly satisfactory work.

The New Virginians. By the author of 'Junia.' 2 vols. (Edinburgh: Blackwood; New York: Scribner & Welford.)—These entertaining volumes comprise the substance of sixteen letters written by a clever Englishwoman from Piedmont, Va., to some friend at "home." They are epistolary only in form, having been pruned of everything personal; but to American readers the interest of them will be mainly personal, and the narrative dependent upon the incidental portraiture of the narrator, which, since she is anonymous, it may be said with propriety has unusual attractiveness. She begins with her arrival at Norfolk some eight or nine years ago, we infer, accompanied by "E.," presumably her husband, and "M.," a near female relation of some sort. Proceeding to the backwoods they join "A.," who has been some time in the country, and, after a dismal experience of "boarding," build themselves a house and begin farming. They have a troubled time, and one wonders that the writer can speak of being so happy as she occasionally does, until the resources of the party in British self-respect discover themselves. They are not entertained as angels, and only ascertain after woful experience that the land has been cleared for thirty years and is expected by nobody to yield much, that pigs and cows must be shot now and then to keep others out of their preserves; that the negroes and poor whites, who are their sole neighbors, are thriftless, untrustworthy, and superstitious, and that there is no prospect of ever getting their surroundings as much to their mind as they easily could in the home they have left behind them. The author is not only clever, as we said, but highly accomplished. She is apparently an excellent botanist, something of an entomologist, once tried her hand at dissection, has travelled widely in Europe, has a thorough understanding of music, is evidently well read, and writes very vividly and simply of what she observes with much keenness and closeness. The story of such a woman suddenly driven to washing and cooking, not only for herself but for her negro servant whenever the latter is surly, awakened from sleep by rats and mice running over her face, milking her own cow and digging holes for her grapevines, living absolutely without social intercourse with any one but negroes and "crackers," amid surroundings which depress even them profoundly, and doing it all contentedly and light-heartedly, is a story of pluck that resembles heroism and cannot fail to be interesting. It is still more interesting, however, to observe that the simple process of unconsciously reflecting that her *entourage* is not English, but American, gives a filip to her existence, and makes it at times almost exhilarating. Even the negro has in this view a stimulating effect. She explains to one with severity that he ought not to use yellow paper in writing to a lady, attends a "baptizing" and hears a funeral sermon that fill her with comfortable disgust instead of mirth, and always speaks of "niggers," not unkindly and perfectly unaware that she is using a colloquialism. The "mean whites" of the neighborhood perform the same service. Their ignorance of all adaptation of means to ends, their whimsical vulgarities and abject poverty are very well described. But we have met with nothing more amusing in a long time than the author's scorn for the claim of connection with the English aristocracy put forth by two of them, and the satire with which she exposes the hollowness of it; unless it be her almost saturnine enjoyment at the unjustifiable use which another made of a "Peerage" lent her by the author—viz., the construction of a pedigree for herself out of it. Her pictures of both whites and "niggers," it follows, are less interesting as portraiture than as a disclosure of her own attitude. Of any sympathetic quality which might give them picturesqueness they are absolutely destitute—in some instances, we are justified in assuming a well-bred Englishwoman would say, *mutatis mutandis*, even to the point of brutality. The account of a funeral in vol. i. is an instance where the faulty orthoepy of the preacher is referred to in terms of the severest condemnation. We feel sure she had never heard the strictly American anecdote of the waiter who replied to a guest's complaint that he had found a button marked "U.S." in his hash—"What do you expect? Silk umbrellas?"

Such an attitude has its own picturesqueness, and, though it has often enough been remarked by ethnologists, it preserves a perennial charm. We fancy it must have been quickly perceived in the Virginia backwoods. The new settlers built their house without any guest-chamber, made no visits or next to none, and evidently saw no F.F.V.'s but the bogus ones they at once found out. As the author says, "It is strange how this desire to shut out intruders—for that is what it is—will cling to us English, travel as we may"; and it was probably strange to the Piedmontese. The "niggers," we think it will be surmised, found it not only strange but agreeable; since it is infallibly accompanied by a certain ingenuousness which "Aunt Caroline," at least, appears to have regarded as credulity. Others also found a willing ear in which to whisper horrors. We dwell on this because it is the only explanation of a great deal in the volumes which is uttered with as much positiveness as if the writer had had trustworthy information in regard to what she had no experience of, and as if her Piedmont experiences were typical of American manners and customs everywhere. 'Martin Chuzzlewit' she discovers to be no caricature but "a literal transcription of facts." 'Uncle Tom's Cabin,' her other source of information about America before coming here, she learned to look upon with some suspicion, we infer. American cars are disfigured by tobacco-chewers, and those railway employés called porters in England are here termed "baggage-smashers." Americans never build for posterity, and so prefer wood to brick except when brick is cheaper; always have hot bread for breakfast; drink either not at all or else immoderately, and never dilute raw spirits before drinking them; and "shoot at sight," and have no vulgar prejudices about shooting victims in the back—the large murderous class being thus particularly unmanly, it is implied. Negro suffrage is "enough to make any Southerner lie down and die" (vol. i. p. 234), and, considering the prospect that the negro race is to be the dominant one in the South, "Were I a Southern woman, mine eyes would become dim and my cheeks furrowed with weeping for the desolation of my country" (vol. ii. p. 262). The Civil-Rights bill, in volume i., is "the last instance of oppressive legislation directed against this down-trodden country," and the author doesn't understand how Judge Hilton is allowed to close his hotel to "Jews equal in wealth and standing almost to our Rothschilds and Montefiores"; in volume ii. she has learned that a hotel is legally equivalent to the owner's private house, but there is the same indignation expressed and the same reference to Rothschild and Montefiore. It does not escape her acuteness that the North, though insulting the South with this bill, does not prevent harsh treatment of the blacks at West Point, nor would "one of those Nor-

therners who helped bring about the war have a black child in his house as a playmate for his children." Alas! nothing escapes her. The Le Mars *Sentinel* serves as an illustration of the undying hatred of the North for the South which will "crop out." "Crop out" strikes us as extenuation, considering that she has manifestly supped full with "campaign supplements." The account of American newspapers is unfavorable throughout. Like the entire community, where parents lose all control of their children after the first eight years (the effect being particularly bad upon the girls), they lack the sentiment of reverence. The manifestations of this are sometimes "merely laughable," but "what do you think of one paper, which, in order no doubt to please its Fenian subscribers," could make game of Queen Victoria? "What do you think of a London letter with the heading, 'Mrs. Guelph at Home'? To my mind there is as little wit in calling the Queen 'Mrs. Guelph' as in calling poor unhappy Marie Antoinette 'Widow Capet.'" The Ku-Klux is, or rather was, an organization to protect people "against a sudden insurrection of the negroes." The Yankee raids during the war are painted in as dark colors as they deserve; the negroes were terrified at the approach of their so-called friends, contrary to the usual impression; and of the Southern survivors of the war the most pitiable are said to have been those "luckless enough to fall into a Northern prison," out of which instead of a man came "a miserable skeleton, full of disease, perhaps half-blind or frost-bitten, starving." Pollard's 'The Lost Cause' is cited on Secession and other questions. Perhaps the most encouraging thing in the book is the following illustration of hyperbole, *i.e.*, as seen in the use of the word "planet": "Does a Democrat complain of the necessity of reform in the civil service? A Republican replies that there does not exist a better on this planet."

All this is attributable to ignorance and a hopeless Philistinism which prevents the consciousness of ignorance or any feeling of responsibility in writing about *res incognitæ*. The singularly superficial view of what is within her own every-day experience, however, and the consequent misconceptions of a singularly clever woman, one is inclined to ascribe to the quality remarked by a French traveller in India, who affirmed, "Les Anglais sont justes, mais pas bons." Very nearly the only good word our observant and just author has to say for the unhappy people whom she has found it so agreeable to be among and aloof from, is expressed with an unconsciously ironical felicity: "It is astonishing what acts of kindness people will perform here without appearing to think that they are doing anything extraordinary" (vol. ii. p. 183).

Life and Her Children. Glimpses of Animal Life from the Amœba to the Insects. By Arabella Buckley. 8vo, illustrated. (New York: D. Appleton & Co. 1881.)—A knowledge of the contents of this little book places one in possession of a very fair general idea of animal life from the protozoa to the articulata, inclusive. Though written for the young, it will find favor with the more advanced classes, with teachers in the common schools, and even with persons claiming considerable special knowledge in particular branches of natural history. It illustrates one of the most successful methods of teaching elementary zoölogy. As outlined in the introductory chapter, all animals are included in seven divisions. The first of these contains the slime animals—protozoa. In the second are placed the jelly-fish, the sea-anemones, and the coral-builders. The sponges are said to "form a sort of separate group hovering between the *first* and *second* division." For the third there are the star-fishes, sea-urchins, and sea-cucumbers. The molluscs form the fourth, the worms the fifth, and the articulates the sixth. The seventh comprises the vertebrates and is reserved for another volume. The selections from each division of characteristic types for description and illustration are well made. Readers are not confused by superabundance of detail. Our best authorities in the different departments have been drawn upon for the information given, and a tolerable idea of the results of their researches is thus furnished up to a very recent date. The order in which the various types are treated is intended to lead naturally from the lower to the higher, but no stress is laid on any theory of derivation. That the "seventh division has struggled side by side with the other six till it has won a position in many respects above them all," suggests a leaning toward the conservative belief in independent lines of descent for the different branches. There is evidence throughout the work of a close adherence to the facts as given by the authorities. The author appears to be one of the comparatively few popular writers able to suit science to the tastes of the unscientific without lessening its value. "She makes the miserable creatures as interesting as fiction, and seems to be telling the truth all the time." Peculiarities of structure and of habits in feeding, growing, reproducing, etc., are traced in a lively and entertaining style that can hardly fail to render the facts attractive and to impress them on the mind of the reader. Scientific names are given, but in such a way as not to interfere with the narrative.

The book is a good elementary work on the natural history of the invertebrates. Still, in the space of three hundred pages it could not pretend to be exhaustive. In consequence of incomplete statement, we notice here and there passages that may mislead. From the remarks on sponges it might be inferred that they are only taken by divers; from those on white coral, that it grows only in the "wild and stormy Pacific." Among minor faults are the "*quintillion* (1,000,000,000,000,000,000,000,000,000,000)," in brackets, p. 204, according to the English notation, and a number of such words and phrases as "tail" for the entire body behind the thorax, "hark back again" for return, "head to stern," etc., which might have been advantageously displaced by others. For a frontispiece there is a group which could exist only in the imagination of the artist. However perfect the individuals may be in such a congregation, naturalists find it ludicrous, and to others it is deceptive.

Victor Hugo: His Life and Works. From the French of Alfred Barbou. By Frances A. Shaw. (Chicago: S. C. Griggs & Co. 1881.)—This book might have been carried in the procession that lately marched through the streets of Paris to bear the homage and congratulations of the nation to Victor Hugo on his eightieth birthday. It is written in a spirit of glorification, but it hardly exaggerates the admiration of the French people for Victor Hugo. They call him the "master," the patriarch of letters in Europe, as Voltaire was in the last century and Goethe in the early years of the nineteenth. In England, in spite of Mr. Swinburne, and in America the estimate of Hugo is not quite so high. The taste of English readers is simpler than of French; we do not share their fondness for big words and fine phrases. In this national characteristic Victor Hugo is a very Frenchman; he is the most dramatic and passionate of them all; his imagination delights in "situations" and striking tableaux, and his expression takes the form of epigram and of antithesis to a degree that is sometimes wearisome and chilling. He thunders too often in a clear sky—a bad omen in a work of emotion. Aaron Burr said there is no such thing as a sublime style; the sublime is in the thought. When Victor Hugo's inspiration deserts him, as it does now and then, and his grand rhetoric flaps its huge wings awkwardly on the ground, we feel the truth of Burr's remark, and we think of circus-posters and show-bills, and if Barnum had been a literary man that he might have written like Hugo at his worst.

In spite of this and other shortcomings, the French are right in their appreciation of Victor Hugo. During his long life he has accomplished an enormous deal of work, nearly all of it good. He has won a very high place, if not the highest, in the three leading branches of literature—poetry, the drama, and romance. Like Voltaire, he has taken a keen interest in politics, and has persistently attacked at his personal risk a government he thought unlawful and despotic. It would be difficult to mention any other literary man who has occupied so conspicuous a position in Europe in the last forty years. Among French poets we think his claim good to the first place. We recommend readers who care for poetry proper, and who wish to get an idea of his range as a poet, to look over the 'Chants du Crépuscule,' the 'Voix Intérieures,' and the 'Rayons et Ombres,' all published before 1841. They will find passion and fire enough, yet but few traces of the "blind hysterics" that disfigure for English people much of his later work; indeed, in many of these poems there is a charming simplicity and pathos. Victor Hugo has accomplished what Mr. J. S. Mill considered the almost impossible feat of writing genuine poetry in the French language. He is a very great man of letters, who deserves the laurels his countrymen have placed upon his head.

This translation, as regards the sense, is fairly well done; as regards form, it is an interpretation rather than a translation, the French idiom showing awkwardly through the English dress.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Evans (A. B.), Leicestershire Words, Phrases, and Proverbs, swd	(Trübner & Co.)	
Floigl (Dr. V.), Cyrus und Herodot, swd	(Wilhelm Friedrich)	
Froude (J. A.), Cæsar	(Harper & Bros.)	$0 50
Littell's Living Age, vol. 148	(Littell & Co.)	
Mongredien (A.), History of the Free-Trade Movement in England	(Cassell, Petter & Galpin)	
" " " " "	(G. P. Putnam's Sons)	50
O'Reilly (J. B.), The Statues in the Block, and Other Poems	(Roberts Bros.)	1 00
Reiss (W.) and Stübel (A.), Necropolis of Ancon in Peru, Part ii	(Dodd, Mead & Co.)	7 50
Saintsbury (G.), Dryden	(Harper & Bros.)	75
Sanders (D.), Neugriechische Grammatik	(Breitkopf & Härtel)	
Scott (Mary E.), Keith; or, Righted at Last	(J. B. Lippincott & Co.)	
Semper (Prof. K.), Animal Life as affected by the Natural Conditions of Existence	(D. Appleton & Co.)	
Sharpe (Dr. W.), Cause of Color among Races, new ed	(G. P. Putnam's Sons)	75
Social Etiquette and Home Culture, swd	(Harper & Bros.)	20
Spofford (A. R.), American Almanac for 1881	(Am. News Co.)	
Stanley (Rev. A. P.), Christian Institutions	(Charles Scribner's Sons)	2 50
" " "	(Harper & Bros.)	50
Stewart (A.) and Long (G.), Plutarch's Lives, vol. 2	(George Bell & Sons)	
Winsor (J.), Memorial History of Boston, vol. 2	(J. R. Osgood & Co.)	

Fine Arts.

FOURTH ANNUAL EXHIBITION OF THE SOCIETY OF AMERICAN ARTISTS.

WITH an even stricter standard of selection than heretofore, the younger Society's exhibition this year is more catholic as well as more sustained. There are several canvases by painters who are commonly supposed to

be most at home at the Academy ; the variety thus obtained, however, being variety of manner rather than of merit, and thus arguing that the Society has found its proper function of signalizing general excellence rather than—as, rightly or not, it has been abundantly reproached for having done—of exploiting certain definite idiosyncrasies of art. The star picture is Bastien-Le Page's "Joan of Arc," purchased for an American bonanza gallery, and a sensation at the Paris *Salon*. It is a large canvas of undisguised ambitiousness, and less original than artificial in its points of divergence from the inspiration of Millet. The face of the Maid is dramatically conceived, and if there is any genius in the picture it is here. Upon the rest, too clearly composed of accessories to allow great vitality to the *ensemble*, abundant talent is expended, and, speaking strictly, thrown away. It is not, perhaps, open to the popular imputation of oddity, which it is nevertheless easy to anticipate—indeed, there is too little genuineness in its pictorial significance to distinguish it as a freak ; but it loses a certain impressiveness for the same reason, and its avoidance of the stupidities of the English Preraphaelitism, to which it is, in some sort, of spiritual kin, is only a relative advantage. Its clear-sighted consistency would be an absolute advantage in a composition by Blake, for example, upon such a theme, but it needs the accompaniment of more spirituality than Bastien-Le Page apparently possesses to make it of much service in producing a lasting impression. In fine, as it is not a great work it is a pity that it sets out to be great or nothing. In spite of much deftness of brush-work and liquidity of color we believe this much may also be said of the picture which fronts it on the opposite wall, and which is the only other work in the exhibition that challenges the ideal with equal boldness—Mr. J. Alden Weir's "Music," namely. Painters may well envy certain of its beauties, within the ability of few other men to compass ; as, on the other hand, painters may suggest a slimmer right arm, more flexible wrist articulation, and more dependence on the sufficient modelling, with less on an unpleasantly obvious linear bifurcation, to indicate anatomy. But as "Music," what is the meaning of the picture? What design could have underlaid the projection of it? Nothing, surely, properly belonging to the spontaneous genesis of a large ideal work. Mr. Weir had a splendid model, or, if he had not, the Venus of Milo would have served him as well, and, casting about to utilize her charms, decided after some thought to make her a muse of music rather than of epic poetry, hunted up a lute, and painted her leaning her left arm upon it, and looking every inch a splendid animal, full and sensuous as a Titian below the chin and beneath her folds of gauze, but with the features and the whole intellectual import of melancholy vacuity. To give such material as this a twist in the direction of ideality is to exhibit a lack of intellectual seriousness ; in other words, a "Music" like this is an inadequate recognition of the dignity of ideality in art, atoned for but meagrely by any possible exhibition of the resources of a palette. These Mr. Weir shows with equal distinction elsewhere, not only in his remarkable portrait of a gentleman, but in a still more remarkable flower-piece, in neither of which are they handicapped by intellectual inadequacy. It is a commonplace that he has, as nearly as possible, a clear field in that department of portrait-painting into which the former naturally falls, but the quality of his flowers is a new witness of versatility upon a high plane. The painter's acute feeling for purely sensuous subtleties is pointedly illustrated by the way in which its light harmonies are held in relation without a discord from anything tropical in which, considering the nature of the subject, a sense less keen might not perceive a jar.

The patrician portraits by Mr. Wyatt Eaton and Mr. A. H. Thayer contribute largely to the distinction of the Exhibition. Mr. Eaton sends three, of which that of the standing young lady is probably the least successful—looking, indeed, as if her statuesque pose were more a contrivance than a characterization. This distinguishes it at once from the other two, of which it would be difficult to select the more felicitous. All three are full of color, and have a luminous, rich effect which Mr. Thayer's half-dozen as noticeably lack. It is quite clear, however, that Mr. Thayer's palette is a product of natural selection, and one is perpetually surprised at the entire sufficiency of his substitution of a certain individual treatment of gray tones for an element which ordinarily seems of the essence of painting. But, all questions of painting aside, what the observer will especially remark in both his work and Mr. Eaton's this year is the high-bred air with which each face and figure is endued, and which, whatever the qualities of the sitter, is to be attained only by an intuitive perception of the qualities of style. A similar trait is illustrated in a number of low reliefs in bronze and plaster by Augustus St. Gaudens. For refined picturesqueness, which we should say is the quality that distinguishes Mr. St. Gaudens's work, there is nothing in American sculpture, if that is anything to say, that equals his portrait of Bastien-Le Page, or the medallion of two young gentlemen in the centre of the room, or the charming little head in the annex. Beside these Mr. O'Donovan's head of an Ethiopian Hercules shows itself a mistake that is almost interesting for its quaintness, though of course nothing can be more unfortunate than the error it illustrates of sacrificing fundamental sculptural conditions to secure unhappy pictorial eccentricities. Mr. O'Donovan's serious sculpture has been abundantly over-praised and abundantly depreciated, but there is no possible room for doubt that he is more at home in it than in such ingenuously direct efforts after picturesqueness as this head, the mere placing of which on its stand indicates a fatal infelicity.

On the other hand, Mr. Warner's portrait-head of a lady is a master-piece in the grand style, and any purely picturesque qualities of color and movement it may possess are felt to be wholly incidental ; it is not Renaissance art, but Greek, and, in respect of sculptural severity, is a work of most impressive largeness and loftiness. When it is said that together with this there is not a line of conventional beauty to be observed, but that the face is as American as the sculpture is Greek, Mr. Warner's accomplishment will be understood. The sense of measure and proportion, and at the same time of a light and bright touch dealing with a subject whose beauty is tinctured with a completely modern pensiveness, is as marked as is Mr. St. Gaudens's magical touch and pictorial treatment dealing with material which naturally inclines toward them. The one other work here with which it has in this respect a clear spiritual kinship is Mr. Eakins's picture of a "Lady Singing a Pathetic Ballad." Both have a dignity definitely intellectual, in virtue of which they command the attention that intellectual work of a high order must always attract amid surroundings of a purely sensuous charm. The sensuous and sentimental note, with its various excellences, is left out of Mr. Eakins's art, and in many of his pictures its absence leaves a void which no attempt is made to fill. But here the matter is too high for such considerations to be felt ; all "the intolerable pathos" of a song of Burns is what is felt. Nothing surpassing the beautiful way in which the influence of the ballad sung by the lady in the foreground melts her own heart, and impels the two accompanists to share in her emotion as far as a sensitive reticence allows, has been produced in a community where, for various reasons, it is unusual for the most "artistic" temperaments to become absolutely mastered by an idea and completely absorbed in the representation of it. The absence of any factitious alloy in Mr. Eakins's genius has here been of powerful assistance to him, and more than compensated for the frequent occasions upon which it has compelled his work to forego the wayside charms of sensuous beauty. Two other pictures have also a spiritual interest, though of a different quality—Mr. Martin's "Morning" and Mr. La Farge's "Study," of which the latter was painted eighteen years ago, we observe by the date, and the former is, perhaps, not quite painted yet. For sheer beauty Mr. Martin's landscape is unique in the display, but, like the lower-toned La Farge, its beauty is of an impalpable instead of a sensuous nature and appeals to the susceptibility only through the intellect. In an exhibition whose most eminent general characteristic is a high excellence of technical expression these two canvases owe their marked relief to an unmistakable subordination of expression to significance, and to a strength of suggestiveness accurately to be described as haunting.

Mr. Ryder's little landscape is extremely poetic and entitled to be called a gem : moreover, its obvious romanticism, which suits so well the prevalent mood of the sentimental mind, is thoroughly pure and genuine. But its main dependence is upon beauty of color ; it is a color-study subtly conceived, and carried out not only with his accustomed sureness, but with an unusual distinction which testifies to his continued progress in the power of communicating the delicate fancies of which he has a store. In color, too, and quality Mr. Bunce's "Apples" reach high-water mark ; nothing two hundred and fifty years old and from Flanders could be richer. The same painter's "Nebo" is, in its way, nearly as great a success, and the sky especially has a quality at once truthful and lovely. Mr. Chase sends several canvases, the largest of which has the main centre, and deserves it on moral grounds, though it serves mainly to show how a painter with the genius of energy backed by training can dignify a trifle. An interior by Mr. Dannat is not so good and more like Munkáczy, but a fruit-piece by him is a bit of superb solidity and strength. A large decorative panel by Mr. Lathrop is one of the most, we will not say attractive, but surely one of the most meritorious works of the Exhibition. Mr. Sargent stiffens into galvanism this year, Mr. Sartain's portrait is a little overloaded and opaque, and Mr. Currier's "Boy" not more interesting for being more kempt than usual. A rainy Broadway evening, by Mr. Lungren, is exceedingly clever, and doubtless Villegas would not hesitate to sign it, though the recessing in the frame is a clear affectation. Mr. Palmer's landscape is vivid and painted in cleverly-handled *impasto*. Mr. Fuller's "Reminiscence of Sicily" may be passed over, but the fact that it may is worth chronicling. Mr. Dewing's fantasia is too graceful to be called feeble, but too slightly grasped to be handicapped with its position. Altogether more deserving of consideration is Mr. Blum's "Dance" in the small room, where also are medallions by St. Gaudens and Warner, a series of Venetian etchings, striking but without the maintenance of the vigorous directness they at first assert, by Otto Bacher, and a bust in marble of Emerson by D. C. French, of Concord, which looks very like the subject. We need return to the main gallery only to notice Mr. Quartley's "After the Rain"—a stretch of water over which wild-fowl are flying towards the foreground sedges ; light is breaking through a leaden sky at the horizon, and the whole effect of the picture illustrates the title with admirable explicitness.

The Nation.

NEW YORK, THURSDAY, APRIL 14, 1881.

The Week.

THE principal financial event of the week was the issue of a notice by the Secretary of the Treasury that on July 1 the Government would pay the principal and interest of the $195,690,400 6 per cent. bonds, which are due at that date. This notice was accompanied by an offer of the Treasury to the holders of these bonds to extend them at the rate of 3½ per cent. annual interest as long as the Government finds it convenient to have them run; this extension to be granted only on the application of the holder of the bonds, and the application to be filed before May 10. The national banks hold about $45,000,000 of these bonds, and as they cannot at current market prices buy other United States bonds at figures which would give them as much as 3½ per cent. annual income on their investment it is thought that at least $45,000,000 of the bonds will be extended. However few or many of the 6 per cent. bonds may be extended, it is certain that the Treasury has ample resources to pay cash for every one. These resources consist, first, of $104,600,000 bonds, which can be issued either as 4's or 4½'s, and for which $115,000,000 to $120,000,000 of cash can be obtained; and, second, of cash in the Treasury derived from surplus revenues. A moderate estimate of the surplus revenues applicable to these bonds this year is $80,000,000; a considerable part of this is already in the Treasury, and the part yet to come in can be anticipated out of other money in the Treasury on authority given by the Bayard amendment to the Civil Expense Bill. So far as the holders of the maturing 6 per cent. bonds elect to have them extended at 3½ per cent., to that extent will the Treasury be in a position to apply the resources named to the payment of the 5 per cent. bonds. The Treasury also gave notice that the "Oregon War Debt" bonds ($638,200) would be paid July 1 without the privilege of extension. As the matter now stands it may therefore be assumed that at least $196,268,600 of the 6 per cent. debt will either be paid or refunded at 3½ per cent. this year, and it may be assumed that it is within the range of possibility that $200,000,000 more of the 5 per cent. debt will be provided for, but only in case the entire 6 per cent. debt (exclusive of Oregon war bonds) is extended at 3½ per cent. Of course the Treasury policy is not commended by every one, but the general opinion is that the Administration have made the best use they could of the means at their command. A question has been raised about the strict legality of the extension of these bonds, but the step has been taken on the authority of the legal counsel of the Government, who have carefully examined all the laws on the subject.

Is it not nearly time for the President to exert his influence, by personal attendance in the chamber if need be, to induce the Senate to attend to the business for which he summoned it, and for which it is paid by the country? It was convened in executive session for the discharge of executive duties. There is no pretence that it cannot discharge these duties with its present officers. The majority has, nevertheless, taken upon itself to disregard its duties, and enter on the ridiculous task of "breaking up the Solid South" and dividing the Virginia Democrats, things which it is no more responsible for and no more called on to attend to now than the tax-laws of California. A very large number of nominations lie before it for confirmation. The failure to confirm some of them, such as United States district-attorneys and marshals, is actually arresting the course of Federal justice in the District of Columbia and in several States. The President owes it to himself, it seems to us, to try and put an end to this bouffe by publicly reminding the actors of their responsibilities to a long-suffering people.

Mr. Hoar, in his reply to Mr. Hill, of Georgia, during the debate of March 30, pursued that bad man's record back to the days when he was opposing the Republican policy of excluding slavery from the Territories. Upon this Mr. Hill made the very proper comment that it would be just as manly and as timely "to make an issue with the framers of the Constitution itself." We regret to see, therefore, that the New York *Times* has followed so doubtful an example for the purpose of injuring Mr. Stanley Matthews's chances of securing his nomination to the Supreme Court. The incident in his career which the *Times* recalls occurred in 1857, when he was United States District-Attorney under a Democratic administration, and conducted "with alacrity" (as the Websterian phrase went) the prosecution of a Cincinnati journalist who had secreted and fed a pair of fugitives from slavery, and had him sent to jail. The story was revived in the *Commercial* in the canvass of 1876, and has since been told in the 'Reminiscences' of Levi Coffin. The offence was aggravated, not only by the tragic fate of the fugitives, but by Mr. Matthews's having figured a few years before as an ardent Free-Soiler; and, as the *Times* puts it, "not the least strange thing is the fact that President Garfield, the successor of Joshua R. Giddings in the most rabid anti-slavery district in the Union, should nominate for a high position one who, in a brief period, was both anti- and pro-slavery, and who, in a most unusual manner, convicted and imprisoned a fellow-being for doing an act of common humanity forbidden by the Fugitive Slave Law." This ought to show Mr. Hoar how dangerous the practice of reminiscence is if carried beyond the war. We do not know how he will vote when Mr. Matthews's appointment comes up for confirmation, if it ever comes up, but, if favorably disposed, what could he say after Mr. Hill had sent up the *Times* article ("Matthews as a Slave-Catcher") to the clerk's desk to be read?

Mr. Morgan, of Alabama, and after him Mr. Bayard, did good service by pointing out the Constitutional provisions for the protection of the minority, such as the clauses maintaining the integrity of the small States, those relating to amendments of the Constitution, to the confirmation of treaties, to the overriding of the veto, to all those, in short, which require a more than majority vote in certain contingencies. This is a wholesome rejoinder to the pretence on which all the Republican case rests, that there is something essentially sacred in the rule of the majority, and that it is only necessary to prove the existence of a majority to justify its right to do anything. The fact is, of course, that the majority is answerable to the country for the mode in which it was formed—for it may be a mere conspiracy; and for the use it proposes to make of its power—for this may be, as in the present case, in contravention of the object for which it was given the opportunity to act together. We were disappointed to find Mr. Sherman at last breaking silence in defence of the "great underlying principle," which he knew his own party had violated for two weeks at the opening of the session until all their plans were ready for capturing the committees. It had been thought and remarked by some of the Washington correspondents that Mr. Sherman's failure to make himself heard was owing to Vice-President Arthur's failure to "see" him; and we must say it would have been more discreet in him to act as if the supposition were correct. He knows, by long Congressional experience, that the time may come when the present situation will be exactly reversed, and that all the Republican talk then will be unblushingly immoral.

Mr. Sherman's remarks on Wednesday week were useful, in connection with Mr. Hoar's, in exposing the cant of which the majority is now so prodigal. The ex-Secretary, speaking for his Republican associates, said they elected Riddleberger not because he was a Readjuster, nor because they agreed with all his notions, but because they did agree "with the general ideas that are proclaimed in his doctrine here about equality of rights, about securing a free and fair election and an honest count, and the repeal of that law" which, under the pretence of levying taxes, had robbed the Republicans of their rightful control of Virginia. This seems a very odd qualification for the post of Sergeant-at-Arms, but, as it is a poor rule that doesn't work both ways, the Democratic minority is evidently quite right in opposing Riddleberger on the ground of his sentiments about repudiation, with which they cannot agree. Yet Mr. Hoar, in order to extenuate the dishonest aims of his candidate, ridiculed the idea that these were a disqualification.

Quoting from a speech made by Senator Vance in Virginia, with a view to preventing a Democratic split there, he read:

"'We have had readjustment in North Carolina. . . . We settled it, and didn't have anything to do with a Presidential election either. And your State debt question——'

"Which has so much to do with the administration of his office by the Sergeant-at-Arms of the Senate!—

"'And your State debt question hasn't either.'"

In other words, it is absurd to make views on local politics a test of fitness for service in the employ of the United States Senate.

Little or no significance attaches to the elections of last week in the West. In Michigan State officers and in Wisconsin a judge and associate justice were chosen, the Republican candidates being, of course, successful. Much more interest was manifested in the municipal contests in St. Louis, Cincinnati, and Chicago, the local press of which cities displayed all the fervor and fury of a Presidential campaign. In St. Louis the present Mayor, Overstolz, who was running for a third term on the Democratic ticket, was badly defeated, owing to a revolt within the ranks of his party against the managers of their machine. Overstolz does not appear to have especially distinguished himself in his administrations heretofore, but he was not himself objectionable. The clique which supported him, however, was highly so to certain malcontents, and very justly we infer from a resolution passed by the nominating convention pledging the candidates to appoint no one but a Democrat to any municipal office. In Cincinnati the case was nearly reversed, the Republican Mayor, Jacob, though vigorously supported by the *Commercial*, being decisively defeated for a re-election, owing to a considerable defection led by the *Gazette*. The canvass was a very excited one in Chicago also, where the Democratic Mayor, Harrison, was re-elected by a majority of 8,000, and the Republican November majority reversed. Harrison is said to have gained much from the vigorous opposition of the Chicago *Tribune*, which denounced him as the candidate of thieves and gamblers, and an apologist for all sorts of social iniquities, but has since explained that it intended no reflection upon his character. The St. Louis *Republican* and the Cincinnati *Commercial* are charged by their respective rivals, on the other hand, with having ruined their candidates by the disgrace of their devotion to them. There has been no clearer demonstration for some time, at all events, of the inability of a certain order of newspaper writing to influence even the communities to suit whose supposed tastes it is expressly designed.

The Senate Street-cleaning Bill was not passed in the Assembly, as we expected it would be at last. On the contrary, the Assembly ordered to a third reading a substitute, which, instead of giving the street-cleaning to the Mayor exclusively, as provided in the bill of the Committee of Twenty-one, gives the Mayor, by and with the consent of the Board of Health, the appointment of a superintendent of street-cleaning, who is to be removable by the Governor, on charges preferred by the Mayor. It is useless to summarize the destructive criticism to which this was subjected by Mr. Husted and others, both as regards its legal and practical working. Everybody knows that it would result in divided responsibility, as all similar machinery has resulted in this city, and that division of responsibility would result in failure to do the work. The arguments by which the Republicans defend their course are simple and direct—that to give the street-cleaning to the Mayor would give votes to the Democrats; and that the Mayor is a bad man who ought not to be trusted with the street-cleaning. There is a great flow of obloquy directed against six city Republican members, two or three of whom are "gentlemen in politics," but have voted with the "Toms," "Barneys," "Als," and "Gusses" against the Senate Bill, and their case is cited as an illustration of the folly of sending "gentlemen" into politics.

There is no doubt that in this State the "gentlemen" have generally failed in politics, and for obvious reasons. The first is, that they seldom get into politics naturally—that is, they generally get in by an arrangement with a Boss, by which they obtain a nomination in return for a handsome contribution to the campaign chest, and they consequently work afterwards under Boss domination. The second is that they are very apt to be young and impressionable when they make their début, and on reaching "politics" find that the notion in which they have been bred at home or in college, that public business is the chief concern of a legislator, is considered ridiculous and visionary by "the practical men." To these the first concern is the distribution of offices and the fulfilment of "bargains," and they only legislate as much as may seem necessary to enable them to keep the offices or to fulfil the bargains, and consider all legislative action which is likely to take offices away, or give them to the other party, or which is not called for by "bargains," as silly. The "gentleman" thus finds himself somewhat of a butt to his associates, and his political philosophy is not sufficient to support him under the strain of the situation. So he soon resolves to show that he can be as practical as anybody, and joins the "heelers" and "workers" in looking after "the party," and lets the community, as distinguished from the party, go to the dogs. There has been nothing more amusing in recent political history than the denunciation of the Mayor, as unfit for his place, by one young "gentleman" at Albany, of course under the inspiration of the "workers," very probably of that eminent man Mr. George Bliss. Of course the plain inference from the attacks on the Mayor, and the refusal of the Legislature to trust the Mayor to discharge a purely executive function, is that the city majority cannot be trusted to elect the mayor, and that he ought to be appointed by the Legislature. In fact, the *Tribune*, in one of its moods, has asserted that if the majority ruled the city there would be "a hegira of clear-headed people from Manhattan Island." But if so, why is it so dreadful for the Southern whites to try to escape the rule of a similar majority at the South?

The way the New York *Tribune* is growing into a civil-service reformer is very interesting and curious. On the 26th of January, under the heading "An Abandoned Experiment," it called the attention of "theorists and doctrinaires" to the fact that Mr. Hayes, by appointing a postmaster at Hartford on General Hawley's recommendation, showed that he had abandoned as a failure the plan of "taking from Congressmen their power of appointments," and "of stripping them of their patronage." On this our sage contemporary complacently remarked:

"But the President, in giving Senator-elect Hawley the privilege of choosing and putting upon him the responsibility of the selection, has indicated that he does not now believe, in the light of his experience, that the public interests are invariably best served by the application of the rule which deprives Congressmen of all voice and influence in the selection of subordinate Government officials. All of which only illustrates the fact that it is much easier to put forth fine and plausible theories than it is to act upon them and carry them into practical effect."

In less than three months, however, such is the power of truth working in an ingenuous and receptive mind, our esteemed contemporary was able to write as follows (April 7) about President Garfield's refusal to allow Senator Conkling to make the Federal appointments in this State:

"It is the misfortune of Senator Conkling that he is not quite willing to have the people rule. They did not elect him to the Presidency, nor General Grant. They did elect James A. Garfield. They clothed him with the Executive powers and imposed upon him the Executive responsibilities, and did so because they wished to see the Government directed by him and not by anybody else. It would be a grave mistake in Mr. Conkling to endeavor to thwart their will. The Executive chosen by the people cannot be reduced by Senatorial fiat to the position of a clerk, to record the will of a Senator. It was not the will of the people that Senator Conkling should make the appointments, and he will find that he cannot with safety attempt to seize by force a trust which the people have deliberately withheld from him."

It is right to add that our esteemed contemporary is not yet wholly converted, for he calls those who think the President in making appointments should act on his own principles "nincompoops," just as in January he called those who denied the right of Senators to dictate appointments "theorists and doctrinaires." But at the rate he is travelling we have no doubt that in three months more he will be calling those who think that officers ought to be removed without cause in the middle of their terms "jackasses," or some other dyslogistic names. He always prepares for a somersault by a flood of epithets.

Some other esteemed contemporaries are disheartened and perplexed because the *Nation*, which has been so much afraid that General Garfield would "surrender to the Bosses," is now not satisfied with Judge

Robertson's appointment, which shows not only that the President has not "surrendered to the Bosses," but is ready to make "war" on the arch-Boss himself. But the *Nation* has never called on General Garfield not to surrender to the Bosses simply to show that he was not afraid of Bosses, or simply because the *Nation* disliked Bosses. The *Nation* advocates Presidential opposition to Bosses, not as a display of personal independence, but as a means of good government. If opposition to Bosses does not mean reform in the manner of conducting the public business, the *Nation* cares no more for it than for a "Græco-Roman" wrestling match. The great mistake the President is making about the "independent element" is in supposing that it needs, or will be satisfied with, "representation" or "recognition" in the custom-houses or post-offices. In so far as it is worth recognition, or has any force in politics, it asks for nothing but an abandonment of the "spoils system," lock, stock, and barrel, and the management of the public business by business methods, and will be satisfied with nothing else. If General Garfield supposes that he can satisfy it by putting a new flint in the old weapon he will discover his error when it is too late.

After much heated discussion between the body of the Republicans and the State-Credit Democrats on one side and the Repudiating Democrats, assisted by a noisy but numerically inconsiderable Republican opposition, on the other, the Tennessee Legislature last week passed a bill to refund the State debt at par with interest at three per cent. The bill was immediately signed by the Republican Governor, Hawkins. The clause which was most bitterly resisted was that making the coupons receivable for taxes, and thus securing the interest, at all events, from possible repudiation in the future. These terms, which involve a reduction in the interest upon about twenty millions of bonds from six to three per cent., and in that upon about half a million from five per cent. to three, were proposed by the creditors of the State, who feel, therefore, that they have nothing to complain of in the "readjustment." When it is considered, however, that the people of Tennessee have no excuse except poverty for repudiation of their debts to any extent whatever, and that they are not poor enough to make payment of them any special hardship, there is very little in this compromise of which the State is entitled to boast. Nevertheless, the passion for repudiation had become so widespread, and found such otherwise respectable defenders, and the contest for even this much of justice has seemed for some time so doubtful, that the friends of the compromise are to be congratulated upon saving their State from the degree of disgrace which has long been imminent.

The loss of life and property caused by earthquake at the island of Chios last week is unequalled in recent times, and the consequent suffering among the survivors can hardly be exaggerated. The president of the Relief Committee at Constantinople reckons the number of killed and injured at fifteen thousand, and adds that forty thousand people are wandering homeless amid the ruins. Subscriptions have been opened in this city in response to the appeal of the Greek Consul-General, Mr. Botassi, and at Washington a number of ladies, headed by Mrs. Blaine, have drawn up an invocation addressed to the people of the whole country. This document is couched in terms of the most ornate eloquence, and designed to heighten the natural sympathies of the humane by the suggestion of various powerful rhetorical considerations. The disaster is one for which no one is responsible, it is explained, being one "which no human error caused and which no human foresight could perceive or prevent." It was due to "the unheralded and unassisted forces of nature." The result has been the desolation of "the beautiful island whose songs have been among the world's most treasured possessions for five-and-twenty centuries." Accordingly pastors of all churches, presidents of boards of trade, etc., are requested to take up collections for "the fainting sufferers whom nature could not spare and whom humanity must restore," since "the King's business requireth haste." It is easy to share in the confidence expressed in the address that the American people will readily avail themselves of the opportunity thus offered them; or, to be precise, that "in this sweet charity the New World insists upon its right to stand and share with the Old." Why not on such an occasion write in the simple English known as "the language of the heart"?

The trouble which has broken out between France and Tunis has been long brewing, and appears to be due to the native jealousy of the French stimulated by Italian influence. The Italian Chauvinists have been long looking on Tunis as likely to furnish them with a colony and foothold on the African coast, and a certain delicacy has finally come to mark the relations of the representatives of the two Powers at the Bey's court. A French company lately bought an immense estate from Khaireddin Pasha, a Tunisian who went to Constantinople a year or two ago to try his luck as Grand Vizir and reformer, but some of the natives have set up a vexatious counter claim and are trying to prevent the Frenchmen from taking possession by raising knotty points of Mussulman law. Then on the Algerian frontier, where there is a considerable tract of debatable land, the Tunisian border tribes have begun to make raids over the line, and they tear up the rails and cut the telegraph wires on a railroad which is being constructed by French capitalists. The French have at last undertaken to chastise the marauders themselves, and declare their intention of pursuing them on Tunisian soil, and, in fact, things begin to look as if a French protectorate of the Bey and all his belongings might not be very far off. This has produced a decided sensation and even a ministerial crisis in Rome, Cairoli not being prepared to come into collision with France. His explanations were pronounced unsatisfactory by the defeat of a motion of confidence by a vote of 192 to 171. He accordingly resigned. The French are sending 13,000 men to the scene of action, but officially deny ulterior designs.

Mr. Gladstone introduced his Irish Land Bill into the House of Commons on Thursday last in a two-hours' speech. We have commented elsewhere on the leading provisions of the bill, so far as they can be ascertained from a telegraphic summary. It seems to be received with great favor by the Liberals, and with a curious doubtfulness, not far removed from acquiescence, by the Tories. This is the more striking as Sir Stafford Northcote, not over three months ago, pronounced the "three Fs" "fraud, force, and folly." Even Parnell is compelled to acknowledge that there is much that is good in it. In fact, Dillon is the only prominent Leaguer who has spoken out strongly against it. To the extremists among the agitators it is, of course, in so far as it is likely to have any pacificatory influence, a very heavy blow. It appears to have been drafted with great pains, and has avoided the danger most feared, of offering too little. For instance, no limit is put on the amount of money which may be used in helping tenants to buy their farms. It seems, on the whole, to promise to be the crowning glory of Mr. Gladstone's remarkable career as a legislator, and to be likely to put an end to the last of the scandals bequeathed to the modern world by the ages of religious discord. Curiously enough, too, the Irish question seems to have exerted a sobering influence on Victor Hugo, for in preparing his manifesto on it he has consulted Admiral Maxse, a member of the House of Commons, who has written him a very lucid exposition of it. The Duke of Argyll has left the Cabinet, explaining that he has differed with his colleagues on the Land Bill, the fault of which is, he says, that it limits the proprietorship too much; neither the landlord nor the tenant has under it sufficient interest in the land.

The five Nihilists accused of complicity in the assassination of the Czar have been found guilty without a jury, and are sentenced to be hanged. They really made no defence beyond a justification of their motives, and one of the women convicted of having given the signal to the men who threw the bombs, Sophie Pieoffsky, has asked that she may be allowed no privileges on account of her sex. She is said to be well connected, and to have had a good position in society before becoming a Nihilist. The Nihilist committee, or whatever it is, has announced that if she is executed the present Czar will be killed, and she will, probably, not be executed; but it will be, ostensibly at all events, because she is a woman. There is a good deal of casting about, of course, among the "publicists" and "jurists" on the Continent for the means of suppressing the Nihilists, but they seem to have thus far suggested nothing more fruitful than the formation of a league of sovereigns, and some sort of attack on the Swiss right of asylum. One has, however, proposed the better moral training of children, which will not do much at best for this Czar.

THE RAILROAD USURY LAW.

AMONG those who have any occasion to be informed on the subject, it is, we believe, perfectly well understood that Mr. F. B. Thurber is the life and soul of the so-called Anti-Monopoly League. Without the impulse of his money, energy, and intense feeling both it and the Committee on Transportation of the New York Chamber of Commerce would, as agitators of the railroad question, long since have ceased from their labors. It was Mr. Thurber, again, who communicated its whole force and persistence to the famous Hepburn legislative enquiry of this State in 1879. Mr. Thurber, therefore, from one point of view, has proved himself a useful and public-spirited man. His motives in no way concern us. Whether he is actuated by a pure desire to correct what he regards as a great public abuse, or, as has been very freely asserted, from a vindictive purpose to come out best in a bitter quarrel with the New York Central Railroad, is quite immaterial to us. The relations of the railroads to the public in this country are a subject which requires, and will continue to require, constant agitation, and a great deal of it. In so far as he legitimately contributes to that agitation, therefore, Mr. Thurber, whether calling himself a League or a Committee, is performing a useful public service. Most unfortunately, however, his utility stops here; and not only does his utility stop, but a very considerable capacity as a maker of mischief begins to assert itself. Mr. Thurber is as illogical and reckless in statement as he is active, persistent, and bitter. Consequently, when he gets Judge Black, or the very highly respectable gentlemen who are his colleagues on the Chamber of Commerce Committee, to endorse to the public his wild statements and unsound theories, he comes very near to making Grangerism respectable. His agitation thus results only in again exciting that unreasoning spirit as respects railroads which cries aloud for immediate repressive legislation, and always takes the shape of a new usury law. Utterly illogical and unreflecting, no good thing can come out of it.

Now, the difficulty with the railroad question, as of all other public questions, is that its successful treatment involves two distinct things. The public mind must, in the first place, be roused up to dealing with it at all; and, in the second place, it must be educated into dealing with it intelligently. We by no means propose to follow Mr. Thurber through the long and inconsequential series of paragraphs which composed his letter in the *Nation* of last week. We have not space; nor would it be worth while to do so if we had. The original charge, that which it is persistently sought to impress deep into the public mind, was a wholly false one. To that charge, and its falseness, we wish to hold Mr. Thurber and his coadjutors—Secretary Windom, Judge Black, and the members of the New York Chamber of Commerce. They have spread it far and wide. It is doing much harm. They are trying to make it the basis for legislation. That charge was, and is, that the railroad system of this country, as a whole, is one vast machine of monopoly, extortion, and fraud; that through it, for the work done, enormous and unreasonable profits are made and divided among a favored few—$75,000,000 of excessive and undue profit going in a few years to one man and his friends alone; that four men in secret conclave put rates up or down, taxing the products of the country in a way Congress would not dare to do—$45,000,000 a year on a single item of business alone—the whole finally culminating in Judge Black's astounding computation of $900,000,000 excessive profit annually on freight traffic, to say nothing at all of passenger traffic. The charge thus made was against the whole system. It was one of monopoly, gross plunder, and excessive profit; a profit vastly out of proportion to the value of any service rendered. To these sweeping charges, thus confidently advanced, we replied by citing the statistics. They showed conclusively that there was no foundation to them. The railroad business, it appeared, was, as a whole, not unduly profitable. The total amount paid by the country for the service rendered to it was not excessive. The return made on the capital actually invested in railroad construction was no more, at most, than what was reasonable, and what the service rendered was fairly worth.

Immediately, as we anticipated, the League, through Mr. Thurber, shifts its grounds. The onslaught on the system, as a whole, is dropped; our answer to it is ignored. It is the individual member of the system which is at fault now. This road, that road, and the other road are pointed out in quick succession as examples of extortion, of monopoly, and of boundless profit. That some railroad enterprises in this country have been extremely profitable we do not deny, and think altogether probable. Side by side with the New York Central, however, is the Oswego Midland; side by side with the New York, New Haven & Hartford is the New York & New England. Mr. Thurber's difficulty lies in this—he only sees the profitable enterprise, and shuts his eyes tight to the bankrupt one. The country, we submit, enjoys the advantages of both.

It is with the remedy proposed, however, that we now have to deal, the remedy always advanced by the Anti-Monopoly agitators. They fall back on the old law limiting profits on railroads to some fixed percentage on the capital of each individual enterprise. They state that this was the contract under which eminent domain was exercised and the rights of way taken, and that this contract has been wantonly and systematically evaded by the corporations through the fictitious creation of capital—"stock-watering," as it is called. The remedy for the evil is, therefore, a return to the original principle of the contract. The creation of fictitious capital should be made a criminal offence. The roads should be operated in the joint interest of the owners and the public, so that, when a profit in excess of the prescribed maximum return shall accrue, the public shall receive the benefit of it in the form of either a reduction of rates or an increase of facilities. We believe we have stated the position of the Anti-Monopoly League with scrupulous fairness. This half-commercial enterprise and half-public trust would be their ideal railroad management. To this our attention is invited, and to our answer we invite the attention of the League.

We have just two objections to make to the proposition: it is wrong in fact, and it is wrong in principle. In the first place, as to the basis of action—the alleged excess. While we decline to make the computation ourselves, we have yet to ascertain what the stock of the New York Central Railroad, even, would now stand at, if computed on a basis of ten per cent. annual dividends from the date of the original charters in 1825; the dividends actually paid being deducted. We have commended this problem to Mr. Thurber. If he proposes to rest his case on anything more than assertions, he had better address himself to it. This we do know, that, wherever in similar cases the computation has been made, it has been found that the arrears of unpaid dividends very much exceed the issues of capital stock on which nothing was paid; a balance is still due from the public to the stockholder. Now, it is absolutely immaterial to the community whether a railroad company of ten millions capital, authorized by law to divide out of its earnings not to exceed ten per cent. annually to its stockholders, pays five millions out in dividends in the course of five years, and then, to increase its plant, issues five millions of stock at par, or whether it passes its dividends for five years and gives its stockholders a fifty per cent. stock-dividend to represent the dividends thus passed. It amounts to exactly the same thing in the end. In one case the stockholder pays for his new stock in cash; in the other case he pays for it in dividends, which are the same as cash. Before, therefore, calling stock "water," and making charges of violation of contract, and demanding the passage of criminal laws, it would be well for Mr. Thurber to establish a basis of fact. What does the stock in question in each case represent? Does it represent undivided profits in past years, legally and fairly applicable to payment of dividends but diverted into the business? Does it represent the rise in value of private purchases of real estate for terminal facilities, wholly outside of any right of way? Does it represent a large increase of rolling stock for which no charge has ever been made? A great railroad corporation is something besides the owner of a mere right of way. It is a common carrier, and a private real-estate owner; often a lessor of steamships, and necessarily a financier. Is the stockholder entitled to no profit from these sources? Does, in fact, the ten per cent. profit limitation apply to every business in which the company may engage?

However, supposing this to be the case—admitting the fact, and coming back to first principles, we have no hesitation in saying that the law itself is, like all usury laws, an absurdity, that its enforcement is impossible, and that if it were enforced it would produce results most disastrous to the public. The professed railroad agitator's ideal railroad management never has existed outside of his own imagination. If it

ever does exist it will work badly. On what is it based? It is based on the sentimental theory that business men—men of action—will work just as well for the public as they will for themselves. If it could be put in practice, which fortunately it cannot, it would result in partially paralyzing every successful railroad. They would earn so much, and when that amount was earned they would earn no more. Conservatism would begin. Development would stop. Railroad men in this respect are like all other men: it is a principle of human nature that here comes into play. Men will not plan and venture and toil if they are to derive no benefit from so doing. It is useless, when it comes to doing the work of a common carrier, to talk of patriotism; there must be an inducement of profit, at least, combined with it. If, therefore, a usury law stands in the way, it not only will be evaded, but we do not hesitate to say that the public good requires that it should be evaded. In business matters we cannot afford to dispense with the inducement which exists in the love of gain. Entirely disbelieving in usury laws, we see no reason why the railroad usury law should be made any exception to our disbelief.

While, therefore, the facts of the Anti-Monopoly League are open to extreme doubt, the remedy they propose for the evil of which they complain is worse than no remedy at all. Seeing one law limiting the profit on money openly violated whenever occasion requires—knowing perfectly well that if it was not violated by common consent the whole machinery of business would be disorganized,—seeing this and knowing this, they yet have full confidence in another law limiting profits as applied to another business. They fondly think that if the incentive to gain beyond a certain moderate limit could be cut off from the railroad manager, he would quietly accept the situation and continue to work just as hard for the public as he would have worked for himself. This we fancy will be the case about the same time that Wall Street contents itself in days of panic with the legal rate of interest. Certainly no sooner.

THE IRISH LAND BILL.

MR. GLADSTONE'S Land Bill is important both for the ferment it is likely to create in English politics and for the change which it is likely to effect in the relations of England to Ireland. The resignation of the Duke of Argyll is a pretty sure sign that the measure will be vigorously opposed in the House of Lords. What the Duke of Argyll cannot swallow probably few other great landowners in the Upper House will be able to swallow, and probably most of the Peers will feel it to be a solemn duty which they owe to "property" to resist it to the last—that is, to resist long enough to force the Ministry to appeal to the country by a dissolution. That they will resist long enough to force Mr. Gladstone to threaten the creation of new peers, is not likely. But even a dissolution upon a question like the Irish land tenure, brought about by the opposition of the Lords, would be a very serious matter, and would cause such excitement as has not been seen in England since the passage of the Reform Bill. The particular wrongs the Land Bill was intended to redress would be speedily forgotten by the English Radicals in the irritation roused by an attempt of the Peers to prevent the passage of the leading measure of a popular Cabinet, and we should probably witness an attack on hereditary legislation to which the House of Lords can make a much less vigorous defence than it could fifty years ago. In fact, as far as their own security and dignity are concerned, there can be little doubt that the wisest course the Peers could pursue would be to pass the bill after a full debate. This would be a confession of weakness, it is true, but it would not be such an exhibition of weakness as the passage of the bill under a storm of popular indignation or a threat of additional creations on the part of the Ministry. The main difficulty with which the Peers, and for that matter most Englishmen, have to contend in the treatment of the Irish land question flows from the strong tradition of the greater sacredness of landed property than of any other kind of property, which runs through both English law and politics. It is not very long since the argument that a man who held no land was entitled to no say about the government—or, in other words, had no stake in the country—ceased to be heard on the Tory stump; and probably to most Englishmen of both parties there is nothing unnatural or even extraordinary in the landlord's power of seizing his tenant's goods for rent without proving his debt in court and obtaining a legal execution.

Mr. Gladstone's bill, considered as an attempt to solve the Irish land question, must be considered with reference to the utmost demands of the Irish agitators, excluding those who, like Dillon and Parnell, have separation in view. If it comes measurably near—to use his own phrase—satisfying these without shocking the great mass of Englishmen and Scotchmen, not personally interested in the maintenance of the present status of property in land and yet as sensitive about the rights of property generally as the bulk of middle-class Englishmen and Scotchmen usually are, it must be pronounced a remarkable success. Now, the extreme demands of the agitators—putting aside, of course, the semi-political demands of Parnell and a small set of his immediate followers—were what are known as "the three F's"; fixity of tenure, fair rents, and a free sale. Fixity of tenure meant that the tenant should not be disturbed as long as he paid a fair rent, and free sale meant that he should have the right of selling his interest in the farm to whomsoever he pleased and for such price as he could obtain, on the theory that inasmuch as in Ireland all improvements are presumably made by the tenant the tenant has presumably an equitable interest in the farm, which has a money value. There were some of the Land-Leaguers whose idea of fixity of tenure was permanent tenure at a rental fixed once for all, but it is obvious that such a rent could not continue to be a "fair rent." It would in most cases before many years either fall below or rise above a fair rent, so that the phrase fair rent was hardly entitled to a place in this programme. It is to be observed, too, that a permanent tenure at a fixed rent would, however desirable for the tenant, be a measure of confiscation, which would entitle the landlord to compensation. Mr. Gladstone was under no obligation to try to satisfy these distinctly revolutionary views. What he had to do was to content the tenant without any diminution of the landlord's control over his property for which increased security would not compensate in the market value. The bill gives the tenant absolute fixity of tenure as long as he pays "a fair rent." What is a "fair rent" is left to be fixed by mutual agreement between him and the landlord, and, if they cannot agree, by an appeal to the courts, and the rent thus fixed remains unchanged for fifteen years. At the end of that period there has to be a readjustment. In case of eviction for any cause the tenant is to be entitled to compensation for his presumed improvements, and this compensation is either to be paid by the landlord or obtained by sale to some outsider. Moreover, no tenant, unless he pays more than $750 a year rent, can contract himself out of the operation of the act, thus remedying one of the great defects in the act of 1870. In addition to this regulation of the relations between landlord and tenant, the bill provides for the creation of a Land Commission which is to be armed with very extensive powers, both for lending of money to tenants desirous of purchasing the fee-simple of their farms from the landlords, and for making advances in aid of emigration and of the reclamation of waste lands.

The objections which may be made to that portion of the bill which regulates the relations of landlord and tenant are two in number, and Mr. Parnell has urged them in an interview with the correspondent of the *Herald*—namely, that the period of fifteen years between the revaluations is too short, and that the courts who are to settle the rent and decide disputes, both in the first instance and on appeal, are likely to lean to the landlord's side, owing to their composition. In a country like Ireland, in which there is no commercial middle class, the bar and bench, as a general rule, are filled with the relatives or connections of landlords; and even though there may not be any danger of unfairness to the tenants from this cause, there is danger of a want of confidence in the courts on the part of the tenants, which, if it arose, would do much to hinder the pacifying influence of the measure. The interval between the valuations is something which, after all, has to be settled by compromise. The right period cannot be ascertained by any process of computation, and would seem to be in this, as in so many other things, somewhere about half way between what one party demands and the other offers. As the tenant cannot be dispossessed at the end of the term in case he pays the rent, the object to be aimed at in fixing the term is the prevention of prolonged injustice to either side in case of a heavy fall or great rise in the prices of produce, and, therefore, in the value of the land.

It will be seen, however, that in the main the demand of the "three F's" has been complied with. The arbitrary power of the landlord is destroyed by the bill. The tenant is placed under the direct protection of the courts in all his dealings with the landlord. His rent cannot be arbitrarily raised. He cannot be dispossessd as long as he is willing to pay it, and even if he is dispossessed he is to receive compensation for the interest which he is presumed to have created by his improvements on the farm. In other words "landlordism," as Parnell calls it, is destroyed, while property is respected. The full importance of all this does not, however, appear on the surface, or at the first glance. Mr. Gladstone is doing considerably more than securing the Irish farmers against extortion on the part of the owners of the soil; considerably more, too, than reconciling the Irish population to the English connection. He is taking the first and greatest step towards the removal of those defects of the Irish character which have done so much to chill or alienate the sympathies of those countries to which emigration has brought Irishmen in masses. The turbulence, the lawlessness, the low standard of living, the want of industrial training and versatility, which make Irish immigrants so unwelcome to the friends of popular government both in this country and in the British colonies, are beyond all question the vices of a people who have never enjoyed security and have never lived under law. What the Irish chiefs were when the first vigorous attempts were made under Elizabeth to bring the Irish under English sway, we only know from the prejudiced accounts of English soldiers and officials, but there is abundant reason for believing that no advance in civilization was possible under their rule or under the clan system of which they were a part. As fast as they were dispossessed the unfortunate natives passed under the more orderly but more arbitrary rule of landlords of the English type, who, in controlling absolutely the means by which the population lived, controlled their lives. The law of the land has been known to the tenant only through their administration of it. In most things the mere will of the landlord has taken the place of the law and shut out the Government from the sight of the population altogether, or only allowed it to appear as the enforcer of ejectment decrees. The interference of the landlords and their agents, too, with the tenants' mode of life and with their management of their family affairs has been minute and vexatious. The aims of the landlords in such interference, we think, have in the majority of cases been the good of the tenant, such as raising his standard of living or improving his methods of cultivation, but their efforts have had the fatal defect of all exercises of arbitrary power. No man or body of men has ever possessed arbitrary power without abusing it, and no men of any race have ever lived long under it without suffering from it in character. It has come closer to the Irish in following them to their very hearthstones, and we might almost say giving them permits to lie down in their beds every night, than to any other modern people. Mr. Gladstone's bill, for the first time in their history, delivers them from it, and gives them a chance to cultivate the virtues of independence, to substitute self-control for other control, and leads them to look on the law as the protector of industry rather than as the weapon of the spoiler.

MÉRIMÉE'S CORRESPONDENCE WITH PANIZZI.

PARIS, March 17, 1881.

THE second volume of Mérimée's letters to Panizzi appeared almost immediately after the first. It begins with the year 1864. Mérimée was at Cannes, looking already in January for a warmer climate than that of Paris; discontented with the Opposition, which was becoming stronger in the French Chambers; seeing dangers everywhere, as anti-clerical as ever. The Danish question was on the *tapis*, but Mérimée confesses that he never understood it. His instincts were for the Danes. "Unfortunately the good God has the evil habit of always being on the side of the big battalions." On October 2 of this year, 1864, Mérimée, speaking of Thiers, says: "Thiers has become nearly Republican, probably because he hopes to be named president in his turn. I consider him bent in a deplorable direction." Mérimée was very hostile to the American Union. His judgment was completely blinded in respect to the American people. "There is in the Americans such a contempt of all morality that, in my view, only the Romans of old can be compared to them. They have their greed and audacity, and five years of a terrible war have made them dangerous soldiers. They will pay their debt by going into bankruptcy" (February 15, 1865). You see what a good prophet he was. On the 22d of April, 1865, he says: "Well! the Confederates are down. What measures will Mr. Lincoln take to pacify the country? With a parliament composed of roughs, like the American Congress, and a Senate presided over by a drunken tailor, what follies may we not expect? The worst of it is that these villains are in reality very powerful, that they have always shown the obstinacy of a mule, and they have no more conscience than your little Italian tyrants of the sixteenth century." When he hears of the assassination of Lincoln he writes coolly:

"Don't you think people make a little too much fuss about the death of Mr. Lincoln? He was, after all, a first-rate second-rate man, as the Yankees say, and you would probably not have accepted him as an employee in the Museum; but he was better than most of his compatriots, and it seems to me that he had gained something in living amid great affairs. The eulogy which was passed on him in the British Parliament shows that England is afraid of America, and the result will only be that these *rustres* will become even more impertinent and proud than they naturally are. Believe me, it will not be long before England regrets her policy at the beginning of the civil war."

These extracts are curious. They show not only how completely blind, how prejudiced, and how unjust Mérimée was himself; they show also in what style people could write in 1865 on American affairs to a person who, like Panizzi, moved in the best London society. It is true that Mérimée did not spare his epithets when he spoke of Lord Russell; he never lost an opportunity of abusing him. He was not tender towards M. Thiers. "People are in ecstasy over the speech of M. Thiers. He is, they say, the first statesman in Europe. It is mere passion. I don't think he ever said anything which better proved his complete lack of political sense. I will add, also, that he does not shine in moral sense." Thiers was as convinced of his infallibility as the Pope himself. If he spoke for an Austrian alliance, it was "by way of payment for the dinner which the Austrian Emperor gave him" (1865). This was the time when Thiers defended the temporal power of the Pope, and Mérimée was more Italian than the Italians, than Cavour, than Manzoni, than D'Azeglio, on this question of Rome. "Thiers is cajoled by the Faubourg St.-Germain, and his women are enchanted to receive duchesses." His "women" were Madame Thiers and her sister, Mlle. Dosne, who is still alive.

When war became imminent between Austria and Prussia, Mérimée was very much perplexed. The "master" said nothing. Mérimée had no illusions:

"What have we to gain? The Rhenish provinces do not want us. No more does Belgium. If there were a remodelling of Europe, I don't see what we could ask for, except a revision of the frontiers, and that is not of much consequence. On the other hand, it is evidently not our interest to favor united Germany. All the more we ought not to intervene. I see but one possible cause of intervention—if the Austrians gain great advantage in Italy; but I believe they will remain on the defensive. . . . Italy is excusable in allying herself with Prussia; she could not be blamed if she allied herself with the devil in order to get Venetia, but we should have only blows to receive."

The victories of the Prussians in Bohemia astonished the world. Mérimée would not have disliked to see the Prussians and the Austrians devour each other like Kilkenny cats. He had no sympathy for Austria, on account of Italy, but around him he saw nothing but sympathy for Austria. "The other day," says he, "on the rumor of a victory of the Imperial army, the Luxembourg quarter was on the point of illuminating, which seems to have displeased the Emperor. It is, perhaps, because he is supposed to have some partiality for M. de Bismarck that the students and the little bourgeois have Austrian sympathies. *Semper maledicere de priore* is the custom of the Parisians." Mérimée would not believe that the Emperor had any idea of annexing the Rhenish provinces. He was afraid that they would become a Venetia for France. His friends, the Italians, were beaten in the campaign of 1866; but they were, after the title of a comedy of Molière, "battus et contents," as the peace gave them Venetia. Napoleon became a sort of mediator. "You cannot imagine the fury of all the parliamentarians. . . . M. Thiers will never forgive Europe for not having chosen him for a mediator." Bismarck became, for a moment, the hero of Mérimée. "As for Bismarck, he is my hero. Though a German, he seems to have understood the Germans, and to have judged them to be as *niais* as they are."

The Roman question came into the foreground when Italian unity was nearly achieved by the cession of Venetia. If Mérimée had a strong passion it was his hatred for the Catholic Church:

"You know my way of thinking about the Pope and the priests. I deplore every day that Francis I. did not make himself a Protestant. But since we have the misfortune of being Catholics we must have ten times more prudence in order to live in peace. . . . I wish the Pope was in Abraham's bosom. If he had under his tiara one ounce of reason, all would be easily arranged; unfortunately he is an honest imbecile and a good Christian. He is in the hands of our enemies, who desire but one thing, to have him for a martyr and make relics of him."

He deplored the Empress's state of mind in standing for Rome. "Imagine what advice can be given by a person who fears nothing, and who sees things

only from the chivalrous point of view!" Mérimée was in mortal fear lest the Pope should leave Rome; he was convinced that "nothing could be more detrimental to the reigning dynasty than the flight of this old priest."

Here and there we find, again, some amiable compliments to the United States. From Cannes Mérimée writes, at the end of 1866:

"The prosperity of these scoundrelly Yankees is awful. Nearly a milliard of surplus in their budget, after four years of war! The speech of President Johnson don't promise us soft pears; neither does it you. Whatever you may say, it was in the egg that the American eagle ought to have been crushed (to speak like Victor Hugo). And if the annexation of Savoy has had on Lord Palmerston the effect which you say, and has hindered him from accepting the offer of a common intervention in America, it proves simply that he was very old when he died."

In 1867 public opinion was occupied with the reorganization of the French army; the war with Germany was "in the air," as we say. The "territorial" army had been voted by the Chambers, an army of reserve, which existed only on paper. This law caused much discontent, and Mérimée observed that it was chiefly attacked by those who had accused the Imperial Government of imprudence and want of foresight:

"It is only too true that we have preached too much that money is the sovereign good, and that we have thus altered the bellicose instincts of France—I do not say in the people, but in the higher classes. The idea of risking one's life has become repugnant, and those who call themselves *honnêtes gens* say that it is low and vulgar. These gentlemen will do so much that they will force the Emperor to throw himself into the arms of the people, a thing for which he has always felt some propensity."

It is quite true that the Opposition in the Chamber, and chiefly M. Thiers, were attacking the Emperor for his complacency towards Bismarck and Germany, and that at the same time the Opposition steadily refused to give the Government more money and more men. The territorial army was never organized; nobody believed in its necessity. The Government lived on the memory of the Crimea and of Solferino; no one dreamed of a possible defeat. On September 27, 1867, Mérimée writes:

"Everybody here believes in war, but really I do not see why. It seems to me that after the evacuation of Luxembourg we have no subject of quarrel with Prussia. To make war on her because she gained the battle of Sadowa would be too absurd, and the consequence of it would be to put all Germany on her side. On the other hand, I cannot believe that M. de Bismarck, who is a man of sense and who has much to do, will for the second time play his *va-tout* in provoking us. After having preached respect for nationalities, we cannot honestly oppose the unification of Germany, any more than we did the unification of Italy. There is every appearance that this unification will greatly embarrass Prussia, who, after having excited revolutionary passions, tries now to resist them, and will thus raise storms. Then the chances will be in our favor. Till then I believe that war is impossible—I say war between Prussia and us, for on the side of the East there may soon be a great conflagration."

Mérimeé's health was failing more and more; his ill-health is visible in all his letters: he finds fault with everybody, he is in ill-humor with the Clericals and with the Revolutionists, with the Pope and with Garibaldi, with the cardinals and with the generals, with the English Reform Bill, with the Englishmen who make visits to the Imperial court, with Europe, with America, with everybody. His prophecies are not cheerful:

"If our Opposition become very strong at the next election (and the thing is not impossible) I do not doubt that the temptation to make war would be the signal of a domestic catastrophe. What the King of Prussia does not say, and what is true, is the existence in Prussia of a considerable party which wishes for war; it is the party of the old Prussians, who only swear by the great Frederic, and who, since Sadowa, think that nothing can resist their new gun. M. de Bismarck, who is a man of sense, is the cork which prevents the explosion of this bellicose foam."

When the elections take place, in the month of May, 1869, he says of Thiers: "Thiers will be elected, but with the help of the Reds. He is now body and soul in the Revolution." He does not deny that "the wind is now with *parlementarisme*, one of the worst governments in a country where there is no strong aristocracy."

The end of the volume is very painful. Mérimeé's days were numbered, like the days of the Empire. He fell with the system which he admired and loved, though he sometimes criticised some details. He was taken by surprise; he denied the Benedetti treaty; he would have denied Wörth, and Sedan, and the captivity of the Emperor. The agony of the Empire was his own agony. He was so ill that he took refuge at Cannes, where he heard the distant echo of the tragic events which filled France with horror. He said "Finis Galliæ," and died.

Correspondence.

HOPEFUL CONDITION OF THE SOUTH.

To the Editor of The Nation:

Sir: I have recently returned from a journey to the South, extending through portions of Virginia, the Carolinas, Georgia, and Florida. Being a native of Maryland, and well acquainted with the institution of slavery, I felt a more than usual degree of interest in ascertaining the condition of those parts of our common country which have undergone such great changes in their social, industrial, and political relations. Census tables and statistics have informed us of their surprising growth in population and in agriculture, trade, and manufactures; but there are other things of importance which cannot be satisfactorily ascertained from such results, but require a direct and personal intercourse and observation. I accordingly, as opportunity presented, conversed freely with people of all ranks and conditions whom I met—the cultivated and the ignorant, white and colored, natives and strangers.

The outcome was highly encouraging. Instead of the gloom and despondency which prevailed until the recent policy was adopted by the Government of the United States of leaving the States to regulate their own affairs, there is observable among all classes a hopeful and enterprising spirit. They look forward with confidence to a better future. New houses are built, new lands are taken into cultivation, new railroads are projected or are in process of completion. Interest is felt in the education of all classes; a strong movement in behalf of temperance is made by legislation in the different States. The Ku-klux movement, which was the bad but natural outgrowth of the carpet-bag régime, has passed away with it and is nowhere heard of.

The emigration to the South of Northern men and the introduction of Northern capital are hailed with gratification. No Northern man of good character need apprehend a cold or unfriendly reception if he goes there in a friendly spirit. He could not express a more thorough dislike or disapproval of slavery than he will hear from Southern men themselves who fought persistently on the Southern side during the war. I did not hear a single voice expressing a regret that slavery had been abolished or that the Union of the States had been preserved. I did not hear a single complaint by any colored person of ill-treatment of colored people, and their manner and bearing were such as to show that they were in the full enjoyment of protection in their rights of person and property.

The relation between the colored and white races was manifestly friendly and pleasant. A slight indication of this is the fact that in some of the leading hotels colored and white waiters were serving together. The intercourse between colored and white seems to be more friendly as you advance southward. The political problem cannot be said to be solved, and the solution is looked forward to by thinking people of both parties not without doubt and anxiety. If the whole mass of the colored people should be united, and under the lead of a few white men should obtain control of the State governments, there would be a repetition of the evils which prevailed universally during the carpet-bag governments. If such a political control should be averted by a resort to force or fraudulent elections, another class of evils would arise of a still worse character, because they would be destructive of the very foundations of republican government.

Several remedies have been suggested. One is the imposition of a reasonable poll-tax on all voters, and to this there can be no sound objection, provided it is consistent with the State constitutions. This remedy would doubtless exclude a large number of voters who are unfit to exercise the franchise of voting; but it cannot be relied on as a sufficient check. It is already in force in some of the States. Another remedy proposed is to impose an educational qualification upon all voters; this would also exclude a large number of unfit voters. But such a law cannot be passed, unless it is sanctioned by the constitutions of the States, and such a power can never hereafter be added to any constitution because the consent of the majority of the voters is necessary, and such a consent cannot be obtained because no people will vote to disfranchise themselves.

Another remedy is a very simple one, but is not objectionable on that account, because all great and fundamental principles are simple. This is especially true in statesmanship. The remedy is to treat the colored voters with absolute justice. This means not only a free ballot and a fair count, but it means that the voter shall be entitled to all the privileges which belong to the citizen. It means that he is not only entitled to vote, but to be voted for, and also to fill by executive appointment any office for which he is qualified. If this principle be adopted and fairly carried out the problem will be solved. Uneducated men, whether white or colored, are not fit for offices that require education, and this they perfectly understand; but they do claim, and they have a right to claim, that they shall not be excluded from any offices which they are qualified to fill on account of race, color, or condition. The colored people have a strong leaning towards the Republican party, and this is natural and proper, because it is to that party they owe their freedom; but they also have a strong leaning towards the educated people of the South—to their old masters and to the descendants of their old masters. From these they expect good treatment and justice. And such people and others like them constitute the strength of the Democratic party. When the Democratic party shall treat the colored people as thus indicated, and shall recognize them in their party affiliations not only in their processions and clubs, but in the distribution of offices for which they are qualified, there will be an

end of the solid vote of the colored people for the Republican party, and they will divide as other voters divide on political questions—according to their sympathies, their ideas, and their personal interests.

The importance of such a division can hardly be over-estimated. In some places it has already begun. The South will then cease to be solid on national questions, and a solid North will become an impossibility.

G. W. B.

BALTIMORE, April 9, 1881.

WHAT THE SPOILS SYSTEM WILL BRING A MAN TO, MORALLY AND FINANCIALLY.

TO THE EDITOR OF THE NATION:

SIR: Facts are stubborn things, so I contribute a few. A gentleman, whom we will know as K., was a year or two ago well established in Kansas. He managed a farm, was editor of a local paper, had charge of a railroad station, and said to me that his net income was over $100 a month. He was a local preacher in the Methodist Church, and preached from time to time. He interested himself in local politics, and controlled caucuses at home and had influence in county conventions. The present Representative in Congress from that district owed his success in that section much to the slates prepared and pushed through caucuses by Mr. K.

The Congressman's interests being secured, attention was turned to K.'s. K. desired an appointment at Washington. One was obtained by the Congressman in the Census Office, and K. brought his family to the capital. When the first salary was paid him it was $50 for the month. The Congressman was appealed to, and could only say that it was too low, but he would get it raised soon. So K. sent home for money to cover the excess of his expenses over his income. Next pay-day he had not enough to pay his debts, and sent home for more money. Then he economized by living in small apartments and without servants. Still again he had to draw upon his Kansas earnings to meet his deficiencies. The fourth month he was advanced to $60 a month, and by straitening his economy still further just about made ends meet. Now he proposes to hire a house, and by renting furnished rooms, which his wife will take care of, manage to get along. He still hopes for a better appointment, and his Congressman has been here a whole month since Congress adjourned, because he dare not go home till he has "fixed" K. and one other ward. The less efficient are already being dropped from the census rolls, and as the work approaches completion more must go. Probably within four months half of the 1,200 now on the rolls will be dismissed. If the less able half go, K. will be among them. He is faithful and tries to do his work well, but he is not educated and drilled for such work, so that he could not be used on the same kind of work in the Pennsylvania Railroad offices or in Harper's. He would not steal a cent for hunger, even, but he could not keep bank accounts with strict accuracy so as to prove his honesty. He might possibly keep them so as to get through with the business in some way or other. In short, he is not adapted to this work, as he ought to be to be appointed. I had rather have the work of the best boy I can pick from ten young men between the ages of seventeen and twenty.

Morally, K. sees no objection to the spoils system. He justifies a caucus he got together secretly five hours before the delegates were obliged to start to a county convention, on the ground that if his machine was not run a worse one would be. Yesterday he sent seeds from the Agricultural Department to his county in Kansas to such men as he thought would be conciliated in the interest of his Machine, and to no others. To-day he is in Baltimore to supply the pulpit of one of the leading Methodist churches. He is as sound in evangelical doctrines and holds family prayers as regularly and as conscientiously as any minister in the city. Financially, he says he acted the fool in coming to Washington, but morally he has not an iota of a confession to make. In both respects, however, he proposes no back steps. I have the fullest means for knowing this case, and while I see all the elements separately in scores of cases, I have in this case alone found such a combination. H.

WASHINGTON, D. C., April 3, 1881.

COLONIAL VIEWS OF QUALIFICATION FOR OFFICE.

TO THE EDITOR OF THE NATION:

SIR: The healthy growth of democratic institutions can hardly be studied anywhere to better advantage than in the town-records of Connecticut of the seventeenth century. I am just now taking a course of reading in a town-clerk's office, and I have observed two facts which seem to me especially noteworthy. The first shows the strong desire of the voters, as a body, to secure for the higher offices men of the best intelligence and greatest social influence. We find them earnestly protesting against the removal of a recent graduate of Harvard, the son of their foremost man, on the ground that they have so few "able helps here for the work of magistracy." He was accordingly invited to become a magistrate in less than a month after his admission as a freeman, and another important and responsible position was almost forced upon him a few months later. A young man of similar standing was called into service about as promptly, and became a magistrate within a few years. The regard thus shown for parentage and collegiate training was no doubt excessive, but they were valued because they were presumed to be proofs of fitness for leadership, and in these two cases the presumption was a very natural one. In harmony with this was the conception, which the townspeople readily accepted when it was stated to them, of the object of the higher education. It was to train their youth "for publique use in church *or commonwealth*." They believed that the latter needed trained leaders as well as the former, that magistrates ought to be as well educated as ministers. The remarkable permanence of tenure in the chief offices of this colony came from the same habit of mind. Rulers were carefully chosen, and being found qualified for their position they were kept there. During the colonial period if a man became deputy-governor of Connecticut in middle life it was fairly probable that he would die governor.

But was not all this a survival of prejudices contracted in a country accustomed to be ruled by aristocrats? In some degree it may have been. But now for the second fact. The same community which was so solicitous about the education of its magistrates sent year after year to the colonial assembly a man who apparently could not write his name. Here, again, we seem to have a tendency in excess. But the deputy in question was certainly not chosen on account of his illiteracy, which was somewhat unusual among men even then. He must have had much natural capacity, for he was constantly employed in minor local offices, and the case simply illustrates the disposition of the mass of the freemen to take their own representatives largely (by no means always) from among men of small estates and ordinary education. If they were upright and sensible they could be trusted to be guardians of popular rights. These voters knew how to discriminate, and in their minds the qualifications for magistrate and deputy were as distinct as those for minister and deacon. They meant to distribute the offices in their gift on the principle of setting men at work which they could do best. It is fair to say that Dr. Dwight, writing more than a century later, but with an eye to the past, names the position of representative as the single one which a demagogue might possibly secure. But he also tells us, in substance (very likely giving to a state of things already vanishing too bright a coloring from his own feelings as a Federalist, a clergyman, and a gentleman), that in the days which he remembers and regrets the only way in which a man could become a candidate for office was by being a good citizen. Whether or not we are ever again to see either elections or appointments determined by fitness, it is something to know that this principle virtually controlled the political action of one commonwealth for a century and a half. X.

NEW HAVEN, April 7, 1881.

MORE "FRACTIONAL INACCURACIES."

TO THE EDITOR OF THE NATION:

SIR: In your issue of last week I noticed my own name in a communication from Mr. F. B. Thurber on "Railroad Stock-Watering," etc., in which he quotes me as condemning "in the strongest terms the practice of capitalizing surplus earnings, in the reports of the Massachusetts Railway Commissioners." I wish Mr. Thurber would refer me to the passages he alludes to. If undivided net earnings are put into the business of a railroad—as in building extensions, buying new rolling-stock, or for any purpose outside of the legitimate "construction account"—they ought, of course, to be capitalized. I have no disposition to defend "railroad financiering," so called; but the idea of a company neither paying dividends nor representing by new stock the net earnings put into the property, strikes me as farcical. It is not business, and it is not book-keeping.

Mr. Thurber also makes queer work in his statement of the origin of the railroad system, and the laws to prevent excessive profits. What does he mean by saying "the cases are very few where capital was originally put in these enterprises as a primary investment"? So far as I know, every road in Massachusetts but one, and generally all the roads in the East, were built wholly with private capital, and as business investments.

Again, he says that "in defining what is a fair profit the Legislatures in several of the States have fixed upon ten per cent. above the cost of operation." I would very much like to see a single specimen of a provision of this sort. As a rule, in this country, a fair profit on capital is made when a road earns, net, 50 per cent. above its cost of operation. In England it is over 100 per cent. Nor is there any excessive profit in these figures. Mr. Thurber evidently had in mind the clause in the old charters authorizing legislatures to reduce rates where profits exceeded ten per cent. on the amount of the capital stock. The capital stock of a railroad and its cost of operation are, however, two quite different things.

There are various other singular inaccuracies in Mr. Thurber's letter, but it is hardly worth while to point them out. C. F. ADAMS, JR.

QUINCY, MASS., April 9, 1881.

THE TYPICAL PRESIDENT.

To the Editor of The Nation:

Sir: Your correspondent, who styles himself "A Faithful Reader of the *Nation*," should have read more faithfully. My general observations on political hero-worship referred expressly to "the typical President which both parties have sought and chosen for the last forty or fifty years," and could only have been met by an impartial review of the candidates of both parties during that period.

His gratuitous championship of "our new President," in view of such an argument, might suggest to a political opponent the proverb: *Qui s'excuse, s'accuse.* I commend to him the good sense which Mr. Garfield himself is said to have shown by excluding from the inaugural procession the "picturesque" canal-boat which had figured, falsely enough, in the popular ideal of greatness.

Spectator.

April 8, 1881.

Notes.

THE firm of Charles Scribner's Sons have sold their interest in the firm of Scribner & Co., and the latter corporation will, as soon as the change can be legally effected, assume the name of The Century Company. The name of Scribner will ultimately be dropped from the titles of *Scribner's Monthly* and *St. Nicholas*. Mr. Roswell Smith will be president of the new company, and no alteration will take place in the business or literary management.——We have received from J. R. Osgood & Co., Boston, an elegant prospectus of a descriptive and historical 'Atlas of the Cesnola Collection of Cypriote Antiquities,' which, if sufficient encouragement be received, it is proposed to issue in fifteen monthly parts, each embracing thirty plates of illustrations, with corresponding letter-press, and the whole work forming three volumes—of marbles; metals, glass, and gems; and terra-cottas, respectively. Not more than five hundred copies will be published, and the plates will be destroyed after subscribers have been supplied. The size of the Atlas will be 14 x 17, the paper and typography of the best quality, and the illustrations (partly in color and partly in heliotype), to judge by the samples, of a very high order of excellence. The price is fixed at ten dollars a part.——An index to volume v. of the *Library Journal* accompanies the current issue, which in its turn contains a tentative alphabetical author-index to serial stories in bound volumes of leading periodicals.——A very valuable preliminary Index to the Railroad Section of the Library of the American Society of Civil Engineers has just been issued by the Society. It is in three parts, each with its separate alphabet—viz., Railroad Titles, Authors, and Subjects. The last division refers not only to the foregoing two, but also to articles in the transactions of certain specified scientific associations.——The editor of the *American Journal of Philology* announces that the first year's experiment warrants a continuance of the enterprise, and that "there is every prospect of an ample supply of original papers for the new volume." Subscriptions, at $3 per volume of four numbers, should be addressed to Professor B. L. Gildersleeve, P. O. Drawer 18, Baltimore.——The first number of the Journal of the American Agricultural Association is now in press, with an interesting table of contents. It will make a book of about three hundred pages. It opens with "The Problem of American Landholding," by Dr. George B. Loring, and ends with the "Culture of Watermelons," by Cassius M. Clay—a singularly peaceful subject for one whose career has been attended with so much turbulence.——Mr. Samuel Garman's Report on the Selachians (from the results of the *Blake* dredging last summer) concludes that the migrations of these animals (and of the fishes) "are much more limited in extent than has generally been supposed," and that they have a period of comparative inaction, like that of batrachians and reptiles. The runs of many species are very limited, and in time our fishermen will "follow their game with nearly as much certainty as the hunter now follows his, from highlands or lowlands, north or south."——Mr. Lucien Carr, Assistant Curator of the Peabody Museum at Cambridge, contributes to the Anniversary Memoirs of the Boston Society of Natural History some "Notes on the Crania of New England Indians," based on a great number of collections. His derived average of cranial capacity agrees almost exactly with Dr. J. Aitken Meigs's for the North American Indians (1377 and 1376 c. c., respectively). But there occurs no typical cranium like that adduced from the measurements, and the series lacks the obvious characteristics of the crania from the stone graves of Tennessee or from Greenland.——A recent canvass shows that among all the religious beliefs of the students of Harvard College and its Law School the Episcopalians outnumber even the Unitarians (275 to 214).——The London *Athenæum* states that the Jubilee fund to be raised this year by King's College, on account of its fiftieth anniversary, will be chiefly devoted to establishing a permanent college at Kensington for the higher education of women; and that the University of St. Andrews, the Newcastle College of the University of Durham, the new college at Liverpool, and Owens College will all in various ways provide for the instruction of women.——L. W. Schmidt, 24 Barclay St., has received catalogues of the art-collection of the late Carl Damian Disch, to be sold at Cologne on the 12th of May. This collection, which ranks among the very first in Germany, is especially rich in ancient Roman glass, specimens of which and of all the other departments are shown in numerous heliotype plates.——As we collect Shakspere libraries the Dutch are making a Hooft collection, to be deposited in the University Library at Amsterdam. It is to consist of (1st) all Hooft's works in every edition, (2) the works of his friends and other contemporaries, so far as he can be proved to have possessed copies of them. We do not recollect having seen this latter feature carried out in any of the Shakspere or Dante or other similar collections, probably for want of evidence and proved material; but every one knows Collier's 'Shakspere's Library,' consisting of the romances, novels, etc., used by Shakspere, and Hazlitt's 'Shakspere's Jest-Books.'——The library of the late Prof. S. S. Haldeman is to be sold in this city on April 12 by Geo. A. Leavitt & Co. It is mainly philological in its character, with a considerable admixture of scientific works. General literature is but sparsely represented.——In addition to the regular edition of the *Portfolio* for 1881, there will be an *édition de luxe* of fifty copies, with specially heavy paper, and artists'-proof impressions of the etchings on Japanese vellum paper. Ten of these copies have been reserved for the American market through J. W. Bouton.——An unfortunate typographical error greatly affected the sense of the second "Note" last week on the army ration (p. 243), in the fourth line of which should be read, instead of "three whole rations," "their whole ration."

—The third part of the Brinley sale was concluded on Thursday evening, with a total net result of about $30,000. More than a quarter of this amount was produced by one book, the Gutenberg Bible, which was bid in at $8,000 by Mr. Hamilton Cole. Next in point of competition came the three copies of Eliot's Indian Bible, the first edition bringing $900, the second $590 and $550. Close upon these came twelve leaflets printed in Gothic letter in the city of Mexico in 1544—Rikel's directions for the conduct of religious processions, etc. ("d' la manera de como se ha de hazer las pcessiones")—which sold for $525, purely as a specimen of early American printing. Two volumes of genealogical tracts and pamphlets were taken at $332 by the American Antiquarian Society, and charged to the account of Mr. Brinley's allowance (in trade) to the Society. Romans's 'History of East and West Florida' (New York, 1775) brought $265, while the John Carter Brown Library paid $250 for Laudonnière and Gourgues's 'Histoire Notable de la Floride' (Paris, 1586). Nodal's 'Relacion del Viaje' (Madrid, 1621) was prized at $240. Thévenot's 'Recueil de Voyages' ($150); John Eliot's 'Further Account of the Progress of the Gospel among the Indians of New England' ($130); Filson's 'Discovery, Settlement, and Present State of Kentucke' ($120); and Haywood's 'History of Tennessee' ($100), were the only other volumes in the collection which attained or surpassed the last-named figure.

—The historic accuracy of the "King's Missive," a poem contributed by Mr. Whittier to the 'Memorial History of Boston,' has been lately very freely discussed in the columns of the newspapers of that city, the chief proposition being whether the letter of Charles II. to Governor Endicott, in 1661, operated to arrest the persecution of the Quakers in New England. Dr. Ellis asserts that "the King's letter, in its demand and in its effect, did not correspond with the poetic representation," and that "it did not require and did not bring about a general jail delivery." Mr. Whittier, believing that "the ballad has preserved with tolerable correctness the spirit, tone, and color of the incident and its time," sustains his position in a long and interesting letter. We do not wish to join in this discussion farther than to say that we regard Dr. Ellis's position as untenable when he says that no "jail delivery" followed the arrival of the King's mandamus. If Dr. Ellis is right, what is the meaning of the following order of council, which we copy from Besse, vol. ii. p. 226?

"To William Salter, Keeper of the Prison at Boston.—You are required, by Authority and Order of the General Court, forthwith to release and discharge the Quakers who at present are in your custody: see that you don't neglect this.—By Order of the Court.

"Edward Rawson, *Secretary.*

"Boston, the 9th of December, 1661."

—We have been requested to print the following:

"A number of weeks ago two large boxes of pikes and lances were found in a garret in the South, where they had lain, almost forgotten, since they were captured at Richmond, in 1865. W. M. H., 712 Market St., Philadelphia, Pa., the owner, would like to receive a line from any reader who knows what organization used them, merely to settle an historical point. The lances all have on them a small 'Confederate' flag, and are about nine and a half feet long. About ten thousand pikes, but of a different pattern, were made in Georgia, and still other thousands were made at the Winans Works, in Baltimore, in 1861. The 6th P. V. C., on the Union side, was armed with the lance, and several regiments of the British army still use it."

—Dr. Samuel Willard writes us from Chicago :

"In 1836 I first heard the word 'blizzard' among the young men at Illinois College, Jacksonville. If one struck the ball a severe blow in playing town-ball it would be said 'That's a blizzard.' For many years I had not heard it, when it reappeared, meaning a storm. Need we look elsewhere for its origin than into Jameson's 'Scottish Dictionary,' to the verb *blizzen* (identical with the German *blasen*, Dutch *blazen*), implying a destructive action of wind ?"

—Bulletin No. 89 from the Census Office contains an epitome of the iron and steel industry of the country, in the form of a preliminary report by Mr. James M. Swank. The whole number of establishments in 1880 was 1,005 ; in 1870, 808 ; and the per cent. of increase in ten years, 24.38. The size and capacity of the works were much greater in 1880 than in 1870 ; but as the capacity of blast-furnaces only was given in 1870, comparison can be instituted in regard to them alone. The daily capacity of the blast-furnaces in 1880 was 19,248 tons ; in 1870, 8,357—an increase of 130.32 per cent. The amount of capital invested in iron and steel works in 1880 was $230,971,884 ; in 1870, $121,772,074—an increase in the decade of $109,199,810, or 89.68 per cent. The total production in 1880 was 7,265,140 tons, as against 3,655,215 tons in 1870—an increase of 3,609,925 tons, or 98.76 per cent. The following table shows the production in each branch, in 1870 and 1880, with the per cent. of increase or decrease in the latter :

Iron and Steel Products.	Census Year 1870.	Census Year 1880.	Percentage of increase in 1880.	Percentage of decrease in 1880.
	Net tons.	*Net tons.*		
Pig-iron and castings from furnace	2,052,821	3,781,021	84	....
All products of iron rolling-mills	1,441,829	2,353,248	63	....
Bessemer steel finished products	19,403	889,896	4,486	....
Open-hearth steel finished products	....	93,143	....	....
Crucible steel finished products	28,069	70,319	151	....
Blister and other steel	2,285	4,956	117	....
Products of forges and blomaries	110,808	72,557	....	35
Total	3,655,215	7,265,140	99	....

—In 1870 twenty-five States were engaged, to a greater or less extent, in the manufacture of iron and steel. Of these the only one which has abandoned that branch of industry is South Carolina, whose total product in 1870 did not exceed 500 tons. Since 1870 the following States and Territories have commenced the manufacture of iron and steel : Colorado, Kansas, Nebraska, Utah, and Wyoming. California and Washington will be manufacturing iron in the near future. New Hampshire made iron many years ago, but does not appear in the census of 1870 as producing any in that year. She reappears, however, in 1880. Oregon and Texas each built a blast-furnace between 1860 and 1870, but they made no iron that year. They appear, however, in the statistics for 1880. Minnesota is now making preparations to embark in iron manufacturing. Pennsylvania stands at the head of the iron-manufacturing States, as she has done for the past century. Her product in 1880 was 3,616,668 tons, which was more than 49 per cent. of the total product of the country. From 1870 to 1880 she increased her product 97 per cent., while the product of the United States increased 99 per cent. Ohio occupied the second place, and still holds it. In 1880 she produced 930,141 tons, an increase in ten years of 107 per cent. The third State is New York, with a production of 598,300 tons, an increase during the decade of 33 per cent. The fourth place is occupied by Illinois, which produced 417,967 tons, while in 1870 she produced but 25,761 tons, and was fifteenth on the list. The fifth State in production is New Jersey, with 243,860 tons, an increase of 112 per cent. Among the other States which have produced largely are, Maryland, 110,934 tons ; Missouri, 125,758 tons ; Michigan, 142,716 tons ; Wisconsin, 178,935 tons ; and Indiana, 96,117 tons. Of the New England States Massachusetts is at the head, both as to production and relative increase during the decade. Her product is 141,321 tons, an increase of 64 per cent. Astonishing progress has been made in several of the Southern States during the decade. The production of West Virginia increased from 72,337 to 147,487 tons, or 104 per cent.; Alabama, from 7,060 to 62,986 tons ; Georgia from 9,634 to 35,152 tons ; Tennessee from 34,305 to 77,100 tons ; and Kentucky from 86,732 to 123,751 tons. All the States which were producers increased their production, with the exception of Maine and North and South Carolina. Twelve States made each 100,000 tons in 1880.

—Brahms's Second Symphony in D major was the opening number of the final concert for the season of the Philharmonic Society. This beautiful composition, which was first introduced here by Dr. Damrosch three years ago, has not been heard since, and Saturday's performance was a delightful surprise to many who received the work rather coldly on its first production. Brahms's compositions, particularly those of his later years, require for their appreciation an advanced state of musical culture and repeated hearing. The first movement of the Second Symphony, a vigorous allegro non troppo, makes at once a profound impression. The long adagio is perhaps the most difficult to understand. It presents great rhythmical and harmonic difficulties, yet, while it is impossible to discover what is popularly called "a tune" in it, it nevertheless abounds in pathetic beauty of instrumentation and melody. The succeeding allegretto scherzoso is one of the most graceful, quaint instrumental movements in modern music, and the finale is powerful and splendid. Miss Winant sang a highly dramatic scene, entitled "Hecuba," by Rubinstein. In a very touching middle movement *Hecuba* recalls the happy morning when *Priam* led her as bride to the palace. This beautiful melody is effectively sustained by a very soft accompaniment of the wood wind instruments, particularly the flutes, with pianissimo touches of the cymbals. Miss Winant sang with great earnestness and expression, but her enunciation was very indistinct and seriously marred the rendering. Wagner's Faust Overture, an old favorite in our classical concerts, was followed by three scenes from Berlioz's dramatic symphony, "Romeo and Juliet," a work which was given in its entirety some years ago by Mr. Thomas. Of Saturday's selections the lovely scherzo "Queen Mab" was particularly welcomed.

—Dr. Denman W. Ross, whose essay on Swiss democracy we noticed some weeks ago (see *Nation* No. 802), has published in pamphlet form (in three parts) his dissertation upon taking the doctor's degree at Harvard last summer. It is upon the "Theory of Village Communities," and is designed to disprove that now generally accepted theory. His polemics are directed against Von Maurer, Thudichum, Nasse, Maine, and Laveleye. The essay is the result of a great deal of well-directed research, but we cannot say that he has fully made out his point. He has shown conclusively that individual ownership of land was far more common in the fifth and sixth centuries than has been supposed. This may have been, however, and, in fact, is generally assumed to have been, the result, in part at least, of the dissolution of the village-community system which accompanied the formation of great estates in the Frank times. On the other hand, he has, we think, proved that the village-community theory finds no support in Tacitus, in whose time there appears to have been no ownership of land at all, whether by individuals or communities. We cannot, however, accept his own interpretation of the disputed passage in Tacitus ('Germania,' 26), as describing a fully-developed system of serfdom. The essential point in the discussion is the genesis of the mediæval land community of serfs, which Mr. Ross considers to have had its origin in a similar community in the earliest times, and to have been servile from the first. The existence of such communities of serfs among the early Germans is, however, as purely a matter of theory as is the village community, while Mr. Ross overlooks the free village communities which, in Germany at least, existed side by side with the communities of serfs. He shows up the inconclusiveness of much of Von Maurer's reasoning, and even picks flaws in Nasse and Thudichum, far more careful writers than Von Maurer. But the controversy is not merely with these specialists. The aspect of early German society presented by scholars of the rank of Waitz and Arnold is wholly consistent with the theory in question. So, too, is the analogy of other nations ; and although Mr. Ross successfully impugns some parts of this argument from analogy, yet the force of the analogy, taken in connection with the primitive structure of Germanic society, is so great that the theory of village communities may still claim the balance of probability in its favor.

—England's chief astronomical prize falls this year to the lot of a Swedish scientist. The fifty-fourth gold medal of the Royal Astronomical Society has been awarded to Dr. Axel Möller, the distinguished director of the Observatory at Lund, for his investigations of the motion of Faye's comet. This object was discovered at Paris in November, 1843, by the astronomer whose name it bears. It was very soon found to be periodic, and it has been fully observed at five returns, the period being very nearly seven and one-half years. Dr. Möller's researches began with the year 1860, and he has prosecuted them with great assiduity up to the present time. In addition to furnishing very accurate data respecting the orbit of the comet itself, it is to be remarked that these cometary investigations have led to other results of noteworthy significance. The early observations appearing discrepant, it was at first supposed that Encke's hypothesis of a resisting medium in space would throw them into entire accord ; however, with the application of one refinement after another, Möller finally arrived at the important result that these observations were perfectly represented without the introduction of any such hypothesis whatever. The very near approach of the comet to Jupiter has been admirably utilized by Dr. Möller for finding the mass of that planet, his determination of this constant being entitled to the highest confidence. The president of the Society, in making the customary address in presenting the medal, very properly remarks the fact that the class of computation involved in Möller's investigations is of a high order, knowledge of the applicability of the refined methods to particular cases being absolutely essential ; and he further entertains the belief that this award of the highest token of the Society's appreciation "will give satisfaction to astronomers in all countries, as encouraging a very monotonous and tedious, but not less important, branch of astronomical research."

—It will be interesting to note some few points in connection with the distribution of these medals in the past. The first gold medal was awarded to Babbage in 1823. In early times several medals were often awarded in a single year, but since 1831 no year has had more than a single award, and many years have elapsed without any whatever. On two occasions, 1826 and 1867, a single medal was awarded to two persons, in each case for conjoint research. One award has been made to a woman, Miss Caroline Herschel's computations on the nebulæ discovered by Sir William winning one of the gold medals of the Society in 1828. No one has ever yet received so many as three medals; but Encke, Sir J. F. W. Herschel, Baily, Bessel, Airy, Hansen, and Le Verrier have each been awarded two. Twelve awards have been made for investigations relating to the fixed stars, mostly for star catalogues; five for researches on comets; five for the publication of astronomical books and periodicals; five for researches on the motion of the moon; five for physical and telescopic discoveries; four for researches on nebulæ; four for planetary reductions and tables; four for general astronomical labors; three for mathematical machines and astronomical instruments; three for investigations of astronomical constants; three for applications of physical research to astronomy; and one for a theoretical discovery. Twenty-eight medallists have been residents of England; thirteen awards have fallen in Germany, five in France, three in Italy, three in America, two in Russia, one in Denmark, and one in Sweden. The American medallists are G. P. Bond in 1865, Simon Newcomb in 1874, and Asaph Hall in 1879.

—It has been made out from the study of the grammars of the Indo-European speeches that there was a parent tribe from which all these nations descended; and from the comparative study of their dictionaries has been discovered what this hypothetical tribe knew and how it lived. The attempt is now making to find out, by a comparison of the earliest literary remains of all the nations, what sort of a literature the parent speech possessed. Prof. Heinzel, in an essay on the style of the old German poesy (Strassburg, 1875), finds, among other things, that the Vedas and the old Norse poetry, as well as the Homeric poems, abound in developed similes, and thence infers that the use of this figure was a trait of the literary style in the parent speech. It therefore must have been a trait of the style of all the Germanic peoples. But the Anglo-Saxon poems have almost no similes. This Prof. Heinzel deems a decaying or weakening of the earlier style produced by the influence of the Christian spirit and its foreign models. Mr. Francis B. Gummere has just published an essay on "Anglo-Saxon Metaphor," in which he controverts Prof. Heinzel. He holds that the development of poetic art was independent in the different nations; that the heathen Anglo-Saxon poetry as it appears in 'Beowulf,' full of metaphors and destitute of similes, is in a primitive condition; and that the foreign culture coming in with Christianity developed the use of the simile as we find it in Cædmon and Cynewulf. The bulk of the essay consists of a collection of the similes and metaphors of the Anglo-Saxon poetry elaborately classified to illustrate Mr. Gummere's theory. He further seeks to prove that 'Beowulf' is really a heathen poem from a study of the uses of epithets of color. He asserts that the words for *light* and *dark*, *white* and *black*, are used with moral associations as *good* and *bad* in the Christian poets, while in 'Beowulf' there is nothing of the sort; there the black raven blithe of heart greets the joyful dawn (ôð þæt hrefn blaca heofenes wynne bliðˇ heort bodode—'Beowulf,' line 1801). Mr. Gummere's dissertation was presented for the degree of Ph.D. at the University of Freiburg.

—One of the most important contributions ever made to the philology of the Italian language has recently appeared in Florence from the pen of Prof. C. N. Caix, under the title, 'Le Origini della lingua poetica italiana: principij di grammatica storica italiana,' forming one of the *Pubblicazioni del R. Istituto di Studi superiori pratici e di perfezionamento* in that city. A well-known peremptory question connected with early Italian literature relates to the language of the poems belonging to the first, or Sicilian, school—whether they were originally written in the Sicilian dialect and afterwards Tuscanized by copyists, or whether their language was common to all cultivated Italians of the period. This question cannot be answered until the Tuscan dialects of the thirteenth century and the fundamental character of the earliest Italian language are studied and established on a firm basis. This Prof. Caix proceeds to do with rare ability in the work cited above. He first examines the MS. collections of early poetry, their relations to each other and the sources from which they were made up, and then studies the groups of poems common to two or more of the *canzonieri*. This study is an admirable specimen of the most approved scientific method in philology, and under the divisions of phonology and morphology the older forms of the language are subjected to a most searching examination, with such comparison with the language of a later period as is necessary to establish the true Tuscan form. The work cannot fail to make the same epoch in the study of Italian philology which Gaston Paris's edition of 'Saint Alexis' did in French, and now, for the first time, we may hope to have the early poets in a correct edition and to see definitively settled the vexed question of Tuscan or Italian language.

BUDDHIST BIRTH STORIES.*

THIS volume contains a translation of forty Jātaka stories, or birth-tales, from the Jātaka collection of Ceylon; with a useful introduction illustrating the subject from several distinct points of view. There are in the Southern Buddhist collection five hundred and fifty of these tales—at least it is currently reported that this is the exact number; M. Feer, however ('Étude sur les Jātakas,' p. 5), states that the "nombre définitif" is only five hundred and forty-seven. Mr. Hodgson, again, gives us five hundred and sixty-five as the number of texts in the 'Jātaka Mālā' of Nepal. The only Jātaka book in China contains fifty-five tales. The Pāli collection, however, has a good claim to a sort of entirety of its own. The story goes that Mahinda, the son of the great Asoka, carried the Jātaka book with him into Ceylon, with the rest of the Buddhist Scriptures, at a date corresponding with his father's reign—that is, according to Mr. Rhys Davids ('Numismata Orientalia,' p. 54), about 265 B.C. This story has been discredited by Dr. Oldenberg ('Vinaya Pitakam,' p. lii.); but yet, though the date may not be quite correct, it seems very likely that the canonical book known as *the* Jātaka was taken to Ceylon at an early period, perhaps in the second century B.C., and has been preserved there ever since. As to the origin of the Jātakas themselves, not necessarily in a selected shape, we must go back as early at least as the compilation of the 'Vinaya Pitakam,' perhaps about 400 B.C., because many of the stories are found embodied in the text of that book. We might safely argue even for an earlier date than this, and say that many of the Jātaka stories must be coeval with the date of Buddha's teaching; that is, a hundred years at least before the last-named date. Mr. Davids, therefore, has reason for his statement (p. iv.) that this Buddhist book is "the oldest, most complete, and most important collection of folk-lore extant."

The author concludes, and we think with reason, that the Jātaka stories were not borrowed from the West, but are of Eastern origin. The Greek poet Babrius, who lived in the first century B.C., wrote in verse a number of fables, of which a few fragments were known in the Middle Ages; these, and some of the tales of Phædrus, Mr. Davids thinks, may owe their origin to the Buddhist story-book. It is evident, at any rate, that the 'Gesta Romanorum'—the Christian Jātaka book—has borrowed largely from its Eastern rival; and from this we may gather that the latter was well known, or, at least, that the stories were well known in Europe, when the 'Gesta' were put together.

It is accepted now as a fact that John of Damascus, whilst in Bagdad, borrowed the story of Buddha's life, and Christianized it under the title of 'The History of Joasaph (Bodhisat), King of India.' Mr. Davids has called attention to this, and given us a tabular list of authorities bearing on the point. We do not find, however, any mention made in it of Symeon Metaphrastes's work, called 'The Paradise,' a translation of which into modern Greek by Agapius, a monk of Crete, is popularly known at the present time. The author of this work describes Joasaph (*i.e.*, *Buddha*) as "'Ο ὅσιος Πατὴρ ἡμῶν καὶ Ἰοάπόστολος," and names the day of his festival in the Greek calendar. We are glad to find that Mr. Davids purposes to investigate this subject thoroughly, and to trace the links of connection between the two stories.

The great interest attaching to the Buddhist Jātakas is derived from the fact that many of them have been discovered among the sculptures of the Buddhist Stūpas, recently found in India. Mr. Davids refers to some of these at Sanchi and Bharhut. If there could have been any doubt about the identifications found in Mr. Fergusson's work ('Tree and Serpent Worship'), as relating to Sanchi, the matter has been set at rest by the Bharhut discoveries, in which the Jātakas are not only figured but named. We have here a record coming down to us, and engraved in stone, from the second century B.C. The Jātakas were, at any rate, popularly known and read in India at that time; and this is a great point to have set at rest. The graceful reference made to the late Mr. Childers (found on p. lxxxvii.) will be appreciated by all who knew that gentleman personally. For conscientious work we know no one to place by his side. We are glad to find the last memento of his earnest studies, standing exactly as it was left, on the first thirty-three pages of the book we are reviewing. This part of the book is, in fact, an introduction to the Jātakas translated from the pages of the Ceylonese compilation. It is an interesting record of Gotama's history from the time of his nomination by Dīpankara Buddha down to his return home after becoming perfectly enlightened. It includes also the presentation of the Jetavana monastery to the Order. With reference to the value of this record, it supplies us with many names and a regular sequence of events not always found in the Northern Buddhist books. We may remark, however, that the sculptures in the Lahore Museum representing Sumedha's offering to Dīpankara are evidently framed on the Northern version of the story, and not on the account in the record before us.

We may question the correctness of the translation (p. 105) of the expres-

* 'Buddhist Birth Stories; or, Jātaka Tales. Translated from the Pāli. By T. W. Rhys Davids.' Vol. i. London: Trübner & Co. 1880.

sion *Yamaka-pātihāriyan*. This can hardly be rendered "the miracle of making another appearance like unto himself." The twin-miracle is, in fact, an allusion to the wonderful appearance of Buddha when he rose in the air and caused fire and water to proceed from his person—"water from one side and fire from another." This proof of his ministry is constantly referred to in Northern works. The account of this miracle, when Buddha converted his father and kinsmen at Kapila, is so prolix or minute that we do not wonder that translators should omit it as too trivial or monstrous for notice. It is, however, apparently a sun-myth, and refers to the cloud gilded on one side by the sun's light, whilst it distils rain on the earth from another part.

The Jātaka stories as a *collection* are of uncertain date. In a Northern record we are told that the 'Jātaka Mālā' was compiled by king Silāditya for his own amusement, in this way: He ordered all his courtiers to compose a verse bearing on the subject of Buddha's previous history, and to leave them written out at his palace gate on a particular morning. There were upwards of five hundred distinct verses so left, and these when put together were the substance of the work known as the 'Jātaka Mālā.' (This, of course, can only refer to a late compilation. Silāditya died 650 A.D.) There is also another account, viz.: That the Jātakas were first put together in the order of the six paramitas by a certain convert to Buddhism called Matrajiva. This individual had been forenamed by Buddha when he was passing through a wood in which a parrot was moved to sing his praises. "This parrot," Buddha said, "shall hereafter be born as a poet named Matrajiva (or Matvajita)." This poet (we don't know when he lived) was so moved by the record he found of his birth that he devoted himself to the composition of certain Jātaka stories arranged according to the virtues (paramitas) which had been illustrated in the great master's previous career.

These Northern legends are not of much historical value; but they are worth noticing, for it is quite possible that some of Silāditya's verses have found their way into the Southern compilation. Considering their early origin and frequent alterations, the tales have a freshness which cannot but be pleasing. For instance, the fable of the "Bull who won the Bet" (No. 28 in Mr. Davids's book) is particularly naïve and interesting. It concludes, too, with a moral which is applicable to all time. It agrees with the familiar story of the traveller and his cloak: what the rough winds could not do, the kind rays of the sun accomplished. It illustrates, moreover, the gentle teaching of Buddha—that we should always try to "scatter seeds of kindness." The story (No. 14) of the "Greedy Antelope" resembles in some particulars the Jātaka of the "Golden Deer" found in the first or Pārājika section of the 'Vinaya Pitaka,' according to the Mahisasaka school. The difference is this: In the Northern legend the golden deer, provided with wings, flies every morning from South to North to feed on the leaves of some unknown tree, and then returns. The queen of the country having witnessed this occurrence during many days, longs to have the golden hide of the deer for a bed-covering. A hunter is despatched to trap the creature and kill it. Having found out from an ascetic the situation of the tree, the hunter proceeds to the place, and after a while contrives a plan for capturing the game. He covers the upper leaves of the tree with honey, and so brings the creature within bow-shot. He is thus killed; but lo! when dead the hide loses its golden color, and becomes common and worthless. The moral of the tale is, of course, "it is not all gold that glitters." Mr. Davids, in translating the story of the "Happy Life" (No. 10), might have referred to the same story of Bhadraka (or Bhadrika), found in the Northern record of the life of Buddha ('Romantic Legend,' p. 382). The similarity of the accounts is very marked; and if, as Mr. Davids observes, this story is "of the very earliest period," we see that the Northern Books are not of the late date some persons would assign to them. We can only refer to one other story, viz., that on page 277, called "The Ox who envied the Pig." This fable is well known to us from the pages of Æsop and La Fontaine, as Mr. Davids has remarked. To our mind it is the best in the book, and ought to be printed in letters of gold. The fact of its being still a favorite with our own children shows its real worth.

When Mr. Davids's work is finished we shall be able to compare the Jātaka book of Ceylon with the fifty-five birth-stories known in China. This book dates as a translation from the end of the second century of our era. We have only found as yet two tales in it which are also contained in the Southern work, viz., the "Hare" Jātaka, which Mr. Davids has made known to us in his 'Manual,' and the "Cat and Cock" Jātaka, which is referred to in the present volume. Meanwhile, we wish Mr. Davids "good speed" in his labors, so well begun, and so welcome to all lovers of genuine folk-lore.

ENGLISH SONNETS.*

A CONSIDERABLE literature of the Sonnet already exists in English, but these two compilations and their accompanying text are not superfluous. Mr. Main's work is a large and elaborate one, and comprises 470 octavo pages divided into two nearly equal portions of text and notes. Living authors are excluded from the former, but the editor has embodied in the latter such contemporary sonnets as may in any degree serve his purpose of illustration and elucidation. Several sonnets thus figure in both volumes, though, of course, only in Mr. Waddington's is full justice done to the product, in this department of poetry, of the Victorian age. Students and scholars will alike find Mr. Main's work of value not only in the sense of a "Treasury" of poetry well worth preserving distinct from other English verse—and in this sense it is of no small value, since it thus constantly recalls the wealth in sonnets of English poetry—but as a storehouse of critical commentary as well. In collecting this, Mr. Main has shown an edifying industry. Hardly anything can have been said of any of the sonnets contained in his text which his drag-net has not secured for his voluminous and detailed annotations. Nor, one feels in reading them over, can he have missed any pertinent poetical correspondences and reflections of his text in later or earlier English verse, whether sonnets or not; cross-references to other languages is all that occurs to one as lacking to the completeness of the scheme. The note on Daniel's sonnet beginning "Care-charmer sleep," for example, is a most exhaustive chronicle of the various similar appearances of the figures of the sonnet in poems by Griffin, Beaumont and Fletcher, Brathwaite, Sackville, Sylvester, Southwell, Chapman, Webster, Drummond, Washbourne, W. Herbert, Shelley, Tennyson, Landor, and R. S. Hawker, and in Sir Thomas Browne's 'Hydriotaphia'—enough, surely, to warrant the observation that the brotherhood of sleep and death is "an immemorial classical commonplace of frequent occurrence in our elder as in our later literature."

This is the perfection of annotating industry, and its worth as a repository of references is obvious; it proceeds upon the *nil alienum* theory, and its only defect, from this point of view, is the probability that something must escape the editor's most diligent search; indeed, the instances here given, it is implied, are merely examples of more that might have accompanied them. Its defect from the critical point of view is that the really significant material is apt to be smothered in the mass of detail collected, and that one can hardly ever rely implicitly upon the refined perceptiveness of a mind thus strenuously acquisitive. For annotating a collection of sonnets, a form of fine-art more than any other distinguished by refinement, this perceptiveness is just what is needed above other qualities. Accordingly it is not surprising to find in Mr. Main's notes a good deal whose elision would leave a more compact volume as well as a better guide to the text. Modesty is, consistently, one of his prominent traits; either that or his turn for collecting leads him to cram his notes with the observations of others, without too nice a regard to their felicity, and when a few lines of periphrasis by himself would be an agreeable substitute. His personal observations are generally supplementary to whatever he can find upon any point, and, therefore, they sometimes seem designed merely to swell the total. Such a remark as that on page 346 to Milton's sonnet on the Piedmontese massacre, viz., "It is with a sinking of the heart that one turns from such glorious co-operation in righteousness, of Poet and Prince, of Parliament and People, to certain episodes in modern England's foreign policy," is an intrusion that can have no other excuse. "But let us rejoice," adds Mr. Main, "that the Poet at least is still 'faithful found,'" and he proceeds to quote Mr. D. G. Rossetti's sonnet "On Refusal of Aid between Nations." This is beyond question a fine sonnet, and not wholly unworthy, perhaps, of association with one of the finest of all times and tongues; indeed, to couple it with Milton's is very happy and suggestive. But to make indignation with Lord Beaconsfield's foreign policy the connecting link between them is, to our mind at least, to shoot very wide of the mark. In notes to a "Treasury" of sonnets it is poetry that is in question. Throughout this particular note, to stick to our illustration, Mr. Main evinces a tacit disagreement with this view. He first remarks the echo in the Waldenses Sonnet from Fairfax's 'Tasso' ("Godfrey of Bulloigne"), and then quotes the appropriate passage from Carlyle's 'Cromwell,' and another from Henry Reed's "Lectures" on Milton's despatches as Latin Secretary containing an allusion to the sonnet and its "fervid imprecation"; next, Macaulay's characterization of it as "a collect in verse," Southey's as "the noblest of sonnets," Porson's as "a magnificent psalm," and Palgrave's as "the most mighty sonnet in any language known to him"; and he concludes with the reference to the Bulgarian atrocities above mentioned.

As it is, after all, Mr. Main's scheme that we are criticising and not his execution of it, we cannot do better than supplement his note with a few words from "A Talk about Sonnets," which the reader will find in *Blackwood* of last August (and which is well worth looking up) concerning this same sonnet:

"What concentrated power, . . . with what few vigorous strokes it paints to us the ancient faith, the simple life, the mountain habitation, the undeserved sufferings of those hapless confessors whose

"Moans
The vales redoubled to the hills, and they
To heaven"!

*'A Treasury of English Sonnets. Edited by David M. Main.' New York: R. Worthington. 1881.
'English Sonnets by Living Writers.' Selected and arranged, with a Note on the History of the Sonnet, by Samuel Waddington. London: Geo. Bell & Sons. 1881.

Do you notice the added force given by alliteration to the lines immediately preceding, which tell us how the bloody persecutors

"Rolled
Mother with infant down the rocks—"?

and the way in which that verse seems to make us hear the fall of the victims; and to hold our breath with horror as we watch them reach their sad resting-place, and lie motionless, shattered and dead, at the foot of the precipice? . . . Then, too, it is so clear. You can take it in at one hearing," etc., etc.

This is, of course, rather rhapsodical and clearly too conversational for a purpose like Mr. Main's, but the spirit of it, in being critical and relevant, differs plainly from that of his note. All the notes on Milton are of a similar concordance-like character. Dr. Trench is quoted in the first as authority for the assertion that Milton's sonnets are "far beyond all question the noblest in the language" (p. 337), and John Dennis (p. 366), as saying that Wordsworth is "perhaps the greatest of English sonnet-writers"—two statements not difficult to reconcile, certainly, but the point is that Mr. Main makes no attempt to reconcile them. On the other hand he chronicles (p. 365) this note by Sir Henry Taylor apropos of his early reference to "Mr." Wordsworth: "In the year 1834 Wordsworth was naturally so designated. In this year of 1878 to write of *Mr.* Wordsworth would be as absurd as to write of *Mr.* Milton." In fine, the ideal Treasury of English Sonnets Mr. Main has not given us, but he has produced a book out of which it may be made by any editor capable of making it at all. As a concordance his work is beyond praise.

Mr. Waddington's beautiful little volume contains 178 sonnets by living English poets, including three by Mr. Longfellow and one each by Mr. Lowell and Mr. Aldrich. It would be hypercriticism to note any omissions or to object to any insertions in so necessarily arbitrary a selection. Much more to the purpose is the reflection that the successful execution of Mr. Waddington's happy thought cannot but emphasize one's respect for the poetical product of the Victorian age. The essay which is appended to the text is devoted to the history and composition of the Sonnet, and is of value, though it leaves the question of origin more undecided than it need be, perhaps; or possibly, we had better say, it discusses the question with too little distinctness to be quite clear. It seems, however, to ascribe the Sonnet's origin, together with that of the "so-called French forms," the *chant-royal*, *ballade*, *rondel*, etc., to Arabian poetry, though it gives only the opinions of authorities for the Sonnet, and no reasons whatever for the French forms, having such an origin; whereas the prevalent opinion is, surely, that the birth-place of the Sonnet is Italy, and certainly the Trouvère invention of the *rondeau*, etc., has never been successfully impeached. There is a sprinkling of criticism in the essay, but its quality is rather uneven. Mr. Waddington quotes Johnson's saying about Milton's inability to carve heads on cherry-stones, with the remark that "He would, perhaps, be a bold man who said this now," and expresses a preference for both Shakspere and Wordsworth over Milton "as sonneteers." The best of Milton's, he says, is that on the Piedmontese massacre; but he finds the rhymes in the octave monotonous, and no pause or division at the end of it, to which he objects. "True it is that the sonnets of Milton," he continues, "do not fill one with rapture and delight as do some of Wordsworth's," and he adds of the latter: "There is in them a combination of strength and simplicity, of truth and earnestness, and a majesty both of thought and diction, that give them a pre-eminence over those of any other writer." Now, nothing could better illustrate how easy it is for tastes to differ upon the subtleties of such subtle fine-art as sonneteering, how easy also it is to write loosely upon them, and how necessary it is to have a clear and definite standard in one's mind at the outset. In such matters one can only speak his own thought, however, and to us Mr. Waddington's judgment here seems due to what we may call the point of view of the virtuoso. That he is—if we overlook the statement about "the so-called French forms"—too exclusively learned in the external and formal part of his subject, one is perhaps justified in inferring from his objection to the monotony resulting from the use of the same vowel sound in all the rhymes of the first two quatrains. The marvellous resonance thus secured has a dramatic grandeur that is one of the chief merits of the sonnet. As to the absence of any separation between the octave and the sestet, one may remark incidentally that this division is precisely what leads certain critics to object to the Sonnet as not a unit. But this is also a purely formal objection; the value of the division is rather logical than formal, and Milton has here very felicitously interlaced the diction, the defect being that in idea his sestet is rather a repetend of the octave than a new turn of it. Finally, what Mr. Waddington says of Wordsworth's is precisely applicable to Milton's sonnets; if it has any value as distinguishing description it is wrongly placed. To distinguish Wordsworth's sonnets from Milton's one needs to speak of the beauty and melody which characterize them, and which we have to seek in Milton elsewhere than in his characteristic sonnets. When Mr. Waddington attempts more specific criticism, and deals with poetry instead of prosody, he makes observations of the following character. Speaking of Coleridge's and Hunt's praise of Blanco White's famous "Night and Death," he says, "Although the sonnet is a good one in many respects, it has the defect that it tries to draw an analogy where perhaps no analogy exists." This is true; it is a defect. But observe Mr. Waddington's conclusion: "Blanco White, Coleridge, and Leigh Hunt all belonged for a time to the Unitarian denomination," and though the sonnet suits them it is unjust to the Buddhists. The defect, of course, consists in the fact that the analogy between night and death is poetic speculation instead of poetic truth, not in the fact that Christians and Buddhists speculate differently. What less liberal people than Mr. Waddington feel in the analogy is not, however, its unverifiable nature, but its lack as a "divine peradventure"; it surpasses the poetry of the astronomical lecturer mainly by the felicity of its conceit. Mr. Waddington confines his critical remarks to authors now no longer living, and accordingly his selections are allowed to speak for themselves. This they do so well that we do not, upon the whole, regret that they are not accompanied by the essay that might have been written upon them.

It is matter for regret, however, that Mr. Main's comprehensive repository contains no essays upon the Sonnet in general, which, even if by another hand, would have increased the value of his work to students. He has himself written one—an "analytical" one, we learn from the preface—but he concluded not to "encumber his volume with it." Something to explain the exact *raison d'être* of the Sonnet, and to instruct readers why the "Guittonian" form is properly called "legitimate" and why Shakspere's quatrains with a final couplet, for example, are a different thing altogether, his volume should have had. Without a clear and definite notion of the advantages of the regular form, and the advantages or drawbacks, as the case may be, of variations from it, it is impossible not to miss the finest points of many sonnets. In order to avoid placing, as Mr. Waddington does, Shakspere above Milton "as a sonneteer," one needs to get the notion, say, of a "Guittonian" sonnet, that it is a poetic syllogism of substance, melody, and diction, of which the octave sets forth the motive, or proposition, or whatever one chooses to call it, and the sestet fully draws the conclusion, points the moral, or contravenes, it may be, the natural deduction only with its last line. Then it becomes clear that one's preference for Shakspere's sonnets above Milton's—and it would occur to no one to deny that such a preference is defensible—depends upon one's preference of Shaksperian qualities to the sense of perfect finish and stately severity. Few persons, perhaps, would—at all events we would not—exchange such a sonnet as that beginning "Poor soul, the centre of my sinful earth," for that one of Milton's which Mr. Waddington thinks his best. On the other hand, if one is talking about sonnets, the interpenetration of fine form with the substance which fits it, and the highest possible development of this, are the important things to keep in view.

A DICTIONARY OF ENGLISH PHRASES.*

IN several respects this is a singular work—singular in the conception, singular in the execution, most singular, perhaps, on account of its authorship. It was prepared originally, as its compiler tells us, for the use of Chinese students who were seeking to acquire a knowledge of the English tongue; it was an afterthought to offer it for the use of those to whom that tongue was the native speech. We are all acquainted with disquisitions on the manners and morals of the Western nations looked at from the Oriental point of view, which have been published in the form of letters. But these, whether purporting to come from the all-accomplished citizen of the world, the polished Persian, the unspeakable Turk, or the blameless Ethiopian, have invariably turned out to be the work of native critics. Here, however, is an instance of a volume prepared by a genuine Oriental not upon the manners of the English-speaking race, but upon the more difficult subject of its language; more than that, upon that portion of its language which is the most difficult of all. Obviously, in the execution of such a work a foreigner is at great disadvantage; but, on the other hand, he is possessed of some counterbalancing advantages. Phrases which have been familiar to us from our earliest years have lost for us every shade of indistinctness or obscurity; and with that has disappeared the suspicion that they might be indistinct or obscure to others. Much, in consequence, would be left out by a native compiler because it would seem too simple for explanation. The present work is, therefore, curious as showing what does strike a foreigner as strange. At the same time to such a person the undertaking from the very outset is an arduous one. It is only the unthinking who could fancy that the carrying out of a scheme such as this would be a task not demanding scholarly accuracy and learning rarely to be expected, and more rarely still to be found, in one to whom the language was not a birthright. There are in this volume, as might be expected, mistakes. But it is the merest justice to say not only that the collection is a curious and interesting one, but that the explanations given are almost always trustworthy, and that the work as a whole gives plenty of proof that the compiler belongs to that not too numerous class of students who in striving to master a foreign tongue consult their brains as well as their dictionaries. To the native reader the book will be one rather of entertainment than of in-

* 'A Dictionary of English Phrases, with Illustrative Sentences. By Kwong Ki Chiu, late member of the Chinese Educational Mission in the United States, and compiler of an English and Chinese dictionary.' New York: A. S. Barnes & Co. 1881.

struction; yet it is only to the few omniscient beings whom, like the poor, we have always with us that it will not afford also something of the latter.

We are careful to make these statements at the outset, because there exist some defects in the work. The most serious is the attempted classification of peculiarities of speech. Any other division of them than into legitimate and slang expressions could not well be made by any one; and to carry even that out satisfactorily in details would be one of the most trying of tasks. The compiler himself recognizes the difficulty of the problem he sets out to solve; for in his preface he tells us that good judges are at variance as to which class some of the expressions should be assigned to. If they attempted any strict and permanent division they could hardly help being at variance not only with each other but with themselves. Phrases which are perfectly proper in one style of formal composition are often sadly out of place in another, not necessarily of a higher but simply of an altogether different character. It is with words as with acts: their appropriateness and dignity depend very largely upon their surroundings. To make successfully so general a division as that indicated above into legitimate and slang expressions would demand from the most cultivated student of speech not alone a long and intimate acquaintance with the best usage both of past and present times, but breadth and acuteness of judgment and the highest refinement of taste. Such a combination of qualities, difficult for the native to acquire, is practically impossible for the foreigner. It was, therefore, a mistake to divide, as has been done in this volume, peculiarities of expression into idiomatic phrases, colloquial phrases, and slang and cant phrases; to which are added various other phrases which would not naturally find a place under any of the foregoing classes. The distinctions are not vital ones; they are, therefore, a hindrance instead of a help. The book throughout shows evidence of conscientious effort to arrange the various phrases given in it under their proper headings; and yet it is in this that it makes its only conspicuous failure. This failure is naturally most marked in the classification which is sought to be made of idioms and colloquialisms. The distinction is often too vague and shifting for the compiler himself to feel it or observe it; and the very same expression is sometimes introduced and explained under both headings. This can be seen, for instance, in "come into play" and in "come to," in the sense of returning to consciousness. So in the same manner "to be cut up," as conveying the meaning of being wounded or mortified in one's feelings, occurs both as a legitimate idiom and as a specimen of slang. But we need not hunt for examples in which the compiler has differed with himself. Why should "between ourselves" be idiomatic, and "between you and me" be colloquial? Or, again, why should "to draw in one's horns" have a position of respectability assigned it in the former class, and "to haul over the coals" sink to the comparative disrepute of the latter? By what stretch of language can such expressions as "the fourth estate" or "a green old age" be spoken of, as they are here, as pertaining, to use the compiler's own distinction, to common conversation, as distinguished from formal or elegant discourse? Most singular is it to the student of English literature to have placed under this same heading of familiar converse the tremendous exhortation of *Lady Macbeth* to her husband to screw his courage to the sticking-place. But the climax of misconception is reached when the very loftiest flights of the reporter's style are similarly and summarily degraded, when such illustrations of high-polite English as "paying the debt of nature" for "dying," and "tieing the nuptial knot" for "marrying," are given as specimens of colloquial speech. How can one, moreover, be expected to retain faith in the traditions of Oriental politeness when he finds that such an expression as "the fair sex" is relegated to the hopeless discredit of slang?

These are extreme instances, to be sure; it would be unfair to judge the rest of the volume by them. But they serve to make emphatic the unsoundness of the division which has been made. As a practical matter, it is right to add, this classification will interfere little with the usefulness of the volume for the native speaker. An index refers him at once to the page where any expression he is looking for can be found; and having found it he can be trusted to decide for himself as to its character. For the foreigner there is no such remedy, but for correcting the misconceptions into which he may be led by the volume the critics of Canton and Pekin must be responsible. The far more important work of definition is in general successfully done. Wherever it is faulty at all—and this is not often—it is more usually so from being inadequate than from being inaccurate. This is to some extent almost inseparable from the nature of the undertaking. The very essence of an idiom or a slang phrase is that it says with conciseness and precision and force what with the use of other forms of speech would be said vaguely and diffusely. The positive errors, however, are very few. In one or two instances where they do occur it is because the compiler has been misled by authorities generally good, and upon which he might justly feel that he had a right to rely. He has also wisely refrained from attempting to account for the origin of the phrases he explains. English lexicography has before it no more difficult task than this. We have noticed only one instance in which he has indulged in etymological speculation, and in that he is misled by his authority. He says that the *had* of "had as lief" is doubtless a corruption of *would*, which is something that it most certainly is not. But for this far from uncommon error Webster is responsible, and not the compiler of this volume.

Perhaps the peculiarity that most strikes the native reader is that in a work professedly devoted to the idioms of the English language not a single idiom is employed in the definitions. The compiler, being a foreigner and an Oriental, does not presume upon any such intimacy with the tongue as to feel justified in using the peculiar or colloquial phrases which he explains. He feels too profound a respect for the speech to treat it with the slightest familiarity. He never ventures to take with it the least liberty, such as all of us do to whom it is a mother-tongue. His sentences are always elaborate, his expression is invariably of the most dignified character. Doubtless this was the only safe course for a foreigner to pursue. But the result is a quaintness and formality of phraseology which make the work, as a whole, curious and entertaining reading for its manner. As specimens the two following examples will be given of the method in which the slang phrases, here denoted by italics, are illustrated:

"My horse jumped over a seven-foot fence, and the stable-boy said, '*How is that for high?*'=My horse jumped over a seven-foot fence, and the stable-boy said, Was not that an astonishing performance?

"Tammany was not admitted into the Democratic Convention at Cincinnati, and Mr. Kelly, the Tammany chief, can *put that in his pipe and smoke it*=Tammany was not admitted into the Democratic Convention at Cincinnati, and Mr. Kelly, the Tammany chief, may digest that rebuke if he can."

Phraseology like this is not idiomatic, whatever else it is; yet it is worth commenting upon as showing what we should come to if those critics and newspaper correspondents had their way who have been brought up on English grammar and not upon English literature; and who take supreme satisfaction in pointing out the instances in which the translators of the Bible, Shakspere, and all our greatest authors have failed to attain to their own private standard of ineffable purity. The formal expressions used by the compiler in his illustrations are more than pardonable as coming from a foreigner; they are entertaining. From a native speaker they would be unendurable if exhibited on any extensive scale; for in language, as in life, there is nothing much more disagreeable than to meet with what is more correct than correctness and more proper than propriety.

The volume contains a good deal of supplementary matter. This consists partly of a collection of English proverbs, of Chinese proverbs, of Chinese maxims, and of Latin and French phrases. To these are added an historical and chronological account of the Chinese dynasties, and sketches of the Life of Confucius and of Christ. Among the maxims occurs one which indicates that the touch of nature which makes the world of office-holders kin is as noticeable in the East as in the West. "Do not," it says, "offend the civil officers; for you cannot appease their wrath when it is aroused." Much of the matter found in the supplement is valuable for reference; and the work throughout is certain to prove interesting even to those who may not be interested in the information it contains.

TANNER'S LOVEJOY.*

ALTHOUGH one may, with moderate trouble and expense, pick up the three books—'Life of Lovejoy,' 'Alton Riots,' and 'Alton Trials'—which are the original sources of information about the man and the event commemorated by Mr. Tanner; and although his modest narrative adds nothing of moment to the materials of history, his labor has by no means been superfluous, or, we will hope, in vain. The public are neither students nor antiquarians, they have a short memory, and they must be drawn into the past by what is newly written or newly printed. They will here find a sufficient outline of Lovejoy's career, characteristic extracts from his writings and speeches, and the main facts in the culmination of his savage persecution. They will also find portraits of Lovejoy and of the author, an enlarged copy of the contemporaneous lithograph depicting the riot of November 7, and facsimiles of two interesting documentary relics of the mob period.

No personal incident of the anti-slavery struggle—the fate of John Brown excepted—made so profound an impression on the North as the murder of Lovejoy. We call it a murder, although the primary object of the riot was not his destruction but that of his press; just as we call him a martyr, though we are accustomed to associate more or less of passivity with martyrdom, and he fell while aggressively repelling with arms an armed mob. In both cases the terms are correctly used, as the circumstances conclusively show. Three presses had already been destroyed on the same spot by the same community; a fourth had been procured, whose destruction meant silence, the opposition, grown more desperate, having already almost compassed the editor's assassination. He might have removed the *Observer* to Quincy or to Springfield, but there was no assurance that the liberty of the press would be vindicated in either place. The violence at Alton was preceded and begotten by vio-

* 'The Martyrdom of Lovejoy. An Account of the Life, Trials, and Perils of Rev. Elijah P. Lovejoy, who was killed by a pro-slavery mob at Alton, Ill., on the night of November 7, 1837. By an Eye-Witness [Henry Tanner].' Chicago: Fergus Printing Co. 1881. 8vo, pp. 233.

lence at St. Louis, and in the heat of that passionate time it is hard to say whether in the so-called free States the mob-spirit was rather contagious or endemic. In Jackson's message of 1835 it had received explicit encouragement. With unsurpassable courage Lovejoy accepted the decision of his friends that the stand should be made then and there, not as for an anti-slavery publication merely or mainly, but for the right under the Constitution and upon American soil to utter and print freely, subject only to the restraints and penalties of the law. To maintain this right against local public sentiment, the impotence of the city authorities compelled the friends of law and order to enrol themselves in a military organization, whose first duty was to prevent an anti-slavery meeting from being broken up, and next to guard the newly-arrived press from being thrown into the Mississippi like its predecessors. Among them, not more in defence of himself or of his property than of the principle at stake, Lovejoy took his place; formed one of the little band of twenty who held the warehouse on the night of the fatal attack; volunteered, with a rash and magnanimous heroism, among the first who left the burning building to face the infuriated and drunken mob; was ambushed and fell, the only victim of the defence.

The greatest feeling produced by this atrocity was in the city the most remote from the scene—in Boston, where by a rich compensation it overcame the timidity of Channing, revealed the oratory and fixed the destiny of Wendell Phillips, and with him drew Edmund Quincy into the forefront of the ranks of the despised abolitionists. The aldermen, who at first refused the use of Faneuil Hall for an indignation meeting, and Attorney-General Austin, who declared in that almost consecrated place that Lovejoy had died as the fool dieth, were surprised by the demonstration of a new Boston upon which they had not counted. The Boston which had come near having its Lovejoy in the person of Garrison, in October, 1835, had undergone a revolution in two years—a revolution perhaps to be defined as the weakening of Southern ascendency. The response of Faneuil Hall to the Alton riot was Northern resentment against a pro-slavery invasion, as it seemed. With more exactness, however, it may be said that Lovejoy was sacrificed on Southern soil. He is an early witness of the truth of Mr. Redfield's recent statistics about homicide North and South as applied to the border States. All the towns along the Mississippi were frequented by Southerners, often largely settled by them. Alton, situated in the southern half of Illinois, across the river from St. Louis and the slave-cursed shore of Missouri, in intimate commercial relations with the cotton-growing districts, was, though owing its prosperity, and even a certain reputation for philanthropy, to Eastern settlers, predominantly Southern in tone. A leading lawyer, who served as a spokesman for the mob, testified: "I had pocket pistols; I carry them always." A Southern divine helped to harden public sentiment against the most touching appeal on the part of Lovejoy; Southern doctors took an active part in the mob, and one of them perhaps fired the murderous shot. So the year before, Cincinnati, tumbling Bailey's press into the Ohio, was truly a Southern city; so the year after, Philadelphia, burning Pennsylvania Hall to the ground. In fact, the least Southern and most surprising of all the mobs of that epoch was precisely the Boston mob against the editor of the *Liberator*.

It is instructive to notice that Lovejoy was expelled with a shattered press from St. Louis while his advocacy of emancipation had not yet got beyond gradualism. The more he encountered the spirit of slavery in his experience at Alton, the clearer seemed the duty of immediate abolition. Remembering that he was a minister of the gospel and, what is more, a sincerely religious man, his argument, while still in St. Louis, in excuse of gradualism is curiously suggestive of the effect of slavery on the ethics of the society in which it exists:

"If I have taken," he writes, "my neighbor's property and spent it, and afterwards repent of my sin, and wish to restore what I had unjustly taken, but have not the means, the Bible no longer holds me as a thief, but sanctions my withholding the money from my neighbor until I can, by the use of the best means in my power, obtain it and restore it. And although, meanwhile, my neighbor, in consequence of my original crime, may be deprived of his rights, and his family made to suffer all the evils of poverty and shame, the Bible would still enjoin it upon him to let me alone, nay to forgive me, and even to be content in the abject condition to which I had reduced him. Even so the Bible now says to our slaves," etc. (p. 63).

We will not undertake to say whether this is better or worse than a somewhat earlier attempt of another clergyman, President Francis Wayland, in the same direction, and which ran as follows:

"I may have embezzled the property of a minor, and may have brought him up in misery and vice. It is wrong for me to hold this property for my own benefit, but it would be neither wise nor right to put it at once into the possession of my ward, and by so doing to expose him to temptations which his previous education had not prepared him to resist. I should first teach him how to use it, and then put him in possession of it."

An obvious comment, covering both these specimens of casuistry, is that it never occurred to the authors what the courts would say to the defence grounded in the one case on the Bible, and in the other on some private standard of right and wrong.

With the usual proximity of farce and tragedy, the mob and the defenders of the press were impartially indicted and acquitted. A more utterly bouffe performance in a solemn procedure than the pleading of the counsel of the rioters has perhaps never been witnessed among Anglo-Saxons. But no single incident compares in humor with the short colloquy during the riot between one Morgan, who, either "crazy or drunk," bare-footed and in his shirt-sleeves, was running for his gun, and the Mayor, who had stopped him. "Morgan asked the Mayor how he would like to have a damned nigger going home with his daughter," and ran on. We smile at this reasoning, but the whole North used it every day, even when clothed and in its right mind.

The Memorial History of Boston, 1630–1880. Edited by Justin Winsor. Vol. ii. The Provincial Period. (Boston: J. R. Osgood & Co. 1881. Royal 8vo.)—A second volume of more than six hundred and fifty pages, with more than double the amount of illustration contained in the first, introducing four new writers to the staff of the work, and again bringing forward fourteen of those engaged on the former volume, has followed the initial one after a lapse of four months. Of these new writers Mr. William F. Poole, formerly of Boston but now of Chicago, has more than once before this broken a lance in defence of the Mathers in regard to their participation in the witchcraft delusion, and he now returns to the same question in explaining the progress of the prosecutions in Boston, as exemplifying more humane methods than obtained at Salem. His conclusions will not be altogether accepted by those who have looked upon the Mathers in this connection as instigators rather than as allayers of the wild excitement, and it must be confessed that Mr. Poole, who manages their defence adroitly, sees a good deal where he wishes and fails somewhat in vision where others see. Be it as it may, since the days of Savage and Quincy the Mathers have had much obloquy put upon them, and, in the opinion of most students of the time, not unfairly—Cotton far more than Increase; and the latter owes this to a less manly and more contracted nature. Mr. Poole gets a good backer in the second of the new contributors, Rev. Dr. Henry M. Dexter, who sums up the question of the influence of the Mathers in New England life, whether it be for good or evil. In times when the fervor of religion and the rigidness of dogma determined a large part of current mental activity the Mathers certainly constituted a ruling class, and the domination of Increase was not an unfair one. He was sufficiently a man of affairs to use his superiority in very many manly ways, and to the good of his compatriots. But Cotton fell in days when decadence of priestly power began to show itself; and when he saw the supremacy totter, he neither acted wisely nor thought strongly. The town laid him in his grave with ostentatious parade, as a relic of past days, and went about its business with due alacrity. Few men so dominant in their day offer so little to account for it. The nearer we get to him the more his littlenesses confront us. He was upright as best he knew how; but his school was not of the frank and cheery sort. His normal condition was prone on his study-floor, averting the wrath of God. This was indeed a trait of his times; good men avert catastrophe otherwise now, but Cotton Mather had not a spark of prescience. He saw all manner of signs of another world, but none of the future on this planet. His period needed beyond all else a guide to the heights of a more salubrious atmosphere, and he had not one of the qualities to become such a guide.

The third new contributor is the Rev. Dr. Alexander McKenzie, of Cambridge, and his theme is the religious history of the Provincial period; and in this he too has to deal with Cotton Mather. His chapter, the longest in the volume, is carefully written, and pictures the gradual change from the strong Puritan expression of the earlier period to the ferment and more practical interpretation of religious life, which found such an earnest advocate in Jonathan Mayhew, whose death, just at the season of the Stamp Act, deprived us of we know not what possibilities.

The last of the four is Mr. George M. Towle, who neatly epitomizes the career of Franklin as a typical "Boston Boy."

Coming to the other writers, we may well expect a thorough and impartial survey of the career of the royal governors in Dr. Ellis's chapter, and such we find it. Boston, during the period of the second charter, with a sort of vice-regal court, became the arena in which more than one, we might almost say, for its continuity, *but* one, struggle took place between prerogative and liberty. The patriot party were stubborn and adroit, far more able than their opponents, better versed in legal devices, and skilful enough always to ward off the implication of treason, until the final arbitrament of war came. One admires the wariness of the Assembly, the outward respect it had for prerogative, the inward zeal it had for self-government. Following Dr. Ellis's treatment of this struggle, we have Colonel Higginson's portrayal of the way in which the French and Indian wars were giving the people the experience which was so opportunely to stand them in good stead, when the Crown—or was it the province?—threw down the gauntlet. During all this period the life of the town was slowly taking on the spirit of equality, and the Sam Adams of the latter portion of it had hardly a counterpart in the earlier years. And yet, amid all the mimic court formalities of the Province House,

amid the precedence of station and birth that prevailed, amid the wealth that grew up, forming its natural complement in a conservative class which abhorred the unrest of politics, the future Sam Adamses now and then appeared; but they bided their season. This is the theme of Mr. Scudder's chapter. How the town changed in its outer aspects, how lanes became streets, how stately mansions were built, how the old historic edifices to which Bostonians point with pride to-day grew before the eyes of the passers-by, is all told with a delicate descriptive skill by Mr. Bynner; while the editor in his introduction plots out the peninsula, and by means of key-maps tells where all the famous townsmen lived, and who were the predecessors on their home-lots. Of the Boston families Mr. Whitmore, as before, tells the story. The enumeration brings out strikingly in the intermarriages the tendency to an aristocracy of birth which prevailed, recruited indeed sometimes from foreign sources, as is shown in the way the Huguenot element, by plasticity and wealth, ingratiated itself and gave a certain vivacity and merriment of living to the more sturdy qualities of the original stock. Of this French Protestant element Mr. C. C. Smith makes in another chapter a very interesting portrayal. Cementing together the interests of all ranks and conditions, the press was beginning then to exercise the power which has later been so effective. The story of the beginning of newspaper literature; the poor show it made beside the teachings of the pulpit; its slow but sure progress in qualifying the clerical influence; the somewhat slavish mimicry of it, having in view the Queen Anne development in England; the life that was put into it from political aspirations as the Revolution drew near—this is the subject of Mr. Goddard's chapter, and he has written the story of this progress with careful discrimination and easy habit of illustration.

The two volumes of this history have shown how from the very beginning in 1630 the protest against prerogative had gone on strengthening. What we call the Declaration of Independence began, so far as New England is concerned, with the very first footfall on this ancient peninsula. The career of this sentiment had indeed some put-backs, but its development was steady. The annulling of the first charter embarrassed but did not destroy it. It sprang back with great elasticity the moment Andros fell. During the whole succession of the royal governors it manifested itself in many ways. Not one of the governors could say it had subsided. Some, more conciliatory than others, dealt with it in a way to disarm it of something of its portentousness; but every one of them felt that it was ready at the least opportunity to paralyze the royal power. We all know how in due time that opportunity came, and the next volume will tell its story.

A Treatise on Etching. Text and Plates. By Maxime Lalanne. Authorized American Edition. Translated from the second French Edition by S. R. Koehler. With Introductory Chapter and Notes by the Translator. (Boston: Estes & Lauriat. 1880.)—This translation of Lalanne's treatise on etching is likely to quicken the interest in the art which is already widespread in America. But whether the kind of impulse which this book gives is likely to be, on the whole, salutary, may be questionable. Etching is essentially a method of delineation. It lends itself readily and perfectly to anything that can be expressed in terms of frank line, but it does not readily render effects of light and shade. It is possible, of course, to render these effects with more or less fulness by etching, but it cannot be done so perfectly, nor so easily or economically, as by other methods of engraving—as, for instance, by the processes of mezzotint or aquatint. Where finished effects of light and shade are desired, these processes naturally and delightfully supplement etching when one or both of them are combined with it on the same plate. In pure etching nothing more of light and shade than pertains properly to a simple and consistent method of delineation—such, for instance, as that employed in their drawings by masters like Raphael—seems strictly right. The want of clear recognition of this fact has led to much confusion of aim and of practice among artists and amateurs—from men as great as Rembrandt to the etchers of our own time. The treatise before us is weakened by the want of this recognition of what the proper limitations of etching are. It is true that M. Lalanne—though he is not by any means a fine master of delineation—does indeed generally keep to the frank line in his own work, and is often too redundant in line; but he does not always keep to the line consistently enough for etching. He frequently encroaches so far upon the province of chiaroscuro as to show a deplorable failure to recognize the essential limitations of the process. Plates 3, 5, and 8, in this book, illustrate his want of sensitiveness in this respect.

On page 44 it is said: "A single point gives a hint of what we desire to do, but it does not express it. It is undoubtedly sufficient for a sketch intended to represent a drawing executed with pen and ink or with the pencil; but it cannot be successfully employed in a plate which, by the variety of color and vigor of the biting, is meant to convey the idea of a painting." Now, it is not at all within the proper function of etching to convey the idea of a painting, and although, under the impression that it is so, some modern etchers have accomplished remarkable feats, yet all such achievements are enormously costly of labor, and are but partial achievements at best. The wonderful etched portraits of Darwin and Mill by Rajon might have been executed with vastly more ease, and with still greater excellence, had the artist employed the process of mezzotint in combination with etching. The art of etching will not make right progress till these misconceptions and misapplications of it are corrected. And when its true functions and limitations are more clearly recognized, it may then further be seen that since etching is essentially a method of delineation, a man must become a good draughtsman before it will be worth while for him to etch at all. It is not desirable to put into permanent and multipliable form anything that is not intrinsically good. Truthful, tranquil, and beautiful delineation is something which modern etchings rarely possess. Indeed, far too little power of such delineation exists among modern artists. The prevailing habit of slight and inaccurate sketching is against the attainment of such power. In etching especially the idea prevails that the merest indication of first thoughts by the most hasty execution should be the aim of the artist, rather than deliberate design. There is no warrant for this. There is no reason why an etching should not be executed with as much deliberation and care as a drawing with pen or pencil. It is the character and aim of the design in any given case that rightly determines the proper degree of slowness or speed with which it should be done—not any peculiarity of the process. As a general principle, slightly-indicated first thoughts ought not to be put into permanent form and given to the public. They are useful to the artist himself chiefly, and may most advisably be executed with pen or pencil. The production for publication of so much loose and characterless work as is now in circulation in modern etchings is truly deplorable, and greatly retards the growth of good taste. The public is easily satisfied with unmeaning sketches on copper which bear superficial resemblance to good work. It is readily led to accept dashing work of this kind, and to think it more artistic than that which is the careful and true expression of real artistic power.

Another misleading principle which M. Lalanne's book, in common with most other recent books on the subject, teaches is that of printing from an etched plate by a method which the French call *retroussage*. This method consists in leaving more or less ink on the surface of the plate so as to produce a tint, or gradations of tint, in the impression. This is an undesirable procedure, because it makes the effect of a plate depend upon something more than the etcher's actual work upon it, and it is bad because tints produced in this way are more or less uncertain, varying, and accidental in character, whereas the excellence and value of tints in a design depend upon their being strictly governed and fixed. These qualities can be obtained only by the actual work of the etcher, on the plate, either by acid, by dry point, or mezzotint or kindred process.

As regards the mere technics of etching this book is altogether trustworthy and exhaustive. The translator has rendered the original sufficiently well, and has added an introductory chapter and supplementary notes which are valuable in elucidation of the somewhat obscure text of M. Lalanne.

Étienne Dolet, the Martyr of the Renaissance. A biography by Richard Copley Christie, M.A., Lincoln College, Oxford, Chancellor of the Diocese of Manchester. (London and New York: Macmillan & Co. 1880. 8vo, pp. 559.)—The name of Étienne Dolet is not very familiar at the present day even to scholars; the contemporary of Scaliger, and almost as renowned in his day as a scholar, his fame has been wholly eclipsed by Scaliger's; suffering death for his indifference to the prevailing religion of his time, he yet has not won the name of martyr. He was one of those persons, very useful in the world, who fall just short of being great men, who exert no great and lasting influence upon the course of events, but who in their own generation are quite as useful as those whom the world remembers. His great work, the 'Commentaries on the Latin Tongue,' was an epoch in the history of scholarship; but this work once accomplished, his results have become the common property of the world, and his book is no longer consulted. His martyrdom, again, was not in the true sense of the word a martyrdom for opinions, which would rank him with Huss, Latimer, and Servetus; it has been disputed whether he should be called a Protestant or a Catholic, and it may almost be said that he was not so much a martyr for opinions as for want of opinions. He was even called an atheist. His biographer hits the point in calling him "the martyr of the Renaissance"; for it was his devotion to pagan letters, and indifference to the hot controversies of his day, that excited against him the hatred of bigots and persecutors. Moreover, his faults of temper were a principal cause of his misfortunes. He made many friends, and appears to have won their warm regard; but in almost every instance there ensued a breach of friendship, followed by either coolness or positive unfriendliness. So much is this the case that one careful student of his career (Baudrier, a French jurist, cited in a note on p. 455) holds that his headstrong and perverse disposition (*mauvaise tête et mauvais cœur*) was the sole cause of his persecutions. Unquestionably it had something to do with them, especially in intensifying the vindictiveness with which he was

pursued. He was punished as guilty of "blasphemy, sedition, and exposing for sale prohibited and condemned books"; that he was not put to death primarily as a heretic appears to follow from the fact that he was hanged before being burned—after torture, to be sure.

Mr. Christie's work is thoroughly well done. There were no materials for a narrative of graphic interest, nor did the character of his hero afford opportunity for what is the best part of biography—the portrayal of noble qualities and the account of a noble life. Dolet was earnest, industrious, amiable in a degree, and generally honorable in his deportment; he was not, however, on the whole an attractive character—excessively vain, quick to take offence, and with a strong element of selfishness. "His enthusiastic love of learning and his intense belief in himself," says Mr. Christie, "are his two strongest characteristics, and both contributed in no small degree to his misfortunes." Mr. Christie cites, as on the whole fair, the judgment passed by the Abbé Niceron: "He was extreme in everything, excessively loved by some, furiously hated by others; heaping some with praises, assailing others without mercy; always attacking, always attacked; learned beyond his age, applying himself to labors without respite; moreover, arrogant, contemptuous, vindictive, and restless." As a biography the book is exhaustive and reasonably interesting; its special value is, however, as an admirable picture of the life of a scholar in the early part of the sixteenth century. In those days a scholar, as well as a soldier or a traveller, took his life in his hand; for he was beset by enemies far more cruel and relentless than wild beast or civilized warrior, and it was the enemies of free thought, taking advantage of his unguarded expressions, that hunted to death a man who carefully avoided allying himself with their enemies. For Dolet openly professed his scorn of the Lutheran heresy. "That foolish sect," he says (p. 199), "has lately scattered abroad certain reproaches directed against the Christian worship." There are many episodes of the book of great interest and value: for example, the graphic description of Toulouse as the home of bigotry and intolerance after the Albigensian crusade (p. 48); the accounts of several scholars and eminent men—we will instance that of Matthieu Grispaldi (p. 292); and the sketch of the printer's calling at this age (p. 316).

The Story of Philosophy. By Aston Leigh. (London: Trübner & Co. 1881. Pp. 210.)—This work has been "written in order to give the reader concisely and in ordinary language—philosophical terms being as far as possible excluded—the history of the rise and progress, during the seven centuries before the birth of Christ, of that which sounds so unapproachable when the word which represents it is heard—philosophy." It is "the result of several years' reading and research," and is very soon to be followed by another "to which this is merely the prologue—viz., the progress of philosophy after the birth of Christ." This book, upon first reading, is extremely puzzling. It might have been written by a sprightly young lady who betrays the "'prentice hand" whenever the real matters of philosophy are touched upon, or by a philosopher who affects baby-talk in a rather clumsy way. Plato is introduced as "a tiny brown babe sleeping so peacefully on the bosom of Perictione." Socrates is "chipping away at a block of marble," noticeable for "the muscles twisting about his arms and against his shoulder-blades like brown snakes," and all the Greek philosophers are represented in appropriate costumes and attitudes, as a long procession of shadows visible to the mental eye—a figure which is sustained throughout the book. The constant modulation from childish falsetto to the deeper though more uncertain manly register, like Orator *Puff* or a Tyrolese *Jodeler*, we confess found to our mind some explanation in the author's exclamation, in commenting upon the decline of the sceptic school: "Who talks of Luther, the bold enemy of Catholic Christianity, now? Where is the word 'Protestant'? Where are the followers of the various seceders from recognized belief even in the Christian era?" *Mind* reviews the book very briefly and disparagingly, and it certainly abounds in crudities, and those petty and countless inaccuracies which utter want of perspective in philosophy is sure to cause. Even the language is clumsy and inexact throughout. Yet we predict that no one will read the book without interest and even profit. The naïve first and rather independent view of Greek philosophy by a mind just awakening from dogmatic slumber is an almost fascinating study. The question at what age and how the study of philosophy should begin, is sure to arise in the mind of every thoughtful reader. We know of no book on philosophy capable of interesting so young a class of readers as this. Finally, the biographical element, always interesting and suggestive in the history of philosophy, is made more attractive here than in any work we know. Thirteen pages, *e.g.*, are given to Aristotle's life and only five to his works, while Plato and Socrates receive far more attention. Since the rise of the psychological school this element has rapidly grown in importance, and it is destined, no doubt, to modify old opinions in the field of historical philosophy considerably.

Old Drury Lane. Fifty Years' Recollections of Author, Actor, and Manager. By Edward Stirling. Crown 8vo, 2 vols., pp. 363, 369. (London: Chatto & Windus.)—This alluring title-page grievously disappoints expectation. To say that Mr. Stirling adds absolutely nothing to our knowledge of the plays and players of his time might, perhaps, be a little unjust; but what we learn from him is as little as may be. His two volumes are divided into four books, of which the first contains "Personal Recollections of the Author from School-Days to the Present Time"; the second is entitled: "Records of Drury Lane and its Lessees and Managers, with a Sketch of the History of Her Majesty's Opera"; the third considers "Actors and Actresses who have appeared at Drury Lane Theatre from its earliest annals to the present time, sketches of their career, and anecdotes connected with them"; and the fourth is given up to "dramatic ana and theatrical varieties, with an account of curious old plays, etc." This is as promising a table of contents as one could wish, and it is as deceptive as the title-page. The last three books are an undigested compilation, made by one who, however much he may know of the stage practically, knows little of the history of the theatre, and who has not the rudimentary knowledge of the professional bookmaker. As typical as anything else of the carelessness with which it has been put together is the frequent misspelling and miscalling of proper names; thus, to cite instances best known to Americans, Miss Cushman is spoken of as "Sarah Cushman" (i., p. 127), the late E. L. Davenport as "E. J. Davenport" (ii., p. 130), and Mr. Lester Wallack as "Leslie Wallack" (ii., p. 171). There are not many anecdotes to reward the search for them. One of the most amusing (i., 100) tells of the clever expedient of the mother of the late T. W. Robertson, the author of "Caste," to prevent his pilfering from a cask of ale which had been given her: she insisted on his whistling all the time he was in the cellar. There is also (ii. p. 238) a characteristic letter of Mr. Dion Boucicault's. But perhaps the best thing in the book is a retort (ii., 157) of Charles Kean's to a country actor, whom it irked to have to play second to the London actor, and who consequently was careless and indifferent. When Kean insisted on certain special "business," the provincial player resisted with: "You need not trouble yourself about me; I know the play backwards." "Probably you do," replied Kean, "but that is not the way I play it."

Fragments of Christian History, to the Foundation of the Holy Roman Empire. By Joseph Henry Allen, Lecturer on Ecclesiastical History in Harvard University. (Boston: Roberts Brothers. 1880.)—Mr. Allen has been long and favorably known to many readers, beyond as well as in the bounds of his sectarian fellowship, as the author of an admirable series of studies entitled 'Hebrew Men and Times.' This book at the time of its first appearance, in 1861, failed of the recognition it deserved, mainly because the time on which it fell was singularly barren of all interest in Old Testament studies. Our civil war was then in its initial stages, and the Old Testament was valued chiefly for such imprecatory passages in the Prophets and the Psalms as suited or could be made to suit the exigencies of the passing days. A new edition of this book has appeared within a few years with an introduction setting forth the bearings of the more recent criticism of the Old Testament, especially that of the Dutch school, on the conclusions which the author had embodied in his work. The publication of this new edition coinciding with a profound revival of interest in Old Testament studies, it is to be hoped that the book has now met with that measure of appreciation which it has merited from the first. Mr. Allen's 'Fragments of Christian History' is in some sort a continuation of his 'Hebrew Men and Times.' He takes up the thread of history where he let it fall at the beginning of our era, and it is his hope to resume it again in a course of studies on mediæval and modern Christianity.

Mr. Allen's studies are not connected into an historical whole, but they have a natural sequence and a single dominant conviction runs through them all. They are all so many illustrations of the author's faith that in whatever way we regard the origin and early growth of Christianity, whether as special revelation or as historic evolution, "the key to it is to be found, not in its speculative dogma, not in its ecclesiastical organization, not even in what strictly constitutes its religious life, but in its fundamentally ethical character." The 'Fragments,' eleven in number, bring us to the time of Charlemagne. The subjects could not be better chosen for the purpose of grouping the most characteristic facts of early Christian history in an impressive and instructive manner. The first, "The Messiah and the Christ," elaborates the idea that the Messianic conception was a social and political force for a much shorter period than is commonly supposed—for about three centuries, from the Maccabæan revolt to the insurrection of Barcochba. The flexible character of this conception is also clearly shown, and thus the relation which Jesus of Nazareth sustained towards it is seen to have been a measurement of himself by his own personal ideal, and not by any conventional standard, which did not in fact exist, so inconstant was the ideal that fluctuated with each variation of the political conditions and the individuality of each new expounder of the law. The second subject is "Saint Paul." The result of this study is not very different from Mr. Matthew Arnold's in his 'St. Paul

and Protestantism.' It is that "the ethical passion"—this is an expression coined by Mr. Allen, and it deserves general currency—was Paul's fundamental characteristic. Wrapped about in strange subtleties of argument that mean nothing to us, mixed up with technical points of anthropology, clouded, obscured in many different ways, it is never for a moment absent from his deepest thought. "Christian Thought in the Second Century," the subject of Mr. Allen's third chapter, takes us into the dim world of Gnostic speculation. And here, again, the ethical genius of early Christianity disclosed itself in its ability to free itself from the bewilderments of this fascinating but unmoral system. The thing to note is that it was unmoral. Its title, Gnosis, indicates its character: it was mere *knowing*. The next following chapter, on "The Mind of Paganism," shows how much of preparation there was in the Roman Empire for Christianity. The fact for which even Gibbon (the sceptic falling into the pit which the apologists had dug) makes no allowance, is brought out, viz., that the first centuries of Christianity coincided with a very considerable revival of religiousness in the pagan world. It would be a pleasant task to follow Mr. Allen through the remaining chapters of his book—on the Arian controversy, the conversion of the Barbarians, the Christian schools, etc. Not one of them is devoid of interest.

Glimpses through the Cannon Smoke. By Archibald Forbes. (Boston: J. R. Osgood & Co.)—This little book is made up of sixteen sketches, only a portion of which would seem to justify its title by relating to warlike themes. The stories which smack of the camp are, as might be expected, altogether the most readable, and of these the best are "Matrimony among the Bomb-Shells" and "How I Saved France." It is rather curious to observe how Mr. Forbes's writing fails in interest as he leaves the special topics which have most contributed to his reputation. Several of the non-military sketches in the book would almost seem to have been done by another hand than his, and are lacking in spirit and continuity of narration. As a whole we should think the volume not so well adapted to American as to English readers. The chapters on "Cawnpore of To-day" and "Lucknow of To-day" are much too full of references to details of the scenes of the Indian mutiny for any one not very familiar with the individual deeds of heroism performed by the British corporals and privates during those eventful days. Mr. Forbes, too, makes use of some local slang which should have been translated in the American edition. There are people here who know that a "peg" means a drink, but we think few could tell what kind of business was transacted in the "tommy shop" which Mr. Pollen is said, on p. 15, to have started.

Observations on the Construction of Healthy Dwellings: namely, Houses, Hospitals, Barracks, Asylums, etc. By Douglas Galton, late Director of Public Works, etc., etc. (London and New York: Macmillan & Co. 1880.)—The arts of sanitary construction are constantly growing more complex, and each of them has a considerable literature. Those which relate to the purpose in hand—the way to build a house that shall be healthy—Mr. Galton has reviewed rapidly but with a discriminating knowledge of authorities, and he has contributed to the discussions upon them results of his own experience. His summary of the duties of sanitation is "embodied in the words pure air, pure water"; but to supply these in a modern dwelling, and especially in a city dwelling, unless at great expense, is often a difficult thing. The physical principles involved in the problem are discussed, with the occasional aid of formulæ, and an interesting body of illustration is given; we may instance the comparison of the elaborate methods by which the British Houses of Parliament and the French Legislative Chambers are ventilated. These methods, though based upon different principles, are equally efficacious in procuring a supply of outside air. But Mr. Galton adds that the air-supply for the Houses of Parliament is taken at the street level, being drawn from "adjacent courtyards covered with asphalt and kept tolerably clean," while for the French legislator "fresh air is brought down by a flue from a height of sixty metres." Not the least valuable part of the work is the discussion of the present state of the sewage question. Mr. Galton disclaims originality for the greater part of his book. The introductory list of authorities would be made more valuable by adding the titles of Mr. Schott's important works on the "Temperature" and the "Rainfall" of the United States, and of Dr. Henry I. Bowditch's study of soil-moisture as a main cause of pulmonary consumption (Mass. Med. Soc. 'Communications,' Boston, 1862).

A RUSSIAN PRISON.

Buried Alive;

OR, TEN YEARS' PENAL SERVITUDE IN SIBERIA.

By FEDOR DOSTOYEFFSKY. 12mo, $1 50.

"The present volume is plainly an absolutely authentic transcript of life in a Siberian prison. . . . Among his fellow-prisoners were some strange characters. In fact, 'humorists' in the old sense—the sense of Ben Jonson—seem to be more frequent in Russia than in any other modern country. One of our author's intimates was an ex-captain in the army, who had been commander of a small fort in the Caucasus, and of whom he tells a perfectly mediæval tale. . . . The book abounds in stories almost as strange as this. . . . To enquirers into the feelings and ideas of the Russian people it will be very curious and interesting."—*N. Y. World.*

A NEW ENGLAND STORY.

A Lazy Man's Work.

By FRANCES C. SPARHAWK. 16mo (Leisure-Hour Series), $1.

"A fascinating story capitally told."—*Boston Transcript.*

Rabbi Jeshua.

12mo. (*Ready Saturday, April 16*)

"As a memoir in the life of our Lord, when stripped of all supernatural attributes and circumstances it is not only a clever sketch but a powerful testimony to the mighty influence on humanity which the mere human element of Christianity has experienced. . . . The most remarkable feature in the whole book is the life and movement which is thrown into the word-pictures which the author paints. . . . A remarkable book."—*London Saturday Review.*

NEW YORK, THURSDAY, APRIL 21, 1881.

The Week.

THE Government scheme for refunding the maturing debt has grown in favor during the week. The holders of a large amount of the 6 per cent. bonds have asked to have them extended at 3½ per cent. annual interest, and many who did not hold the bonds have been buying them in the market for the purpose of securing the extended 3½ per cents. These purchases have advanced the market price of the 6's to 103⅛; and a premium of 1⅛ to 1¼ per cent. is bid for the extended 3½ per cents, to be delivered in the month of July. Altogether, the prospect now is that nearly all of the $195,000,000 6 per cents will practically be refunded into 3½ per cents, and that the resources of the Treasury (estimated at about $200,000,000, provided the $105,000,000 4's or 4½'s are sold) applicable this year to refunding will be used to refund the 5 per cents, which may by the terms of their issue be paid this year. This refunding scheme of the Treasury meets with opposition from two quarters. The Democratic politicians object to it because they supposed that they had put the Republican party in the attitude of blocking the way to a reduction of the interest on the public debt; and they now find that, instead of this, the Republican Administration will get the credit of putting the debt in a better position than the Refunding Bill proposed. The other class which objects to the scheme is made up of the dealers in Government bonds, who lose the commissions on buying and selling $195,000,000 of bonds. They would probably, in one way or another, collectively have made about $1,000,000 by the exchange of the 6's into any low-rate bonds authorized by a refunding bill. According to the Treasury scheme, this sum is saved to the owners of the 6 per cents, and is of course lost to the brokers, who therefore do not heartily approve the scheme.

The objection of the Democrats is mainly that the Secretary has exceeded his powers. They say he is virtually contracting a new loan without authority from Congress; that if he has the money he is bound to pay off the six per cents, and that if he has it not, he has no right to accept from the bondholders a release of their right to payment. It is hard to see, however, how he can be brought to justice. The bondholders who enter into the arrangement will not bring him; the people, who get the benefit of the reduction of interest, will not do it; and, in fact, it looks as if he would escape scot-free. There is no denying that the transaction is of doubtful legality, but it is a kind of transaction which executive officers who are dependent for authority on legislative bodies have frequently to carry out. There is no nation which would excuse an executive officer for refusing to take as much responsibility as might be necessary to prevent a stoppage of administration through legislative oversight or shortcoming, during the parliamentary recess. Of course judgment has in this case to be exercised in deciding how much or how little of such responsibility he will assume, as in all other emergencies. The proper object of censure is Congress, which passed no Funding Bill until the last moment of the session, and it would be a great pity if the country, for any reason, lost sight of this fact.

The foreign exchanges continue to rule in favor of specie imports, which during the week rose to $5,679,777 against $6,375 in the corresponding week of last year. Since January 1 the specie imports amount to $24,134,280 against $2,859,734 a year ago; since August 1 last we have imported $94,884,599 specie against $80,865,220 in the corresponding time a year ago. The domestic money market, in view of these gold imports, the return of currency from the interior, and the prospect of a large reduction of the cash in the Treasury incident to refunding, promises to be very easy for borrowers during the next six months, and is so now. The week at the Stock Exchange witnessed a general depression in railroad securities, chiefly the result of speculation based on a reduction in trunk-line rates for freight (afterward restored) and on continued backward weather, which was construed as foreshadowing poor harvests. The real reason, however, for the decline appeared to be that the leading speculators are out of stocks and wish to get prices down so as to "load up" again for a summer "bull" campaign, when Treasury influences will be so favorable for a buoyant speculation.

The meeting of the medical profession at Chickering Hall last week in behalf of the Citizens' Street-cleaning Bill made itself decidedly the most impressive of the public meetings that have taken place by combining substance with its indignation. The number of deaths in this city during January, February, and March, 1880, it was shown was 6,800; for the corresponding period this year the number was 9,200; the death-rate having thus increased from 40 to 50 per cent. Of course statistics of this kind are not absolutely conclusive as to proximate causes. For instance, this winter has been much colder than the last, which may have something to do with the increase. Dr. Parker reminded his hearers that of the 1,200,000 inhabitants of New York 900,000 lived in tenement-houses, and, of course, in districts where the filth is considerably beyond the imaginations of people living in the better cleaned streets. The coming hot summer, he said further, would succeed an unusually cold winter, and, unless a tolerable sanitary condition was secured, he looked forward to cholera; in 1847, he added, the cholera broke out May 7. "We might easily lose 20,000 of our people," he concluded, "with such a pestilence as we have had before on more than one occasion." In the light of such statements, made by a physician of Dr. Parker's standing and with perfect temperance, the trial of the Police Commissioners, which has been going on before the Mayor during the week, makes curious reading.

The Washington correspondent of the Springfield *Republican* describes, with entire correctness, the revolution backwards in the Interior Department under Secretary Kirkwood. Mr. Schurz, we need not say, had scrupulously applied the principles of civil-service reform throughout the Department as they had never been applied before, freeing it from all political influence and bringing it to a high degree of efficiency and hopeful emulation. The authorization of an enlargement in the force by Congress has been improved by Mr. Kirkwood to introduce new and untried men either named or approved, upon the Secretary's humble submission, by their respective Congressmen; and they have been assigned places not at the bottom but wherever it seemed desirable, regardless of the claims to promotion which Mr. Schurz's régime had justly created. Of course competitive examinations have been discontinued as a ridiculous encumbrance to the good old plan. We shall not stop to ask what are the feelings of the older clerks on being thus treated, or what effect the Secretary's course will have upon the morals of his subordinates. The chief point is that in a department second to no other in importance the President has passively permitted to be undone all that the Hayes Administration had toilsomely achieved towards a purification and rectification of the Government service. We said months ago that in General Garfield's choice of a Cabinet we should have a sure sign of his sincerity as to the reform he once knew how to advocate so well; or that, if he did not select men known to be in favor of the reform, he might bind them to carry it out in their several departments. He did neither, and his appointments to other positions have been equally unfaithful to his earlier utterances. It is not pessimism to predict that in the Government's own practice the present Administration will leave the civil service worse than it found it, for the facts already accomplished are irrevocable.

An instructive suit was tried and dismissed in this city last week, in which Judge Gilbert M. Speir, of the Superior Court, was defendant. It appeared that the so-called "Citizens' Reform Association" had in November, 1873, "endorsed" a ticket bearing among others the name of Judge Speir, and had gone to great expense in hiring rooms, collecting names of voters, printing and distributing ballots and circulars, and so forth, and had assessed the candidates proportionately, putting down the judge for $2,000. The Association alleged that he seemed quite satisfied with this little bill and promised to pay it, but prudently waited until after the election, when he ignored the debt and has continued to do so ever since. On the trial, Judge Speir denied having promised to

pay anything for the assistance rendered, and through his counsel cut short the case by moving its dismissal on the ground that some of the expenses incurred by the Association were illegal under the statute prohibiting the use of money to influence elections except in certain specified ways. The court held that the plaintiffs had failed to show the contrary, and granted the motion, though with some hesitation and with an intimation that a new trial might be had. Viewed in any light the incident is a forcible commentary on the system of an elective judiciary. Assessments on a judge for the working of the political machinery which puts him upon the bench, are dangerous and degrading, if not corrupting. That they should be levied by a "reform association" shows the value of names as an index of principles.

It must astonish the weary champions of the "great underlying principle" in the Senate that there is not the slightest excitement on the subject in the country at large. The rule of the majority is in danger, the Senate is nearly half filled with traitors and revolutionists, Mr. Don Cameron declares that the obstinate opposition of his Democratic colleagues is only the Mississippi shot-gun policy in disguise, and still the Northern public, if it pays any attention at all to what is going on at Washington, is simply bored by the monotony of the morning's news. This is all the more discouraging because the party press keeps standing head-lines about the "inexcusable" behavior of the naughty Democrats, the "bull-dozing minority," etc., etc. There is, however, no public in the world which is gifted with a greater sense of humor or ability to detect humbug than the American, and the business which Mr. Dawes has been saddled with is nothing else than a pretentious farce.

It is well known by Democrats that the Tammany Society is an exclusive, non-partisan, and aristocratic association having nothing to do with the political organization known as the Tammany-Hall Democracy. For some unexplained reason, however, it has hitherto permitted this political body the use of its hall, and it therefore becomes the duty of the latter to see to it that the officers of the former continue well disposed towards them. Composing as they do substantially the entire membership of this Society, this is a simple matter except in cases of a difference of opinion among themselves. At the annual election this year such a disagreement disclosed itself. Dissatisfied with the misconduct or ill-success of the Boss, a large number of heretofore good Kellyites openly revolted and nominated a ticket in direct opposition to his wishes. Their efforts, nevertheless, have resulted in miserable failure, as might have been expected from the unscrupulous nature of the man with whom they had to deal. He appears, indeed, to have resorted to the most questionable "methods" in quelling this insurrection. In the first place, as soon as he scented disaffection, he procured the election of some fifty new members, who were, of course, his "creatures," and who gave him most of the majority he got for his ticket. During the election his personal bearing and behavior are described as indefensible, and he went so far as to have a force of policemen present merely to intimidate the rebels by "swaggering around" under the direction of his trusted lieutenant, "Sid" Nichols. He also got another henchman to place a third ticket in the field, so as to split the ranks of the opposition, and violated every one's sense of decency by peeping into the ballot-box as each vote was deposited, thus, as his own ballots were marked, casting contempt upon the rule prescribing a secret ballot. He even condescended to the cheap device of following the count and humiliating his opponents by having the names upon their ticket read off without the prefix "Mr.," which was invariably applied to the regular nominees. In short, he behaved precisely as if the Tammany Society election of sachems was an ordinary political contest, instead of the choice of its officers by a social organization of gentlemen for benevolent purposes.

Senator David Davis has written a private letter to a complaining friend in Kansas, which the latter has made public without any violation of good faith, as the Senator says the opinions expressed in it "have long been entertained without the least desire for concealment." On the contrary, they are of the nature of thoughts which a man who is so unhappy as to possess them invariably seeks relief in communicating to as large an audience as possible. They arise out of a deep depression which the Senator feels in regard to the present wretched condition of the country. Unless this is speedily changed, "free institutions are bound to be substituted by an oligarchy" of wealth. "Every farmer in the West is bound hand and foot by the manacles of monopoly," and not only do soulless corporations hold a mortgage on their crops, but, also for the benefit of monopoly, "every blanket with which their children are warmed, every ploughshare that turns the soil," and doubtless every silver cup from which their babies drink, are taxed by an exorbitant tariff. Every avenue leading to improvement of this state of affairs is blocked by the "consolidated monopolies," which rule legislatures and courts, are strong in Congress, and are even "unscrupulous in the use of means to conquer prejudice and to acquire influence." It is doubtful if the Senator could lay his hand on another man in the country whose prejudices are entirely safe from being conquered by some of these means. He could not be found in either of the two parties, at all events not among the conspicuous members of either; and the rank and file are "enslaved by leaders that secretly unite whenever a venal object is to be gained by combination." The Republicans are corrupted by having the offices, and the Democracy discredited because "a prejudice exists in the Northern mind that it was hostile to the Union during the civil war." Still, if the Democrats would give up their name something might be done. There are "cheering signs" of a better state of things, the Senator says, but we submit that, as he specifies none of them and the present situation is shrouded in such complete gloom, this seems like trifling with the hopes of a down-trodden and despairing people with a flippancy that cannot be too severely characterized.

The Cincinnati *Commercial* has always been very amusing on the silver question and grows more so. Speaking of the appointment of M. Cernuschi as one of the French delegates to the Monetary Conference, which ought to be very gratifying to it, as he is the leading bimetallist of the world, it says: "He is a gentleman of great talent, but mad on the exact figure of the ratio between the two precious metals. He holds that the whole world should come to the 15½ to 1 of France, and is copious to that effect. Now, 16 to 1 is just as scientific as 15½ to 1, and if the proposed readjustment is to be made for centuries instead of years we must move in the direction of the movement of the ages, as history records it. The American ratio is the true one, and if it is not accepted the Conference will not be a success." Criticism of this is impossible. It reminds us very strongly of the story of the lunatic asylum, where one of the patients pointed out another to a visitor as very mad. "Why," said he, "he thinks he is Prince Bismarck, but I am the Emperor William, and I know nothing about him." We may add that the market ratio of silver and gold is neither 15½ nor 16 to 1, but about 18½ to 1.

The New York *Tribune*, discussing the nuisance of office-seeking, declares that there is one thing which the President can do with the help of Congress to lighten his burden and allay the chronic irritation of office-seeking, and that is to establish a fixed term for places great and small, and that "this is what General Garfield proposes," and it calls on the reformers "to take hold and establish this excellent and feasible principle," and then all will be well. But the reformers did take hold long ago. They have always been in favor of any increase of stability in the tenure of office, even if it be much less than they themselves seek, and for much the same reason that a man seeking to reform a drinking friend joyfully accepts a pledge from him only to drink with his meals, or not to drink at all except in the evening. The President "took hold" after them, but has greatly discouraged them by letting go, as soon as he came into office, by the Robertson nomination, which is a clear and gratuitous violation of what the *Tribune* calls the "excellent and feasible principle" that "when an office is once filled by a new appointment, no change can be made in it during a definite term of years, except on clearly proved charges of incompetency or dishonesty in the holder."

Lord Beaconsfield, not unexpectedly, died on Tuesday morning. He has during the past six years been the subject of so much discussion, and has had his biography written so often, that little now remains to be said about him, and we shall leave our English correspondent to make any needful additions to what has already appeared about him in

our own columns. The one thing in his career which has hardly received, and perhaps can never receive, sufficient examination is the state of English politics which made his success possible. He was distinctly the kind of politician whom Tory pessimists would have, before 1832, predicted as a likely result of the Reform Bill, but, strangely enough, he rose to power in the party which was least affected by the Reform Bill, and to which the qualities by which he achieved his success were supposed to be most repulsive. That fifty years after the Reform Bill a man of the Disraeli type should represent Conservatism, and a man of the Gladstone type Radicalism, is a more striking warning against political prophecy than anything to be found in Senior's 'Conversations.' The way in which he was, down to his last hour, surrounded by an atmosphere of sensationalism was also very remarkable. That is, his illness has been enlivened by the trial of one of his doctors by his medical brethren for consulting with the other doctor, and by a newspaper correspondence on medical etiquette apropos of his case. The public, too, enjoyed in watching his singular career an advantage which it has probably never enjoyed in watching a singular career before—viz., that of possessing in his earliest novel a frank exposition both of his aims and of the means by which he expected to attain them.

The Liberal Ministry in England has suffered much in prestige from the passage of the Irish Coercion Bill and the opening of Land-League and Fenian letters in the post-office. There is, however, in the problem with which they have been trying to deal in Ireland and in the condition of public opinion in England, a plausible defence for these things. The same thing cannot be said of the prosecution of the editor of the *Freiheit*, a blood-and-thunder little Socialist German paper published in London, edited by one Most, a sort of journalistic Justus Schwab. Most had a terrible article on the Czar's assassination, in which he called the Czar "a crowned, murderous thief," and expressed his joy that he had had "his legs shattered and his belly ripped open," and his belief that it would make the other "despots" from Constantinople to Washington—thus including even that slave of the people, President Garfield—"tremble for their long-forfeited heads." The Government have actually prosecuted this poor creature for this crazy stuff, and seized his little stock of type and his little press, and shut up his dirty little office; these last things, it is believed, without any warrant of law. He has been solemnly examined before a magistrate and committed for trial, and Sir William Harcourt has made a speech in the House of Commons, on the enormity of his gibberish, which carries one back seventy years at least. There is hardly any doubt that the prosecution will be a failure. The jury will either acquit the prisoner or disagree, and nothing will come of the affair but great notoriety for Most, increased circulation for his *Freiheit*, and considerable discredit for the Liberal Ministry. All prosecutions of this character have failed in England during the last fifty years. Lord Palmerston was driven out of office by that of Bernard. The people are rather proud of keeping open a harbor where the poor devils of refugees, who have undoubtedly solid grievances, can bellow and foam at their enemies from afar, and will not be got to believe that it can do anybody any harm. Moreover, Sir William Harcourt has in this case, as in the case of the Coercion Bill, made a doubtful proceeding unnecessarily offensive by an insolent and domineering manner.

The confession of Ryssakoff, the only one of the Czar's assassins who seems to have shown the white feather, for he fainted at the gallows, and, besides confessing, petitioned for pardon and offered to turn spy for the Government, has been published in the London *Standard*. There is nothing very remarkable in the story, as he tells it, in so far as the preparations for the crime are concerned. The chief by whom he was employed, and who appears to stand third in grade from the "Executive Committee," and was charged with the superintendence of the assassination, was Zheliaboff, who was hanged with him, and who appears to have voluntarily put himself in the hands of the police. Zheliaboff declares that when he called for volunteers to execute the crime forty-seven offered themselves. The account they all, including Sophie Perovski, gave of their aims was as vague as usual, and may be described under the general term of the elevation of society. When the news of the assassination first came we called attention to what seemed to be the unprecedented existence of a reserve of assassins, who were ready to throw a second bomb in case the first failed. Some of the esteemed contemporaries scoffed at this; but Ryssakoff, who knew more about it than they, confirms our conjecture. He says that the conspirators who were stationed along the Emperor's route were under instructions, after the first bomb was thrown, "to run towards the spot to ensure the death of the Emperor, if the explosion had failed to do its work." The second bomb was undoubtedly thrown by a second man, who was in waiting.

Among the facts brought to light in extenuation of the Nihilist persistence is the deportation to Siberia during the last two years, on mere "administrative order," of 60,000 persons, which, of course, represents an enormous amount of suffering. Nothing positive is known as yet about the new Emperor's policy. It appears to be distinctly peaceful as regards foreign relations. Skobeleff has been recalled from Central Asia, by way of reassurance to England, and the construction of a chain of fortresses on the German frontier has been countermanded. Whether the election of the Municipal Council at St. Petersburg indicates a leaning towards representative government remains to be seen. Some of the late police measures—such as the erection of barriers on the roads leading into St. Petersburg, and the prohibition against leaving the Empire addressed to youths of both sexes between ten and twenty-one—look the other way. But the latest news announces positively the preparation of a ukase providing for some sort of representative body.

The Monetary Conference was opened in Paris on Tuesday, M. Magnin being elected President. The telegraphic summary of his speech does not indicate whose ratio is expected to prevail, or, indeed, much confidence in any general agreement. M. Barthélemy St.-Hilaire also addressed the delegates, and made the statement that even if the Conference did not achieve any immediate success it would excite discussions which would lead to "the discovery of truth." The French economist M. Leroy-Beaulieu, who, we incline to believe, represents most of the competent opinion of France outside the circle of those who are responsible for getting rid of the enormous accumulation of silver now in the bank-vaults, continues to heap scorn on the Conference in the *Économiste Français*. He shows by the citation of authorities that there is no probability of the adoption of bi-metallism in England, or Belgium, or Switzerland, or Germany; that, if anything comes out of the Conference, it will probably be a bi-metallic convention between Russia, Austria, and Italy, who have no metal of either kind worth mention, and France and the United States, who have more silver than they know what to do with. He treats France, too, as the dupe, or likely to be the dupe, of the "Yankees," who have got the whole thing up in order to be able to "unload" their silver, at the proper time, on the simple-minded and credulous Gauls. He declares that a French Minister who should sign a treaty providing for unlimited coinage of silver during the next twenty years, as is proposed, would inflict a loss on his country which could not be estimated in advance, "but would probably equal the war indemnity of 1871."

The Greeks are going through the painful process of reconciling themselves to the result of the negotiations at Constantinople, and M. Coumoundouros has apparently accepted it, in a very ungracious note addressed to the ambassadors. The new line, which was kept very secret until now, appears to be the same as that proposed by the Treaty of Berlin, from the Ægean just south of Mount Olympus until it nearly reaches Metsovo, but it then turns almost abruptly south, and runs almost directly southwest down to the Gulf of Arta, leaving Prevesa on the cape at the mouth of the harbor to the Turks, but with the provision that the fortifications are to be demolished. The Greeks thus still get all the best part of Thessaly, but only a small slice of Epirus, and they lose Janina, which they had set their hearts on and which is really a Greek city. They leave the Turks in possession of a very troublesome mountain region, which they certainly will not police and the condition of which is sure to make fresh trouble before long. The settlement is only temporary, for of course it will only stimulate the discontent of the Greeks left outside the line, while increasing the power of those inside to help them, and we shall have the trouble all over again the next time Turkey has to fight anybody.

THE ROBERTSON NOMINATION.

THE position of some of those who think that civil-service reform will be promoted by the appointment of Mr. Robertson to the Collectorship of the port of New York is comprehensible enough. Senator Conkling has during the past twelve years become in their eyes the personification of most of the civil-service abuses. He created and brought to perfection what is known as "the Machine" in this State. His ascendency over General Grant was so great that he obtained facilities such as no other American politician has ever enjoyed for the full organization and development for his personal benefit of the "spoils system." He has for the first time made it stronger for electioneering purposes than public opinion itself, and has given to the "workers" a faith in its power and permanency which before his time did not exist. It is not unnatural, therefore, that many should think that the first step towards reform is the disorganization and overthrow of Conkling's Machine, and that that can be most effectively taken by putting at the head of the Federal service in this State the man who has been most prominent in opposing him and his methods in State politics. There is no doubt that the appearance of Mr. Robertson in the Collectorship would be to the Conkling "workers" the proof of all proofs which they would most readily accept that his reign was at an end, and that there was no use in expecting any more favors from him.

Now, if this were to be the end of it, there would be a good deal to be said for the change. But one of the strongest advocates of it—the Cincinnati *Commercial*, which is in some sense an organ of President Garfield—declares that civil-service reform consists not simply in putting Mr. Robertson in the Custom-house, but in "the fullest employment of the war-club and the scalping-knife" against Conkling's adherents. What is proposed here, though veiled in Machine slang, is simply that Mr. Robertson should take the Custom-house with the understanding that he should dismiss all the employees who either owed their appointments to Conkling, or who while in office have "worked" in his service. We have little doubt that the service would be improved by the dismissal of most of them; but under the "war-club and scalping-knife" plan they would not be dismissed for the good of the service, but as a means of damaging a political opponent. Neither the officers dismissed nor the public would regard their incompetency or misconduct as having had anything to do with their dismissal. It would be treated as one of the ordinary weapons of party warfare under the spoils system. It would be treated as the triumph of Conkling's enemies over him in his own game, to be borne patiently until the opportunity of winning back what was lost came in the same manner. No Government officer and no politician would think of it for one moment as a sign that the Machine had been broken up, or was likely to be broken up. They would conclude that it had passed into fresh hands, and, instead of being used any longer for Conkling's aggrandizement, was to be used for the aggrandizement of some one else, and instead of calling it the Conkling Machine, they would call it the Garfield or Robertson Machine. If you said to them that the reform was now going to begin in real earnest, they would not only refuse to believe you, but they would laugh at you. Moreover, it would deepen greatly that disbelief in the sincerity of reformers, and in the practicability of reform, which is one of the greatest difficulties in the way of reform. It is not a sound argument against reform that many reformers are self-seekers, any more than it is a sound argument against religion that many professors of religion are hypocrites, but it is an effective argument. Human nature is so constituted that men are disposed to conclude that what worthless persons advocate is worthless, and in seeking to bring about changes which are dependent on public opinion we have to take this peculiarity of human nature into account. A reformer who uses the Machine will always be set down as a Machinist. Nobody will ever believe that he is using it for the purpose of bringing about a state of things in which there will be no Machine. Possibly if President Garfield and Mr. Robertson were to have life-tenures, they might overcome these suspicions and vindicate their motives by their mode of managing the Custom-house. But they have not life-tenures. They are only sure of four years, and in entering on any transaction of which the complexion is doubtful, they ought to be very sure that within four years they will be able to present it to the public in its true light. It will not do for another President who has talked civil-service reform to go out of office leaving the impression that his attempts at reform were simple aggravations of the abuse.

There is still another consideration which the President has apparently not taken into account. Nobody, we believe, has ever maintained that Congress was likely to abolish the spoils system on its own motion. The most which those who believe the reform cannot be effected by the President alone have ventured to say is, that legislation will be necessary to make it permanent and substantial, but that this legislation must be obtained through Presidential recommendations backed up by public opinion. President Garfield takes this view himself. In his inaugural address he said:

> "The civil service can never be placed on a satisfactory basis until it is regulated by law. For the good of the service itself, for the protection of those who are entrusted with the appointing power against the waste of time and obstruction to the public business caused by the inordinate pressure for place, and for the protection of incumbents against intrigue and wrong, I shall, at the proper time, ask Congress to fix the tenure of the minor offices of the several executive departments, and prescribe the grounds upon which removals shall be made during terms for which incumbents have been appointed."

The "proper time" will doubtless be soon—probably next winter. Now, we know from General Grant's experience how hard it is for any President to obtain the support of Congress in any attempt to change the mode of appointment or the tenure in the civil service, no matter how free from participation in the abuse he may be himself. We know from President Hayes's how useless it is for a President to ask Congressmen to give up their hold on the patronage, if he has himself been using it to reward his own friends and supporters. They are only too eager to lay hold of any excuse, however slight, for returning an emphatic no to any demand for a change, and a better excuse than the inconsistency of the President who asks for the change they could not desire. President Hayes, by his use of the Southern appointments soon after he came into office, furnished all the enemies of reform with a sufficient reason for turning a deaf ear to everything he said on the subject. President Garfield has, within one month after he has taken office, proceeded to remove one of the most important subordinate officers in the Government in the middle of his term, not, as he admits by offering him another place of dignity and emolument, because he has any fault to find with him, but, as he can hardly deny, and as every one in and out of Congress believes, in order that he may use the place either to reward one set of politicians or inflict injury on another. When, therefore, he comes to ask Congress to protect "those who are entrusted with the appointing power against the waste of time and obstruction to the public business caused by the inordinate pressure for place," and to protect "incumbents against intrigue and wrong," by fixing "the tenure of the minor offices, and prescribing the grounds upon which removals shall be made during the term for which incumbents have been appointed," he will expose himself to some very embarrassing questions. Asked whether Mr. Merritt applied to be removed from the Custom-house in the middle of his term, he will have to answer no. Asked whether Mr. Robertson applied for Mr. Merritt's place, he will have to answer no. Asked whether any improvement in administration is likely to be effected by Mr. Robertson which Mr. Merritt could not or would not have carried out, he will have to answer no. Asked whether any law or usage of the service called for Mr. Merritt's removal in the middle of his term, he will have to answer no. Asked whether this removal does not indicate that he himself does not believe in his own remedy, he will have to answer that this construction may undoubtedly be placed on it. Asked how he comes to recommend Congress to provide by law for the prevention of things which he, while a perfectly free agent, committed the very first moment he had it in his power, he will have to be silent. Unfortunately, however, the matter will not end here. All his recommendations about civil-service reform will be so discredited that he will not only accomplish nothing by them, but he will, for the sake of his own peace and dignity, have to drop the subject, just as General Grant and Mr. Hayes dropped it, and acquiesce in all the abuses against which he has for years been inveighing, and with which a large body of his supporters, without whose aid he could not have been elected, confidently

expected him to deal with a master-hand. We have little expectation that he will now recede from the position in which he has unhappily placed himself with what seems to have been very little deliberation. The New York Custom-house could very well have been let alone for at least half a year, until he had made himself a little better acquainted with the situation in this State. Had he examined it he would have found that the Republicans here owe their majority, which is small enough at best, to the expectation that Conkling would be by this Administration overthrown, by means which would make the appearance of other Conklings impossible, or very improbable; in short, by giving the public such an experience of the benefits of a business management of Government affairs as would put a return to Machine methods out of the question.

THURBER *VERSUS* FINK.

IN response to the request of the Anti-Monopoly League we last week explained to some extent what we did *not* believe in as a solution of the railroad question. We do not believe in a law limiting profits. We do not believe in relying on public spirit as a substitute for profit in railroad management. What, then, do we believe in? That we propose now to explain.

The difficulty with the Anti-Monopoly League and the whole Granger school of agitators seems to be that they will not study out their subject. Approaching it with certain preconceived notions, they pick up a fact here and a fact there; from these facts they manufacture a list of abuses; to this list of abuses they proceed at once to apply their preconceived notion of a remedy. Passing by the questions of fictitious capital and excessive profits, in regard to the first of which their case is at best not proven, and in regard to the second of which they have no case—passing by these, the real allegation against the railroad companies relates to the systematic method which they pursue of discriminating as between man and man. Here the case of the League is in great degree made out for them. There is no question whatever that the railroad business of the country is to-day, as it always has been, based on a complicated system of special rates. One place enjoys preferences over others, one man or one firm over other men and other firms. That this system is good cannot for a moment be maintained. That it has led to abuses of the gravest description every one who knows anything of the railroads of the country, and does not belong to them, freely admits. That it is now with great rapidity concentrating all the large branches of business in the country at a few points, and in the control of not many men, is apparent. That some remedy for this condition of affairs should, if possible, be devised, and that speedily, no thoughtful man having any acquaintance with the subject is disposed for a moment to deny.

Here, then, is a confessed evil—an ill of the body politic, so to speak. A cure is to be sought. In what is it to be found? Of course, in order to discover the cure, the cause of the ill must first be clearly ascertained. It does not do to attribute it to human wickedness, the greed of gain, or the general prevalence of bad men in the world. This is a convenient and simple way of solving the question, but one which leads to results hardly satisfactory. A code of legislation built on it as a foundation will hardly prove efficacious. In the present case, also, the cause of the ill is not far to seek. In fact, it lies almost on the surface. Obviously enough, the root of railroad discrimination is in railroad competition. That competition is peculiar. Not only is it local, but necessarily there are very few parties to it. Generally there are but two. There are never more than five or six. Where it does exist, also, this competition is of the sharpest description conceivable. It is no child's play. A race of men are thus trained up to it the one object of whose lives—whose very subsistence itself—depends on their getting for their employers "their share of the business," as it is termed. All the rest follows as a matter of course. The most astute and the least scrupulous of these agents go by promotion to the great centres of competition. There they have recourse to every device conceivable by human ingenuity to secure traffic. These devices all tend to one result—the concentration of business at the points of competition, and in the hands of a few men at these points. The man who has business to give can, through this system, command rates of carriage which enable him to defy competition on the part of any who cannot command equal rates. Cut-rates, draw-backs, rebates, time-contracts, every expedient is in turn resorted to, and they all result to the advantage of the competing point and the large concern. This is the discrimination complained of. To deny its existence is mere folly; and neither Mr. Thurber nor Judge Black nor Secretary Windom can overstate the evils which now do result from it, or the yet greater evils, both economical and political, which, if it goes on, seem likely to result from it.

While not overstating this evil, however, they resolutely refuse, one and all, to recognize the cause of it. The railroad system was organized in this country in a full reliance on the natural laws of competition. We are the single nation which has accepted the logical result of this reliance in our general laws authorizing free railroad construction. Well, the railroads have moved in the line marked out for them by public opinion and public policy a great deal too strongly. That is what is the matter. Where they have to compete they compete too much, and, as a logical consequence, where they have not to compete they do not compete enough. The cause of the evil is found, then, not in the badness of men, but in a radically mistaken railroad policy. The general laws of trade and competition, on which we have put our reliance, have worked—but not in the way we expected them to work, or that Mr. Thurber and Judge Black and Secretary Windom now think they ought to work. But what remedy do they propose? Their remedy is always a very simple one. Seeing as clearly as any one that unregulated local competition is the cause of the evil of which they complain, they propose—more competition. In other words, they fall back hopelessly, helplessly, and angrily on their preconceived notions. From this point forward, therefore, they themselves become the one great obstacle in the way of every intelligent effort to solve the problem. They now have recourse to those stereotyped phrases in political economy which with the unreflecting put a stop to discussion. Competition, they keep reiterating, is the life of trade; combination is monopoly. Combination, therefore, must be prohibited by law, while competition—well, competition must be pieced out by law. There is not quite competition enough to go round, and what there is is too strong; so they seek by statute to prescribe a competition of their own, to be conducted on Christian principles, which shall be at once good, and gentlemanly, and high-toned, and plentiful—not this scant, cut-throat business. No one must compete secretly, or indulge in any ways that are dark; all must compete according to rule, and not too much. So laws are to be passed regulating the whole thing: more usury laws; laws making discriminations and draw-backs and rebates criminal offences; laws threatening Mr. Vanderbilt with fines and his freight-agents with imprisonment.

Just such laws as these the world has been making for several thousand years—laws in restraint of trade. During the last dozen years the legislatures of twenty States in this country have been busy making them as respects railroads. They have come to nothing yet. They never will come to anything. Such a law is the so-called Reagan Bill, annually before Congress, which Mr. Thurber and the Chamber of Commerce specially commend; a law which, if it were passed and rigidly complied with to the letter by the railroad companies, would paralyze the traffic of the country in a single week.

Such, as we understand it, is the method of dealing with this great evil advocated by the Anti-Monopoly League—a method worse than leaving the whole thing alone; a method condemned not only by reason, but, in the case of railroads, by the experience of fifty years. How should it be dealt with? The true method of dealing with it, we think, is very plain. As the evil arises from unregulated local competition, the remedy is to be found in a regulated general competition. On that point we have not the slightest doubt that Mr. Fink is right. The first step towards a better condition of affairs will be found in the closer combination of the railroad companies, so that they can restrain their own agents. They must be allowed, therefore, and even encouraged, to organize themselves together, and their organization must be made public and responsible. Once public and responsible, it cannot long exist without becoming amenable to law. This has been the experience of all railroad amalgamations, both in this country and in Europe. The chief difficulty hitherto has lain in the fact that the would-be railroad reformers are unable to realize it.

We are perfectly aware of the answer which will be advanced against

this doctrine. Judge Black will again dilate on the political dangers involved in thus letting development take its course. We shall have over again the whole cant of the discussion—its stereotyped phrases, the *imperium in imperio*, the power behind the throne, and all the rest. Even admitting the soundness of this political argument, which we do not for a moment propose to do, the alternative would seem to lie between railroad combination and railroad consolidation. Under the pressure of that competition, which the League clings so closely to, the roads have of late years been consolidating with significant speed. The crushing-out and rolling-into-one process shows no signs of stopping. On the contrary, it is going on faster than ever, and each new turn of competition accelerates it. We really are unable to see that a dozen combined corporations are politically more dangerous than one consolidated one. They are infinitely less dangerous. Yet to that consolidated one competition is fast driving us.

We do not, however, admit the argument from political danger. These things regulate themselves. As we look at it Mr. Fink is quite right from a public point of view in seeking to check discrimination, and regulate competition through a systematic, organized combination of railroads. We doubt very much, however, whether he sees equally clearly the ultimate result to which his efforts tend. The thing will not stop here. The forces at work are too deep-seated and too subtle to be finally disposed of in this way. They will work to the distinct end of some sort of direct political responsibility. Exactly what this will be we do not pretend to divine. The course the telegraph is now taking foreshadows that of the railroad. From its inherent conditions the latter consolidates more slowly, but it does so equally surely. It is a law of development. Statutes may check but they cannot prevent it. Those interested in the outcome of the railroad problem can, therefore, now most profitably watch that of the telegraph problem. The consolidation which controls the latter is at present on its good behavior. In the course of a short time we shall be able to form some idea of the degree of restraint which responsibility before public opinion will exercise over an unchecked combination. If it proves insufficient to protect the public interests, there is but one recourse—the Government must intervene and extend its functions. How far and with what results, remains to be seen. Meanwhile, so far as the question in hand and the immediate present are concerned, our sympathies are entirely with Commissioner Fink in his efforts, and opposed to Mr. Thurber. If the latter could accomplish all that he hopes he would only aggravate the evils of which he complains, and in the existence of which we fully concur. He would break up, so far as he could, the one logical, systematic effort which has yet been made looking to something which might result in a solution of the railroad problem.

IMPERIAL TOPICS IN PARLIAMENT.

LONDON, March 31, 1881.

AFTER nearly three months spent on Irish affairs, England is now again occupied by those questions of imperial policy which filled the public mind during the latter part of Lord Beaconsfield's reign, and on which the general election of 1880 turned. Two of them—the question of the Transvaal territory annexed to our South-African territories by the Conservative Government in 1876, and the Afghan war which it began in 1878—have been practically settled and disposed of during the last fortnight. The third, that of the frontier lands in Thessaly and Epirus, which Greece claims and the Turks refuse to give up, is now in an acute phase, and may at any moment break out in war. But the negotiations relating to it have been kept so secret that one can speak for the present only vaguely about it. In both of the two former questions issues larger than the points directly concerned have been raised. In both a very similar tone of attack on the conduct of the Government has been adopted by the Tory party, while the same principles have been appealed to by the Liberals in their defence.

A peace, as you have already heard, has been concluded with the Dutch farmers of the Transvaal which concedes to them complete internal self-government, reserving to the British Crown only a nominal suzerainty, a right of protecting the native tribes, and the control of the foreign relations of the Boer republic. No one seems to object very much to these terms in themselves, for it is felt that little, if anything, would be gained by retaining the Boers as unwilling subjects; nor are their territories needed for British colonization. It is rather the time and manner of the peace which have excited disgust. The Boers had been made subjects of the Queen, so it is urged that they ought to have been forced to submit before indulgence was offered to them. They had defeated British troops in several engagements, so the army and all that large class in our aristocracy which sympathizes with or is influenced by the army are bitterly mortified that some vengeance should not have been taken for these disasters. People say that the character both of the army and of the nation will be permanently lowered in the eyes of the world by the meekness or timidity of the Government. Strong as this sentiment is in the upper class, it does not touch the great bulk of the electors, who had grown, under Lord Beaconsfield's régime, tired of colonial wars which were costly without being glorious. Hence the Tories, while taking every opportunity of questioning and taunting the Ministry, have not yet formally impeached their conduct by proposing a hostile vote in Parliament. Through Lord Cairns, in the House of Lords, they have inflicted a damaging criticism on the policy which allowed the Boer war to break out; but at the bottom of their hearts they are probably glad to be well rid of a disagreeable business, even upon disagreeable conditions.

They could not, however, equally well allow the reversal of Lord Beaconsfield's Afghan policy to pass unchallenged. Those who have followed the intricate history of the war in Afghanistan know that the grand plans of annexation with which that war was begun by Lord Lytton, then Viceroy of India, were soon abandoned. After the expulsion of the Amir Shir Ali Khan, and the capture of Kabul, a treaty was concluded by which the frontier of British India was advanced some distance to the westward, up the passes which penetrate the mountains from the plain of the Indus. Before long it was discovered that the possession of these passes did not really strengthen our frontier, for they were very unhealthy and exposed to the attacks of savage independent tribes. Accordingly the late Government was preparing to retire from the northern parts of the recently annexed territory at the time when it was driven from office. Our troops, however, were then holding, and have continued until now to hold, the city of Kandahar, the capital of Southern Afghanistan. Soon after Mr. Gladstone succeeded to office his Indian Secretary, Lord Hartington, announced that Kandahar also would be abandoned, and Afghanistan left to itself just as it had been before the war began. This was, of course, the most complete reversal of the policy of the late Government, and the heaviest censure that could be passed on it; for it left us with nothing whatever to show for the sixteen millions of pounds sterling that have been spent on the war. The Tory leaders, therefore, felt bound to protest. Some of them were chiefly anxious to prove that they had originally been in the right. Many more were annoyed at the idea of retirement and surrender, thinking it unworthy of our reputation and likely to damage our character for courage in the eyes of the natives of India. A certain number, especially of old Indian generals and civil-service officials, believe Kandahar to be really a valuable outpost against those Russian armies whose approach across the deserts of Persia and Turkistan they constantly prophesy. These Indian veterans, being men of vigor and ability, and speaking with the authority of experience, and sometimes of distinguished service, are a powerful body in English society. They are not usually party politicians, but as the Tory party has latterly been the party of war and annexation, and the Liberal party that of peace, those of them who fear Russia and propose to move forward to meet and check her have practically become associated with the Tories. The two leaders of this school were Sir Henry Rawlinson, known for his deciphering of the cuneiform inscriptions, and Sir Bartle Frere; it was they who, working on Lord Salisbury's mind, are believed to have really caused the war of 1878. At the head of the opposite school stood Lord Lawrence, the most famous of all the Indian heroes of recent years, whose last public appearance was when he came forward, weak in health and nearly blind, to dissuade that war. Latterly the balance of Indian opinion, both in India itself and in England, has been in favor of the so-called "forward policy," and therefore of retaining Kandahar. Emboldened by this, the Tories have moved in both houses of Parliament resolutions condemning the abandonment of that stronghold at the present moment, when the advance of Russia is supposed to be specially menacing. The question was raised in the House of Lords by Lord Lytton, and decided by a majority of eighty against the Government, and in favor of retaining Kandahar. The Conservatives have so overwhelming a majority in that House that nobody attached any political importance to this victory. Some, indeed, doubted whether by registering an opinion which was certain to be contradicted by the House of Commons and disregarded by the Government the Upper House had not gone out of its way to proclaim its own impotence. A fortnight later the matter was brought on in the House of Commons, and decided in favor of the Ministry by a majority of one hundred and twenty, just the majority which three years ago in the last Parliament approved the very policy which is now condemned. This has been the first serious party conflict of the session. As the result was foreseen, the debate caused no great excitement till the numbers were declared, when the Liberals, realizing their overwhelming strength almost for the first time since the general election, broke into cheers which seemed endless. The decision is one whose importance goes far beyond the point nominally involved. That was only whether a post whose occupation with a force of twelve or fifteen thousand men would have cost

something over a million sterling per annum should be held by British troops. But the matter really in debate was the whole policy of advancing the frontiers of India, with a view to meet or threaten Russia. For the last fifty years this question has occupied Indian statesmen. It has become, or appeared to become, more serious with the progress of Russia towards the East and South. It will continue to be a source of anxiety, as well as a theme of contention between those who hold that Russia must be checkmated by seizing every point of vantage, and reducing under our control the tribes that separate her dominions from ours, and those who conceive that as the chief real danger to English dominion in India is from disaffection caused by heavy taxation, the better course is to await Russia on our present frontier, and strengthen ourselves by a strict economy which will make it possible to reduce the burdens of the native population. Besides, as the Afghan war was the part of the late Government's policy which had proved least successful and had most contributed to discredit them with the country, the emphatic condemnation which this House of Commons has pronounced on it is looked on as a condemnation of the principles of their foreign policy as a whole, and as a proclamation that, in future, wars of aggression and the extension of territory are to be avoided. It became still more significant in this aspect from coming so closely on the heels of the peace in South Africa. Of course, both these "surrenders," as they are called, will be useful weapons to the Opposition for galling the Government in future. But in the meantime, the tide still setting towards a policy of retrenchment and domestic reform, they have greatly strengthened the loyalty of the Liberal party to Mr. Gladstone's Cabinet. No minister has been so powerful since William Pitt as he is at this moment; nor has the party he leads ever been so united as its personal devotion to him makes it for the moment.

During the last month active and incessant negotiations have been going on at Constantinople for the settlement of the claims of Greece to an increase of territory. Three years ago they would have excited keen interest. At present people are rather tired of the endless Eastern Question, and give Greece a less lively sympathy than she had expected. Although the six Powers have kept their secrets better than they usually do, it has now leaked out that the new Czar, although his wife (by whom he is supposed to be greatly influenced) is sister of the King of Greece, has looked very coldly on the Greek demands. Thus England was left to plead the Greek cause almost alone; and when the other Powers accepted the Turkish ultimatum, she had to choose between agreeing with them or breaking up that European concert on whose supreme importance Mr. Gladstone has so often insisted. In taking, however unwillingly, the former course she has incurred not only the reproaches of the Greeks but has also disappointed a certain number of enthusiastic spirits at home, who would gladly see a flame kindled in the East which would burn up the Sultan and the whole system of Turkish government. The worst of it is that no one can say how far such a flame might spread. It might involve Russia and Austria, whose interests are really more hostile in the East than are those of Russia and England. Germany might step in, perhaps France also; the result might be another great European war. Though England would hardly be called upon to take a side in such a struggle, she could not contemplate its possibility without regret and alarm. Such considerations have probably forced even Mr. Gladstone, whose sympathy with the Greeks is well known, to make the maintenance of peace his first object, especially as he, and everybody else who watches the condition of Turkey, must see that her Government cannot hold together much longer, so that the Greeks are pretty sure to obtain, within a few years, a substantial share of the Ottoman inheritance. The question of the moment is whether they will put up with the temporary disappointment of their hopes, or attack the Turks even without the countenance and moral support of any of the great Powers. Their forces are not a match for the Turks in the open field; for though probably equal in number, they have never seen active service. The best they could hope for would be to keep up a guerilla warfare in Thessaly and Epirus until either insurrections in other parts of the Turkish dominions compelled the withdrawal of the Turkish troops, or till the great Powers interposed to put an end to the strife. In the latter case it is doubtful if Greece would get more than she is to receive peaceably now. But considering the instability of the monarchy in Greece, and the shock to national sentiment which a tame acquiescence in the balking of their aspirations and patriotic plans implies, a Greek statesman might reasonably think that war ought to be chosen, with all its obvious dangers. It may do great good to the Greek people, who have hitherto only talked, to be forced to show their capacity for action and self-sacrifice. Y.

ALEXANDER II. IN EUROPEAN POLITICS.

PARIS, March 31, 1881.

THE assassination of the Emperor of Russia is one of those momentous events which give, so to speak, a new turn to the history of a country, sometimes of the world. What could there be more different than France during the reign of Henry IV. and after the crime of Ravaillac? On one side glory, light, tolerance, a great country learning to support two religions, two churches, preparing for a final struggle with Spain, which then represented darkness, tyranny, oppression of the body and of the soul; and on the other, France fallen again into a state of complete anarchy, with factions tearing her constantly during a long minority, and the traditions of Henry IV. despised and finally forgotten. Thus is it in the power of one man to dispose of the fate of millions, since the kingly or imperial power is a representative power. Regicides pretend to make war on the theory which gives to one individual sovereign power, and they are themselves the worst supporters of this theory. The men and women who have darkly been plotting for the last few years against the life of Alexander II., and have finally succeeded in assassinating him, have done so without consulting the Russian people; they have disposed of an immense nation without its leave: they have forcibly thrown the history of Russia into unknown paths. Is it not as strange as it is horrible that any human creatures should invest themselves with this new sort of divine right, and make themselves the executors of an artificial Providence?

Alexander II. was marked with a tragic mark. He ascended the throne when his country was humbled, when the armed forces of England and of France had broken the iron will and the pride of Nicholas. The prestige of Russia was gone: Sebastopol had fallen; Germany, which had long accepted a sort of protectorate of the North, learned to look without respect on her neighbor; the formula of the new situation was invented by the Chancellor Gortchakoff: "La Russie ne boude pas, elle se recueille." The first effect of this *recueillement* was a social revolution as great as the revolution which was accomplished in America during the war of secession. The great proprietors of Russia, though they had no political power, had always been able to counteract all schemes for the emancipation of the serfs. Alexander II. chose new councillors; he opened his ears to the advice of true patriots; they bade him, "Free your people, if you wish them to be great again." His own heart was inclined to humanity and to justice. He was of a sad and melancholy disposition. By goodness of heart, more than force of character, he became the greatest reformer of the century in Europe. For it was not enough to say to the serfs, "You are free"; everything was to be organized, from the family to the commune; lands had to be apportioned to the peasants; schools had to be built; new courts, a new code of laws, became necessities. These great reforms were accomplished by the will of the Emperor amidst the greatest difficulties, and against much avowed or hidden resistance. Russia, moreover, was not alone in the world; and though she had promised to "collect herself" she could not remain entirely apart from the movement of European politics. France had a ruler full of "ideas," and always ready to make war for one of them. After the Crimean War Napoleon had coquetted for a while with Russia, but one "question" makes another "question," and by and by the Polish question was revived in its turn. Nothing could have been more unfortunate for France, as it created in the heart of Alexander II. a feeling of animosity which was never completely soothed. The Poles were represented to him as the most tyrannical of landlords, the most hostile to the great measure of emancipation, and every attempt to raise Poland again among the rank of independent nations could only draw nearer the sovereigns of Germany and of Russia.

Alexander had feelings of the greatest devotion for his uncle, the King of Prussia; he admired his military exactitude, his conservative principles, his confidence in an overruling Providence, his strong faith in the destiny of the German people and in the dynasty of the Hohenzollern. The personal friendship of these two sovereigns will be remembered as one of the great features of the policy of our age, as it was an efficient factor in all the great events of our time. It was a perpetual check on the designs of Napoleon III.; it was also a check on the ambition of Austria. It prepared the ultimate triumph of Prussia, the consolidation of a new German Empire under the leadership of the Hohenzollern, and what more recent times have seen—a sort of infeodation of the House of Hapsburg to the Hohenzollern. Russia could, at almost any moment, have hindered the development of these gigantic events. She could have hindered the Danish war; she could have hindered Sadowa; she could have hindered the confederation of states which followed Sadowa. Alexander II. did not oppose the designs of Germany; he saw a new Europe forming under his eyes, and understood that the consolidation of great nationalities was a necessity of the times. But his German leanings gave no satisfaction to the old Russian party; at any rate, they were a sort of indirect encouragement to the efforts of those who began to think that after a great Italy, a great Germany, a great *Slavia* ought also to be formed. Liberty is a strong wine which inebriates weak brains; the Russian universities became the nurseries of all sorts of wild socialistic and national projects. A curious alliance was formed between science and revolution; the discoveries of chemistry and physiology were regarded by enthusiastic-fanatics as the only instruments of progress. All the moral thoughts of the past, the religious beliefs, the traditions of old ages, the time-honored notions of respect, of honor, of devotion to some ideal cause, were looked upon with contempt; the army of the Nihilists was formed not only of poor

and ignorant youths, it enlisted also some of the most corrupt and *blasé* members of an aristocracy which had no duties, no rights, no responsibilities. Between the Emperor, surrounded with the seventeen official and gilded circles of the Russian *Tchinn*, and the millions of peasants who lived humbly on the land, there was nothing; and it thus happened that a handful of men, imbued with a sort of malady of destruction, found themselves able to control, in one sense, the destinies of the country.

The Emperor, though he was at all times averse to war, thought it necessary to find an outlet for the hidden energies of his people. He thought that a definite national aim would satisfy the nation, and that Nihilism would disappear as a bad dream is ended in the morning. The Eastern Question was re-opened and the Russian armies crossed the Danube once more. The Eastern war was not so successful as to surround the Russian Government with a great prestige; the military operations were conducted with great slowness; the Russian armies were kept for a long time before the improvised fortifications of Plevna; the administration of the army was found to be incompetent and corrupt; and, finally, the prize of victory was taken from the hand of the conqueror. Everybody knows how the peace of Berlin was substituted for the peace of San Stefano. The Russian army, which already had Constantinople in its grasp, was obliged to turn its back upon Saint-Sophia, and recross the Danube. It cannot be denied that the results of the war were important—Bulgaria became independent of the Turks, Eastern Rumelia obtained a semi-independence; but these results were not judged equivalent to the great efforts which had been made. The revolutionary party denounced the weakness of the Government, its prompt obedience to the dictates of London and of Berlin. A curious feeling of impotence and of uneasiness was felt in the political spheres of Russia; the old Chancellor Gortchakoff fell into a sort of disgrace. The life of the Emperor was embittered by family quarrels; his brothers were violently accused for their behavior during the war; the Grand Duke Constantine was at the head of the navy, and Russia was not satisfied with its navy; the Grand Duke Nicholas was at the head of the army before Plevna, and he had been sharply criticised. I will not speak here of things which are well known, and which could not contribute to create much harmony in the Imperial family.

The sad and melancholy nature of the Emperor was soon subjected to the hardest trials; the discontent of all parties in Russia, the growing animosity towards the Germans, who after the treaty of Berlin were accused of ingratitude, the disorders of the administration, the distant triumphs of revolutionary principles, all helped to increase the audacity of the Nihilists. They soon came to consider that Russia was their own, and that there was nothing between them and the triumph of their negative principles but the life of a few men; and they went to work with the determination of semi-barbarous sectarians. They have made already many martyrs, and they have their own martyrs; they are proud of their crimes, and each one seems to them to invite another. They pretend to rule the world by intimidation; they are the new terrorists. They have their hidden tribunals; they pronounce their condemnations in the name of their own infallible justice; they pretend to keep Europe in bondage, for the spirit which animates them is not confined to Russia. Have we not living among us and breathing the same air that we breathe the men who shot the hostages in 1871 and who fired our monuments? We have pardoned them; they have not pardoned us. There is growing up through the whole world a curious feeling of despotism. The new despots are not crowned, they are not anointed; they have constituted themselves the rulers of opinion by virtue of the new sort of sovereignty. They are the high-priests of the revolution, and if you ask them what they mean by revolution, they cannot say much more than the Russian Nihilist: "Destroy first, in order to build afterwards." The end of our century will witness terrible struggles, throughout the world, of this new religion and of all the religions of the past.

Correspondence.

AN AMERICAN STATISTICAL LIBRARY IN GERMANY.

To the Editor of The Nation:

Sir: Mr. Carl Lautenschlaeger, of Stuttgart, Germany, has been collecting for some time a number of books and documents bearing upon the history, the statistics, the social and industrial development of the United States, and will open at Stuttgart on the 4th of July next a public library "for the purpose of communicating correct and useful knowledge respecting America in Germany." He has received from private persons and some State officers the latest revised codes and statutes of several States, reports of railroad commissioners, of school superintendents, of geologists, etc., but of course thus far only on special application, involving a very extensive correspondence and much time and labor. I have thought it best to bring this matter to the notice of the public, and I know of no better medium than the *Nation*, which is very apt to bring such notice home to those persons who most likely will take an interest in the enterprise.

One who reads the newspapers and periodicals, as well as published books, of the continent of Europe, is often astonished at the want of knowledge still existing in regard to the political, social, and industrial condition of the United States, and it seems to be a very meritorious, and for us useful, undertaking to shed light upon our affairs by disseminating correct and official information. Stuttgart is a place of more than one hundred thousand inhabitants, in the heart of Germany, and the seat of a considerable American colony. As a publishing place it is only inferior to Leipzig, and except that city is undoubtedly the best location for the "American Public Library." I do not know Mr. Lautenschlaeger personally, but he has referred me to Mr. Jacob Schiff, of the firm of Kuhn, Loeb & Co., and to Mr. Jesse Seligman, of your city. They will undoubtedly give any further information which may be required as to the place where public documents may be sent to be forwarded to Germany, as to the expenses of freight, etc., etc.

Yours very respectfully, Gustave Koerner.

Belleville, Ill., April 16, 1881.

MORE FRACTIONAL INACCURACIES.

To the Editor of The Nation:

Sir: Under the above caption Mr. Charles Francis Adams, jr., in your issue of April 14 says: "In your issue of last week I noticed my own name in a communication from Mr. F. B. Thurber on stock-watering, etc., in which he quotes me as condemning, in the strongest terms, the practice of stock-watering, in the reports of the Massachusetts Railway Commissioners. I wish Mr. Thurber would refer me to the passages he alludes to."

On page 13 of the Sixth Annual Report of the Board of Railway Commissioners of Massachusetts, of which Mr. Adams was at that time chairman, we find the following:

"The necessities of development should be provided for, as the original construction was provided for, by the investment of fresh capital. Upon the capital required for it that development should pay a fair profit—if it could not do so, it should not be ventured upon; but the community ought not to be called upon, as it now is, to pay in that capital itself under the disguise of surplus earnings; these surplus earnings should be left in the pockets of the people. Instead of paying interest on an increased railroad system built by private capital the community has itself to furnish capital to develop roads which are the property of the private corporations. Under the system called 'stock-watering' a similar practice is pursued, but in that case the surplus earnings are represented in the increased value of the property, and are from time to time capitalized and divided in the form of new securities among the stockholders. Thus the community not only itself pays in the capital required for the development of its railroad system, but it afterward is taxed, through unnecessarily heavy rates, to pay the dividends on the very capital thus paid in; in the other case it continually pays in new capital, which, however, only improves the original property of the corporations, as no new dividends are paid. Unless railroads are in no respect public corporations both systems are false, though the last is a much less flagrant abuse than the first."

The above is not the only instance in which Mr. Adams has exhibited a short memory since he entered the service of the railroads. When the bills proposed by the Hepburn Committee for the prevention of railroad abuses were pending at Albany last winter Mr. Adams was quoted on both sides of the same question, and one of the speakers, in commenting on this fact, stated that Mr. Adams had graduated from a Massachusetts railway commissioner at four thousand dollars per year, into a pool-line commissioner at ten thousand dollars per year, and as a commissioner of the pooled lines he entertained very different views from those he advocated when chairman of the Board of Railway Commissioners of the State of Massachusetts. By this I do not mean to convey the idea that Mr. Adams is not a perfectly upright man; I believe that if he was filling a judicial position where he was sworn to protect alike the interests of the public as well as those of the railroads, his opinion would be entitled to great weight, but at present he is virtually the counsel of the railroads and naturally advocates their interest. The same thing is true of Mr. Fink, than whom, perhaps, a fairer man does not exist; but his recent arguments in defence of the pooled lines lean much more to that side of the question than before he entered their service, and doubtless this is to be expected.

Mr. Adams says, "The idea of a railroad company neither paying dividends nor representing by new stock the net earnings put into the property, strikes me as farcical." I am not aware that I have ever advocated such a thing. If a board of directors sees fit to pass a dividend and put it into extensions and improvements which are afterwards capitalized, there is nothing wrong in that, although I think the preferable way of doing it is to declare the dividends, and then issue and sell the stock to raise the desired funds. By the latter method there is less chance for that sophistication of railroad accounts which Mr. Adams, when railway commissioner, so strenuously objected to.

Mr. Adams says, "Mr. Thurber also makes queer work of the origin of the railroad system and the laws to prevent excessive profits." I may not have made this part of my letter quite as clear as it should have been; what I meant to illustrate was that the governing motive in constructing railroads has been not so much a remunerative investment of capital, as it has been the desire of the public to realize the enormous advantages resulting from these improved highways; as, for instance, the increased value in real estate resulting from better access to markets and in the increased commerce of communities resulting therefrom, etc., etc. These have been controlling motives, and have resulted in hundreds of persons, as well as national, State, and municipal governments, aiding these enterprises, which have afterwards got into the hands of financial freebooters, who have "frozen out" all other interests and wielded these great organizations to tax the public unduly for their use.

Mr. Adams professes not to understand the meaning of the term "ten per cent. above the cost of operation," and evidently seeks to quibble over terms, because later on he says that I "evidently had in mind a clause in the old charters authorizing legislatures to reduce rates where profits exceeded ten per cent. upon the amount of the capital stock." Unless a person wishes to be extremely technical I claim that a part of the cost of operating railroads is the interest on the capital actually invested, and I am willing to make this a liberal rate, but I claim that the rate ought to be defined and lived up to.

It may be that I am more than usually obtuse, but I cannot understand one of Mr. Adams's expressions—viz: "As a rule, in this country a fair profit on capital is when a road earns net fifty per cent. above the cost of its operation; in England it is over one hundred per cent. Nor is there any excessive profit in these figures." Now, does Mr. Adams mean that fifty per cent. of every hundred dollars of gross receipts is a fair profit in this country, and if so, how can it be that in England there can be over one hundred dollars net on every hundred dollars of gross receipts? If, on the other hand, he means that a road in this country ought to earn net thirty-three and one-third per cent. of its gross earnings, and in Europe fifty per cent. net of its gross earnings, why does he not say so? There are various other singular inaccuracies in Mr. Adams's letter, but (as he says) "it is hardly worth while to point them out."

There is, however, a close connection between some of the points raised in Mr. Adams's letter and your editorial entitled "A Railroad Usury Law," and although I may be thought guilty of temerity in endeavoring to controvert at one time the opinions of the editor of the *Nation* and those of so high an authority as Mr. Adams, I desire to ask why, if I am all wrong in my opposition to stock-watering, does the railway law of Massachusetts (Section 177) prohibit in severe terms this practice? Why should the *Nation* say, "Mr. Thurber is as illogical and reckless in statement as he is active, persistent, and bitter." I have never advocated any reforms in railroad management which are not already embodied in the railroad law of the State of Massachusetts and the decisions of the Supreme Court of the United States. The enormous accumulations in a short time of railroad men are themselves evidence of the power they wield to gather into their coffers the wealth of the nation; the corruption of our elections and legislatures by railroad managers is known to all men.

Men like Horace Greeley and Abraham Lincoln have in times gone by, when the necessity was far less urgent than now, advocated the same views which I now advocate. Official investigations by the Senate of the United States and the legislatures of New York and other States fully confirm the necessity for remedial action. This latest investigation pronounced the principal charges "*fully proven*," and in their report use the following words:

"The mistake was not in providing proper safeguards to protect the public interest, and hold the railroads to a strict accountability for their transactions; thus, through the laxity of our laws and the want of governmental control (measurably excusable, considering the unforeseen possibilities of railroad development at the time of the enactment of those laws, but no longer pardonable in the light of the evidence herewith submitted), have crept in those abuses hereafter mentioned, so glaring in their proportions as to savor of fiction rather than actual history."

And yet in the face of this the *Nation* seeks to belittle the whole question by substantially alleging that I am the only person interested, and that there is no necessity for action. Perhaps "the unkindest cut of all," however, is when you reproach the anti-monopolists for not figuring up the amount which passed dividends would have amounted to on the actual capital invested, when, owing to the wilful sophistication of railroad book-keeping, this has been rendered impossible. If there is any one thing which the anti-monopolists have strenuously worked for it has been a uniform system for keeping railway accounts, which would afford a correct basis upon which to base the relations that should exist between railway corporations and the public.—Respectfully, etc.,

F. B. Thurber.

New York, April 18, 1881.

Notes.

GEO. H. ELLIS, Boston, announces the early publication of the Channing Centenary Volume, edited by the Rev. Russell N. Bellows. No memorial meeting in this country or in Great Britain will be overlooked, while full reports will be given of the principal ones.——J. B. Lippincott & Co. have in press 'Word-Building,' for the use of classes in etymology, by the late Prof. S. S. Haldeman; and 'Notes of a Pianist,' by the late L. M. Gottschalk, edited by his sister Clara, and translated from the French by Robert E. Peterson, M.D.——Macmillan & Co. have brought out a popular edition of Ward's 'English Poets' at a dollar a volume—a price which now puts this admirable work within general reach.——We have received from Arthur P. Schmidt, Boston, the libretto of the "Œdipus Tyrannus," with the music for male chorus and orchestra by Prof. J. K. Paine. We reserve our comments on this composition until after the Harvard performance.——The attention of students living within reach of public libraries should be directed to the Monthly Reference Lists issued by Mr. Foster from the Providence Library, and intended for universal circulation at the price of five cents a copy or fifty cents by the year. The first three numbers contain very discriminating references to books and periodical articles relating to the Stability of the French Republic, the Demand for the Cession of Dulcigno, Alexander II. and Nihilism, Thomas Carlyle, George Eliot, the Plantaganets in England, George Washington, Hamilton's Influence, Webster and the Constitution, the Sanity of Hamlet. The typographical good taste of these small folios is noticeable.——The Philadelphia *American* offers prizes for the best editorials, essays, and poems written by college students or graduates, and will use and pay for the unsuccessful productions if they do not fall below the *American's* standard. Particulars may be obtained by addressing the managing editor. The competition is intended to be "a test of the capacity and inclination of American college students and graduates for practical journalism," but in the nature of the case must be a very imperfect one. The connection, too, between poetic ability and practical journalism seems a little obscure.——A limited number of students will be received at a new Seaside Laboratory to be opened at Annisquam, Mass. (on the north side of Cape Ann), from June 5 to September 15. Some beginning in the study of natural history must already have been made. Address Mr. Alpheus Hyatt, Curator Boston Society of Natural History. The Laboratory is under the patronage of the Woman's Education Association.——The programme, list of officers, delegates, etc., of the International Congress of Americanists to be held at Madrid, Sept. 18–22, has been issued in a neat form from the press of M. G. Hernandez, in that city. The first day will be devoted to American geology, the history of pre-Columbian America, and the history of the discovery; the second day to archæology; the third to anthropology and ethnography; the last to linguistics and palæography. The General Secretary is Captain C. F. Duro, Sauco, 13 dupiclado, Madrid.——Apropos of this announcement we can mention the publication of the Appendix to the new edition of Duran's 'Historia de las Indias de Nueva España' (Mexico, 1880), from the pen of that eminent scholar Mr. Alfred Chavero. It is nominally an explanation of the hieroglyphic codex of M. Aubin acquired by Ramírez, but really a masterly sketch of ancient Mexican society, religion, government, etc., down to the Spanish conquest. A number of interesting plates from this codex receive general and special explanation in the text.——A connection between the barber's pole of China and of Europe is suggested by a writer in the *China Review* for Nov.-Dec., 1880 (Trübner).——The Brothers Kröner in Stuttgart have resumed their sumptuous illustrated work 'Unser Vaterland' (first series, "Die Deutschen Alpen") in a second series, entitled "Küstenfahrten an der Nord- und Ostsee."——Parts 23, 24 of the new 'Stieler's Hand-Atlas' (B. Westermann & Co.) contain a beautiful physical map of Middle Europe, with reference to altitudes; the East-Prussian part of the great map of the German Empire; a general map of France; a north-polar map; the trans-Mississippi Gulf States; New Zealand and West Australia. The polar chart indicates Nordenskiöld's route, and all the interesting discoveries of late years in Smith Sound and about Franz-Josef Land.——The same publishers send us a specimen number of a Paris children's magazine, *Le Musée de la Jeunesse*, which marks out a new track in juvenile literature. The form is quarto, with a correspondingly broad and elegant typography, and with profuse illustrations not only on wood, but in color—and not only in color on the full page, but in single tint or many tints in the midst of the text. In the audacity of these effects we have never seen anything to compare with it, and yet the *Musée* will appear fortnightly. In the number before us a double-page cartoon in half-a-dozen colors shows a negro-minstrel employing a boot-black in the streets of London, a sight only to be witnessed on that side of the water. The accompanying article gives cuts in black and blue.——No. 90 of the Berlin Geographical Society's *Zeitschrift* contains the usual annual classified catalogue by the editor, Dr. W. Koner, of the geographical publications of the year.——Two articles on Russia of immediate interest appeared in the *Revue Politique et Littéraire* of March 19 and April

2: M. Alfred Rambaud's "Les Libéraux Russes et la Réaction (1790–92)"; and M. Leroy-Beaulieu's "Les Résultats de l'Émancipation des Serfs," a chapter from his forthcoming work on 'L'Empire des Tzars et les Russes.' ——A 'Dictionary of Living Italian Artists,' by Achille Lanzi, will be shortly undertaken (Milan: P. Faverio).

—Mr. Conway's paper on Carlyle in the May *Harper's* opens with complimentary allusions to Mr. Froude which evidently antedate the late "unpleasantness." It is avowedly composed with a view to propitiating American sentiment towards the author of "Ilias in Nuce," and it will do so to the extent that it convinces the reader of Carlyle's complete ignorance of the material, moral, and political conditions of this country, and of his absolute incapacity to imagine the practical workings of slavery from the mere definition of the term. On the other hand, Mr. Conway's narrative would support a charge of ingratitude against the prophet who was honored here with fame, and admiration, and pecuniary reward for his literary labors before they received recognition at home. There is also to be found in this paper some excuse for the hesitation which Mr. Froude implies he felt in publishing the 'Reminiscences.' We have a picture of Mrs. Carlyle, "a gentle invalid on the sofa," correcting her husband as to matters of fact in his conversation, and offsetting his narrow censure with timely per-contra suggestions of what was laudable in the victim. "In the end, whatever had been the outburst of indignation, justice was sure to be done, and the mitigation sure to be remembered." In this light, Mrs. Carlyle's death appears all the greater calamity to her husband, with reference to the judicious editing or suppression of the 'Reminiscences.' "Ah, well, you shall give the revised and corrected edition presently," he says to her, in the interrupted conversation on Mrs. Barrett Browning reported by Mr. Conway. The effect on Carlyle of the 'Harvard Memorial Biographies,' by the way, is explicitly set forth in this paper. Mr. Kegan Paul's sketch of George Eliot naturally contains less that is novel than does Mr. Conway's. He points out that the science with which she overloaded her later works was not necessarily derived from Mr. Lewes, but, like some other defects and mannerisms, is to be found in her very earliest writings. What she and the world owes to him is his original "suggestion that she should try her hand at fiction." The best anecdote which Mr. Kegan Paul has to relate is of "one of the greatest English poets," who met George Eliot walking, and at parting, after an "evolutionary" encounter, "As she went down the hill, I said, 'Well, good-by, you and your molecules,' and she said to me, 'I am quite content with my molecules.'" The portrait accompanying this paper is evidently not after any photograph. It is a profile of extreme masculinity and power, which well bears out Mr. Kegan Paul's remark: "The face was one of a group of four, not all equally like each other, but all of the same spiritual family, and with a curious interdependence of likeness. These four are Dante, Savonarola, Cardinal Newman, and herself." *Dantesque* is precisely the adjective to apply to it.

—Of the *Atlantic's* serials, continued in the May number, it may be remarked that Miss Phelps's "Friends: a Duet" is more sentimental and less anomalous, if possible, than heretofore, and that Mr. James's "Portrait of a Lady" has reached the thick of the story, and raises difficulties which a less firm grasp than it is evident he has upon each of his characters would make formidable. Mr. J. Brander Matthews has a paper on Scribe, conspicuously free from illusions, but yet apparently as fair as it is discriminating. The book reviews are not of importance, but are restricted to the most considerable on the *Atlantic's* list, the rest retreating to fine print and condensation at the end of the number. This is the only mark of the change in the editorship that we have noticed. The *Contributor's Club* is retained without any clear effort to improve its quality. The noteworthy articles are "The Martyrdom of a Monarchy," by Mr. E. H. House, and some "Personal Recollections of Carlyle," furnished by the elder Henry James. Mr. House's "Empire" is Japan, and he paints a pitiful picture of that realm, designed to surprise those who hold rose-colored views of its condition and prospects. Mr. House alleges that "the plainest evidence indicates a settled purpose [on the part of England] to impoverish the country, render it incapable of maintaining its own industries, make it dependent on England for supplies, and so hamper the public finances as to compel, if possible, the negotiation of British loans, which again shall be used as fresh instruments of oppression, etc." That Japan has suffered, and is suffering considerably, from the engagements forced upon her by foreign Powers, there is little doubt, and an examination of the economical working of these engagements from a competent hand would be very interesting. But the above extract shows how little fitness Mr. House possesses for any such task. "Plain evidence" that England is impoverishing Japan in order to force her to put loans on the London market, is something which no one who had even a rudimentary acquaintance with the relations of the London market just now to foreign states would talk about at all; and the account of the Japanese tariff is written in the same "reportorial" frame of mind. The same thing may be said of the account of Sir Harry Parkes, who would well repay a judicious exposure, but whom Mr. House's attack will, owing to its extravagance, not hurt in the least. Mr. James's Carlyleana contains some amusing anecdotes, but is mainly valuable for some excellent criticism. This is not to be called sympathetic, since Mr. James lays down the proposition that ideas derive no consequence from the persons who maintain them, and is also a humanitarian optimist; but it is all the better for that, as it does not fail in appreciation.

—Among the recent publications of the Census Office is a bulletin showing the distribution of the population in latitude and longitude. The tables in this bulletin exhibit—first, the distribution of the population in 1870 and 1880 in latitude, with the increase, absolute and relative, between every two parallels, and the total population, with the per cent. of the total, living north of each parallel at the time of each of the two censuses; second, similar data regarding the distribution in longitude; and, third, the population living, in 1880, within each "square degree"—*i.e.*, the quadrilateral included within two consecutive parallels and meridians. The first table shows that 98.2 per cent. live between latitudes 30° and 45°, a region which in 1870 contained 98.8 per cent. The most populous of these latitude belts is that between 40° and 41°, which contains 7,859,938, or 15.7 per cent. of the total population. Next to this are the two belts lying immediately north and south of it, which contain respectively 11.8 and 12.5 per cent.; the three together containing no less than 40 per cent. of the total population. The percentage of increase has been greatest in the higher latitudes. The second table illustrates the fact that 90 per cent. of the population live east of the 95th meridian (*i.e.*, that about one-half of the area of the country supports nine-tenths of its population), and 96.3 per cent. east of the 100th meridian, while the arid region of the Cordillera plateau contains, as yet, only about 1.5 per cent., the remainder consisting of the population on the Pacific Coast. In this classification the most populous area is that between the 73d and 74th meridians, which contains 3,033,921, or 6 per cent. of the total population. Between 71° and 96° of longitude these belts show considerable uniformity in population, ranging from 1,000,000, or slightly less, up to about 3,000,000, while the average is 1,840,000. West of 96° of longitude the decrease in population is very rapid. The increase in population east of the 96th meridian during the past decade has been 9,281,710, while west of this line, the medial line of the country, it has been but 2,312,785. The proportional increase has, however, been vastly greater in the western half. In one of these sub-divisions, that between 99° and 100°, it reached 912 per cent., and in a number of others above 500 per cent.

—Census Bulletin No. 89 contains a statement of the financial condition of the State of Ohio for the year ending November 15, 1879. These statistics have been collected and compiled by Mr. R. P. Porter, Special Agent in charge of the Statistics of Wealth, Debt, and Taxation. They represent an assessed valuation of real estate, $1,102,677,704; and of personal property, $443,068,896, or a total of $1,545,746,600; a total indebtedness amounting to $44,654,168 55; a total taxation for other than school purposes of $18,781,910 11, and total school-tax of $6,954,051 77. The statement of bonded indebtedness is irrespective of sinking fund, or other property that may be available for the payment of principal and interest. The tendency in Ohio toward bonding all indebtedness is very marked, so much so that there are few floating public debts. Only three counties have floating debts, which amount altogether to but $4,778 18; five cities only have floating debts, of which the total is $56,869, and in only six of the counties have the villages floating debts, which amount to $32,058 90. The total floating public debt in the State is but $93,706 08.

—*Science* (March 19 and 26) contains two curious articles by Professor Burt G. Wilder on anatomical nomenclature, or rather on the reform he proposes for it. There certainly is ample room for it, but one cannot help thinking that in his desire for set names Professor Wilder approaches pedantry. Why should we not speak of the names of certain organs instead of their *organonomy?* or of their position instead of their *toponomy?* Again, the cortex of the brain is said to be the *ectal* layer, although no ingenuity, however perverse, could mistake *superficial*. Still, it is impossible not to respect the sincerity and thoroughness with which Dr. Wilder attacks the problem. His second paper is essentially a list of from one hundred and fifty to one hundred and sixty names of parts in the brain. Of course a great deal is retained as it is, or but slightly altered. We give some examples of the changes: For ventricle we have *cœlia*, and, accordingly, *rhinocœlia*, *procœlia*, *dicœlia*, as the case may be. It is suggested that for convenience *rhinencephalon*, *prosencephalon*, etc., may be shortened into *rhinen.*, *prosen.*, etc. The commissures are to be called the *præcommissura*, *medicommissura*, and *postcommissura*. Professor Wilder opens a vast field for discussion. The acceptance of his nomenclature would be a revolution, indeed; but he evidently is not sanguine of its early success. He says, truly enough, that "the trained anatomist shrinks from an unfamiliar word as from an unworn boot."

—Some months ago we noticed the report in an Athens newspaper of the discovery, by Mr. W. J. Stillman, of a very ancient Greek inscription on the island of Ithaca, in the neighborhood of the bay called Port Polis after some city whose remains are still traceable. At the time Mr. Stillman was un-

aware that he had been partly anticipated by Dr. Schliemann. The mural tablet, as the stone seems to be, is in two fragments, of which the right-hand and major part alone was observed by Schliemann. Mr. Stillman ransacked a heap of rubbish to find the counterpart, and having done so and taken a photograph of both, sought in vain for an interpretation until he had submitted the inscription to Professor D. Comparetti, who has lately reported upon it to the Reale Accademia dei Lincei ('Iscrizioni Greche di Olympia e di Ithaka,' Rome, 1881). This eminent scholar finds the epigraph to be boustrophedon, with archaic forms of ϭ and ϊ, and very crudely carved in a friable rock. Deciphered, it is seen to have had no relation to a sarcophagus (as Schliemann had hastily surmised in his 'Ithaka, der Peloponnes und Troja') or to the dead, but to have marked the spot of the hidden treasure of a temple dedicated to Athena, Rhea, and Hera. Probably, Comparetti conjectures, in time of war or revolution, the priests deposited the sacred furniture (τὰ ἔντεα) in a safe place, and with their own unskilled hands executed the inscription. Mr. Stillman could not learn that any pottery or objects of bronze or stone had been found near the demolished structure with which the tablet had apparently been associated, but with the new light afforded by Professor Comparetti's determination of its significance he contemplates making further researches on the same spot. The exploration will now have a Captain Kidd attractiveness. We should notice that a heliotype of the tablet from Mr. Stillman's negative accompanies the memoir, together with three reduced fac-similes of inscriptions at Olympia already interpreted (and very badly interpreted, as Comparetti endeavors to show) by Kirchhoff and other German savants.

—The late earthquake on the island of Chio seems to be too remote to awaken much attention from the dwellers in the sixth and seventh stories of our New York hotels and manufacturing establishments, and whoever calls attention to a possible danger from earthquakes on the island of Manhattan will be called an alarmist of the worst type. There is serious matter for reflection, however, in the prediction that our great cities will be destroyed by earthquakes. The high price of land and the introduction of elevators or lifts induce builders to erect loftier and loftier structures. It may be affirmed that there is less danger to cities from fires in these high buildings, and the present difficulty of reaching the roofs with streams of water, than from earthquakes. Scientific means can readily be provided for flooding upper stories with water; but there is no protection possible against the earthquake shock, which would feed the cracked and disjointed furnaces of the block with the tumbling superstructure. A comparatively slight movement, continued long enough, would suffice to topple over or crack the walls of a seven-story warehouse, and New England and the Middle States are not unacquainted with earthquakes of considerable strength. John Winthrop, Hollis Professor of Mathematics and Philosophy at Harvard College, has described the "great earthquake which so lately [Tuesday, November 18, 1755] spread terror and threatened desolation throughout New England," in a lecture delivered in the chapel of the college on the week following the earthquake. The shocks were sufficient to throw bricks from the professor's chimneys with a velocity of twenty-one feet per second, to burst a distiller's cistern by the agitation of the liquor in it, and to break off the spindle of the vane on Faneuil Hall in Boston. This spindle was a pine stick, five inches in diameter and ten feet in height, and carried a weight of thirty pounds on its top. Professor Winthrop, during a shock which followed the first one, felt the bricks of a hearth rise beneath his feet; and in a foot-note he speaks of the wide extent of this earthquake which he noticed in New England. At Lisbon the damage done far exceeded that in Massachusetts. This was due, he remarks, to the nature of the buildings, many of them being seven stories high, chiefly built of stone laid in clay. He dwells upon the danger to lofty buildings from undulating earthquakes, and remarks that "had Boston been built in that manner, probably at this day it would have been little better than a heap of ruins."

—In every century of New England's history an earthquake has been chronicled of greater or less severity; and who will maintain that severer ones are not in store for us? The accounts given of the "dreadful earthquake of 1775" are doubtless much exaggerated, but we have every reason to believe that Professor Winthrop's account is a calm and philosophical one, and that his remark in regard to the danger to seven-story buildings is perfectly just. An earthquake which creates a yawning chasm, or even perceptible billows upon the surface of the ground, is not needed for the destruction of lofty warehouses. It is well known that if a structure should vibrate long enough synchronously with the vibrations in the ground produced by an earthquake the danger would be great even from comparatively slight shocks. There are American architects who unite a good knowledge of mechanics and engineering with artistic taste; but there are also architects who trust to builders and so-called practical men for their foundations, framework, and sustaining walls, and devote their attention mainly to the decorative and artistic branch of their profession. These practical men rely upon existing conditions, are firm believers in the doctrine of continuity, and economize where only an earthquake will reveal their scrimping. There are many large and showy structures in our cities whose walls have cracked from defects in engineering, which have been covered up by architectural details. The architects should be the first to sound the alarm, and then the municipal authorities should be led to restrict the height of buildings on shaky foundations. They should be reminded that the earth's crust is very thin, and can be represented by the pencil-mark which outlines a nickel cent on a piece of paper, the enclosed circle representing the earth; and that this thin crust is all that has separated them from a very hot and probably tumultuous region. The earth has been very lenient to them in the past, but it may rise any day to claim its own.

—A parliamentary inquest into the attitude of the Catholic clergy towards the public schools in Belgium was lately ordered, and has revealed facts which are to be called surprising not with reference to the theory or the history of the Church, but to the age in which we live. Some of the sworn testimony just begun to be taken in February was commented on in a speech delivered in the lower House on Washington's birthday by Count Goblet d'Alviella, a Protestant member of the Left. The debate was upon that part of the budget which provided for the salaries of the clergy, and the Liberals, in view of the fanatical and tyrannical opposition of the priests to the common-school system, proposed that the pay of these disturbers of the peace should be diminished proportionally to their neglect of their proper duties. Passing over the priestly vituperation of everybody connected with or responsible for the non-Catholic schools, up to the Government and the King himself, the speaker showed that it is the rule to refuse the sacraments to pupils of these schools and their parents—to administer, the exception; that the first communion is, if not denied, evaded, even to the length of suppressing it; that absolution is refused not only to father and mother, but to grandparents, uncles, and aunts; that persons are excommunicated for merely boarding attendants at the public schools, or for visiting families whose children so attend. In one case the *conseil communal* was excommunicated to the fourth generation for appointing a schoolmistress objectionable to the curé. Baptism is threatened to be withheld from future infants. The last sacrament is withheld from dying parents as a means of forcing them to withdraw their children. Some atrocious cases of this sort were related by Count Goblet d'Alviella: "Le curé se promenait dans la chambre, frappant la table de son tricorne, lui disant qu'elle serait enterrée dans le trou aux chiens," etc. More revolting still are the counsels given to the wife in her sexual relations to her husband in order to force him to comply with the priest's demands; the instruction to the children to work upon the feelings of their parents by tears, or to disobey and defy them openly, to play truant, to refuse to learn at school, etc. These odious practices were proved by the testimony of the priests themselves. The curé of Virginal declared: "J'ai dit que c'était un moindre mal de tuer un homme que de voter pour un libéral, parce que le libéralisme est une hérésie." As a consequence, hitherto peaceful communes have been thrown into sad disorder, and there has been a marked falling off in the church attendance, although in many cases the clerical service has been ostentatiously increased—a significant fact for a state which salaries its clergy. Among the Walloons a spirit of independence and resistance is manifested which augurs ill for the growth of Catholicism in their cantons; but among the Flamands the subjection is almost complete. "I will ruin you," is the frequent menace of the priest to the recalcitrant, and all sorts of boycotting are resorted to to overcome those who stand out. In more than one case a man's business has been broken up by this policy. In short, if it were not for the name of the thing the Belgian Catholics might as well dispense with their "religion."

—Perhaps no living archæologist has the art of administering his learning so as to make it seem more succulent and less pill-like than Olivier Royet, supplementary professor in the College of France and auxiliary director of the Beaux-Arts School. Quantin's publication of the 'Monuments de l'art antique,' to a set of heliogravure plates which seem to reproduce the very substance of the originals, adds a set of notes by this author which are always fresh, popular, epigrammatic, yet which science accepts as in harmony with its researches. The work is to be completed in six parts, each containing fifteen folio illustrations, and it begins attractively with Tanagra figurines, the bronze dancers of Naples, and the lady Naï, gracefullest of Egyptian girl-figures. The perfection of the helio-process, whether applied to stained marble like the "Hercules drawing his bow," from the Carapanos collection, or the more archaic "Hercules and the Cretan bull," is satisfying beyond all that we have been accustomed to. In this work, for the first time, we obtain an authentic photographic representation of the Parthenon "Demeter and Kore," repeating the aspect of the original stained stone, not of a plaster. In the notice of this divinest of groups M. Royet permits himself to speak slightingly of the Athenian school of sculpture, declaring it inferior to the school of the Peloponnesus, to which, indeed, Phidias belonged; thus reminding us that the political stimulus of Pericles not only silenced the voice of rhapsodic poetry, but made Athens dependent upon provincial art. M. Quantin's publication is regularly received by Mr. Bouton, in this city.

—Méryon, supposed to be unapproached as an etcher of architectural *motifs*, has left successors, hardly inferior in breadth of style and in a kind of inspired tact in representing buildings both constructively and artistically, among the illustrators working under M. Sadoux's direction for 'La Renaissance en France' (Paris: Quantin; New York: Bouton). The work, to occupy thirty parts, begins most effectively with studies of the splendid Renaissance façades of châteaux in Artois, Picardy, and Flanders. The remaining provinces will follow in course, and the impact upon Gothic and Roman styles of rich Palladian luxury will be traced under influences widely differing according to latitude. The text is learnedly written by Léon Palustre, who seems to be a wide reader, for he alludes to Perkins's 'Italian Sculptors.' The work, though it promises to be stuffed with information for architects, is not a work of information only, but has the popular interest of a most suggestive study of style and decoration, with pregnant hints for everybody, while it incidentally suggests itself as the most persuasive guide-book for a tour in France that we have seen.

—On p. 217 of his newest publication, 'Sacred Polynesian Folklore' ('Die heilige Sage der Polynesier—Kosmogonie und Theogonie.' Leipzig: F. A. Brockhaus. 8vo, 302 pp. 1881), the traveller, Dr. Adolph Bastian, remarks that "One of the problems to be solved by ethnology is that of making psychology a natural science. We mean by this that in psychology the inductive method must become the leading mode of investigation. . . . The materials to serve as quarry-stones for the edifice of psychologic science must be furnished by ethnology. These quarry-stones will be the social, religious, and æsthetic ideas found among the various nations and races of the globe, but a critical selection of them can be made only after establishing standard rules for their adoption." To these principles Bastian has endeavored to give currency by a long series of publications, in which ethnographic material is presented by means of the comparative method. To illustrate one striking fact or idea he often adduces a dozen or more, gathered from the most diverse tribes, zones, and epochs, as parallels. In his work on America ('Die Culturländer des alten America') this method is, especially in the second volume, much abused, even to the point of obscurity. But in the volume on 'Polynesian Folklore' the author seems more intent upon presenting the results of mythologic studies made during a trip to these regions in 1879 and 1880, in his capacity as director of the Royal Museums at Berlin, than upon illustrating them by comparisons with other mythologic systems. While professing belief in the high importance of mythology (in its most ancient, undefiled shape) for ethnic research, he shows that, respecting some island-groups of that vast ocean called the South Sea, we have forfeited the chance of securing some of the links necessary for obtaining the full system of Polynesian cosmogony and theogony. However this may be, Dr. Bastian has certainly had the good fortune to obtain excellent information, and even mythologic texts in the native tongues, on the creation of the world, of the deities, of the plants and animate beings, from colonists, missionaries, and natives of New Zealand and Hawaii, which, we trust, will go far towards clearing up many of the mysteries of speculation indulged in by the gifted and thoughtful Polynesian race. The Hawaiian text of the Creation Myth, He Pule Haiau, fills not less than twenty-two pages, and candid students of Bastian's commentary upon it must admire this mental production of so-called "savages."

VON HOLST'S CONSTITUTIONAL HISTORY OF THE UNITED STATES.*

THE opinion so commonly expressed last year that the office of Vice-President is of very little account any way, and that it makes no matter who is nominated for it, receives an instructive commentary in the fact that the new volume of Von Holst's 'Constitutional History' has for its termini the administrations of two Vice-Presidents, accidentally raised to the Presidency. The administrations of Tyler and Fillmore mark the most important turning-points in our political history between "the era of good feeling" and the outbreak of the civil war. The one consummated the annexation of Texas, which first made slavery a leading question in our politics; the other was distinguished by the Compromise measures which made slavery *the* leading question. Nor was this a mere accident. The position of both Tyler and Fillmore upon political questions was largely conditioned by the fact that they were not elected to the office that they held; nobody knew or cared for their opinions while they were candidates, and the moral independence which might have resulted from this if they had been abler and stronger men was more than counterbalanced by the weakness and isolation of their political position.

Our history presents no other so sudden and radical change in political issues and party relations as that which took place during the administration of John Tyler. The campaign of 1840—so far as it was not made up of "Tippecanoe" and "log-cabin"—was a serious political contest of a genuine type, carried on upon economical questions of the most fundamental character: the tariff, the bank, the sub-treasury. In 1844 all was changed. These economical questions had been relegated to a secondary place, and the great issue of the election was the annexation of Texas—not a pure question of policy, the acquisition of so much territory and the augmentation of the national power in that degree, but at bottom a question of the extension of slavery. From that time, although the fact was not at once clearly apparent and acknowledged, slavery formed the paramount issue in our politics. But it must be noticed that it was *the extension of slavery* that thus became the leading issue. The *existence* of slavery in the States was a wholly different question, and one which under our political system could never be more than a moral issue. By the Abolitionists, not less than by the country at large, political action was regarded as possible only where the nation as such had direct authority—that is, in the District of Columbia and the Territories. It was upon this question, therefore, that the great controversy was waged for nearly twenty years, ending at last in war; a controversy complicated and embittered by the moral question of slavery in the States, but which in its successive phases—the annexation of Texas, the Wilmot Proviso, repeal of the Missouri Compromise, Squatter Sovereignty, even in a degree the Fugitive Slave Law—concerned itself with the right and duty of the nation to prohibit slavery in all places which were within its own jurisdiction.

This great contest fell into two distinct periods, divided by the passage of the Compromise measures of 1850. Hitherto the controversy had been in a certain sense masked, and the old parties, divided originally on economical and constitutional questions, took no decided and antagonistic stand upon the great question of slavery. All this time it was not difficult to forecast the position which they would eventually take upon the question of slavery in the Territories. This question was at bottom a question of the power of the national Government; and the Democratic party had always stood upon the doctrine that the national Government had no powers but what were explicitly granted by the organic law. Of course, therefore, the Democratic party was certain as a party to oppose the exercise of power in this regard by the general Government. Again, even when the issues were economical ones, the parties tended to divide by sectional lines. The Whig line of policy—tariff and bank—was identified with the great commercial and monetary interests, and these interests were all centred in the great cities of the North. Long before the period under consideration the war-cry of the Democrats had been opposition to banks and other corporations—hard money, free-trade, anti-monopoly. Naturally the South, having no large monetary interests, associated itself more and more with the Democratic party; this party could not afford, therefore, when the question of slavery became paramount, to cut loose from that section where it found its principal strength, and was forced both by its fundamental principle and its sectional affiliations, to oppose itself to the prohibition of slavery in the Territories. The Whig party, on the other hand, was incapable of espousing frankly and earnestly the cause of free soil. This issue was too far removed from the economical questions which were its primary concern to enlist its sympathies very heartily; moreover, it had a sufficient following in the South to make it unwilling to alienate that part of its supporters. What might have resulted if Webster had had Calhoun's earnestness of conviction and intensity of purpose, it is impossible to say. The Democratic party, allied with the South, had a leader and a programme; the Whig party had neither. No result, therefore, was possible but that which followed: the Southern Whigs one by one passed over to the Democratic party, which thus was converted more and more into an essentially Southern party; the majority of the Northern Whigs gathered about new leaders, with a new name, and a positive policy; while a few old Whigs in both sections, unwilling to join either of the two live parties, clung hopelessly to their old organization until it was overwhelmed in the storms of war.

Dr. von Holst's new volume narrates the first stage of this contest, extending from the annexation of Texas to the passage of the Compromise measures of 1850—the period when slavery was rapidly becoming the leading issue, but was not yet recognized as such; when contests were fought on false issues, leaders were blind to the signs of the times, and party names were fast losing their significance; a period of compromise and moral decline. The great Compromise of 1850 proved that compromise was no longer possible, and from that time there was a new spirit and earnestness in politics. But during the period before us the past was dead, and the new life had not yet begun. There was, it is true, a certain greatness in the history of these years. The three illustrious statesmen of the middle period of the republic were still in the strength of their powers, and their influence was still all-powerful; but they were disappointed men, and none of them, except Calhoun, understood or sympathized with the spirit of his time. They all passed from the stage at almost the same date—a date which nearly coincided with the close of this period, and were succeeded by men who, if less able and eloquent, were better fitted than they to do the work of their generation. In the character of the leaders, therefore, as well

* 'Verfassung und Demokratie der Vereinigten Staaten von Amerika. Von Dr. H. v. Holst, Professor an der Universität Freiburg i. B. I. Theil. Staatensouveränetät und Sklaverei. 3 Abtheilung: Von der Annexion von Texas bis zum Kompromiss von 1850. [Verfassungsgeschichte der Vereinigten Staaten von Amerika seit der Administration Jackson's. Zweiter Band.]' Berlin: Verlag von Julius Springer. 1881.

as in the character of the contest, the volume before us deals with a period which affords less to excite sympathy and engage the imagination than either that which precedes or that which follows. The author's strength lies in analysis; and the tangled politics of the period—the negotiations with Mexico and with England, the nominations of 1848, the Compromise movement and its triumph—all these are traced with great minuteness and clearness. But for personal character—one of his strongest points—this period affords little scope. Its great men have already been sufficiently characterized in the former volumes; the great men of the ten years which followed are not yet fairly upon the stage. We have, therefore, in this field only such comparatively secondary characters as Polk, Taylor, and Cassius M. Clay—men whose individuality was of great consequence in their own generation, and who are admirably sketched here, but whose influence and importance were very transient. On the other hand, the events which really stirred the emotions, and excited the interest of a genuine contest, the events which are seen now to have been the precursors of the mighty struggle which was coming, are not those in which Dr. von Holst is at his best. That part of history which appeals to the imagination does not come within the range of his highest powers. He by no means neglects the heroic contest carried on by Adams, Giddings, and Hale; the long struggle for the election of Speaker, when New England was "ahevin' the honor of a chance at the Speakership showered upon her"; and, above all, the great debate of 1850, one of the most impassioned and momentous in our history. Still he treats it analytically rather than concretely, as, we may say, an Anglo-Saxon historian would do. What we mean will be best expressed by saying that the student will learn from this volume the events of these years, the characters and motives of the leading men, the intrigues of both politics and diplomacy; but that if he would enter into the spirit of the times he must supplement it with the 'Biglow Papers.' It may be said that this is a constitutional, not a political, history. Very true; and yet one of its titles is "Verfassung und Demokratie." And we all know how much more real insight into the English Constitution one gets from Mr. Bagehot's book than from, for instance, Mr. May's. Mr. May's is simply descriptive and analytic, Mr. Bagehot employs the imagination as well as the intellect. The truth is, we cannot expect all qualities in one writer. In analysis of character, institutions, and events Dr. von Holst ranks far above writers like Mr. May; and all we have asked is that his book should be *supplemented* by the vivid picture which he does not aim to give.

This volume consists of seventeen chapters, and is devoted in the main to the three great series of events which distinguished these six years—the Mexican War, the settlement of the Northwestern boundary, and the Compromise of 1850. The Oregon question, the least familiar of all here discussed, receives a masterly and exhaustive treatment. Even this was not disconnected with the slavery question, far as Oregon seemed to be from the actual slave territory; and the demeanor of the Administration towards its two antagonists is well expressed in the sub-titles of the two chapters—"Towards strong England, a warlike policy with the sword hung upon the wall," "Towards weak Mexico, a policy of peace with the drawn sword." And, of course, many questions and events not directly connected with either of the three specified are handled incidentally—the "spoils" system and the theories of radical democracy, Mr. Hoar's mission to South Carolina, the tariff of 1846, etc. It need not be said that the tone is throughout that of a sympathizer with the North. The arrogance and perfidy that marked the treatment of Mexico are well shown up; and Dr. von Holst throws upon General Taylor a part of the responsibility for this, in his first aggressive acts (p. 189). Indeed, he does not give General Taylor as much credit as is usual for simplicity of character and blunt independence; he was early seized, he thinks, by the Presidential fever, and readily allowed the politicians to use his name, even if he never suffered himself to be warped from his honesty of purpose. For Seward he expresses high admiration, and says that his utterance, at this juncture, of the claims of the "higher law" "would alone have been enough to engrave his name for ever upon the tables of American history" (p. 403).

We are glad to see that the deficiency of the former volumes in helps to the reader are amply remedied in this. There is an elaborate table of contents, referring to the substance of every chapter, page by page; and the eye is further assisted by headings to the pages. The publisher promises a complete index to the work when finished.

REED'S JAPAN.*

IF Mr. Reed's narrative and compilation may be called 'Beaten Tracks in Japan,' it is none the less fresh in flavor and unhackneyed in style. Miss Bird journeyed painfully in the valleys, and hence took low views of the "Land of the Gods." The member of Parliament abroad in Japan breathed the air of the mountain-tops and sea-shore, and seems to take wide and lofty views of everything within his ken. It is rather amusing to find him saying of a previous work on Japan that "the key in which Mr. —— has pitched his work is likewise somewhat too high for pleasant perusal in our country" (England), and then to discover that he has himself caught the infection of admiration. He not only praises most things Japanese, but seems bound to protect, maintain, and defend the ideas of New Japan before the world. His strictures on British diplomatic policy in Tōkiō, and his advocacy of the Japanese side of many questions, have already provoked long and loud disapproval from the clubs and newspapers of Yokohama. It is but simple fact to state, by way of enlightenment, that the mainspring of British policy at the Mikado's Foreign Office lies in the hongs of the port, and commercial necessity is apt to override abstract ideas of justice. The trader exiled from home and consumed with the desire to make his fortune quickly and then go back to live within theatre-train distance of London, is able to bring a strong pressure upon his minister and consul while on heathen soil. It is rare that even a British "visiting statesman" is able to take a view of the situation above that of the commercial conscience.

Having designed for the Japanese Government three iron-clad vessels of war, and being invited by their admirals and cabinet officers to come out and see their country, the ex-naval constructor may have gratefully accepted the loan of the spectacles offered to him in Tōkiō. As he travelled in the richest and most interesting portions of the Empire, the panorama left on his mind is strikingly different in outline and color from that of Miss Bird's. He arrived on the soil January 10, 1879, and left, so at least we gather, in March, 1880. He had no idea of writing a book, but his experience as editor of the *Mechanic's Magazine*, and as a writer on naval architecture, has made composition habitual and facile. We find him writing verses on the scenery even while bowling over the rough roads in a *jin-riki-sha*, or swinging in the *kago*. Even in the chapters devoted to religion and history he shows the animal spirits and the intellectual zest of a man in the prime of life accustomed to look at things in a practical light. He handles questions in an easy, off-hand way which the casual reader will certainly enjoy, though it may startle the plodding scholar. Plain people, looking at the subject in hand without glasses, and in the light of common day, will be apt to say that the secret of Mr. Reed's general accuracy lies in the fact that his chambers in London are not very distant from the Japanese Legation. They may even add that the young diplomatists there have taken great interest in the work as a campaign document in the contest concerning treaty revision now going on. His excellent plea for the full recognition of the sovereign rights of Japan, and her treatment on terms of absolute equality by treaty Powers, would have far more weight if uttered by one in no way indebted to or directly influenced by the Japanese officials. There is no doubt, however, of the justness of the claim of Japan to be treated as an equal in the diplomacy of Christendom, and not as a conquered tributary or semi-barbarous state. The adherence by our Government at Washington to the old policy of diplomatic solidarity in Tōkiō, making the binding force of a treaty to rest upon the consent of European nations, seems to us anomalous and anti-American. One would suppose, after the iniquitous concert of the United States with the three European Powers at Shimonoséki in 1864, and the subsequent extortion of an "indemnity"—ridiculous by its very exaggeration—that the folly of diplomatic solidarity would have been demonstrated, and the absurd tradition abandoned. Mr. Reed faithfully shows that the supreme object of the embassy that compassed the globe in vain in 1872 was to secure the withdrawal of the obnoxious extra-territoriality clause. Their failure was utter, and all the subordinate advantages gained by studying western civilization at home scarcely sufficed to coat the bitter pill. The fruits of their experience and observations have just been published in Tōkiō, but their hope of governing foreigners in Japan has not yet been realized. Consular judges and the legations in the capital can snap their fingers at Japanese laws and customs, break the quarantine, and keep the tariff to suit themselves.

Following out the method of the American work which he seems to have made his model, Mr. Reed divides his work into two parts; the first treating of the history of Japan, and the second of his personal experiences in the country. After an introductory chapter on "The Land and its Inhabitants" and another on "The God-period," he discusses "The Shinto Religion." Here, like most writers off the soil, he is wise above what is written, and dogmatic beyond what is formulated by the Shinto revivalists themselves. He has misunderstood Mr. Ernest Satow in his translation of the opening sentence of the Kojiki, or Shinto 'Bible'—"In the beginning, neither heaven, nor earth, nor the sun, *nor anything else* existed." The italics are Mr. Reed's, who attempts to prove that, to the Japanese mind, a Supreme Creator first had being, and originated all things. So far from this, the text and context of the Kojiki show that the phrase, "nor anything else," refers to visible, familiar objects. The profoundly metaphysical idea of infinite space is unknown to the ancient Japanese writings. That the Kojiki teaches, as Mr. Reed asserts, "there existed in the beginning one god, and nobody and nothing besides," before chaos or earth or heaven came into being, the simple reading of the Kojiki's opening sentence will show to be a fancy. That matter came into existence first, and deity afterwards, is the simple and per-

* 'Japan: Its History, Traditions, and Religions. By Sir Edward J. Reed, K C.B., F.R.S., M.P.' 2 vols. 8vo. London: John Murray.

spicuous teaching both of the Kojiki and the Nihongi—the former containing the pure native traditions, composed A.D. 712; the latter having the same matter but expressed in the forms of Chinese philosophy, and written in 720 A.D. "The grand conception of the Great First Cause," of which Mr. Reed speaks (Introd. p. xxix.), exists nowhere in the Kojiki. To thrust a Hebraism into the Japanese Scriptures savors of the license of a Fifth Monarchy man. In his idea of the "generation of solid lands by the rotary motion in the fluid mass of matter," Mr. Reed is mixing up text and commentary in a very free way. Hirata, a native critic well acquainted with European notions of geography, which he learned from the Dutch, at Nagasaki, during the last century, did suggest that the plunging of the spear of Izanagi into the turbid waters of chaos was the origin of the daily revolution of the earth. This, however, was a millennium or more after the ancient texts were written, in which nothing is said about rotary motion. It is rather surprising to find a Briton roving with such desolate freedom in the rarefied air of antiquity. Humbert, the Swiss writer, takes similar liberties; but he correctly puts matter first in the Japanese scheme of creation, and mind or deity second. The paper "On Infinite Vision," largely utilized by Mr. Reed, is by Captain J. M. James, who is not "an English gentleman," but an American, formerly professor at West Point.

Besides chapters on art, literature, language, and religions, we find the history of Japan faithfully sketched and brought down to within a twelvemonth. The author has used the translations and notes of foreign and native scholars very judicially, and the composition of these two handsome volumes within the space of a few months shows remarkable industry. He gratefully acknowledges his authorities, one work, 'The Mikado's Empire,' receiving the honor of no less than sixty-three quotations. In the second volume Mr. Reed takes us with him in a rapid journey to Nagasaki and the Inland Sea, Ozaka, Nara, Kiōto, the Isé shrines, Nagoya, Shidzuoka, and the Hakoné mountains. He tells us just enough of himself to enliven our interest, while he not only points out the present beauty of the landscape, but casts on it the light of past history. To us the special charm of the book lies in just this. The scenery of Japan is wondrously fascinating to the student of her history. Every battle-field, castle, lake and sea-shore, mountain and temple, is mnemonic. Mr. Reed has helped to do for Japan what, in a greater way, Farrar has done for Palestine and Lossing for our own country. Mr. Reed appreciates the beauty of the women and the courtesy of all classes, seeing on the edge of everything, even the discomfort of travel, a prismatic gleam. He travelled in winter—the time of clothing. Miss Bird saw the people in summer, when clothing is scant. He has the *sense* of the interesting, and there are few dull pages in his itinerary.

As a piece of book-making, the mechanical execution of the work is all that could be desired. The illustrations are especially fine, from photographs or sketches drawn on the spot, except eight full-page drawings from Hokusai, which were engraved, as they ought to have been, by natives in Japan. To study them carefully is to receive a good insight into Japanese art. The comparative table of Japanese and African words given in the Appendix, designed to illustrate the theory of the descent of the Japanese from a Turano-African race, shows much industry and misdirected energy. In the list of "Japanese" roots—evidently compiled from no uniform source—are a number of words of purely Chinese origin, and others so badly spelled and miswritten as to make all analogies based on them misleading. The list is made out by Mr. Hyde Clark. The theory is indeed "novel and far-reaching," but too nebulous at present to shed any light on a deeply interesting subject. It may be safely said that Reed's 'Japan' is the best book on the subject yet written by an Englishman, and is far more truly a history than that, so-called, of Mr. F. O. Adams, which narrates chiefly the British naval and diplomatic relations with the Tycoon and the Mikado.

COPPÉE'S CONQUEST OF SPAIN.*

CONTEMPORANEOUSLY with the decline of Mohammedan political power there has been going on a change in the attitude of European literature towards the Mohammedan religion and its founder. When Sale published his translation of the Koran (1734) he was accused of being a Mohammedan in disguise, because he did not consider it necessary to represent the author of that work as an incarnation of imposture, cruelty, and sin. But as men's fears have diminished so has their hatred. Works relating to the history of Mohammedan nations are becoming both more instructive and more attractive. This is especially true of Professor Coppée's book. It will be read with pleasure from beginning to end. In his preface Mr. Coppée gives a short account of the authorities upon which he has relied. By far the most important of these is a translation made by Don Pascual de Gayangos, published in 1843 by the "Oriental Translation Fund," of an Arabic writer, Al Makkari, who compiled from other Arabic writers a history of the Mohammedan dynasties in Spain. Mr. Coppée says he is more indebted to the voluminous notes of the translator than to the work itself, but careful examination reveals so much reliance upon the Arabic author that it would not, perhaps, have been out of place to mention that he was an African Arab, who compiled his work at Cairo about 1630, or nine hundred years after the principal events of the conquest of Spain.

Mr. Coppée's work is divided into ten books. The first sketches the history of Mohammedanism from its origin to the invasion of Spain, and gives a very clear and satisfactory account of the causes which led to that event. The second book treats of the history of Spain previous to the conquest. The successive invasions of the Romans and of the northern barbarians, Huns, Alans, Suevi, Vandals, and Goths, are disposed of in the first chapter. Though necessarily a mere outline, and, as the author says, presenting only well-known facts, it is one of his best pieces of literary workmanship. When the Goths came they came to stay, and the remaining chapters of the book give the history of the Gothic kingdom of Spain, and depict its condition when the Arab-Moors, urged by religious zeal and tempted by stories of its wealth and its weakness, swooped down to its destruction. The next five books comprise the history proper of the conquest, covering the period from A.D. 711, when the Arabs crossed the Straits of Gibraltar, to the death of Abdu-r-rahman I., in 788, when the Moslem power was fully established. From this point Mr. Coppée gives, in Book viii., a sketch of the history until the final extinction of the Moslem power by Ferdinand and Isabella in 1492. It was during this period, at the close of the reign of Alhakem II., in 976, that Spain became the most populous, the richest, and the most enlightened country in Europe, and Cordova the most magnificent capital in the world. The ninth and tenth books treat of the civilization and intellectual culture and achievements of the Arab-Moors.

Even some of those points in which we find this work defective as a history increase the charm of its perusal. The critic will shake his head over many of the details of the stories of *El Cid Campeador* and the "Dolorous Rout of Roncesvalles"; but they have been told so long and believed by so many that an acquaintance with them has almost become part of a liberal education, and Mr. Coppée repeats them with a confidence and an enthusiasm which will no doubt infect many of his readers. He never likes to reject a good story because the evidence in support of it is weak. If some of its incidents are absurd or impossible, he endeavors by ingenious reasoning to put it in such shape that it is possibly true and certainly interesting. But the process has sometimes too close a resemblance to that of the historical novel. It is the picturesqueness more than the importance of an event upon which he loves to linger. The philosophical reflections are often rather commonplace. We are, for example, reminded in varying phrases a little too frequently that history repeats itself. The elaborate chapter in which the author attempts to refute Gibbon's opinion as to what might have happened had the Mohammedans defeated Charles Martel, seems to us to occupy space which might have been better employed, notwithstanding Mr. Coppée's efforts to justify its insertion. There is, to our mind, a general tendency to diffuseness which savors of magazine-writing. We can only refer to a few matters of detail. On p. 2, vol. i., we read:

"On Friday, the 16th of July, A.D. 622, Mohammed . . . fled from Mecca . . . he arrived at the city called Yathreb. . . . It was also on Friday, two weeks later, that he entered this protecting town. From the former day, called el Hijrah, or the emigration, the Mohammedans date the beginning of their calendar. From the coincidence of the two they established that day of the week, Friday, as Yawn (Yawm?) el joma, the day of assembly for prayer."

Mr. Coppée cites a note to chap. lxii. of Sale's Koran which falls far short of justifying his statements. It would be possible to cite a great number of manuals, dictionaries, cyclopædias, etc., which state the same thing. Even Gibbon in his text seems to regard the Hijrah and the commencement of the Mohammedan era as coincident, but he corrects the false impression in a note. The era commences, as Mr. Coppée states, on Friday, July 16, 622, that day being, in that year, the first of the Arabian month Moharram. But Mohammed did not leave Mecca nor did he arrive at Yathreb (Medina) on that day. Silvestre de Sacy says that he left Mecca on the 8th of Rabi 1 (Monday, September 20), and arrived at Medina on Tuesday, the 16th of the same month (Tuesday, September 28). But other Oriental scholars place the date of the departure from Mecca a week earlier, viz., the 1st of Rabi 1 (Monday, Sept. 13). The Khalif Omar fixed the year in which the Hijrah occurred as the first year of the Mohammedan era. In other respects he left the calendar unchanged.

Mr. Coppée repeats the story of the burning of the Alexandrian Library (vol. i. p. 52). Gibbon supposed he had exploded it, one among his many reasons being that it was first mentioned by Abulpharagius, a writer who lived more than six hundred years after the event. Dean Milman, whom Mr. Coppée refers to as his authority, attempted to revivify the story by mentioning four other Arabic writers who told the tale. He gives the names but not the dates of these writers. Three of them lived long after Abulphara-

* 'History of the Conquest of Spain by the Arab-Moors. With a sketch of the Civilization which they achieved and imparted to Europe. By Henry Coppée.' Boston: Little, Brown & Co. 1881. 2 vols. 8vo, pp. xxxiii.-455, 496.

gius; the remaining one, Abdollatiph, died after Abulpharagius was born, and very likely the latter copied from the former. The four do not increase the credibility of the story. We believe it has been kept alive by the barbaric sententiousness of the order which the Khalif is said to have given for the destruction of the library: "If these writings of the Greeks agree with the Koran, they are useless and need not be preserved; if they disagree, they are pernicious and ought to be destroyed." We are inclined to agree with the laconic judgment pronounced by Schlosser, the learned Professor of History at Heidelberg: "Die ganze Erzählung ist ein Märchen."

In relating the history of Musa, the chief commander of the Mohammedans of Africa when Spain was invaded, Mr. Coppée tells with what skill he conciliated the barbarous tribes, by assuring them that they were of the same race as the Arabs and "were destined to have a glorious share in the victorious fortunes of their brethren from the East." This was not a stroke of policy on the part of Musa; he believed in the prediction. It had been current among the Mohammedans for more than half a century. It originated with the Khalif Omar, who said that he had heard it from Mohammed himself.

At the time of the invasion, Ceuta, on the African side of the Straits of Gibraltar, was still in possession of the Goths under the command of a Count Ilyan. It is related that his daughter Florinda had fallen a victim to the arts or the violence of Roderick, the Gothic king. Partly from revenge and partly from political motives Ilyan turned traitor. The story labors under every sort of historical difficulty. Mr. Coppée devotes a great deal of space to investing it with a plausibility. Of Ilyan he says (vol. i. p. 86): "He appears to us in many and vague shapes. . . . The Ilyan of history is the resultant of many Ilyans as presented by the reason or fancy of the writers who have undertaken to present his likeness." And again (*ib.* p. 225): "Let me call attention, finally, to the mists that envelop the personality and the authority of Ilyan himself. We can only dimly discern him as a distinct character. . . ." Yet this dim and shadowy form, whose very existence the critical historian might not unreasonably doubt, plays one of the most important parts in Mr. Coppée's narration of the invasion. Ilyan at the critical moment makes his treasonable overtures to Musa. They come to the latter "like a miraculous answer to his prayers." Ilyan makes a preliminary invasion, and comes back laden with plunder to tempt the greed of the Arab. Ilyan guides the Arabs across the Straits of Gibraltar; he conducts them through the passes; he cunningly manages that the Gothic king, Roderick, shall be in northern Spain when the invasion takes place; he brings reinforcements to the Arabs before the great battle which decides the fate of Roderick and his kingdom. We submit that it does not render the picture entirely truthful to write under one of its most important figures, "perhaps this ought to be omitted."

In the opening chapter of Book ix. Mr. Coppée returns to the Eastern khalifs, more especially Haroun Alraschid. He says Haroun succeeded the Khalif Al Hadi, his cousin, in 786. Haroun was not the cousin but the half-brother of Al Hadi. Both were sons of the Khalif Al Mahdi. Mr. Coppée says Haroun sent presents to Charlemagne "which astonished the Western world by their value, their rarity, and the ingenuity displayed in their construction." Among them was "a linen tent of such fineness of texture that it could be folded into a very small compass, and yet when pitched it rose so high in air that an arrow shot by the strongest arm could not pass over its summit." This is manifestly only another version of the story of the pavilion which the fairy Pari Banou, in the "Arabian Nights," sent to the Sultan of India. Indeed, in regard to this whole story Professor Palmer in his recent life of Haroun Alraschid says: "I am afraid it must be relegated to the ever-increasing category of exploded popular errors."

In his chapter on the Arabic language we think Mr. Coppée is inclined to exaggerate its influence upon the Spanish. We can notice only a single point; he says (vol. ii. p. 343): "To the Arabic the Spanish language certainly owes its syllabic accent." On the contrary, the Spanish probably owes its accent in the great majority of cases to the source of most of its characteristics, the Latin. No direct relationship has been satisfactorily shown to exist between the Latin and the Arabic, yet it so happens that the rules of accent in the two languages are exactly the same. They might be transferred from the grammar of either language to that of the other without altering a word. Where the accent in Spanish seems inconsistent with the genius of the Latin language it can be shown to arise from causes quite independent of Arabic influence. Of course this remark does not apply to adopted Arabian words, the number of which, however, is much smaller than is usually supposed.

The American Code of Manners. A study of the usages, laws, and observances which govern intercourse in the best social circles, and of the principles which underlie them. Reprinted from *Andrews's American Queen.* (New York: W. R. Andrews.)—It appears from the preface of this little manual of good breeding that the editor of the *American Queen* has been for some time "the recipient of innumerable letters," the writers of which have begged him "to enlighten them as to some vexed questions of etiquette." These letters show how widespread is the interest in the subject, for they come from "young ladies," from "young housekeepers," from "young men rising in the world" and "beginning to aspire toward that knowledge of society from which they have been debarred by a youth of industry," from "elderly people" whose children are to be introduced to polite society—in fact, from all classes and conditions of people thirsting for instruction on the great subject of manners. In order to answer them collectively Mr. Andrews wrote a series of articles, which are now incorporated into this book, covering the whole ground. The author divides books of etiquette into three classes: first, those written by people who either know nothing of society or "have only been permitted a glimpse of its coarser manifestations at a watering-place"; second, by those who seek by publications of this kind to gratify a feeling of revenge arising from anger at not having been admitted to society; and third, those written by people who know so much of society that they "forget the steps by which they have risen." According to our experience most books of the kind come under the first head, and the author has certainly omitted a very large class of books which, though they do not profess to teach good etiquette, often throw a strong light on the subject of breeding —that is to say, tourists' books giving accounts of the manners prevalent in foreign countries, English descriptions of the manners prevailing in America and American descriptions of English manners, French accounts of German etiquette and German reflections upon French society. These are not only valuable for the purposes avowed by the author but often because they throw a reflected light upon the manners and breeding of the observer himself. The author further insists that no book of etiquette, even when written by an expert, can be perfect, for, as he says, etiquette is "cumulative, changeful, and uncertain"; but we may make some approach to this. The fundamental rule which he insists upon throughout is that the forgetfulness of self and the recognition of the rights of others are the basis of all true politeness; but any one who looks through his treatise with a view to qualify himself to perform his part in society will find that this moral ground is after all insufficient to furnish a correct guide in matters of detail.

To turn at once to the body of the book, it will be found full of the most valuable information upon points of the most abstruse character. There is no subject which has so deeply engaged the attention of thoughtful persons in the field of enquiry covered by our author as the matters discussed in the seventh chapter: "Who should bow first? Who should speak first? Who should call first?" The author thinks that "we are on a sliding-scale in America. No one knows with thorough exactitude where he stands socially, as every one may from the humblest position rise to the very highest. Therefore, if a person have assumption, arrogance, pretension, he may assume to be a great personage, and may by his manner hurt the feelings of some other humbler person. We call such a person a snob, and he deserves the odious name." It follows from this that to assume an air of lofty disdain and to affect not to know people whom we know perfectly well is a snobbish and vulgar thing. This paves the way for the consideration of the important point, which is: "Who should bow first." Some authorities insist that a gentleman should not bow to a lady until she bows to him; the author says that this is all wrong: "A gentleman should always bow first to a lady, no matter whether she returns it or not; if he sees by her face that she does not wish to return it he can refrain from bowing the next time." This is on the ground that "a lady, particularly an elderly one and a society leader, perhaps, has so many acquaintances that she does not remember all the young men who have been presented." This, however, does not seem to settle the question conclusively, for it may be that the young man has quite as many acquaintances as the lady, even if an elderly one. He may himself, too, very likely be a society leader; in fact, a very large number of the leaders of society at the present time are of what would have been considered fifty years ago a comparatively immature age. Our own opinion is, and it has been arrived at after long reflection, that both persons should bow simultaneously; perhaps in the case of very near-sighted persons a little latitude might be given, providing the fact of myopia can be clearly proved by medical evidence. There is, however, always danger in these exceptions to social rules, and therefore it may be safer for near-sighted persons to bow in all cases of doubt, accustoming themselves to do this with uniform courtesy whether they are themselves recognized or not. With regard to calling first our author says: "The etiquette in Washington is very definite; the latest comer calls first," and he adds: "It is a thousand pities that this is not the custom in every town, it would simplify matters so much." This again we think is open to criticism; the reason why the latest comer calls first in Washington is because society there is based to a great extent upon official receptions, and it cannot be expected that the President of the United States, the heads of Departments, the judges of the Supreme Court, the senators and representatives, should all be going around examining the hotel registers to see who are the last comers. This would take too much time from their official duties and involve the business of government in confu-

sion. In New York, the author says, "it is the fashion for the oldest residents to make the first advances," although at the present time "new people, if they choose, send their card for a tea or reception, and await the action of the social leader whose acquaintance is thus gracefully solicited." He does not point out, however, how the new people are to ascertain who the social leader is "whose acquaintance is thus gracefully solicited," but he or she can probably always be identified by an examination of a file of the daily papers, which now devote so much of their space to "society news." As to speaking first, the author criticises the habit of American ladies of refusing to speak to one another without an introduction, and declares that they even "gaze at each other as if they belonged to hostile tribes of Indians" (p. 99).

We get on still more difficult ground when we come to the code prescribed for the hostess. She, it seems, ought to introduce her young guests to one another "if she sees shyness or true humility" on their faces (p. 100); on the other hand, "it is not etiquette for her to introduce two New York ladies to each other if they are in such a position that they might possibly know each other and yet do not." Whether this would still be the true rule if "shyness or true humility" appeared on their faces, we are not told. The author next proceeds to give some valuable hints on the delicate matter of cutting acquaintances. Everybody who has considered the subject must have observed that a great deal of trouble arises in cases of cuts from the act being performed in a slovenly and timid manner, by looking away, or by pretending to be interested in some passing object, so that the person who is cut remains in complete ignorance of the fact. The author insists that all cutting should be "done promptly and peremptorily. Look the offender in the face and recognize her fully, but do not bow." This, of course, is intended for the guidance of ladies. Gentlemen who should adopt this plan toward ladies would probably get into serious trouble. The chapter contains many useful little hints on other matters not directly connected with bowing or cutting; for instance, Mr. Andrews advises that in cases of prolonged illness the patient should often be enquired after and a card left on which the visitor may write "kind enquiries" or "sympathy," as he pleases (p. 104). We suppose, however, that he is not confined to these two methods of expressing his interest, but may put on his card a great variety of other matter, provided it be not ribald or scurrilous. Again, if a gentleman expresses a desire to be introduced to a lady she should say "Thank you," and "show pleasure as he advances." How much pleasure she ought to exhibit is not stated; this would depend probably upon the appearance of the gentleman and the length of the interval during which the lady has been left to herself. We cannot agree with the author's opinion that she "need not know him again if he does not please her." A lady who should make a habit of permitting gentlemen to be introduced to her and "show pleasure as they advance," and afterwards cut them whenever she chose, would, we fear, not produce a pleasant impression in general society.

Across Patagonia. By Lady Florence Dixie. With illustrations from sketches by Julius Beerbohm. 12mo, pp. xv.–251. (New York: R. Worthington. 1881.)—Some thirty voyagers and tourists, since Magellan's visit in 1520, have been to Patagonia and returned to write books about it. John Byron's 'Narrative of Sufferings' (London, 1768—in the poet's phrase, "my grand-dad's narrative") remains, unless we except Guinnard's 'Trois ans d'esclavage chez les Patagons' (Paris, 1864), the most interesting book upon the list, as D'Orbigny's and Darwin's works are the most important contributions to our knowledge of the country. Lady Florence Dixie's book is an interesting but not an important narrative. We have seldom read a book of travel in which so few accurate data of any kind are given: the author does not even date the term of her visit to Patagonia; but she was *en route* on the first of January, 1879, and if there is no error in the terms of the dedication (to the Prince of Wales) she spent six months of that year upon what she calls "unexplored and untrodden ground." This is not quite a correct description of her route, which for long distances followed old, though certainly unfrequented, tracks; nor is the title of her book more accurate. Lady Florence did not cross Patagonia, though her party made its way far into the interior. The party included her two brothers, her husband, and Mr. Julius Beerbohm, whose 'Wanderings in Patagonia' have been noticed in the *Nation* (No. 724), and whose sketches, from which the present work has been illustrated, form not the least valuable part of it. The narrative is little more than that of a hunting expedition. On leaving Sandy Point for the interior the cavalcade, including four guides and one English servant, numbered nine persons, besides thirteen pack-horses laden with provisions and ammunition and nine hunting-dogs. Leaving the Straits some time in January, this well-provided company penetrated the country to the northwest as far as the Cordilleras, which put a barrier to their explorations, supporting themselves meanwhile, in large part, by the chase of ostriches, guanacos, and small game of many kinds, but also, whether for food or play, letting few wild creatures escape that they could destroy. Lady Florence herself, accustomed to ride to the hounds at home, was an eager and a rather cruel huntress in Patagonia. In one instance, having shot an animal that was too ignorant to run away, one of the dark "golden deer" of the Cordilleras, who "eyed her with extreme astonishment," she confesses regret for "the loss of that innocent and trusting life, which had hitherto remained in ignorance of the annihilating propensities of man." For the most part the characters presented in this book are those of merciless hunters and hard riders—a well-equipped and typical English party, who went to Patagonia wholly for their own pleasure and for the destruction of the Patagonian fauna. Of course we shall not look for much information at the hands of their historian. Much might have been given, had giving it been an object, as the party explored regions which no English traveller had ever reached before, but we can only refer to Lady Florence's observations on the Tehuelche Indians, the tribe which, through Magellan's report of them, has given to Patagonians in general the name of giants. They are actually the tallest race of men that have been measured, Topinard estimating their average height at 1.78 metres (5.84 feet).

Goethe-Jahrbuch. Herausgegeben von Dr. Ludwig Geiger. Erster Band. (Frankfurt-am-Main: Literarische Anstalt. 1880.)—The mere appearance of a Goethe-annual is of itself an event in literary history. It ought to bring home to many of our readers a truth which we have persistently striven to inculcate, namely, that Goethe's star in Germany is completely in the ascendant. We are removed from him only by a generation or two; there are men still living who saw him or might have seen him in his last years. Yet already the mass of Goethe-literature grows so fast that the demand for some central organ is imperative. The editor, Dr. Geiger, evidently does not regard this first volume as a fair specimen of what the periodical is ultimately to be, and, as we glance over the list of contributors, we observe that more than one eminent name is conspicuous by its absence. This was doubtless to be expected. There are in every land scholars and writers, among the best in their line, who can never be induced to participate in a new enterprise until it has actually taken shape. But they will come forward in time, and there are other contributors only too ready with their offerings. We think that some of the pieces in this volume might be missed without any serious loss—*e.g.*, Bobertag's forty-page disquisition on 'Faust und Helena.' Goethe-criticism can profit little by fine-spun subtleties. But time will rectify all these inequalities and make the periodical a store-house of the best, and only the best.

In general we judge the subdivision of contents to be too complicated. There are four subdivisions: 1, *Abhandlungen;* 2, *Forschungen;* 3, *Neue Mittheilungen;* 4, *Miscellen, Chronik, Bibliographie.* The *Miscellen* can be arranged under the *Forschungen* or under the *Neue Mittheilungen.* And the so-called *Chronik* consists of little more than *Miscellen.* There is need of only three general subdivisions: *Abhandlungen,* or essays upon Goethe; *Forschungen,* or researches into obscure points in his life or the sources of his writings; *Neue Mittheilungen,* or newly-discovered letters by or to him. The annual Bibliography must, of course, stand by itself.

Herman Grimm's essay on Bettina von Arnim deserves its place of honor as the leading article. Although not upon the poet himself, it is upon one who stood very near to the poet and influenced him directly. It is well written, and gives a clear, sober-tinted picture of a most interesting character. Biedermann's statement of the personal relations between Lessing and Goethe will not be very welcome, we suspect, to the unflinching admirers of Lessing. It shows that the elder poet was somewhat tainted with envy and personal malice. After the lapse of a century we can afford to close our eyes to the defects of a Lessing, but it is only fair to Goethe to echo Biedermann's conclusion, that if the connection did not end in an explosion it was due to Goethe's kindliness and freedom from envy. The remaining contents are too much in the line of detail-study to warrant us in dwelling upon them. Either they discuss debatable points in Goethe's authorship, or they are gleanings of correspondence and contemporary allusions. They all have their value, which we should be the last to ignore; but they are, at best, only materials for literature. In conclusion we congratulate the friends of Goethe on both sides the water on the timely appearance of the *Jahrbuch.* It is an undertaking the results of which will be far-reaching and permanent.

The Atomic Theory. By A. D. Wurtz. [International Scientific Series.] (New York: D. Appleton & Co. 1881.)—We do not know where a better exposition of the atomic theory, from the purely chemical side, can be found than that which is presented by Wurtz. The physical side of the subject, however, is imperfectly given, and the importance of the study of thermodynamic relations in the theory of molecules and atoms is not insisted upon. This omission is especially noteworthy in connection with the name of Berthelot, who, in his work entitled 'Essai de Mécanique chimique fondée sur la Thermo-chimie,' has made some of the most striking generalizations in modern chemistry. The doctrine of the equivalence between work and heat, and the wide-spread relations of physics to chemistry, are subordinate in the mind of the author to the curious relations produced by the combination of

atoms—relations which are undoubtedly the expression of physical laws, but which should be studied from the higher standpoint of the transformations of potential energy into kinetic energy and the reverse. The law of Dulong and Petit, which states that the products of the atomic weights of elements by their specific heats are equal to a constant quantity, is placed upon the same footing as the thermodynamic laws of Ampère and Avogadro; but it is well known that the specific heats of substances vary with the temperature, and have rarely been determined with that exactness which is required when numbers and coincidences of numbers are made the basis of a theory. The student will find in this treatise a very good exposition of Mendelezheff's "periodic law" and of the doctrine of valency.

It is perhaps too soon to ask for a philosophical treatise on atoms and molecules. A physicist is cramped by his want of knowledge of the immense number of facts in chemistry, and most chemists are handicapped by their ignorance of the great subject of thermodynamics. Yet the writer on the atomic theories of the future must be both a physicist and a chemist. Any treatise on the atomic theory at the present time, it is true, must give the study of various combinations and permutations which have characterized chemistry; it must not fail to describe at length the wonderful scaffolding which organic chemistry has reared. On the other hand, the philosophical writer must call attention to the great laws of the transformation of energy, and lead the reader to regard a long series of coincidences as indicative not of diagrams or maps of atoms but of the change and interchange of their potential and kinetic energy. This philosophical treatment is not characteristic of the treatise of Wurtz.

A History of England under the Anglo-Saxon Kings. Translated from the German of J. M. Lappenberg, F.S.A., formerly keeper of the archives of the city of Hamburg, by the late Benjamin Thorpe, F.S.A., Editor of the 'Anglo-Saxon Chronicle,' 'Ancient Laws and Institutes of England,' etc. New edition, revised by E. C. Otté. In two volumes. (London: George Bell & Sons. 1881.)—As Dr. Lappenberg's history of England under the Anglo-Saxon kings has for many years been out of print, it has been thought advisable to republish it in a cheap form in Bohn's Standard Library, in which it occupies two volumes. The new edition has been carried through under the care of Miss E. C. Otté, who has made some alterations in the arrangement, and restored some of the passages omitted in the original translation by the late Mr. Thorpe. It is not necessary to speak at length of the value of a book so well known and of so high reputation. Notwithstanding the number of histories of this period which have been published since 1834 (the date of the original appearance of this work), its solid merits still keep it in use; it is one of the books that no student of the period can afford to overlook. Its most valuable feature is the prominence given to the German element in the people and institutions of England, and the fulness with which their connection with the population of Germany and Scandinavia is pointed out. In this, to be sure, the author agrees in the main with Mr. Hallam and Mr. Freeman; but there is this difference, that Dr. Lappenberg was himself a German, distinguished for his familiarity with the history of northern Germany. The original work belonged to the admirable series of *Staatengeschichte*, known as the Heeren and Ukert series. The present edition has a number of useful tables, an index to each volume, and a good map—small, but especially serviceable as giving the modern English names of towns by the side of the Anglo-Saxon names.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*

Fine Arts.

FIFTY-SIXTH ANNUAL EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.—II.

NOTHING that Mr. Eakins does fails to be interesting in some way, for the reason that it is sure to have some import, which distinguishes it at once from what is rightly enough termed shop-work. Shop-work abounds at the Academy, and without much more relief this year than usual; accordingly Mr. Eakins's "May Morning in the Park" (No. 645), though it has not in itself qualities particularly striking, no one will be apt to pass over, in spite of the position assigned it in a corner of the little North-west gallery. It is perhaps a little paradoxical that what fault there is to be found in it discovers itself in its expression. In general it is in Mr. Eakins's conception that the weaknesses of his pictures are felt. An inadequate sense of beauty, and, indeed, a contentedness with what is conventionally ugly almost involving a sniffing contempt for anything conventionally æsthetic, he sometimes discloses with apparent satisfaction. Nevertheless it is not too recondite an explanation of this to say that he seems to fail as an artist, when he does seem thus to fail, mainly because he fails as a painter. In spite of his evident ability, his possession of what it is possible to acquire in drawing and color, and an obvious native felicity in handling this effectively, it is not unreasonable to infer that occasionally, when his work falls short in point of art, it is due to the insufficiency with which he has expressed what he had in mind. It would be easy but, like most *à priori* reasoning when it is specific, unconvincing to infer that what has evidently impressed so deeply a painter of such force could not originally have had as little attractiveness as it sometimes has in his pictures, even though the technical insufficiency of these is neither felt nor to be perceived. This "May Morning," however, palpably confirms such an inference in its own case, and suggests the reasonableness of the same in other instances. There is just enough of a May morning effect in the landscape and atmosphere of the picture to show clearly the artist's intention, and just enough indistinctness and lack of accent to indicate the imperfectness with which it has been executed. There is also, perhaps owing to the same reasons, an agreeable lack of the rather labored and conspicuous light and shade which distracts the attention in some of Mr. Eakins's work—in, for example, the "Lady Singing a Pathetic Ballad" of which we spoke a fortnight ago; but the harmonious concert of contrasting color-values which should take its place is lacking too in some degree, the result being that at the necessary distance the canvas looks as if the paint-rag, or the "blender," or some degree of scumbling, had unhappily blurred its appropriate piquancy into something almost common. Actually, thus, it fails in the blithe freshness of "ethereal mildness" which, nevertheless, it is perfectly evident it was designed to express. The indubitable success of the picture is to be found elsewhere—in the happy way, namely, in which the coach, its horses, and its freight of ladies, gentlemen, and footmen are painted. The slow, swinging gait of the horses—a particularly difficult variety of action to fix upon canvas, we should imagine—and the bearing of the group on the front of the coach are capitally caught.

With few exceptions (the chief being Mr. Hennessey's "Spring Idyll" in the East room, the effect of which is very delicate and the painting very solid), the rest of the *genre* is of that kind of art which is composed with the eye upon the observer, so to speak. The value of this often depends more or less directly, therefore, on the cultivation of the beholder to suit whose taste it is painted, rather than upon the genius of the artist. The artist in this case—or, in other words, the successful artist—deserves credit precisely in proportion to the amount of good work he furnishes in excess of his public's demand for it. This is a consideration having more to do with morals than with art, perhaps, but how is one to judge with any accuracy of what a painter might do merely from what he does? And it is, at all events, the only way that occurs to us of expressing appreciation for the contributions of Mr. J. G. Brown, Mr. S. J. Guy, Mr. W. H. Beard, and Mr. E. Wood Perry, for example. Each of these painters has painted so long in his especial vein that he must have a public of his own—a kind of personal *clientèle*, one would say. Mr. Beard's keeps him busy with bears, and frogs, and rabbits; Mr. Guy's affects children with domestic virtues and charms; Mr. Brown's has a perfectly insatiable taste for ragamuffins, and Mr. Perry's delights in red-haired young women inhabiting the interiors of rural New England. It is hardly to be denied, though there is, of course, some guess-work in the matter, that Mr. Beard would have pleased his following just as well if he had painted his "Too Much Game" (No. 589) as ill as Mr. J. H. Beard has painted his "A Bird in the Hand," etc. (No. 388); instead of which he has expended great care in the disposition of his frogs, in the rendering of their brilliant but appallingly clammy bellies, and in the fitting of their several speaking attitudes to the words which a diagram key on the frame declares them to be uttering. Mr. Brown taxes his imagination to the utmost to invent new situations in the drama of the street *gamin;* Mr. Perry exhausts the resources of his palette in imitating beams of sunlight falling aslant his interior; and Mr. Guy paints his children roasting apples at a grate with a completeness and fidelity which many a painter of genius might envy without necessarily desiring to emulate. About Mr. Brown's waste of good work we are not sure; he deals almost exclusively with broad farce or unmistakable character-sketching, and it is not difficult to appreciate any of his strokes. But a connoisseur who could put up with Mr. Perry's woman will, we venture to say, miss the finer shades of his work; and certain qualities of Mr. Guy's painting decorate uselessly the simple sentimental allegory they are here employed to convey. The same may be said of Mr. Bridgman's "pot-boiler" (No. 387). All these painters have done much more interesting painting, and they are certainly entitled to have such picture-making as their present exhibits called shop-work. Either that, or they must be assumed to be genuinely in love with their unlovely work and to bestow on it the caressing solici-

tude of the Dutch masters who show a tender solicitude for the unpretending and homely. This is a little fanciful, but even if it were sound, it would, to say the least, call for better work than their best; that is to say, before one can enjoy Mr. Perry's interior as much as De Hooghe's it would need to be painted even better than it is.

Neither is the landscape of the Exhibition noteworthy. Mr. Wyant's "An Old Clearing" (No. 415) has the main centre of the large gallery, given it probably because it leaves a pleasant impression of landscape unaccompanied by anything tremendous or sensational. It is, in effect, the landscape analogue of Mr. Eastman Johnson's "Funding Bill," though, unlike that work, it is weak and mannered in execution here and there. Mr. Inness's "An Old Roadway" (No. 411) is, on the other hand, strong and simple, and if it had any particular point, instead of lacking precisely that, it would be the large work it distinctly fails to be. The way in which the principal figure is presented indicates that the painter took no absorbing interest in the picture. A low-toned sketch of lonely sea-shore, by Mr. Sartain (No. 406), which hangs near it; Mr. F. S. Church's "Foggy Day," in the East room (No. 289), and Mr. Blum's "Going and Coming" (No. 116), in the Corridor, are more interesting than either Mr. Inness's or Mr. Wyant's contribution. The first two are excellent renderings of vivid impressions, the pervasive misty light in Mr. Church's being very well managed indeed, and perhaps the best thing he has done. With its scantily-clad and barefooted little girl, and the absence of any encumbering paraphernalia, it is not unlike a water-color by Homer, but its originality is nevertheless perfectly apparent, and the handling of it shows a soft luminousness beyond water-color capacity. Mr. Blum's blue picture is the most attractive thing in the Exhibition, to our mind, if we except Mr. Weir's portrait. Black gondolas are "going and coming" on the unruffled surface of the Adriatic, beneath a sky whose blue depths of perfectly cloudless space are reflected in the water below; at the far horizon appears the low and faint mirage of Venice, the roseate yellow of which is, excepting some costumery in a gondola, the only color that relieves the black and blue effect of the picture. The whole scheme is strikingly individual, and executed with a refined delicacy of workmanship extremely agreeable to meet with here. From where it hangs any one may get a view of Mr. James Hart's "In Our Village" (No. 418), a large and, so far as appears, ambitious representation of the progress of a circus through the wide street of a Connecticut river town, which is as nearly as possible the exact opposite of Mr. Blum's picture; on which account, and in view of their being both imaginative works, we mention them together. In the same room are at least two of Mr. William Hart's characteristic landscapes with cattle, or rather, considering the title of one of them, "Cattle, with Showery Day" (No. 483), we should say cattle with landscape. The unexpected and frank felicity of this title, indeed, is a reminder that Mr. Wm. Hart's cattle are the best cattle of the display; but the fact that their only rivals are some ferocious-looking beasts of Mr. Bispham's and some feeble ones by Mr. James Hart is also a reminder that the circumstance is hardly worth chronicling. It is equally unnoteworthy that Mr. Swain Gifford has two not uninteresting landscapes which look identical in every respect except size; that Mr. Bierstadt has a "Sierra Nevada" panorama; that Mr. Tait has painted some animal life into a landscape by Mr. Sonntag; that Mr. Bristol, Mr. J. D. Smillie, Mr. George H. Smillie, and Mr. Brevoort expose sizable but rather meagre stretches of country; and that Mr. Cropsey is still revelling in the representation of autumnal splendors by splotches of chrome and crimson. These things have become part of the organic unity of Academy Exhibitions.

MRS. HOLMES'S LANDSCAPES.

FOR some weeks Mrs. Oliver Wendell Holmes, jr., has had upon exhibition at the rooms of the Ladies' Decorative Art Society a number of landscapes done in embroidery which are works of fine art, of a quality, so far as we know, unique. The interest excited by them is, of course, an interest of curiosity at the outset. That effects so similar to the effects secured by the brush and pigments can be obtained with the needle and silk or crewels is of itself a curiosity of the first order, amusing evidence of which is furnished in the anxiety of lady visitors to discover the secret of Mrs. Holmes's stitches. The fact is, however, that these have no secret discoverable, and are exactly as imitable as a painter's or sculptor's "handling," and no more so. The artist's method is prescribed by her specific purpose, and is thus capable of variations as numerous as the different effects possible within the range of needle-work. This at once distinguishes the work from the analogous embroidery of the Japanese, which has acquired all the formal subtlety of a method mature enough to have become classic. In spirit and purpose, also, as well as in method, Mrs. Holmes differs as widely from the classical formality of Japanese landscape embroidery. Her pictures are entirely free and individual, being in nothing more remarkable than in their avoidance of the semblance of conventionality, good or bad. In fine, she is an American artist of noticeable qualities, and one speedily gets beyond thought of the material she employs in looking at the effects she presents. We use the word "effects" designedly, for each of these nineteen landscapes depends for its artistic interest not upon its successful imitation of natural forms or its composition of pictorial elements, but upon the spirit and sentiment of some natural scene which has impressed the fancy of the artist. These have a considerable range. There are three snow-scenes, for example, one of a driving storm and the others of winter twilight; several sea-shore studies, one with an enshrouding mist admirably rendered; a mid-ocean fantaisie, as it might be called; warm views of vistas through trees, with daisies or golden-rod in the foreground, and so on, including several decorative panels. Each discloses the turn of the artist for color, and her success in producing its softer and more subtle harmonies, though now and then, as in a sunset, she essays splendor and effulgence without failure. We like best, however, such a delicate piece of refined color as an apple-orchard, over which hangs a sky of pearly softness, between which and the dark green and brown foreground are pinkish and opaline masses of blossoms. This work alone would give Mrs. Holmes a place among her artist fellow-countrymen, few of whom show so much feeling for what is delicately poetic. Not the least noteworthy thing about these works is the recognition of the limits of the material; this is almost as noticeable as the fertility of resources displayed within these limits: the perfect completeness, the solidity, mellowness, and depth that distinguish the possibilities of painting in oil are nowhere sought. The possibilities of this kind of art are rather analogous to those of water-color drawings, the satin groundwork being taken as a key in general by Mrs. Holmes, we observe, and the effects sought being rather transient impressions of natural phenomena than imaginative creations of large substance, as we have said. In one respect they teach a lesson which might well be taken to heart by a good many of our draughtsmen-painters —namely, the comparative unimportance of light and shade as it is popularly practised; Mrs. Holmes's perspective is as good and her pictures as firmly compounded as if she had used black and white crewels freely. But, then, to be as successful as she is one needs as acute a sense of color, it must be confessed; and that, in the degree here manifested, is a rare possession.

"A REMARKABLE BOOK."

Rabbi Jeshua.

12mo, $1 25.

"As a memoir on the life of our Lord, when stripped of all supernatural attributes and circumstances it is not only a clever sketch but a powerful testimony to the mighty influence on humanity which the mere human element of Christianity has exercised. . . . A remarkable book."—*London Saturday Review.*

Buried Alive;

OR, TEN YEARS' PENAL SERVITUDE IN SIBERIA.

By FEDOR DOSTOYEFFSKY. 12mo, $1 50.

"There are very few books of any sort which appeal so strongly and in so many ways to attention as does 'Buried Alive.' It is a minute picture of life in a Siberian prison; a close study of the effects of penal servitude upon the prisoners themselves; a rich collection of character portraits and singularly varied psychological studies."—*N. Y. Evening Post.*

A NEW ENGLAND STORY.

A Lazy Man's Work.

By FRANCES C. SPARHAWK. 16mo (Leisure-Hour Series), $1.

"A fascinating story capitally told."—*Boston Transcript.*

NEW YORK, THURSDAY, APRIL 28, 1881.

The Week.

THE "Star-route" exposures at Washington are the principal political topic of the week. The Star-routes are stage-lines in the far West, over some of which it is said pass not more than three letters a week. There are 9,225 of them in all, for which in 1878 the annual appropriation was $5,900,000. Between 1878 and 1880 the Second Assistant-Postmaster-General, Brady, and a number of confederates appear to have gone to work to furnish reasons, in the shape of sham petitions and other things of like nature, for having the service on ninety-three of these routes "expedited," or made more frequent. They were so successful that they raised the cost of these ninety-three routes from $727,119 to $2,802,214; so that there were only $3,097,786 left for the other nine-thousand-odd routes. The deficit which Congress was called on to meet last year first brought the matter to public notice, but Brady was successful not only in staving off exposure but in getting his money. The accession of Mr. James to the Postmaster-Generalship was, however, fatal to him, and he and some of his helpers seem to be in danger of criminal proceedings. Various Congressmen of both parties seem to be seriously implicated, amongst others Page, Elkins, Maxey, Money, and Blackburn, of California, New Mexico, Texas, Mississippi, and Kentucky respectively.

The affair throws a good deal of light on that mysterious "social event," the Dorsey dinner in this city, which so many respectable men were deluded into attending, and at which the Vice-President of the United States made that very cynical speech about Dorsey's electioneering operations in Indiana while Secretary of the Republican National Committee. Our readers may remember that the New York *Times*, to which the public is much indebted for the boldness with which it has followed up the Star-route frauds from the very beginning, suggested at the time of the dinner that it was got up as an "endorsement" to aid Dorsey in getting a friend of his put in the Assistant-Postmaster-Generalship by President Garfield, who was then Cabinet-making at Mentor. How near the truth this explanation probably was, may be inferred from the fact that among the Star-route contractors are Dorsey's brother, his brother-in-law, Peck, and his former partner, Miner. Dorsey himself very likely had interests in other contracts, but that he had nothing to complain of as regards the contracts awarded to these three, the following little table shows:

	Number of Contracts.	Original Amount.	Total increased Amount.
J. W. Dorsey	8	$14,479	$147,273
J. M. Peck	8	30,396	218,141
J. R. Miner	8	10,371	135,658
Totals	24	$55,246	$501,072

So that it appears as if what may be called Dorsey's "military family" pocketed a cool $445,826 between them. How much of this the great man himself got, even if he got nothing else, is, of course, as yet unknown, but it is almost certain that the New York dinner was paid for out of it. Who did pay for the dinner has been a disagreeable question for a good many of the guests, since they found out what manner of man Dorsey was. Of course, it was plain that nobody paid for it out of admiration for Dorsey himself, and the dinner was probably part of "the plant" of the Star-route conspirators. This ought to be a warning to all men of character who find themselves suddenly bidden to a feast in honor of a "worker."

As we go to press, a Republican caucus in the interest of good sense and loyal service appears imminent. This means, of course, a retreat from the thoroughly false position in which the Vice-President, General Mahone, and the Republican half of the Senate have placed themselves. But what is to be taken back? Is it not everlastingly true that the majority ought to rule in this country, and, as Logan says, to be allowed to act its own pleasure in its own time? Is not the division of the solid South as imperative as ever? Do not Mr. Riddleberger's views on a free ballot and a fair count still command the hearty respect of the Republicans? Very good; but it seems that all this, after all, had nothing to do with the dead-lock. The majority can wait, Mahone's claims upon it can be postponed, Riddleberger can be shelved or dropped—Gorham, too, perhaps, with the odor of Brady and the Dorseys strong upon him—and the public business will at once proceed, if only the President will withdraw Judge Robertson's nomination. We do not vouch for the correctness of this solution, but it is universally given out in the press, and apparently has the full credence of the Washington correspondents. The elder Cameron has, they say, been closeted with the President in a futile effort to "harmonize" him with Conkling. Mr. Edmunds is reported to be equally anxious that this should be brought about. And still nobody has the manliness—we had almost said the decency—to get up on the Republican side, remind the party of its recent ridicule of Democratic government by caucus, and announce his intention to oppose every resolution looking to another day's delay in transacting the urgent public business for which the Senate was convened.

Mr. Dawes has been very roughly handled this week, both in and out of the Senate. After honorably guarding the name of the "old, grey-headed" refugee from Mississippi, who had suffered so much and so long for the crime of being a Northern man, his humane purpose to prevent further persecution was defeated by the repetition of the victim's story in several columns of the Boston *Advertiser*, under his own signature. It appears, however, from Mr. Charles Heath's narrative, that the scene of his troubles was not Mississippi but Louisiana—a slight discrepancy, to be sure, on the Stalwart *ab uno disce omnes* principle. Nor was he a refugee, after a fifteen-years' struggle to maintain himself amid a hostile people; his home is in Malden, Mass., and has been for the past twenty years, and he only makes annual visits to his plantation. Nor is he "old and grey-headed"; the Boston *Journal's* reporter makes him "a fine, hearty, strong man, with iron-grey hair, coal-black eyebrows, and apparently good for a score of years." Nor was any one of his employees murdered, though one negro was shot and crippled some dozen years ago. Nor did he have to put iron shutters on the houses of his hands to protect their lives. Nor were his "factories" burned; and as for his gin-house, he has only a suspicion that it was fired by an incendiary. In short, there is no ground for believing that, whatever happened, there was the slightest sectional or political cause for it. More than this, the Boston *Journal* accuses him of having told essentially the same story, except as to the burning of his property, ten or a dozen years ago, though he now "places these episodes no farther back than 'along in 1877 or 1878,'" and shows that his pretended appeal for protection to Governor Warmoth was made long after Warmoth was out of office. Finally, a judge of the neighborhood telegraphs to a New Orleans paper that he believes the property was burned for its insurance, and a Republican ex-judge testifies to the peacefulness and entire political freedom of Caldwell parish. It will scarcely be believed, but when these facts had been brought to Mr. Dawes's attention by Senator Jones, he "transferred the controversy" to that gentleman and to Mr. Heath.

Heath's story, as related by him to Congressman Bowman and by him repeated to Mr. Dawes, who paraded it in the Senate with all the embellishments now exposed, and with a confidence calculated to make his hearers believe that his information was first hand, is a good illustration of the manufacture of "outrages." The times, happily, have so far changed that enquiry cannot be satisfied by the bare word of the narrator, or by a refusal to publish names, dates, and particulars for the verification of what is alleged. At last, too, the Northern public—Mr. Dawes's constituents included—admit that some weight is to be attached to denials from a community whose good name is involved.

It is, therefore, high time that a feeling somewhat warmer than surprise should be manifested when a Massachusetts Senator gives currency to a fabrication which does not bear the slightest investigation, and hears it refuted without offering an apology, we will not say to the South or to the country, but to his colleagues. Such conduct in the midst of a Presidential campaign would be only natural, but it is unpardonable in the midst of a session which, whatever else may be said for it, has furnished an opportunity for real even if irrelevant debate. The age of Heath's narrative alone should have prevented its being revived now for any partisan object, but this is less to be wondered at considering how the "historical" novel of Judge Tourgee imposed upon the North as a picture of actualities. The sub-editors instinctively placed the caption 'A Fool's Errand' over Heath's romance.

The news about the Monetary Conference is very bad for the bimetallists. The English delegate, Mr. Fremantle, the Deputy-master of the Mint, has, it is announced, instructions simply to be present at the debates and take notes, and to avoid any expression of opinion which might imply concurrence in the principles of the convokers of the Conference. The Berlin *National Zeitung's* Paris correspondent also writes that the failure of the Conference is certain, and that a proposal to postpone or adjourn may soon be looked for. The Powers who have a gold standard will not give it up, but are quite willing that those who hanker for silver should set up the silver standard. This is the long and short of the situation. The Cincinnati *Commercial* wishes to know what we think the effect on the market price of silver would be if all the Powers agreed to unlimited coinage at 16 to 1. Well, we think, it would raise it; but nothing would keep the rates at 16 to 1. No treaty or agreement or law could possibly prevent in the long run the effect of comparative cost of production on the relative value of the two metals. Those who think it could are "mad," as M. Cernuschi is about 15½ to 1, and as Mr. Halstead is about 16 to 1. Our silver-men are now, it seems to us, bound after this second failure to settle down soberly and quietly to get us out of our own silver scrape. Our own currency we can control, and the currency of the world we evidently cannot control. The wisest thing we can do, therefore, is to stop coining silver until England, Germany, and other besotted Powers agree to take some of it off our hands.

The enquiry before the Mayor into the charges against the Police Commissioners in connection with the street-cleaning is in its nature judicial, and the possession by the Mayor of the power to institute it undoubtedly carries with it the power, if not to "commit for contempt," to keep order in the room during the progress of it, and protect himself and the witnesses and counsel from insult and interruption. His failure, therefore, to expel Mr. George Bliss, one of the Police Commissioners' counsel, on several occasions—in fact, on every day since the trial began—is exciting a good deal of surprise among all decent people. Mr. Bliss seems to be mainly occupied in insulting not only the Mayor but the witnesses, and sometimes in the grossest manner, as when he proposed to "mark" one gentleman's nose, who testified to bad odor in the streets, as "an exhibit in the cause." The New York bar contains a great many ill-mannered, ill-bred, and worthless members, but we imagine there are very few besides Mr. Bliss who would consent to take part professionally in an investigation of any kind, before any tribunal however despicable, without accepting the professional obligation of decent and orderly behavior. Mr. Bliss is consequently surprising even his enemies—a very large and influential body. Even those who believed him to be what the old play calls "a fine natural blackguard" had no idea that he would parade the fact in this conspicuous way. But he is rendering some service to his country by showing what kind of thing a "worker" in this city is, even when a man of education, a member of an honorable profession, and in possession of a comfortable fortune. The Mayor's patience has thus far been admirable, but he nevertheless owes it to the public not to carry it too far.

The testimony taken thus far by the Mayor contains no revelations calculated to disconcert the Police Commissioners, who bear the ordeal with great steadfastness. It is to be remembered, however, that this is due to the fact that nothing has yet been elicited which has not been for a long time matter of public notoriety. To a stranger the evidence would appear very scandalous, and the placidity evinced by the Commissioners in the face of direct incrimination very extraordinary. The statements of the manager of the Metropolitan hotel on Monday, for example, proved the complicity of the head of the Street-Cleaning Bureau with the illegal exactions of its employees for removing the ashes of that house. The witness testified that the cartmen who had been removing them for ten dollars a month suddenly "raised on him" to twenty-five dollars, whereupon he protested at headquarters. There he got nothing but sympathy, of which there was an abnormal amount to be had, and accordingly he left his ashes on the sidewalk. For this he was arraigned in court but immediately discharged, after which the rate was reduced to the original extortion. Abundance of other evidence has been given to show the prevalence of the practice of paying street-cleaners privately for doing their regular work. This, by the way, has greatly shocked the Commissioners, and they have begun investigations of their own in various precincts in order to discover how far this sort of "bribery," as they call it, has corrupted their force.

Although about $4,000,000 foreign gold arrived during the week, the import movement, so far as new operations are concerned, has been stopped by the rise in the rates for foreign exchange. As we have already, since January 1, received nearly $30,000,000 of foreign specie against less than $4,000,000 a year ago, the stoppage of gold imports is not of controlling importance to the money market, which is becoming so easy that lenders offer money for six months on good securities at 4 per cent. United States bonds were in active demand during the week; the 4's advanced to 115¼, the highest price yet attained, and the 6's (which carry the privilege of extension into 3½ per cent. bonds) to 103⅞ to 104. Of these last-named bonds about $15,000,000 were held in Europe, and as fast as they arrive in the market they are taken for extension into 3½ per cents by brokers and dealers. The week at the Stock Exchange witnessed the beginning of the unfolding of Jay Gould's scheme to organize out of the six railroads southwest of St. Louis his new system. The first step is a union of the Missouri, Kansas & Texas and the International & Great Northern; and papers were circulated for a consolidation of these on the basis of two shares of the former being equivalent to one share of the latter. The next two lines to be brought together are the St. Louis, Iron Mountain & Southern and the Texas & Pacific; proceedings towards this union have been checked by a diversity of views as to the terms of union. When these consolidations are completed, the scheme is said to be to run the two new consolidated lines in connection with the Missouri Pacific, under the control of another company something like the Pennsylvania Company, which manages a number of railroads in the interest of the Pennsylvania Railroad Company. While this gigantic scheme began to develop during the week the elevated railroad scheme came near collapsing. The Manhattan Company, which leases all the elevated railroads of this city and guarantees the securities and stocks of each, made application for a remission or reduction of taxes, and accompanied the application by a most dismal statement of earnings and of prospects. The result of this revelation was a decline of $9 to $29½ per share in the stock and 1 to 7½ per cent. in the bonds. Outside of these two movements the speculation at the Stock Exchange was not remarkable, and prices closed somewhat lower than a week ago.

The Irish Land Bill, as described in Mr. Gladstone's speech, for the full text has not yet reached us, does not differ materially from the telegraphic summary of it. It is clear, however, that the court is to play a very important—some of the Land-Leaguers maintain a too important—part in it, and the composition of it will be a very delicate matter. It is not only to decide what is a fair rent, but when the landlord asks for a right of re-entry, after the expiration of a second term of fifteen years, to decide whether his reasons are good; and when the tenant offers his tenant-right for sale, and the landlord exercises his statutory right of objection to the purchaser, whether the grounds of his objection are good. It is true that resort to the court is optional—the landlord and tenant may agree between themselves if they please; but no such agreement will probably be made in the vast majority of cases, or perhaps in any case in which the tenant is not an independent man with capital. The weak point of the bill is probably to be found in these very extensive discretionary powers of the court, which is in the first

instance the ordinary Civil Bill (or County) Court of the district. The Court of Appeals is to sit in Dublin, and no light has been thrown in the debate on the very important question of the expense of going up to it for a final decision. Unless this is very small the legal protection afforded to the tenant will be illusory, and the chief of Mr. Parnell's present warnings against the bill—for he has changed his tune since it was first introduced—will be justified. Reason for believing that the Ministry has considered this point is to be found in the fact that the bill proposes in the case of sales of their farms to the tenants, through the Land Commission, to give them their title free of law-costs. The amount of money extorted from the poor men who bought their little holdings from the Church Commission after the disestablishment, by way of mere legal expenses, was a painful feature in an otherwise very admirable transaction. Mr. Gladstone's speech was one of those remarkable examples of that power of lucid exposition which he has so often displayed in the introduction of his budgets, and which seems to have as yet suffered no abatement from age or weariness.

There has been one debate on the second reading of the bill, which was adjourned, however, until to-day. The bill was assailed with some questions by Mr. Gibson, a Conservative, of which the cable despatches give only a confused account, and which the Ministry asked for time to consult the law-officers before answering. The chief point of attack seems to be what even some English Liberals—such as the London *Economist*—admit to be a weak point, the distinct diminution of the landlord's interest which it makes without compensation. There is no doubt it does make a diminution in the landlord's legal rights, but it must increase the market value of his property, which has been greatly reduced by the working of the existing tenure. What the landlords ask is what no government on earth can give, perfect security in the enjoyment of a title which the occupiers of the soil passionately question. There has been a meeting, or caucus as we should call it, of the Conservative members, both English and Irish, in London, to determine the course they are to pursue towards the bill, and they are said to have determined to oppose it, unless the Government agree either to compensate the landlords or buy the estates of all who are willing to sell at a fixed price, calculated on the rental. As the bill now stands, the Land Commission is authorized to buy estates if it thinks proper. The compensation they have in mind is doubtless, as we have said, compensation for the difference between the position in which the bill will put the landlords and the ideal position in which they would be if tenants were peaceful and contented; and this would perhaps be something handsome. What they are entitled to really is compensation for the difference between their actual position and that in which the bill would put them; but in estimating this benefits would certainly swallow up damages. There is still in London a confident expectation that the Lords will reject the bill, in spite of Gladstone's warning that he will use every constitutional power he possesses to pass it.

There appears to be already some prospect of an international difficulty, in which the United States may not appear very well, arising out of Mr. Blaine's formal objection to the decision of the Count Lewenhaupt, the Swedish Minister, the umpire in the Commission now sitting to decide claims of the United States on the Spanish Government for damages on account of certain Cubans owning property in Cuba, but holding American certificates of naturalization. The umpire has decided in favor of going behind the face of the certificate and enquiring whether it was lawfully granted, and whether the holder did really reside in the United States for the period required by law as a condition of naturalization. In the Treaty of 1871, under which this Commission is sitting, the right of Spain to traverse the allegation of American citizenship was expressly conceded, and the propriety of this concession was subsequently demonstrated by Mr. Evarts in a despatch to the Spanish Minister before he went out of office, on the ground, among others, that some of the certificates held by Cubans with claims on Spain were possibly fraudulent, having been granted in the city of New York "during the existence of the so-called Tweed Ring," and that the Commission was a high international court which could enquire into anything. Mr. Blaine now contends that the clause of the Constitution which requires "full faith and credit to be given in each State to the public acts, records, and judicial proceedings of every other State" is binding on foreign powers, umpires, international commissions, and all other persons whatsoever; and he invites the umpire to reconsider his decision, to disregard the provision of the Treaty of 1871, and the decision of Mr. Evarts, the late Secretary of State, and make it agreeable to Mr. Blaine's view of the law. We have here, within three months, one of the contingencies which we had in mind when we complained in February of the fact that Mr. Blaine had no legal training, no diplomatic experience, and a rockety mind. We call the attention of the Chicago *Tribune* to it. Of course we admit that it will look well in the conventions to have Mr. Blaine reputed as forcing the haughty umpire to come down off his high horse and acknowledge that the certificate of the lowest American tribunal was something which the mightiest monarch on the globe dared not question. "Johnny" Davenport may, but no foreign despot.

What the Greeks mean to do it is very difficult to make out. The decision of the Powers on the frontier line was too much for M. Coumoundouros and he resigned, but not before he had written a sulky note calling attention to the fate of the Epirote Greeks and asking for autonomy for them, and doubting whether the Turks would hand over the territory awarded to Greece, and saying that if Greece was to have to fight to get possession of that she might as well fight for something more, and asking whether the Powers would put her in possession of it. The Powers then announced that the new line was a European decision and invited the Porte to comply with it promptly, and it has announced its readiness to hand over the ceded territory in ten days. Since then, however, it has begun to make the excuse that it made the cession with the view of establishing a firm friendship with Greece, but if Greece is not satisfied there is no use in ceding anything. The latest accounts of Greek feeling seem to make war probable, but to-morrow may bring a different story. The chances are still, on the whole, in favor of peace.

The French have entered Tunis for the chastisement of the Kroumirs, and the Italians disclaim all dissatisfaction, and Cairoli has withdrawn his resignation and taken office again. His assertion that England sympathized with Italy in objecting to French ascendency in Tunis has been completely disproved by the revelation of a despatch from Lord Salisbury to M. Waddington in which, probably in order to secure French acquiescence in the great Cyprus *coup*, he declared that England did not mind what France did with Tunis, even if she went so far as to dethrone the Bey. This, of course, makes some sensation in England as another proof of Lord Salisbury's unsafeness. He secretly committed England to a position touching the French influence in Africa which, coupled with his admission of her to a share in English domination in Egypt, was something which, if not dangerous, was distinctly new, and liable to become embarrassing. The worst of it is, he seems to have deceived both the Bey and the Italians about what he said to the French.

The Russian Nihilists have addressed a sort of manifesto to the Emperor, pointing out to him the futility of all attempts to put them down, describing the growth of the movement under persecution, and their success in meeting violence by violence; predicting that the revolutionary feeling will grow until it will result in a terrible convulsion enveloping the whole of Russia; denying that there is any real government in Russia, or anything better than a "camarilla" or "usurping gang," which has reduced the masses of the Russian people to "beggary and ruin"; and warning him not to be deceived by the reports of his "flatterers and minions," and that "regicide is very popular in Russia." This is all an old story, but the close of the document is interesting as containing the first offer of accommodation which has come from the Nihilist side. They propose a complete amnesty, to be followed by the election of a popular legislative assembly by universal suffrage, under freedom of speech and of public meeting, and they offer to conform unconditionally to the decision of a national assembly so elected, and to refrain in future "from violent proceedings against the Government sanctioned by such national assembly." They have never before offered a constructive programme, and this may mean either that they are themselves growing weary of the struggle or think the Government is.

THE REASON WHY BRADY WAS NOT A GOOD POSTMASTER.

THE pending Post-office scandal, otherwise known as the "Star-route frauds," which Mr. James has been bringing to light at Washington, and which seems to threaten some of the principal actors in it with criminal proceedings, is a good deal more than a fresh illustration of the weakness of human nature. The Post-office was in General Grant's day handed over to the late Senator Morton, as his share of "the spoils" in Washington, and he held it until his death on a sort of feudal tenure, the condition being that he should use it to "carry Indiana." It was accordingly officered in the higher grades under his dictation. Mr. Tyner was his henchman; so was the present culprit, Brady. Brady was not put into the Post-office because he was a good man for the place or had any love of letters, but because Mr. Morton had found him useful in politics in Indiana. He has always been, accordingly, a politician principally, and only secondarily and subordinately a postmaster. His chief function and that of Mr. Tyner, in Mr. Morton's lifetime, was not the proper despatch of the mails and the correct keeping of the Post-office accounts, but the preparation of Republican majorities in Indiana. During the electoral troubles of 1876 Brady was called away from his proper duties for a whole month and despatched to Florida to procure a "fair count," and was one of the worthies who accused General F. C. Barlow of treachery for admitting that a "fair count" could possibly in any district give a Democratic majority. He was also very active in exposing the Democratic cipher telegrams, and has been a generally useful man of the Dorsey type. His remarkable skill in this, as in the political field, was shown last winter in the success with which he not only prevented any effective investigation of his Star-route operations, but procured appropriations to enable him to complete the very transactions which were attacked as fraudulent. He has even gone so far as to purchase a newspaper published in the very capital itself—edited, too, by the estimable Gorham, the Republican candidate for the Secretaryship of the Senate—in which he opposes the nomination of Judge Robertson, castigates such public men as seem disposed to criticise him or enquire into him, and even had the boldness two months ago to warn Mr. James when he came to Washington against attempting to play the rôle of "reformer," which he described in almost the same terms of reprobation and disgust employed by Senator Thomas C. Platt at the Rochester Convention in 1877. In fact, take him for all in all, it would probably be difficult to find a better specimen of the kind of public servant whom the spoils system, under conditions favorable to its perfect working, produces.

Both the present case and that of the Bureau of Engraving are also very useful as illustrating the way in which, under the spoils system, Congress is deprived of its value as the grand inquest of the nation. One of the most important functions of all legislative bodies in our time is the supervision of the mode in which the executive spends the money voted to it for purposes of administration. A legislature may not always have the power of punishing maladministration directly, but it has the power of exposing it, and thus providing for its punishment *in*directly at the polls; and this power it is bound to exercise. In other words, investigation and enquiry stand quite as high among its duties as the enactment of laws. To perform this duty effectively, however, the members of the legislature must be independent of the executive. Some of them may hold office, as in England and France, but only openly and with the express permission of their constituents. None must be under secret obligations to the executive. It was because the majority of the House of Commons were paid by the Government, either in places, pensions, or "lump sums," in the days of Sir Robert Walpole and Lord North, that the English Government became the mass of corruption with which the history of the latter part of the eighteenth century has made us familiar. Under the spoils system we have the same occult and corrupt relations between the two branches of the Government here. It has grown up in the most natural way possible. From consulting Congressmen about the qualifications of office-seekers from their respective States the reference of all applicants to Congressmen for nomination or appointment almost inevitably resulted. From this came the supply of candidates by Congressmen for such vacancies as happened to exist, and from this again the creation of vacancies for the benefit of those Congressmen who had more candidates than they knew what to do with. The working of this system in its extreme form was well exhibited in the condition of the Engraving Bureau in 1877. It had three-fifths more employees than it had work for, and in order to provide even room for them a sort of shelf had to be erected on which the supernumeraries slept and lounged during the working hours. Every member, of course, who had supplied officers for such a concern as this was placed under a tacit obligation not to investigate or expose its working, or, in other words, to neglect one of the chief duties of his place. As long as there are not "offices enough to go round," to use a slang phrase—that is, as long as it is not possible to give every Congressman as many offices as he wants—there must always be a large field of discretion in which the executive can excite the gratitude of particular Congressmen by extraordinary concessions to them, or extraordinary exertions in their behalf; so that an executive officer may actually prepare for a course of successful malfeasance by purchasing with patronage, if not the connivance, the silence or unwillingness to examine of large numbers of his constitutional overseers. This is really what it seems as if Brady had done. That there was something wrong with regard to the Star routes has been known for some time, and the wrong, whatever it was, was easily discoverable and provable, because the service rendered was an open and public one, and its relation to the price paid by the Government was something which any child could calculate. It was, as we have said, brought before Congress last year, examined by the Committee and denounced; but Brady was too strong for the Committee. He baffled all attempts to array the House against him, and actually defied the Committee on the witness-stand. Both parties, with a few honorable exceptions—of whom Senator Hawley was the chief—apparently concurred in refusal to prosecute the enquiry, and he would doubtless have enjoyed impunity a good while longer if a Postmaster-General of the old stamp had been appointed by President Garfield. His downfall has been due to what we may call the accident of the appearance of a business man at the head of the Department. Had Mr. Kirkwood, of the Interior Department, been made Postmaster-General, there can hardly be a doubt that Brady would have been allowed to carry on his operations unchecked, and would have carried them on a good while longer.

It is to be observed, too, that these operations were exceedingly bold. They were conducted on a great scale and with great openness. That this is one of the results of Brady's consciousness or subconsciousness of the shortness and uncertainty of his own tenure, we think there can hardly be a doubt, and it illustrates what is one of the strongest objections to President Garfield's plan of civil-service reform. It is most human and natural for men to make hay while the sun shines. In every calling and occupation in which the time in which success can be achieved is brief, they take great risks. There can hardly be a better way of making a man dishonest than putting him under strong temptation in an office of which his tenure is insecure, and of which he knows neither efficiency nor integrity can make the tenure secure. In fact, if Satan had to frame a system of civil administration for a democratic republic so as to obtain for himself the greatest number of victims among the Government employees, he would certainly adopt the plan propounded in the President's inaugural address, of making short terms to be filled by needy men on small pay, without the power of improving their condition by either knowledge, or skill, or industry, or fidelity. Under such a system he would not need to lift a finger in temptation or deception. All the circumstances of each case would work for him. All the weaknesses and some of the virtues of the officeholders would incline them to walk in his way, and to array them against the community which they serve. Their family affection, their foreboding about the future, the bitterness of feeling that they were the only class in a Christian community to which honesty and zeal brought no benefit, the only class which served a master without pity and without even a decent regard for his own interests, would help to blind them to the arguments against corruption and theft.

We are told that there is no use in trying to change this system, because the people like it; but there is no proof that the people like it, or semblance of proof even, except that a considerable number of persons are eager enough to profit by it. This argument might, however, be

used with much greater force in favor of raising the public revenue by State lotteries or by heavy license-fees on gambling-houses. The question whether the people of the United States like their affairs to be administered in a way which discourages in their officers all virtues which hold civil society together, and make national prosperity possible, has never been submitted to them. They have passed no opinion on it, and there is nothing from which the politicians who live by the abuse shrink from so much as asking the people how they like it. The cant on this subject is the most repulsive cant of the day. It bemuddles not only the Machine newspapers into snivelling about the popular fondness for "rotation in office," but, we think, very likely has beguiled President Garfield into the belief that he removed Mr. Merritt and nominated Mr. Robertson under the overwhelming pressure of popular demand; the fact being that the people knew and cared as little about the matter as about the French troubles with the Bey of Tunis. Nobody knew or cared about it, probably, but three or four politicians in Washington, who ought to be attending to the public business, but prefer, as a sort of substitute for poker or euchre, a fresh division of offices, so as to "slaughter," or "knife," or "scalp" their enemies, and convince a little knot of hangers-on that they are great men.

CARLYLE'S POLITICAL INFLUENCE.

THE numerous articles called forth by Carlyle's 'Reminiscences,' both in this country and in England, while varying greatly in the proportions in which they mix their praise and blame, leave no doubt that there has occurred a very strong revulsion of feeling about him, so strong in England that we are told that the subscriptions for a proposed memorial to him have almost if not entirely ceased. The censure which Carlyle's friends are visiting on Mr. Froude for his indiscretion in printing the book, though richly deserved, has done but little to mitigate the severity of the judgment passed on the writer himself. In fact, we are inclined to believe that Mr. Froude's want of judgment rather helps to deepen the surprise and disappointment with which the book has been received, as affording an additional proof of the feebleness of Carlyle's own powers in estimating the people about him. That, after heaping contempt on so many of whom the world has been accustomed to think highly, he should have retained to the last his confidence in and respect for a person capable of dealing his fame such a deadly blow as Mr. Froude, not unnaturally increases the irritation with which the public has read his recollections of his friends and contemporaries. The "disillusion and disenchantment" worked by the book, in so far as it affects Carlyle's fame as a prophet, is of course a misfortune and a very serious one. What it was he preached when his preaching first startled the world, but very few now undertake to say, and these few by no means agree in their story. His influence, apparently, was not of the kind which reaches a man through articulate speech, but rather that which comes through the blast of a trumpet or the marching tune of a good band, and fills the heart with a feeling of capacity for high endeavor, though one cannot say in what particular field it is to be displayed. But though he founded no school and taught no system of morals, his eminence as a mere preacher was one of the very valuable possessions of the Anglo-Saxon world, as a sort of standing protest against the materialistic tendencies of the age; and this eminence rested a good deal on the popular conception of the elevation of his own character. This conception has undoubtedly, whether justly or unjustly, been greatly shaken, if not destroyed, by the revelation that invidious comparison between himself and others was almost a habit of his life; that, while preaching patient endurance, he did not himself endure patiently even the minor ills of existence; that, when looking at the fine equipages at Hyde Park Corner, he had to support himself by "sternly thinking"—"yes, and perhaps none of you could do what I am at"; that his mental attitude during the preparation of most of his books was that of a man not properly appreciated who was going to cast pearls before swine—or, in other words, the attitude of an ordinary literary hack, burdened with too much vanity for his powers, and more concerned about the effect his work was likely to have on his personal fortunes than on the mental or moral condition of the world; that, while full of contempt for literary sciolists and pretenders and newspapers, he wrote, and was ready to write, on the American war without any knowledge of the facts, and scorned Darwinism without ever bestowing a thought on it. Carlyle's public were long ago conscious, as one of his critics has said, that he canted prodigiously about cant, and talked voluminously in praise of silence; but then it recognized that much repetition has always the air of cant, and that to persuade men to be silent, as well as to do anything else, one must talk a great deal. A prophet has to be diffuse and loud, and often shrill, and his disciples will always forgive any number of mistakes in method or manner as long as they believe that behind the preaching there is perfect simplicity and self-forgetfulness. That this belief has been destroyed in many minds with regard to Carlyle by the 'Reminiscences' there is no question, and the consequence of it is that the Anglo-Saxon world has lost one of its best possessions; and it is a kind of possession which no apologies or explanations, and no proof of Mr. Froude's indiscretion, can restore.

There is, however, some compensation in the catastrophe. If there was nothing positive in Carlyle's moral teachings, if nobody could extract from his earlier utterances anything more definite than advice to "be up and doing with a heart for every fate," there was in the political teachings of his later works something very positive and definite, and something which he managed to surround with some of the diviner light of his first arraignments of modern civilization. There is, for instance, nothing in literature more ingenious than the way in which he presents Cromwell as the apostle of "truth" during the campaigns in Ireland, after the death of the King. He lets slip no opportunity of setting forth the importance of those military operations as a means of bringing "truth" to the Irish, so much so that the reader at last begins to expect the revelation of some formula in which the Lord-General presented the truth to them. But long before the end is reached one finds that the only truth which Cromwell was spreading in Ireland was the simple one that anybody who resisted him in arms would probably be knocked on the head. This collocation of truth and superiority of physical force, and of falsehood and weakness, was, in fact, worked into all Carlyle's writings of a political character, and did through his writings become a very positive political influence after the generation which was roused by the first blasts of his moral trumpet had grown old, or had passed away. To most men under fifty, in fact, Carlyle is more known as a very truculent political philosopher than as a moralist, and most of his later imitators—Mr. Froude for one—have imitated him rather in preparing the way of the Strong Man in government, and recommending the helpless and forlorn to strip for a salutary dozen on the bare back, than in preaching self-knowledge or the inner worship of the "veracities." That the effect of this on English politics has been bad, and very bad, during the past thirty years few will deny. It beyond question has had an evil influence on English opinion both about Ireland and about India, and about the civil war in the United States. It had much to do with the production of that great scandal, the defence of Governor Eyre, by nearly the whole of London society. Nay, we think we are not far wrong in saying that it did much to prepare the way for that remarkable episode in English history, the late administration of Lord Beaconsfield, with its Jingo fever; its lavish waste of blood and treasure; its ferocious assertion of the beauty of national selfishness; its contempt for all that portion of the population of Turkey which was weak and subject and unhappy. When one contrasts the spirit in which John Stuart Mill approached all such subjects in his day, his patient pursuit of the facts, his almost over-earnest efforts to get at the point of view of those who differed with him, his steady indifference to his own fame in dealing with all public questions, and then reads the contemptuous way in which Carlyle disposes of him in the 'Reminiscences,' one gets, we were going to say, an almost painful sense of the contrast between the influence of the two men on their day and generation.

In so far as the 'Reminiscences,' therefore, ruin Carlyle as a politician, their publication must be considered a gain for the English race. The particular political vice his influence fostered, that nobody who cannot thrash you in fight is worth listening to, is, it must be said, a vice peculiar to the English race. It is only in the Anglo-Saxon forum that a man of foreign birth and unfamiliar ways of thinking has to obtain a *locus standi* by making himself an object of physical terror. The story which has lately gone the rounds of the papers, of Carlyle's discussion with some Irishman who got the better of him in an argument in support of the logical right of the Irish to manage their own

affairs, in which he met his opponent in the last resort in half-humorous vehemence by informing him that he would cut his throat before he would let him have his independence, is not a bad expression of the spirit which has governed English policy in dealing with dependent communities. There is a certain wisdom and justice in exacting from every malcontent who asks for great changes in his condition some strong proof of his earnestness; but it is a test which has to be applied with great discretion, which nations that have made a great fortune with a strong right hand are not likely to apply with discretion, and which is apt to make weakness seem ridiculous as well as contemptible. The history of English politics for fifty years, at least, has been the history of the efforts of the nation to accustom itself to some other than the English standard of political respectability, to familiarize itself with the idea that pacific people and poor people and queer people had something to say for themselves, and were entitled to a place in the world. To the success of that effort it is safe to say that Mr. Carlyle's political writings have been more or less of an obstacle, and that the destruction of his influence will contribute something to the solution of some of the more serious pending problems of English politics.

MR. GLADSTONE'S LAND BILL.

LONDON, April 9, 1881.

THE great event of the year in domestic politics has at last arrived. Mr. Gladstone has brought in his Irish Land Bill, the measure which has filled every one with hope or fear for the last ten months, the measure of which people have lately talked as if it was to give the last and only chance of reconciling Ireland and making her a peaceable and contented member of the British Empire. Before saying anything about its contents, I had better try to state some of the reasons why the land question in Ireland is so peculiarly difficult, and also so supremely important. It is so hard as to be practically impossible for any one who has not both studied Irish history and travelled through Ireland to understand the distress and discontent of the Irish people. So few English politicians have done either the one or the other that we in England are driven to ask for light from Irish public writers and Irish members. But these have differed so widely from one another, and have usually employed such vehement language, that darkness has remained on the English mind, and men have felt sure of one thing only, that something must be terribly wrong with the land system when agitation and outrage are chronic.

Many countries in Europe have had their land questions, culminating in some grave crisis. France settled it at the Revolution; Germany a little later; Russia has only partially disposed of it. The phenomena which make the case of Ireland peculiar, and which most markedly distinguish her condition from that of England, are the following:

In Ireland the ancient lords of the soil have been several times dispossessed, and each change of owners has been accomplished with violence and left bitter memories behind. English law first turned the common land of the tribe or sept into the land of the chief; then in Elizabeth's time, again under Cromwell, again after the dethronement of James II. it drove out the chieftains and parcelled out most of the country among English adventurers. Even where the particular circumstances have been forgotten the resentment of the people has remained.

In Ireland the landlords are not only mostly Protestants, and therefore aliens in religion; of English origin, and therefore aliens in blood; but to a great extent they are absentees, living in London or on the Continent, and spending there the incomes which they draw from their pauper tenants. More than £80,000 sterling per annum thus goes out of Mayo, one of the poorest counties in Ireland, to support landlords who return nothing of it there except the salaries of the land-agents.

In Ireland improvements on the land, reclaiming bogs or mountain ground, draining, fencing, building cottages or farmsteadings, and so forth, is usually done by the tenant, whereas in England it is the landlord who pays for most of such work. This is a double evil: the landlord's money is not spent in paying labor on the spot, and the landlord has not the personal interest in the farms which the undertaking of these enterprises by himself would give him.

In Ireland there are scarcely any branches of industry other than the cultivation of the soil—no manufactures to speak of, except in one corner of Ulster; no fisheries on the coast; no mines, no iron furnaces; very little shipping on the shores, very little inland commerce by rail or river. The towns are small, and have no trade except in the supplying of such articles as the neighboring peasantry require. Thus there is really no career open to a man unless he will emigrate. Agriculture is the one occupation on which people are forced back; they are driven to pay more for having it than it is worth because the laws of supply and demand, of free competition between different trades for labor and capital, scarcely operate in this unfortunate island.

Till comparatively recent times, the tenants in Ireland, most of whom hold only from five to twenty or thirty acres of land, had been allowed to go on from father to son at the old rents. The landlords left them alone; doing nothing for them, but not worrying them nor squeezing an exorbitant rent out of them. In some parts of the country, especially in Ulster, when a tenant left his holding, when he emigrated, or died leaving only young children, or was turned out because he could not pay his rent, the good-will of the farm was sold, and the purchase money paid to him or his widow. All this was not recognized by the law, but rested only on long-established custom, which, since it was enforced by public opinion, few landlords cared to outrage. Thus legal theory and actual practice were wholly different. In the eye of the law the whole relations between landlord and tenant were those of free contract, whereby the tenant promised to pay a certain rent for a limited time, at the end of which the landlord might turn him out without any compensation, even if the tenant had greatly improved the land or erected valuable buildings, and might let the farm to somebody else, whomever he pleased, at a much higher rent. But, in point of fact, the landlord did none of these things, and would have been ashamed to do them. Contract was hardly named; it was not supposed by either party to be the substantial basis of their relations to one another. Within the last thirty-five years, however, since the famine of 1846; since the establishment of the Encumbered Estates Court, which sold off the mortgaged estates of many old proprietors and brought a new set of harsher landlords on the scene; since railways opened up the country and carried produce away to distant markets, all this has been changed. Rents have been raised, the usage of selling the good-will of a farm has been narrowed down, landlords have not hesitated to put in force their full rights, and have justified themselves by appealing to abstract principles of political economy and to the letter of the English law.

Such causes sufficiently show why the land question is so vital to Ireland, and why, from being a chronic disease, it has passed into an acute stage. And it is easy to understand, if one bears these facts in mind, what are the main grievances which the tenants complain of. First, the want of security in their holding. They are liable to be arbitrarily turned out by the landlord, even though they may have paid their rent and cultivated the ground with due care and industry. The Act of 1870 gives them a certain compensation, but this does not prevent them from dreading eviction.

Secondly, the absence of a claim to be compensated for improvements made by them to the farm. This also was partially, yet only partially, remedied by the Act of 1870.

Thirdly, the power of the landlord to exact a higher and, as they say, an exorbitant rent. This is a consequence of his power to evict; but it is felt as almost a greater evil, because it is for the sake of getting a heavier rent that he usually does evict.

Fourthly, the refusal to permit the tenant to sell the good-will of his farm—that is to say, to nominate the purchaser of the good-will as the person to succeed him in it; or the surrounding the exercise of this right to sell (where recognized, as it is in Ulster, by the Act of 1870) with a number of vexatious restrictions which diminish its value.

Fifthly, the difficulties which the complicated and expensive English law of land throws in the way of those who wish to buy small properties for themselves.

Sixthly, the existence, especially along the West coast, of a great number of very diminutive holdings—one can scarcely call them farms—ranging from two to six acres each, and obviously insufficient to support a family.

You in America may ask how it comes that, if the tenants complain of these grievances, they do not themselves get rid of them by refusing to take farms except at a moderate rent, or for a long term of years, or of sufficient size. Their deliverance might seem, with our ideas of free contract, supply and demand, etc., to lie in their own hands. The answer made is that custom and the peculiar conditions of the country, the desire to cling to and live on the same bit of land where one's fathers lived, the impossibility of making a livelihood in any other way, the consequent excess of demand for land over its supply, all exclude or seriously qualify the operation of the usual economical laws, and force the tenants to look for redress to new legislation.

So they have looked, and looked in vain for many weary years. When Mr. Sharman Crawford brought forward his tenant-right bill thirty years ago no one heeded him. "Tenant-right," said Lord Palmerston, "is landlord-wrong," and in a parliament so largely composed of landlords this answer was deemed sufficient. At last, in 1870, after the Fenian panic, an act was passed to improve the tenants' position. Its results were disappointing. Agitation recommenced; the bad seasons of 1879 and 1880 prepared the tenants for a revolt. The Land League appeared on the scene and organized this revolt for them under the nominal leadership of Mr. Parnell, but chiefly under the guidance of Mr. Michael Davitt; England was at last forced to listen. The result is Mr. Gladstone's Land Bill.

Extraordinary curiosity had been manifested to learn its provisions, which, it was rumored, had been so elaborately discussed and so frequently changed that not less than twenty-three different drafts of the bill had been successively printed for the use of the Cabinet. But the secret was well kept until, two days before the date fixed for introducing the measure, one of the daily papers published what purported to be an abstract of it, but turned out to be really an abstract (apparently surreptitiously obtained) of one of these earlier drafts. On the momentous evening every available gallery-seat had been bespoken long beforehand, and the attendance of members themselves was greater than it has been at any time even during this exciting session. The chief performer was evidently in a state of high nervous tension. Three days before he had made in a speech of more than two hours' length, full of complicated figures, his financial statement for the year. But this effort did not seem to have told upon his strength, wonderful for a man past seventy-one. When he rose he was cool, calm, and forcible, speaking with perhaps a shade more than usual of seriousness in his easy dignity. The statement was singularly plain and business-like; nor was it till quite the end that he allowed himself to rise from details into a strain of grave and lofty eloquence. Similarly, the interest which the audience felt in the substance of the discourse was too intense to let them take much thought of its form. During two hours every sentence was caught up and noted with growing eagerness, men forgetting to cheer in the effort to follow, grasp, and apprehend the effects of the various provisions which were being unrolled before them. When the statement was over hardly any one ventured to pronounce a judgment on it as a whole. Even now, after several days, public opinion remains to some extent in suspense, only extreme partisans having been bold enough to condemn it, while the vast majority are inclined to believe that it will turn out, when fully explained and considered, to be as satisfactory a compromise as can be hoped for on a subject of so much difficulty.

Its scheme is far too complex, too full of technical details, to be capable of being set forth in a letter like this; so I will only indicate generally how it meets the grievances already enumerated. It gives the tenant an ample power of selling his holding (reserving to the landlord the right of pre-emption at a price fixed by the court). It enables him, whenever the landlord seeks to raise the rent and at any other time, to apply to the court to fix the rent to be paid, which rent is not to be altered for fifteen years. The landlord is prohibited from turning a tenant out of his holding except for certain specified causes or in pursuance of the authority of the court—the court being throughout a local court, from which an appeal lies to a higher body created by the bill and called the Land Commission. Thus, what the tenants have demanded under the name of "the three F's"—free sale, fair rents, fixity of tenure—are practically given, although the second is very much left to the discretion of the court, and the third attained by an intricate machinery which the Irish peasant may perhaps fail to understand. These are, indeed, the two obvious defects of the measure—its great complexity and the wide discretion it leaves to the court. Both are perhaps unavoidable, for they arise from the necessity of conciliating and appearing to save the rights of the landlord even when conceding the demands of the tenant. And there is some danger that, while the landlords may think that their present strong legal position has been destroyed, the Irish tenants may be too much puzzled by these elaborate details with which the bill bristles, and have too little confidence in the liberality of the proposed court to be really satisfied with the scheme. It is round these provisions that the controversy of the next few months is likely to rage. But the bill contains other clauses likely to be scarcely less useful and to be more universally welcomed—those which enable the Land Commission to make loans of money to tenants to aid them in purchasing their holdings, to assist projects for the reclamation of waste lands, to organize or help in organizing emigration on a large scale. The only objections to be apprehended to this part of the measure is from those who fear that this may lead not only to the wasting of public money, but to further political difficulties between the Government as a creditor and the peasantry as debtors. This, however, will become a real danger only if loans are made on a very large scale, a scale much larger than Mr. Gladstone seems to contemplate.

It is too soon yet to say how either the Conservative party or that which follows Mr. Parnell will behave when the second reading of the bill is taken, on April 25. The English landlords, of course, greatly dislike it, and may be emboldened to resist it in the House of Commons, as well as in the Lords, by the fact that so eminent a politician as the Duke of Argyll has, in spite of his personal attachment to Mr. Gladstone, quitted the Cabinet rather than be responsible for a measure which he thinks economically wrong and unfair. (He is a great land-owner in Scotland and very strict in enforcing his full legal rights.) On the other hand, the Irish landlords, nearly all of whom are Tories, are believed to wish that the bill may pass. They are tired of struggling with their tenants; they are depressed by having received very little rent for the last two years; they fear that if they do not accept this measure a worse thing may befall them. Their counsels are likely to be for peace, and would probably prevail with the cool head of Lord Beaconsfield. But Lord Beaconsfield lies in great danger, and, if he should pass away, the leadership of the Tory party might devolve on rasher men. Y.

MUSIC IN VIENNA.

VIENNA, April 2, 1881.

M. LÉO DELIBES and his last opera have been the subject of much private and newspaper talk in Austria-Hungary during the last few months. A week or two ago "Jean de Nivelle" was brought out at Pesth; and now at last, after much delay, it has also made its appearance in Vienna. It had already been accepted for performance last October, the part of *Arlette* having been originally intended for Frau Lucca. But as it was found not to suit her taste or style, Frl. Bianca Bianchi was entrusted with it. Subsequently a delay was occasioned by Bianchi's departure for St. Petersburg, where she remained a couple of months; and some final postponements were due to the exactions of the composer, who, here as at Pesth, personally superintended the rehearsals, although he did not conduct. The procrastinations, in a word, were so numerous that some wit aptly called the opera "Jean der nie will."

Although "Jean de Nivelle" is only a year old, having first seen the light at the Opéra Comique at Paris on March 8, 1880, it has yet had a success very unusual in these days, having had so far over a hundred performances at that theatre. This fact, coupled with the numerous postponements, served to excite considerable interest in the work, so that the opera-house was crowded to the last inch on the first night. But I venture to say that at the close of the last act there were not half a dozen people who did not, on regaining the open air, feel like a lot of school-boys just released after several hours of tedious work. The unanimity with which, when a new opera is produced, all the critics denounce the libretto as silly stuff, to which the failure of the music must be mainly attributed, is getting to be not only monotonous but positively comical. But what can the poor critics do? A fact is a fact and must be recognized as such. How a man of so much taste and tact as Delibes has shown himself by his music, could accept such rubbish as this joint work of MM. Gondinet and Gille and set it to music, is past comprehension. There is not a single flash of wit in it, not the slightest dramatic motive or even connection in the events; and the persons in the play talk and behave like babies. I have only succeeded in extracting from it a few hints, which, with some hesitation, I venture to offer to indulgent readers.

Jean de Nivelle, the hero of the opera, has fled the court of Louis XI. in order to escape a matrimonial alliance with the ugly daughter of a foreign ambassador. He is in reality a count of Montmorency, but in the first act we meet him in the forests of Burgundy, near Armançon, disguised as a shepherd and with the pseudonym of Jean de Nivelle. He is known in these regions as a man who always runs away when he is called, or, as the French song, based on an historical fact, has it:

"C'est ce chien de Jean de Nivelle,
Qui s'en va quand on l'appelle."

The only person whom he does not avoid is the beautiful peasant girl *Arlette*. *Arlette* has been chosen by the sorceress *Simone* as the future bride of her son, who fortunately does not make his appearance, being kept in prison during the whole of the three acts for having committed theft. *Arlette*, however, tells *Simone* that she hates her son and will never consent to marry him, because she loves the unknown shepherd. *Simone* in return vows to work the ruin of *Jean*, whom she suspects, on account of his refined manners, of being the fugitive count whom two courtiers have been despatched to find and bring back, to be punished for running away from his bride and an impending war with Burgundy. Act the second takes place in the ducal palace at Dijon, whither *Arlette* has gone for some obscure reason or other. So much, however, seems clear, that her lover has been thrown into prison by a courtier named *Saladin*. This courtier takes a fancy to *Arlette*, and to secure an interview with her sends her a forged letter purporting to come from *Jean*. But his plot fails, for at the critical moment *Jean* escapes from prison and kills *Saladin*. For this he is sentenced to be hanged by the neck until dead; but he prefers to die as a nobleman, and therefore tells his real name and birth. No sooner has he done so than he is set at liberty by *Count Charolais*, who begs him to become his ally in the war which has just been declared. In the third act we hear a good deal about this war, the outcome of it being that *Jean* secures a victory for the Burgundians, but nevertheless at the end passes over to the French. Louis XI. offers him pardon if he will return to Paris; but *Jean* having meanwhile discovered that *Arlette* has not broken her faith, as he had suspected, prefers to remain and marry her.

So much for the story, which, be it remembered, is only advanced here as an uncertain hypothesis, subject to correction. The bare outline of the plot is so completely covered up with "spring poetry" that it is almost impossible to find it. The music is much better. Delibes was already previously well known in Vienna through his charming ballets "Sylvia" and "Coppelia," and his opera "Le Roi l'a dit." The latter I have never heard; but in his ballets the music is so thoroughly appropriate to the action that there was

reason for believing that he would succeed equally well in adapting his music to the spirit of the words and the action in an opera. He has done so in the one genuine dramatic episode of "Jean de Nivelle"—the incantation, or *Ballade de la Mandragore*—and would probably have done so in other places had there been any capable of exciting his creative powers. The piece referred to is quite original and impressive, partly owing to its exotic character. Indeed it might have been written by Bizet. Delibes was fully aware of its beauty, for he makes it recur as a sort of leading *motif* at intervals throughout the opera. There are, of course, numerous other passages that display the cleverness of the author, his tact in the combination of instruments, his command of musical form, and, above all, his avoidance of downright commonplace and trash, such as Brüll's operas consist of. Yet it is difficult to understand how M. Saint-Saëns could bestow the epithet of "perfection" on an opera in which, with the one exception mentioned, the lack of new ideas is so conspicuous. One act of Bizet's "Carmen" is worth a dozen operas like this. Bizet was rather reckless in the way he borrowed other people's ideas, yet there is in his opera so much that is new and his own, and such an uncommon dramatic instinct, that, had he lived, he would doubtless have become the greatest dramatic composer France has produced. Delibes will never take his place. His talent is admirably adapted for the ballet, and to that he ought to devote his powers. Bizet would have never committed the blunder of accepting such a libretto as that of "Jean de Nivelle." Nor would he have undertaken a task to which, unfortunately, Delibes subjected himself in preparing his opera for Vienna. In Paris "Jean de Nivelle" belongs to the category of opéra comique—that is, the music is interrupted by spoken dialogue. This dialogue Delibes changed into recitative with orchestral accompaniment, which makes the opera a great deal longer and does not add an item of beauty to it. He has already seen his error, and the second performance has been postponed for a few days, when the opera will appear without the recitatives. The reception on the first night was not enthusiastic. After the first act the applause was scant. After the second the vocalists were twice recalled, dragging with them the composer; and this performance was repeated at the end. It was what is called a *succès d'estime*. I doubt if "Jean de Nivelle" will remain on the répertoire, either with or without recitatives.

This seems to be the season of charity concerts, or "Musikalische Academien," as they are often called. Usually they consist of declamation and other things besides music, and are not very well attended. At a concert of this character, given for the benefit of the pension-funds of the opera-house a week ago, the principal attraction lay less in the programme than in the executants. Among them were Materna, Braga, Stahl, Rokitansky, Horwitz, and Walter of the Royal Opera; the pianist Heymann, who played in his usual brilliant but rather cold manner; and two young brothers, Arnold and Edward Rosé, whose performance on the violin and 'cello respectively was not without merit. But by far the most remarkable feature was the performance of Brahms's "Liebeslieder," for soprano (Minna Walter), alto (Bettelheim-Gomperz), tenor (Herr Walter), and bass (Herr Rokitansky), with pianoforte accompaniment for four hands by Brahms and Hans Richter. These two artists seem to live on the best of terms, in spite of the fact that the latter is one of Wagner's leading apostles. Some of the "Liebeslieder" are well known and good, and were therefore warmly applauded; but served up *en masse* in this way they proved somewhat monotonous, so that at the end the applause hardly sufficed for a recall.

At the last Philharmonic concert Brahms's new "Academische Fest-Ouverture" was performed, and showed its author in the most favorable light. It is decidedly superior to its companion, the "Tragische Ouverture," because it is less erudite and obscure. What Brahms lacks is inspiration, and this in the present case was furnished him by some students' songs which he has woven into his overture. One must not only be a great musician, one must also have been a student and sung these songs in his youth, as Brahms has done, to be able to subject them to such clever and effective treatment. The inspiring rhythms and brilliant modern instrumentation of this overture make it an admirable prelude for festive occasions, and I do not hesitate to predict for it as wide and lasting a popularity as have some of Weber's and Mendelssohn's overtures. There is even a touch of humor in it—an element which I had never before noticed in any of Brahms's works. For the first time, also, have I heard an audience greet a new work by Brahms with applause that came from the heart and not from the faculty of esteem. Of course, it does not rank as his greatest work, but yet one cannot help wishing he would pursue this vein and embellish some more student-songs with golden frames. Nothing is more conspicuous in recent operas than the adoption of characteristic folk-songs; and within reasonable limits the same proceeding would meet with approval in concert pieces. As these melodies are well known everywhere, no one would accuse the composer of plagiarism, while he could gain an advantage which literature has hitherto had over music—the right to make a quotation. Brahms's overture was preceded by Spohr's "Jessonda" overture, and Beethoven's "Concerto for Violin," fairly rendered by Ovide Musin. The last piece was Volkmann's "First Symphony in D Minor," which should be better known than it is, as it contrasts favorably with most modern symphonies by the freshness of its themes, its tasteful instrumentation, and, above all, by elegance of form and the fact that the composer had the good sense to stop short as soon as he had said all he had to say.

Correspondence.

MR. ADAMS AND MR. THURBER.

To the Editor of The Nation:

Sir: I see that in your last issue Mr. F. B. Thurber undertakes to comply with my request, that he would refer me to the passages in the reports of the Massachusetts Railroad Commission in which I "condemn in the strongest terms the practice of capitalizing surplus earnings." He sees fit, by the way, to change the last three words between the quotation marks from "capitalizing surplus earnings" into "stock-watering"; thus ingeniously shifting the issue from the special one, made by me, into a (to him) more convenient general one. I submit that, if he pretends to quote, he should quote correctly.

So far as the extract from the report of 1875 is concerned, I had by no means forgotten it. I wrote that passage, and thought it good sense then. I think it is good sense now. It does not, however, in the slightest degree help Mr. Thurber's case. It illustrates, indeed, rather curiously the little effect that laws prohibiting stock-watering have towards causing tariff reductions. Certain roads in Massachusetts, at the time that report was prepared, made full ten per cent. dividends, and then devoted their surplus net earnings to construction, keeping rates up meanwhile. I pointed this out in the passage Mr. Thurber quotes, and, as commissioner, argued that in these cases all the net earnings should either be divided among the stockholders of the companies, or applied to tariff reductions; but that they should not be tucked away in new construction. That was to be paid for by issuing new capital. If, however, dividends had not been paid, or but half dividends had been paid and the rest of the net earnings had been applied to new construction, then the surplus earnings, up to ten per cent. on the stock, ought to be capitalized. I did not perceive, however, that my arguing led to any reduction of rates.

I think Mr. Thurber will have a good deal of difficulty in hunting up, in the reports signed by me, passages "condemning in the strongest terms" even stock-watering, pure and simple. However, it is not very material to me, or any one else, whether he finds them or not. If it is any satisfaction to him I will say at once that, with much careful search, I have failed to detect any perceptible effect which railroad capitalization has on railroad rates. I do not see that those rates are lower in Massachusetts, where stock-watering has been practised to no considerable extent, than they are in New York, where Mr. Thurber complains of it so bitterly. It has, therefore, long been my impression that capitalization could safely be left to regulate itself, and that tariffs were controlled by other influences.

Mr. Thurber also says:

"It may be that I am more than usually obtuse, but I cannot understand one of Mr. Adams's expressions—viz.: 'As a rule, in this country a fair profit on capital is when a road earns net fifty per cent. above the cost of its operation; in England it is over one hundred per cent. Nor is there any excessive profit in these figures.'

"Now, does Mr. Adams mean that fifty per cent. of every hundred dollars of gross receipts is a fair profit in this country, and if so, how can it be that in England there can be over one hundred dollars net on every hundred dollars of gross receipts? If, on the other hand, he means that a road in this country ought to earn net thirty-three and one-third per cent. of its gross earnings, and in Europe fifty per cent. net of its gross earnings, why does he not say so?"

In the language quoted I meant to say exactly what I did say. Mr. Thurber had been speaking of "ten per cent. above the cost of operation" as being a fair profit on railroad capital. I gave him credit for understanding the meaning of the elementary terms he used. He now says that he did not understand them, but included "interest on the capital actually invested" as a "part of the cost of operating." As his case now stands, then, after correction, Mr. Thurber considers ten per cent. above operating expenses, *in which he includes interest on capital*, a fair railroad profit. Few railroads would, I fancy, object to this rule. I submit that it is not I who "quibble," but Mr. Thurber who has not yet succeeded in saying what he means.

Cost of operation is, however, a perfectly well understood term in railroad parlance. It never, under any circumstances that I ever heard of, includes interest on capital. To pay interest on the capital invested in them railroads in this country must, on the average, earn their operating expenses and half as much, or 50 per cent., more. In England they must earn their operating expenses and as much, or 100 per cent., more. In neither country would ten per cent. above operating expenses begin even to pay interest on capital.

This was what I said ; and this was what I meant to say. I fail to see how I could have expressed myself more clearly.

Referring to the quotation he makes from one of the reports signed by me as a railroad commissioner, Mr. Thurber further says :

"The above is not the only instance in which Mr. Adams has exhibited a short memory since he entered the service of the railroads. When the bills proposed by the Hepburn Committee for the prevention of railroad abuses were pending at Albany last winter Mr. Adams was quoted on both sides of the same question, and one of the speakers, in commenting on this fact, stated that Mr. Adams had graduated from a Massachusetts railway commissioner at four thousand dollars per year into a pool-line commissioner at ten thousand dollars per year, and as a commissioner of the pooled lines he entertained very different views from those he advocated when chairman of the Board of Railway Commissioners of the State of Massachusetts."

Passing by the question of taste involved in this style of discussion, I have only to confess that, during the years I have been investigating the railroad question, I have seen occasion to modify my views very frequently. I hope for quite a number of years to come, in the light of a larger knowledge and experience, to modify them still further from time to time. Whenever I do thus modify them, also, I propose on proper occasions to acknowledge the fact. Heretofore, I believe I have not failed to do so. Sticking for consistency's sake to a wrong opinion, after you come to see it is wrong, is a kind of lying which is common enough ; but I can't say I admire it. Meanwhile, I am not aware of any particular change my opinions have undergone since, as Mr. Thurber is pleased to express it, I "entered the service of the railroads." On the contrary, I have, while in that service, been very strongly confirmed in the views I had previously entertained, and, as Mr. Thurber very well knows, openly expressed. I have, however, seen the thing from the other side.

Since I have begun confessing, perhaps I may as well go on ; what I have to say may possibly interest other of your readers, as well as Mr. Thurber. What is called the railroad problem seems to me, more now than ever before, a thing perfectly easy of solution ; and yet one the practical solution of which is, under existing circumstances, hardly to be hoped for. The difficulties in the way are very obvious. Our laws, the political catch-words which outweigh all argument, and an uninformed public opinion do not allow the railroad system to follow out quietly its natural course of development, subject to an intelligent restraint when that development runs into essential abuses. We are always pounding away at it, it is true ; but generally after a crazy, mistaken fashion, or on some false or quite immaterial issue. The weak points of the system are not commonly known ; the patience necessary to find them out is looked upon as a sign of timidity or treachery ; and thus every attempt at dealing with a really great and intricate subject assumes, soon or late, the form of a new, quack, cure-all, legislative pill. Now, in dealing with the railroad corporations of this country, the passionate denunciation in which the orators of the Anti-Monopoly League are wont to indulge is not going to accomplish much. Neither will the ignorant and vindictive legislation to which doubtless that denunciation will lead. That these will accomplish something I would not seem to deny. So, perhaps, would a mob hooting and throwing bricks at a fortress. They would, at least, break any windows there might happen to be about ; and, perchance, might bruise some of the garrison. That they would cause the place to surrender is possible, but highly improbable. That would call for a trained force and a siege. So it is with the railroad question. What is needed, it seems to me, is the continuous pressure, and the steady building up of legislation, which can only come through the employment of trained specialists—a class politically despised, but of which the railroads avail themselves with good results to them.

Such are the present situation and outlook, as I see them. Mr. Thurber says, very frankly and characteristically, that my habit is to shape my opinions to meet the views of my employers for the time being—whether the public or the railroads. It is, perhaps, natural enough that he should think so, and I am not going to fall to scolding on that score. As respects the railroad position I now hold, however, I will freely acknowledge one thing : I accepted it in the hope of doing something toward remedying certain glaring and notorious abuses in our system of railroad transportation. I refer especially to discriminations and fluctuations in rates. My efforts in that direction have met with only a very modified degree of success, and have not, it seems to me, been of great value to my employers. I should consequently have severed the connection long ago, had not my friend Colonel Fink, who is really doing a work of vast public value, over-persuaded me. The fact is, however, that I am so far from wishing to have any "employers" at all, or caring for their opinions, that there is but one possible position connected with the working out of this railroad problem which I covet. I should like for the next ten years to represent the United States officially in the discussion which ought to take place ; just as, during ten of the last twelve years, I represented Massachusetts. There would then be, so far as I, at least, should be concerned, no terrible grapple with a great monopoly—no life-and-death struggle for popular liberty—nothing, I fancy, even remotely resembling that sort of thing. There would, though, be a good many tedious investigations—a great deal of rather intricate discussion—the gradual exposure of a large number of abuses ; and, finally, some very prosaic suggestions of laws calculated to correct them. It seems to me blood and thunder is a little out of place here, though I dare say it may serve its purpose for a party leader almost in despair in his long hunt after a taking political issue.

I have no idea that either through myself, or any others more or less competent than I, the course I have indicated will be pursued. The dislike and distrust, not to say the contempt, felt for all specialists and specialist work in our political circles is so marked that it is ten to one the country will have to wallow through this difficulty, as it has wallowed through so many others. Fortunately it is strong, and, when it comes to wallowing, has an enormous staying power. The process, however, is not an edifying one. But, as things are now going, it is the railroads themselves which will force an issue of the railroad problem. In doing so, however, they would be much aided by a stronger and more wisely-directed Government action. Indeed, their chief present difficulty is that the outside pressure, at once intelligent and constant, which would compel the correction of those internal public abuses of their system from which they are themselves the greatest sufferers—this healthy outside pressure they do not now feel. Consequently, they are apt to run riot.

They also, however, will doubtless wallow through somehow. Meanwhile, the net result of that "graduation" of mine from one side to the other of this issue, to which Mr. Thurber so pleasantly refers, has been to afford me, at any rate, a new illustration of old Oxenstiern's famous aphorism in regard to the amount of wisdom with which the world is governed. That, perhaps, is not much to get after going so far ; but it is something.

Mr. Thurber will have to excuse me from any further discussion.

I am, etc., C. F. Adams, Jr.

Quincy, April 23, 1881.

THE RAILROADS AND THE STATE.

To the Editor of The Nation :

Sir : I have been a careful reader of the *Nation* for ten years, and, though by no means always agreeing with its conclusions, its discussions of important public questions have always commanded my highest respect. But I must confess that its articles in the last two numbers on the Railroads and the Anti-Monopoly League have surprised me. These articles seem to me very unfavorably but remarkably distinguished from any I have ever read in your paper. I do not mean to be impertinent by asking a few questions.

Are not the sovereign powers of the State held by it in trust for the good of the whole people? If they are, can they be anything other than *public property*, even though delegated, for convenience, to a private individual or corporation? And would not the individual or corporation be bound to wield the sovereign powers delegated, primarily, in that interest for which they exist? Could they not, consistently with enlightened governmental policy, be called to account for a failure to do so? Will the *Nation* deny that the *eminent domain* and the right to take toll are sovereign powers and can never be exercised solely or primarily in a private interest?

If they cannot, when a private corporation attempts so to exercise them, or does so exercise them, is it not as much a *conversion* as if Smith fed his cattle with Brown's fodder? And would not a law to restrain such an exercise be more a law in restraint of robbery than in restraint of trade? When Brown takes advantage of Smith's necessities and exacts more than lawful interest, it is usury. The law limiting the rate for the use of money is a usury law. But is a law which restrains Brown from first taking Smith's money, and then making Smith pay him a high rate of interest on his own money, a usury law? Is a law forbidding a railroad company, through the indirect but most effectual means of discrimination, from transferring for a consideration $1,000 of Smith's money to Brown, a law in restraint of trade or in restraint of a criminal brokerage?

Now, I am just crazy enough (and am willing to take the odium of being thought so) to believe that if Mr. Vanderbilt and his freight agents do this kind of things, *both* the agents and Mr. Vanderbilt ought to suffer fine *and imprisonment* for a violation of the primary laws of property and of society. And I, for one of the Anti-Monopolists, prefer to look to the State of New York rather than Mr. Fink's grace to protect my rights. In this position I do not overlook the importance and difficulty of the economic questions involved in railway management.—Very respectfully,

Robert P. Harlow.

New York, April 25, 1881.

[To the first five questions we cheerfully answer yes, and put one of our own—What of it? If our correspondent means to convey the idea that the State has delegated "sovereign powers" to the railroads, we deny it. No corporation has, to our knowledge, in this country exercised

the power of "eminent domain" or of "taking tolls." Consequently, we know of no corporation which has been guilty of a "conversion," like Smith's use of Brown's fodder to feed his cattle. The railroads have obtained the permission of the State to effect a compulsory purchase of land for their lines at a fair price, because it was believed that in making their lines they would furnish the public with a great convenience. The money they collect from passengers and freight is not a "toll," but the remuneration for transportation, such as has always been furnished by common carriers. When they made their lines no one was compelled to use them unless he pleased, or is now compelled; on the other hand, Smith, in feeding his cattle with Brown's fodder, was, if we understand the transaction, guilty either of simple theft or of robbery *vi et armis*. He took the fodder without any color of right, and never offered anything in payment for it. The law which restrained Brown from first taking Smith's money and then making him (Smith) pay interest on it, would not, it seems to us, be a "usury law" exactly, but a statute making robbery an indictable offence. Such a law exists in every civilized state. How Brown makes Smith pay him interest on the money already stolen, except by fresh acts of violence, we fail to perceive. If he collects the interest by violence he is undoubtedly liable to a fresh indictment and a separate sentence. We cannot, without seeing more than our correspondent's very compendious summary of it, say whether a law "restraining a railroad company from giving Brown some of Smith's money would be a law in restraint of trade, or in restraint of criminal brokerage." If Smith owed the money to Brown we should say it was a law in restraint of trade, while if the railroad held the money as stakes in a gambling transaction it might be a law in restraint of criminal brokerage. We do not exactly understand, either, what "the kind of things" is for which our correspondent wishes to send Mr. Vanderbilt and his agents to jail. If they have been giving Brown's fodder to Smith's cattle, or have been helping Brown to rob Smith of money, and then rob him again of more money on the grotesque plea that he was bound to pay interest on what he had already lost, we think they ought to suffer a long term of imprisonment at hard labor.—Ed. Nation.]

THE BESSEMER STEEL MONOPOLY.

To the Editor of The Nation:

Sir: I would call the attention of Mr. Thurber and the Anti-Monopoly League to a monopoly much more real than the so-called railroad monopoly about which they are so much exercised. I refer to the manufacture in this country of Bessemer steel rails, of which I will briefly state the following facts:

This important industry is in the hands of but eleven companies, and is rendered a veritable monopoly by a double protection; it being protected against domestic competition by a number of patents held by the Pneumatic Steel Association, of which these eleven corporations are stockholders, and against foreign competition by a tariff of $28 per ton, amounting at the present price of English rails to about 85 per cent. Against our patent laws in general—although believing them to need much improvement—I will say nothing. But such a tariff on an article of prime necessity and one already protected by patents is simply iniquitous. The revenue to the Government is small, and would be nothing were it not for the fact that the capacity of the Bessemer mills is not equal to the present demand. In fact, a few years ago (I think 1878) no steel rails were imported, the Government thus getting no income from this source, while the employees of the steel-mills were reduced to starvation wages, and the country had to pay nine million dollars more for its steel rails than it could have bought the same rails for abroad. So, of the four interested parties, the Government, the consumer, the employee, and the manufacturer, the last only was in the slightest degree benefited. Was there ever anything more selfish and indefensible?

But all has not been told. While enjoying a complete monopoly of the home market under the paternal protection of a tariff ranging from 85 to 125 per cent., the Bessemer steel manufacturer, quite forgetful of other home industries, has been importing in large quantities Spanish, African, and other foreign ores, the ore-mining industry being looked after to the extent only of a tariff of 20 per cent. ad valorem.

Now, railroads are not protected either by patent or tariff laws, and wherein the monopoly consists is past my comprehension. If the New York Central or any other railroad is making an undue profit on a watered capital, there is no legal obstacle to Mr. Thurber and his friends building a competing road with bona-fide capital and making still greater profits. But should Mr. Thurber, attracted by the enormous profits of the Bessemer steel ring, determine to build a competing steel-rail mill, he would, I think, learn the meaning of the word monopoly.—Yours truly, Como.

Phillipsburg, N. J., April 19, 1881.

ARMY DRUNKENNESS AND THE APACHE WAR.

To the Editor of The Nation:

Sir: In the *Nation* of the 7th ult. there is a communication signed "W.," asking for information about the matter of drunkenness and the cause of the Apache war.

Now, sir, that disastrous outbreak of the Chief Victorio, and all of its sequent horrors, were unquestionably brought about by the bad conduct of a drunken lieutenant of a negro regiment. *He was court-martialled*, but not until a long time after the offence, and until public clamor long continued demanded it, and his conviction did not take place until he appeared before the court several times drunk. During the progress of his trial he was arrested on the street by the civil authorities of Santa Fé for disorderly conduct. He would have been screened had his conduct not been so infamous subsequent to the main offence as to put him beyond the pale of sympathy of a false *esprit de corps*.

But, beyond the initial crime of causing Victorio's rebellion, a much greater outrage upon the rights and security of the innocent settlers was the imbecile and useless manner in which the war was carried on against him. The chief was never subdued until he went into Mexico, and there was crushed by General Terrèsas. His contempt for the colored soldiers and their officers engendered a reckless impunity that made him an easy prey to the Mexicans.

Mr. Hayes is unjustly held accountable for the reinstatement of drunken officers convicted by court-martial. The remission of these sentences was nearly always, as the general orders will show, an answer to a prayer by the courts themselves for a mitigation of their sentences. The frontiersmen make no sweeping charges against the Army; because there are regiments and regiments, and officers and officers, as we all know. After the war there was a popular clamor that induced the Government to promote many men from the ranks. The colored regiments, until the later drafts from West Point, were officered in that way and from civil life, and the former is the worse method of the two.

Some officer stated in a letter to your paper a year ago that his objection to this class of officers was, they were so self-assertive. I suppose an English translation of this remark is that they were overbearing and coarse in manner. The frontiersman's objection is not so refined, but that they have failed in the sagacity and energy necessary to successful partisan warfare. While this colored regiment has been here these Indians have scourged us, verily, as a scourge of God. The untold torments of the settler became more and more unendurable, until the Mexicans in protecting themselves protected us.

One thing, however, I will say in conclusion. The young officers from the Academy have by long odds made the best, in every way the most successful, Indian fighters. Whatever may be the cause, whether it is the result of the mental gymnastic from the curriculum there, or their physical training, or their being better material *ab origine*, one thing is undeniable—they have adapted themselves to the peculiar necessities of the case; they have mastered the strategy of the Indian sooner, been more persistent in following him, and encountered him with more *vis* and *verve*. This much I must say. I could say no less.

Pardon the length of this, for I have no time to make it shorter. I necessarily write *currente calamo*. Ranchero.

Silver City, New Mexico, April 17, 1881.

THE NEGRO AT THE SOUTH.

To the Editor of The Nation:

Sir: Having had occasion to travel somewhat widely in the Southern States during the past two winters, it may not be amiss for me to say that, so far as I have been able to judge, after much careful enquiry and observation, the condition of the Southern negro and his relation to the whites are much more promising than the average of communications to Northern newspapers would indicate. I may be wrong in my estimate, but I feel very sure that nowhere has any ignorant peasantry made such progress within so short a time as have these negroes; nor have a poor peasantry anywhere been so encouraged and aided in their progress by the more fortunate classes about them.

I do not mean to say that there is not yet a vast deal of ignorance, brutality, and sullenness, nor that by any means a majority of the whites regard the negro with special friendliness; but I think I see an improvement in this respect even within the space of a single year. I have talked with persons of all classes, and in such a manner as not to lead people to talk for effect;

and, so far as I can see, the opinion of all whose opinion is of value and whose influence is important is one not only of sympathy and hopefulness, but of actual pride in the result of their home-efforts for the improvement of the blacks. Repeatedly have I been told that the negroes of that particular locality were "the best class of working people in the world." Testimony is uniform as to their increasing industry and thrift, their pride in the education of their children and in the ownership of their homes, as well as in success in their little agricultural enterprises. It is said on every hand that, while the race has not improved in the matter of chastity—a virtue mainly unknown to it—they have improved in every other respect, being ambitious for the possession of property and giving great evidence of self-respect. I may have taken a wrong impression in the matter, but the uniformity of the testimony of others and my own observation indicate that I am right. Not the least hopeful feature of the matter is the spirit of the whites of all classes regarding it, and regarding the introduction of those habits of thrift and tolerance and personal industry and enterprise which are seen to have been so effective at the North. If only politics could be suspended for five years the country would unite itself on a most secure basis.

GEO. E. WARING, Jr.

NEWPORT, R. I., April 21, 1881.

Notes.

GINN & HEATH publish immediately 'Wood-Working Tools; How to Use Them,' a manual prepared for the Industrial School Association of Boston. It is the result of much practical experience and criticism, and is illustrated in a very original way by drawings made after photographs exhibiting the proper attitude in the several operations.——Dodd, Mead & Co. will reprint Rawlinson's 'Ancient Monarchies,' with the illustrations, in a handsome manner. They have also in preparation a student's edition of Lübke's 'History of Art,' at a reduced price.——An American edition of Dr. Emil Holub's 'Seven Years in South Africa' will be issued by Houghton, Mifflin & Co. in two octavo volumes, with maps and many illustrations.——A picturesque history of Rhode Island, by a graduate of Brown University, is announced by J. A. & R. A. Reid, Providence.——Dr. J. Hammond Trumbull has in preparation a very valuable 'List of Indian Names of Rivers, Mountains, and other Localities in Connecticut, with Interpretations.'——In our obituary notice of the late William Beach Lawrence we overlooked the fact, which we had previously reported, that the fourth volume of his French work on International Law ('Commentaire sur les Éléments du Droit International') appeared last October (New York: F. W. Christern).——Mr. Edward S. Philbrick's 'American Sanitary Engineering' (N. Y., the *Sanitary Engineer*) comprises a series of twelve lectures originally delivered before the School of Industrial Science in Boston, and partly published already in technical periodicals. They treat of Ventilation, Drainage, and Plumbing, and contain, especially in what relates to plumbing, some very good practical suggestions. Much of the matter, particularly in the earlier lectures, might have been omitted, we think, without impairing the value of the book.——Part XIII. of Dr. Grove's 'Dictionary of Music and Musicians' (Macmillan) extends from J. R. Planché to Hans Richter. The great names embraced in it are those of Pleyel, Porpora, Purcell, Raff, and Rameau; the more interesting general articles are polka, programme, programme-music, quartet, recitative, and requiem, in which last is given in brief the curious story of Mozart's 'Last Requiem.'——Parts 9 and 10 of Ebers's 'Egypt' (Cassell, Petter & Galpin) continue the account of Cairo, with the usual wealth of illustrations.——The International News Co. are agents for the United States of 'Letts's Popular Atlas,' of which six parts have appeared. The whole number contemplated is not stated, but the subscriber is not committed to an indefinite series: he may discontinue at any moment. Though not of the first order of excellence, in accuracy or in execution, they serve well the common needs of reference, at a price per map of ten cents. The United States will ultimately be represented in detail on a scale befitting its importance and not customary in foreign atlases.——Scribner & Welford are the American publishers of the sixth edition of Stormonth's 'Etymological and Pronouncing English Dictionary,' a handy and compact work, following the German example in its word-groupings as well as in fineness of type, of which weak eyes should beware. The supplement to this edition will reward comparison with those to Webster and Worcester.——J. W. Bouton will receive subscriptions for Walter Crane's 'The First of May: a Fairy Masque'—upwards of fifty designs, reproduced from the original drawings by Goupil's photogravure. There will be 500 copies only, on India paper, in first and second proofs, and numbered. Mr. Bouton is also the American publisher of a fac-simile of Dame Juliana Berners's 'Boke of Saint Albans,' a treatise on the art of hunting (1486).——From the Government Printing-Office has just appeared the Second Report of the U. S. Entomological Commission, whose labors have already been so productive of good and so creditable to American science. It covers the years 1878–79, and is well supplied with charts and illustrations. At the end will be found a bibliography of some of the literature concerning destructive locusts, by B. Pickman Mann. Dr. Packard's study of the brain of the locust, for which he manifests a certain respect, is a noticeable feature of this report.——A condensed English version of H. Kiepert's 'Manual of Ancient Geography' has been made, with the author's careful revision, for the use of schools (Macmillan, 12mo, pp. 309). The latitude of abridgment ought to have ensured an idiomatic translation, but the difficult sentence introducing the account of Armenia (§ 75 of the 'Lehrbuch,' § 44 of the 'Manual') is an instance to the contrary. An index of names is a real improvement upon the original.——To the catalogue of the Exhibition of American Etchings now to be seen at the Boston Museum of Fine Arts Mr. S. R. Koehler has prefixed an account of the history, process, and function of etching which makes it an instructive vade-mecum for visitors.

—A novel periodical has been launched at Bangor, Maine, by the author of the "Q. P. Indexes," entitled the *Monograph*. It is a fortnightly publication, in paper covers, ranging from four pages to twenty-two in the six numbers before us, each of which, save one, is provided with a special index. The subjects are as follows: "France; its Growth and Consolidation," by E. A. Freeman; "The Countess of Albany, Charles Edward, and Alfieri"; "The Venetian Inquisition"; "Herder, Goethe, and Carl August," by Karl Hillebrand; "Cleopatra"; "Puritan and Cromwellian England." The peculiarity of some of these monographs is that they are not derived from a single source, but are pieced from several, without quotation-marks but with due acknowledgment. The editor contemplates, we believe, introducing French and German translations if his scheme meets with the requisite support, and this manifestly depends on the judgment displayed in his selection of articles "which unite scholarly accuracy with literary merit." So far as the scope of these is concerned, time will show how wide a class will find their interest in the *Monograph*; but the quality will, we apprehend, certainly approve itself and make the periodical worth preserving. It is both continuously and separately paged. The series is neatly and attractively printed, but we hope that prosperity will enable "Q. P. Index" to enlarge the type and add to the cover some hint of the contents.

—Among the illustrated articles in the May *Scribner* Mr. John Muir's "Wild Sheep of the Sierra" and Mr. William H. Gilder's "Among the Esquimaux with Schwatka" are decidedly worth reading. Colonel Waring's "Sanitary Condition of New York," with its instructive map, will be read anyhow. It stops short of the remedy, which is promised in a later number, but has two grains of comfort: our sewers are not so defective as they might be, and more danger arises from house-plumbing, which can be rectified. A perennial topic, "The Mutineers of the *Bounty*," is treated by a native lady who formed one of the party that recolonized Pitcairn's Island from Norfolk Island. The narrative hardly meets one's expectations. Mr. Seitz's account of "Artemus Ward; his Home and Family," invests a commonplace character with no new interest. Sir Julius Benedict reviews agreeably the career of Jenny Lind, and recalls the well-forgotten fact of her extraordinarily wide musical knowledge and thorough training. "It would be almost impossible nowadays," he says, "to name a vocalist able to read at sight the most difficult compositions, to remember strains of irregular rhythm and perform them immediately as if she had herself created them." Mr. Closson has engraved beautifully a portrait of Jenny Lind from a daguerreotype, and another *tour de force* of this kind is Mr. Cole's head of Carlyle. Mr. Emerson's "Impressions of Thomas Carlyle in 1848" are calculated to puzzle thoroughly the present generation in their search after the nature of the Scotch philosopher's doctrine and the source of his power over their fathers. On the other hand, Mr. Saintsbury, who passes judgment on Carlyle's literary work, underrates the intelligence of his audience when he writes: "It was a great characteristic of Mr. Carlyle himself that he never spoke with insufficient knowledge. It is a characteristic of some of his imitators that they never speak with knowledge that is sufficient." That this writer himself, by the way, speaks as a critic with sufficient knowledge we readily allow, on his own representation; but while we admire the only Englishman besides John Morley who has read Diderot's works from a to izzard, we do not feel that this quite settles the question of the superiority of Carlyle's estimate of Diderot over M. Scherer's.

—The May *Lippincott's* contains three illustrated articles: an historical and descriptive paper on "Granada and the Alhambra"; the second instalment of Dr. Oswald's "Zoölogical Curiosities" Series, on the Sloth, which is good popular science; and a paper on "Oyster Culture," which calls attention to the increasing exhaustion of American oyster-beds, and describes the system of artificial culture successfully employed in France. Some one makes a transcript of Mme. Jaubert's reminiscences, and "The Truth about Florida" is told by Louise Seymour Houghton, who has apparently the authority of experience and draws a line between enthusiasm and detraction. The serial "Craque O'Doom" is fairly launched with an impossible hero in the mis-

shapen person of a dwarf whose nickname gives the title to the story, and an ambitious "poor white" heroine who discharges the duties of an occasional servant in the family which Craque O'Doom is visiting. Of three short stories the most pretentious is "In Search of a Soul," by A. Gray, whose notion is a rather platitudinous variant of 'Undine' and 'The Marble Faun.' The man in this instance seeks a soul by marriage, but having miserably failed, learns that he must gain it by self-sacrifice, and then succeeds. Among other topics, "The President's Policy" is discussed in "Our Monthly Gossip." The writer, who expresses himself temperately, is somewhat given to vaticination, and sees in the present situation another rising of the moral sentiment of the country which is likely to break up the Republican party. He thinks, too, that, however admirable General Garfield might be as the head of a homogeneous party, this new movement will have "no use" for him, and that his policy will represent the preliminary "eddy of conflicting currents." This is a fair summary of his article, which, however, is designed to appreciate fully the President's merits.

—"American Stained Glass" is a subject that has been awaiting popular exposition for a year or more, and Mr. R. Riordan, who is apparently a competent and evidently an enthusiastic writer, begins a series of papers upon it in the *American Art Review* for April. Except for this and the news summary there is nothing noteworthy in the text of the number, unless it be worth noting that the *Review's* critical standard seems to be acquiring a geniality usually the product of more maturity than the *Review* can yet boast. We have an article on Mr. Huntington, in which he is called "an artist of a spiritual turn of mind," accompanied by Casilear's engraving of the painter's "Sibyl," which has now a quaint look; another on Munkácsy, who is said to be "one of the few painters who, like the ideal poet, are born not made," and, "as Pope is said to have lisped in numbers, as Giotto traced his earliest studies in the sand," to have begun to draw when a carpenter's apprentice; and a note on the etchings of Mr. C. F. Kimball, beginning: "We are startled occasionally by phenomena which seem to have no cause. A display of skill, without a previous course of adequate training, . . . springing up suddenly before us fully equipped, as Minerva sprang from the head of Jupiter—these are enigmas which we cannot unravel," and so on before we even get to Mr. Kimball. All this is of the essence of that perfunctory writing upon art which we should think it would pay the *Review* to protest against. It is, in importance, of a piece with Mr. Hamerton's occasional naïveté, such as the following, in a note to the etched head of an elephant by Mr. Heywood Hardy, in the April *Portfolio*: "An elephant is a perfectly harmonious piece of construction, and so is a gazelle; yet the proportions in the two cases are as unlike as they possibly can be. Except the horns, all the parts of the gazelle exist in the elephant; but how differently!" The March number of the same journal, we may mention here, contains an admirable reproduction by Amand-Durand of Dürer's "St. Jerome," which is worth having. In the first three numbers of the new volume of the *Etcher*, the other English art journal devoted to etching, which we have just received, there is nothing to remark unless it be an elaborate but rather undecided figure of "A Halberdier," etched by G. W. Rhead, and inspired by Burgkmair's "Triumph of Maximilian I." The *Magazine of Art* (Cassell, Petter, Galpin & Co.) is really now and then the most interesting of art journals in English, though it has absolutely no standard of selection. The April number has a fragmentary but intelligent sketch of Bonnat, accompanied by his portrait and wood-cuts of two of his pictures.

—The late James T. Fields, who died on Sunday in his sixty-fifth year, had rendered valuable services to American literature, besides having done something towards decorating its lighter departments himself. He held intimate personal relations with a very wide circle of men of letters here and abroad, whose books were published by the firm of which he became a member at an early age. These relations he contrived to make subservient to the interests of literature with a very happy tact, and at a period which was of great importance to American letters and the spread of general literary culture in this country. It is to be inferred from his own *causerie* about Hawthorne, for example, that but for his insistence and confidence in its merit 'The Scarlet Letter' would have got no further than the manuscript, with which Hawthorne was himself disgusted. He also found in his acquaintance an inexhaustible fund upon which to draw for the entertainment of lyceum audiences and readers of his 'Yesterdays with Authors,' and similar personal gossip very agreeable to the mass of the magazine-reading public, whose tastes he understood very well and very sympathetically. He edited the *Atlantic Monthly* with success for a number of years, and several other literary ventures, such as a collection of the works of De Quincey, and, conjointly with Mr. E. P. Whipple, 'A Family Library of English Poetry, from Chaucer to the Present Time.' At different times he published no fewer than four small volumes of verse, some of which had a light humorous or pathetic character that gave them some popularity, and won for them warm praise from competent contemporary criticism.

—Mr. Joseffy's last concert at the Academy of Music was one of the pleasantest musical occasions of the season. He had secured the assistance of Mr. Thomas and the whole of the Philharmonic orchestra, and displayed excellent judgment in the arrangement of his programme. The most interesting number was Liszt's Second Concerto in E major, a composition not often heard in public. His First Concerto in E flat is the *pièce de résistance* of every ambitious pianist, but the less dazzling work requires a command of technical difficulties possessed by few living virtuosi. Mr. Joseffy gave another admirable rendering of Schumann's concerto and several solo pieces, among which an *Aria di Balletto* by Gluck, arranged by Joseffy, and Tausig's brilliant version of Weber's "Invitation à la Valse" were the most noticeable. The orchestral numbers included Mozart's "Jupiter Symphony," the Introduction to Wagner's "Tristan und Isolde," and Berlioz's bright overture "Le Carnaval Romain."

—The season of the Brooklyn Philharmonic Society came to a close on Saturday last. The performance opened with a long selection from Gluck's "Orpheus," in which Miss Cary took the solo part, and was supported by the large chorus which Mr. Thomas organized during the winter. Schumann's charming "Gipsey Life," for soli, chorus, and orchestra, was the most attractive feature of the programme; an old Latin hymn of the sixteenth century, "Salve Regina," in the *à capella* style, was also very well executed by the chorus. The instrumental numbers included Beethoven's "Pastoral Symphony" and Saint-Saëns's picturesque "Suite Algérienne."

—The latest publication of the English Dialect Society on "Leicestershire Words, Phrases, and Proverbs" (Trübner) is one of the most interesting of the series of original glossaries, both in consequence of and apart from the fact that Leicestershire "has contributed more than any of our living dialects to the formation of our present standard English," on which the Introduction dwells. In the chapters on the pronunciation of this dialect it is remarked that "*H* is inserted or omitted in a highly miscellaneous manner, but its insertion is far less common than its omission. . . . A strong emphasis often develops an aspirate where it is latent in ordinary converse. 'It's a o'd un' is an assertion which if controverted would be repeated in the form 'Hit his a ho'd un.'" In the chapter on literature we read: "None of the Leicestershire writers, however, are so rich in illustrations of the Leicestershire dialect as Shakspere and Drayton, while in our own time by far its best literary exponent is the Warwickshire author of 'Adam Bede' and 'Middlemarch.'" Under local nomenclature: "The 'ingtons,' the 'tons' and the 'stons,' the 'worths' and the 'hams,' are strewn thick and threefold over all the land except within the forest boundaries." Charnwood Forest "lies in a clearly-defined ring-fence of 'tons' and 'bys,' while within the ring not a single 'ton' nor 'by' is to be found except where it is intersected by an ancient highway. Almost the same may be said of Leicester Forest." A list of local names is added. Some of the gems of the glossary are: *Belong*, a word generally used in a sense opposite to the ordinary, and always without the preposition—*e.g.*, "Hi, mister! d'yo *belong* this 'ere ombreller?" *Bosworth man*, applied by players to the knave at cards, with sarcastic allusion to the inhabitants of the next town or village. "At Bosworth it would generally be, 'Theer's a Hinckley man!' and so on." *Calf-lick* for cowlick. *Chip out*, to fall out or quarrel; not the contrary of our slang *chip in*. *Rile*, to irritate: "This is not an imported Yankeeism," any more than the exclamation "*My gosh!*" *Sack*: "to '*sack*,' or 'give the *sack*,' is to discharge, and to 'get the *sack*,' to be discharged from any function, office, or situation." *Society*: "In the Methodist Connexion 'to be in *society*' is equivalent to being a Wesleyan"—*e.g.*, "Mrs. Stroker is a member of *society*, but her husband is a worldly-minded man." *Hadley*, or *head-ley*, is equivalent to *adland*, a division of a ploughed field at right angles to the main ploughing. The eighth annual report of the Society shows a prosperous condition, though an enlarged membership is still desirable. The treasurer is George Milner, Esq., Moston, Manchester.

—The practical usefulness to the stage or the studio of Racinet's exhaustive 'Costume' has been several times pointed out in these pages, and we see no slackening of the author's hand as the work progresses. The term exhaustive, however, can hardly apply to a treatment of documents that seem to approach infinity, and we have given over the search for any evidence of waning resources, surmising only that an author thus equipped may reach the end of his volumes with the burden of a budget unrelieved. The work is now half done, and the tenth section is about as rich as its predecessors. All of the archæology of the painter Leys, and more, seems revealed in the photographic reproductions of Jost Amman's studies of society in the sixteenth century, where knights, hunters, burghers, pages, bankers, goldsmiths, and lawyers, with their ladies, ride after each other in Chaucerian procession. An earlier age reveals its uncomfortable furniture, as the throne of Dagobert, still preserved with the St. Denis treasure, of which the successive restorations are learnedly noted in the text. This same seat is found in a neighboring plate copied from a thirteenth-century source, where Philip the Hardy is seen sitting in it. Philip the Fair (1285), from his tomb, and John I. of

Brittany (1217), clothed in a mantle entirely covered with his family blazon, as seen on a window at Chartres, reveal quaint and true costumes for the historical painter, and Isabeau of Bavaria (1385) and her contemporaries show almost a dozen forms of the horned head-dress, or *hennin*, which the wives of Crusaders copied from the Druse women of Lebanon. One very elaborate plate represents a Flemish chamber of the fifteenth century, from a Louvre picture formerly attributed to Lucas of Leyden, and the details are annotated in the text with a learning which no commentary on the picture as a picture ever embodied. Indeed, the erudition of M. Racinet is fascinating, and descends from the time of Cheops down to the Zulu war without fatigue, the dozen pages devoted to the score of African illustrations being a remarkably hopeful costume-study where no costume exists. The tidbits of the bric-à-brac hunter are scattered profusely by the artist and nursed sapiently by the editor—Italian carved stirrups, Gothic beds, Asiatic jewelry faithfully copying that of Schliemann, and whatever makes the collector glad. The prints, as heretofore, are missal-like illuminations in gold and colors. The work, issued in Paris by Firmin-Didot, is represented here by Bouton.

—We have received two brochures—'Petöfi's Eperjesi Vérpad (Die Blutbank von Eperies 1687)' and 'Camoëns in Deutschland'—pertaining to one of the most individual of serial publications, the *Fontes Comparationis Litterarum Universarum*, edited by Drs. Meltzl and Brassai, of Klausenburg, Transylvania. This series consists of amplified reprints of articles previously published in the *Acta Comparationis*, etc., a polyglot semi-monthly under the same management, devoted to that *Weltliteratur* for which Goethe generally stands as sponsor. The prospectus, itself of a polyglot nature, informs us that the *Acta* accepts contributions "in any language" and relating to any literature, to "chansons, contes, proverbes, légendes, superstitions, devinettes et autres traditions de tous les peuples," as a French clause states it; the only condition being that contributions in "exotic" idioms must be accompanied with an interlineary version in one of the eleven standard languages of the *Acta*. Not having seen the journal, we do not know which languages are thus distinguished, but of the treatises so far reprinted in the *Fontes* thirteen are in German, four in French, two in English, and two in Hungarian; though it is proper to state that in some cases, such as Thorsteinsson's 'Isländische Volkslieder,' and Meltzl's 'The Black Wodas: an inedited Gypsy Ballad,' the original text is published together with the translation. Of the other themes treated in the *Fontes* we may mention Dora d'Istria's 'La Poésie des Persans sous les Khadjars'; Podhorszky's 'Ein Volksepos der Steinzeit' (from the Bulgarian); Grundtvig's 'En märkelig vise om de söfarne mänd: an old Danish ballad,' etc. Each number is printed in a hundred copies, fifty of which are at the disposal of the author. Of the brochures before us, Wilhelm Storck's 'Camoëns in Deutschland' is a useful bibliography of the Camoëns literature of Germany by the most recent German translator of the poet, one volume of his translation having lately appeared and three more being in press. The other number of the *Fontes* is a German translation of a posthumous, dramatic fragment of Petöfi. It treats of a bloody episode of the iron rule of the Austrian general Caraffa in Hungary, and breathes the patriotic fervor which has found in Petöfi's lyrics such beautiful expression. Few of his critical admirers, however, will regret that this dramatic effort was abandoned. It recalls the dramatic compositions of a lyric poet with whose muse Petöfi's sometimes claims kinship—Heine's 'Almansor' and 'Radcliff.' The editorial remarks prefacing the translation betray, in not quite perfect German, an uncritical patriotism which seems strangely out of place in so cosmopolitan a publication. We are told that the "wild grandeur" of this fragment "is perhaps only equalled by Shakspere's dramas, while the vividness with which the soldiery is painted even [!] recalls similar scenes in Schiller's 'Wallensteins Lager.'"

A SOLDIER'S LIFE.*

CARLYLE has said somewhere that no man's life, however dull or uneventful it might have been, would fail to prove of surpassing interest to all men if only we could get a genuine account of it. This reflection was continually recurring to our thoughts as we turned the pages of 'A Soldier's Life.' General Ewart frankly disclaims all literary capacity at the outset, and in so doing he does himself no injustice. We have encountered few authors whose verbal resources were so limited, and few books in which the element of reflection was so completely lacking. The people with whom the general is brought into contact in his way through life are, for the most part, sketched off in a brace of epithets—the one having reference to their physical exterior, the other to their intellectual and moral equipment. Thus, for a woman, the formula is that she was or was not "pretty" and was or was not "particularly nice." The men are either tall or short or remarkably handsome, so far as their outward presence is concerned, but for their characters our general, exercising a wise economy, employs the same phrase as that for the lovelier half of creation. His men either are or are not "particularly nice." Only once, so far as we can remember, does the subject inspire him to attempt anything more in the way of description. This solitary exception occurs in the case of Sir Charles Napier; and him the general speaks of as "a great man who ought to have been made a peer." It was the general's hap to play a part in many great events and to be known among men of whom the world would gladly hear somewhat. He went through the whole of the Crimean War; he lost an arm in the suppression of the Indian mutiny; but, to judge from his book, he appears in neither of these momentous experiences to have thought of anything outside of the military duties he had undertaken to do. At the same time the book is one which it is impossible to read without interest or without a strong liking for the author of it.

The war in the Crimea and the war for the suppression of the Indian mutiny are the two great episodes in the 'Story of a Soldier's Life'; and it is interesting to contrast the spirit in which the former was carried on with that which animated men in the latter. The Crimean War, with respect to the feelings of Englishmen and Russians, might truly be described, like the tournament at Ashby-de-la-Zouch, as "a gentle and joyous passage of arms"; and the moment that peace was declared the antagonists were eager to grasp each other's hands as friends.

"On the 28th of April," writes the general, "I paid my first visit to the north side of Sebastopol harbor in company with Adrian Hope. . . . It was a most lovely day, but rather warm. On arriving at the great redoubt on the north side we were told we might enter it, and accordingly crossed the bridge over the ditch. An extraordinary scene now presented itself, as numbers of Russian soldiers were singing and dancing in every direction, all in full dress, whilst several bands were playing. We had hardly looked round when several Russian officers seized upon us. I was literally pulled off my horse and dragged off to one of the casements, where we found a grand luncheon laid out, and a large concourse of Russian officers. All sorts of good things were offered to us, one of our recent enemies wanting me to drink off a tumbler of brandy."

On another occasion the general (then, however, only a major) has the "good fortune to meet two very pretty girls" (the general has the eye of a lynx for "pretty girls" and meets them in surprising quantities) "seated in a carriage with two Russian officers." To the great delight of the susceptible Highlander (Major Ewart is in the 93d Highlanders) they are "good enough to give him a smile and a bow." This is the very chivalry of warfare. Far other were the feelings which animated our "soldier" in the suppression of the Indian revolt. Almost a quarter of a century has now passed since Great Britain was startled by the intelligence that the native army of Bengal had broken out into revolt, and there are few thinking Englishmen who do not regret the terrible and indiscriminating severity with which that revolt was suppressed. The massacres at Cawnpore and a few other places, which then absorbed the horrified attention of the nation to the exclusion of all else, can now be seen in their proper relation to events as a whole. Englishmen can now perceive how false and how unjust it was to attribute to an entire people the atrocities of a very few individuals. At Cawnpore the massacre of the women and children was the work of two men, the Nana and his minister, Azeemoollah; at Delhi, at Meerut, and other places, the slaughter of the English residents was not the work of the soldiery, but of the riffraff of the city population. The executive authority had suddenly disappeared, and the scum and dregs of the city rabble found themselves suddenly at liberty to act in accordance with their natural instincts. And they *did* act, as the scum and dregs of a city rabble would have acted in any large city in Europe or the United States.

The marvel of that time, as we look back upon it after a lapse of twenty years, is not the cruelty of the few, but the loyalty and devotion of the many. But for the extraordinary gallantry of the regiments recruited in the Punjab the Indian Empire could never have been recovered. But for Dost Mohammed's (the then Ameer of Kabul) singular fidelity to his treaty engagements, it would have been impossible for Sir John Lawrence to have stripped the northwest frontier of the regiments which stormed Delhi. Over and above all this, the history of that time teems with stories of kindness and generous protection shown to wandering refugees, by natives of all ranks, from a disinterested impulse of humanity, and at exceeding peril to themselves. If Englishmen had had the eye to see all this *then*, if in the hour of their triumph they had exhibited a spirit of clemency and generosity, the British Empire in India would now be founded on a rock. But it was not to be. It is one of the many penalties of such a domination as the British have set up in India that it replaces the natural human relations by others which are hardening and corrupting to all who participate in them. For the position is such that the instant the Englishman is compelled to use force in order to assert his supremacy over the native of India his acts become morally indefensible. Hence his impatience of the mere expression of adverse criticism, lest it should lead to corresponding action; hence, too, the terrible ruthlessness with which revolts are put down. He makes a solitude that his own conscience may be at peace.

Not that Major Ewart's was a mind to be troubled by any nice points of

* 'The Story of a Soldier's Life; or, Peace, War, and Mutiny. By Lieutenant-General John A. Ewart, C.B.' 2 vols. London: Sampson Low & Co.

casuistry such as these. He is the typical soldier, who, upon entering the army, deposits his conscience in the charge of the higher military authorities, and is ready to shoot any man or thing according to orders received. But when he stood beside the well of Cawnpore a new spirit took possession of him; the campaign was no longer a mere Horse-Guards' affair, but one in which he was fired by an intense personal desire for revenge. Nor, as we read of the scene he saw, is it possible to marvel at this change:

"My next visit was to the house to which the unfortunate ladies and children had been taken, and where they were all so barbarously murdered. . . . The rooms, at the time of my arrival at Cawnpore in October, were still full of the remains of ladies' dresses, and numbers of shoes were lying about in all directions, together with locks of hair of various colors. The mats were all stained with blood, and the sides of the room also, and the trees in the compound were covered with sabre-cuts. It is known that the villains used swords only for their murderous work; and it seemed to me that many of the unfortunate victims must have been held against the trees, or had tried to hide behind them. On the morning after the massacre the bodies were thrown into one of the wells, some, I fear, still alive; but I found under some bushes the head of one of our poor countrywomen; it had beautiful teeth, and may have belonged to some fair girl of eighteen. As I looked around I could almost have cried with rage, and when I left this house where this fearful crime of unsurpassed brutality had been committed, I felt that I had become a changed man. All feeling of mercy or consideration for the mutineers had left me; I was no longer a Christian, and all I wanted was revenge. In the Crimea I had never wished to kill a Russian, or ever tried to, but now my one idea was to kill every rebel I could come across."

At that time it was considered profoundly dishonorable for an Englishman to be inspired with any feelings save a thirst for indiscriminate slaughter; and "Clemency Canning" was the name given to the Governor-General, under the impression that it was a term of reproach. Major Ewart reached Cawnpore at about the turn of the tide. Delhi had been stormed and taken after six days of heavy fighting; Havelock and Outram had fought their way into the Lucknow Residency, and the flood-tide of rebellion was manifestly ebbing backwards. Sir Colin Campbell was at Cawnpore, where troops from Delhi and England were rapidly collecting for an advance upon Lucknow. In the operations preceding the withdrawal of the Lucknow garrison Major Ewart's regiment took a conspicuous part, and in the storming of the Sekundra Bagh —"the most gallant feat of arms he had ever witnessed," as Sir Colin described it—Major Ewart greatly distinguished himself. His narrative of the storm is the most exciting episode to be found in "the Story."

The Sekundra Bagh was a strongly walled garden, held by two thousand Sepoys. The walls were loopholed, and from behind them an incessant fire was kept up upon the 93d Highlanders and the 4th Punjab Infantry. There was some delay before a heavy gun could be brought up to breach the wall, but at length a very small breach was effected, and the order was given to storm. Instantly the Highlanders and the Punjab Infantry, who had been lying down to escape the musketry from the loopholed walls, sprang to their feet, and a wild race took place for the honor of being the first man in at the breach. That honor is claimed by more than one, but at the time it was supposed that to Gokul Sing, a native officer of the 4th Punjab Infantry, it rightfully belonged, and he is so mentioned in Sir Colin's despatch. A terrible struggle then began. There was no outlet of escape for the two thousand Sepoys shut up in the garden, and all that was left for them to do was to sell their lives as dearly as possible. The British troops, fresh from the horrors of Cawnpore, were not in a mood to give quarter. As the assailants poured through the breach, they were met with a volley from the defenders at a distance of only ten yards. Then began a hand-to-hand conflict which did not cease until the last man of the two thousand had fallen. Major Ewart was in the thick of this fight, and cut down or shot with his revolver eight of the garrison, capturing a color. He richly deserved the Victoria Cross, which, however, he was not so fortunate as to obtain. His reflections on the loss of this coveted distinction show the modest and manly character of the man: "However, it did not much matter, and I have never troubled myself since on the subject, being perfectly satisfied with the consciousness of having done my duty to the best of my ability; and, after all, I was no braver than the rest of the 93d."

ENGLISH ASSYRIOLOGICAL STUDIES.*

IT is a delicate task to revise another man's book, especially when the revision means a complete rewriting of it. This is what Professor Sayce has done for George Smith's 'Chaldean Account of Genesis.' This very important work contained the whole of George Smith's discoveries in the field of Chaldean myths of the beginning of the world and its early fabulous history, including the famous "Izdubar" epic, and especially the eleventh of its twelve tablets, containing almost complete the story of the Deluge of Hasisadra. George Smith was a pioneer, and he gave his translations hastily to the press before they had received his own final revision, and left them to await the criticism of other scholars. This criticism they have to a considerable extent received since 1875, the date of the publication of the first edition, although, most unfortunately, the tablets giving the story of the enticement of Heabani by Samkhat and Harimtu, and that of the war with Khumbaba, have been mislaid and cannot be found. (The reader will correct the reference, p. ix., to these tablets so as to read pp. 203–224 instead of "pp. 103–124.") Professor Sayce has set himself the task to correct the translations of Smith in the light of further studies, and to alter and add to the text according to his best judgment.

This judgment he has used with great freedom. He has not contented himself with making corrections in foot-notes or in an appendix, but has substantially rewritten the whole book. So completely has this been done that the reader should understand that it is not Mr. Smith but Professor Sayce with whom he is dealing. Mr. Smith and his opinions are spoken of in the text in the third person, and frequently, without a word being said to indicate it, his conclusions are quietly set aside and Professor Sayce's put in their place. Indeed, in one case that we notice, Mr. Smith had, in his first edition, mentioned (p. 180) the opinion of Sayce's that Nimrod was to be identified with the god Merodach, and given his reason for rejecting it. In this revised edition (p. 190) this objection is omitted, and in place of it is a statement of the reasons in favor of the identification. The reader has warning in the preface that "numerous alterations and insertions have been made in the text which accompanies the translations." We cannot but wish, however, that these changes had been so indicated that when a judgment is reversed or a date altered seriously we might know that it is not Smith but Sayce with whom we have to do.

The translations needed serious revision. Of course the connected texts of any length which contained a story, like that of the Deluge, would be correctly understood, for substance, at first. Neither Mr. Smith nor any of his successors has had occasion materially to modify the translation of the eleventh Deluge tablet since his first translation in 1872. But there are others whose meaning was misapprehended, and especially was this the case with the important text which Mr. Smith supposed to contain references to the temptation and fall of man. Even in this case Mr. Smith's translation has for the most part been followed by Oppert (in the appendix to Ledrain's 'Histoire d'Israël'), whom in turn Sayce follows; but a few words whose meaning he misapprehended led him astray. The tablet contains no reference to the temptation of man (though it does to his creation), but is a hymn to Hea. We have, then, in this cycle of Chaldean myths no account yet recovered of the temptation and fall of man, and can only conclude that the Babylonians once possessed it from the facts that they paid special regard to the sacred tree, and that the dragon, or embodiment of disorder, who is punished by Merodach, the champion of the gods, is identified on a cylinder with the serpent. We notice that Mr. Sayce (p. 90) adds a figure of the important cylinder belonging to Dr. S. Wells Williams, now first published, which gives this identification, and which he must have received from his American correspondent, Dr. Ward, who discovered its value.

The chief modification, however, in this new edition of Mr. Smith's work is in the line of Professor Sayce's marked tendency to seek reasons and explanations where the former carefully avoided all speculations. Mr. Smith was by nature as conservative as Professor Sayce is radical. To Smith, Izdubar was probably a real king, the actual Nimrod, about whom numerous legends had gathered. To Professor Sayce he is a solar myth; and Atsusunamir, the sphinx, the messenger sent by Samas to Hades to secure the release of Istar, is the dawn, and is identified with the two dogs of the Rig Veda who guard the road to the abode of Yama, the king of the departed, as also with Cerberus and Geryon; thus showing a relation between Aryan and Accadian mythology. This is somewhat hazardous. But, notwithstanding some hasty and ill-considered conclusions, Professor Sayce's changes have for the most part been wisely made, and are warranted by other scholars; for, unlike Smith, Sayce is a careful reader of the writings of his brother scholars, and is ready, sometimes too ready, to accept any of their seductive guesses. An example of this is his hasty acceptance of Menant's assertion that the two seated figures on the signet cylinder (p. 88) are both males. The new cylinder figured on p. 263 he describes as representing "Izdubar among the trees of the gods (?), from a Babylonian cylinder found in Cyprus by Gen. di Cesnola." But it is almost certain that the cylinder is not Babylonian (it has marked Hittite features), and neither of the two figures shows the slightest resemblance to Izdubar. So, too, the figures on the other seal cylinder added by Sayce (p. 101) show it not to be "Babylonian," but decidedly Persian.

It is very annoying, when one wishes to verify the translations of new tablets added by Sayce, to find that no reference whatever is given. We are

* 'The Chaldean Account of Genesis. By George Smith. A new edition, thoroughly revised and corrected (with additions), by A. H. Sayce, Deputy Professor of Philology in the University of Oxford.' With Illustrations. New York: Charles Scribner's Sons.

'The History of Esarhaddon (son of Sennacherib), King of Assyria B.C. 681–668. Translated from the cuneiform inscriptions upon cylinders and tablets in the British Museum Collection. By Ernest A. Budge, M.R.A.S.' London: Trübner & Co.

'Archaic Classics. Assyrian Texts. Being extracts from the Annals of Shalmaneser II., Sennacherib, and Assur-bani-pal. With philological notes. By Ernest A. Budge, M.R.A.S.' London: Trübner & Co.

'The Bronze Ornaments of the Palace Gates of Balawat (Shalmaneser II., B.C. 859–825). Edited, with an introduction, by Samuel Birch, LL.D., with descriptions and translations by Theophilus G. Pinches.' Parts I. and II. London: Society of Biblical Archæology.

told (p. 86), "A hymn put into the mouth of Merodach thus speaks," and on p. 104, "An Accadian hymn speaks as follows"; but it is something of a task to find that the former ought to have been identified for reference as W. A. I. ii. 19, 2, and the latter as W. A. I. iv. 2, col. 5. There is not a little of this carelessness of editing, of which we see examples in the meaningless repeating of two lines of Scripture (p. 66); in "Hea-bani" for *Khumbaba* (p. 221, l. 7); in the failure to identify Nebo with Nusku, described under separate names (pp. 48, 52, 55); in the utter confusion in the use of parentheses and brackets in the translations; and in the bewildering typography, which makes no distinction of types or quotation-marks between the narrative and the translations of Assyrian texts. Smith, however, was much more careless than Sayce. Barring such less important errors and Sayce's characteristic venturesomeness, he has added very much to the value of Mr. Smith's work. The revision shows a much better apprehension of the science of comparative mythology, and an absence of the striving to verify Mosaic chronology and history. The overthrow by Bel Merodach of the dragon Tiamat ceases to be in punishment for its temptation of man, and becomes, as seems reasonable, a representation of the demiurgic victory of order over disorder, of light over darkness. It is, however, a question whether Professor Sayce is justified in his own conceit that he has found the Chaldean version of the destruction of Sodom, and he seems to be quite too certain that a fragmentary tablet refers to the confusion of tongues.

Now that Mr. Ernest A. Budge has issued 'The History of Esarhaddon' (Trübner & Co.), we have in convenient form their own chronicles of the three greatest kings of Assyria, father, son, and grandson—Sennacherib, Esarhaddon, and Assurbanipal. Mr. Budge's 'Esarhaddon' is in a smaller and less expensive form than George Smith's Histories of Assurbanipal and Sennacherib, perhaps because he does not have the patronage of the late munificent Mr. J. W. Bosanguet, who used to make Mr. Smith's translations float his own chronological fancies. In this book Mr. Budge has used all the principal texts, but does not profess to have included every notice of Esarhaddon on contract-tables, nor the tablet of "Addresses to Esarhaddon," nor another containing an account of his buildings. It is a pity these were not included. The "Addresses" are not very long, and, though of no great historical value, would have afforded an excellent specimen of Assyrian poetry. Mr. Budge does not interline his translations, as did Mr. Smith, but sets the Assyrian text on one page and the transliteration and translation on the opposite page. Following the texts is a vocabulary with equivalent forms, chiefly Hebrew and Chaldee. The value of such a work rests entirely on the correctness of its translations, and, though the production of one of the young scholars, this is generally correct, as, indeed, historical inscriptions offer very few difficulties. We lack the constant evidence of thorough linguistic scholarship, which not one of the English translators has ever shown, and which we now meet for the first time among the Germans, who have been so late in taking up the study of Assyriology. Thus it is puerile to explain *citu* by the Chaldee *cituna* and the Greek χιτών. There is evidently no knowledge of Hebrew even, beyond what is picked up from a dictionary. The translation sometimes is at fault from unfamiliarity with Shemitic idioms. Occasionally we wish fuller references, as in the preface where Mr. Budge, speaking of Esarhaddon's son Assurbanipal, says:

"The following is his full and interesting account of his subjection of Tirhakah, King of Egypt and Cush, translated from the large decagon cylinder containing the 'Annals of Assurbanipal,' recently brought from the East, and bearing the number R M 1 in the British Museum Collection."

But unfortunately the account which follows is nothing but a duplicate of that in Smith's 'Assurbanipal,' pp. 15, 16, 17, 29, following Smith's translation almost exactly, even repeating one or two of his mistakes—as, *e.g.*, "I was walking" instead of "by a long journey." With some faults of execution the book is a credit to so young a scholar, but makes us regret that he has not had a better acquaintance with cognate languages.

The 'Assyrian Texts' from the same author and publisher belongs to the series of "Archaic Classics," and is a selection of extracts from the Annals of three Assyrian kings, intended for the use of beginners in the language. It is a serviceable, inexpensive volume, but marked with the same narrow linguistic training, as is evident from the philological notes, and disfigured with too many misprints. It lacks a syllabary, being in this respect quite inferior to the second edition of Delitzsch's 'Lesestücke,' which, though very beautiful, full, and accurate, so far as texts are concerned, cannot be used without a teacher, as it has no notes nor vocabulary.

Mr. Pinches, George Smith's successor in the British Museum, is bringing out the reproductions of the bronzes recovered from Balawat, near Nineveh, where Shalmaneser II. had a palace. These were large plates laid as ornaments on huge wooden gates, and were marked in *repoussé* work with representations of the campaigns of the king. The bronze plates have been restored with wonderful skill, and the magnificent copies of them, in the natural size and the exact tint of the patination, are the finest reproductions ever made of Oriental antiquities. Two of the five parts have been issued, and when complete they will double the pictorial history of Assyria as drawn by native contemporary artists.

RECENT NOVELS.*

CHERBULIEZ'S novels seldom fail in entertainment, and 'Noirs et Rouges' is, above all things, amusing in the best sense—a sense which implies a first-rate romancer doing his best, and bringing to his work qualities which many novelists consider of too much public importance to be employed merely in entertaining a frivolous public. It is one of the merits of a frivolous public, which is nevertheless not stupid, that it is sufficiently *blasé* concerning explicit instruction in novels to encourage amusing writers of the first class. The light touch, which is perhaps the main characteristic of Cherbuliez's works, is the most difficult thing in the world for a writer conscious of the importance of what he or she has to communicate to acquire. Just at the present time, it may be parenthetically remarked, in view of the serious attention paid on all hands to the "human documents," it does not seem as if there were likely to be too much refined vivacity in novels, though doubtless it is possible to overdo the matter. But Cherbuliez has also, besides the felicity of manner which comes from presupposing his readers to know as much as himself about things in general, a great deal of a quality not usually to be found in the imaginative writing of his countrymen—the quality of humor, namely. Usually one is perfectly safe in looking for the best sort of humor in an Anglo-Saxon work, and the best sort of wit in a French one; but this writer is an eminent exception, and the flavor of his books is a compound which it would be puzzling to analyze, but which is certainly as clearly humorous as it is witty. At all events, it is employed in the service of whimsical and sometimes farcical conceits, and in shrewd and benevolent ones as well, and it can hardly be said to differ from the analogous Anglo-Saxon quality except in the important particular of always preserving decorum and significance; certain palates may, indeed, in this respect find it lacking in heartiness. Entertaining as 'Noirs et Rouges' is first of all, however, it has the value of suggestiveness as a picture of the situation in contemporary France. The title gives the key to the substance of the book, which deals with Jesuit intrigues on the one hand, and chronicles the happenings in a Radical interior on the other. Mademoiselle Jetta Maulabret, the heroine, is left an orphan by the suicide of her father and the death of her mother, who had run away with an Italian count. To expiate these sins she enters a hospital where her aunt, a nun, is a nurse, and declines the offer of a home with her great-uncle M. Louis Cantarel, who is a Radical Republican, and the next thing to an atheist. M. Antonin Cantarel is an atheist outright, but a very different man from his brother, being, among other things, a man of intelligence and a gentleman. He is a surgeon at Jetta's hospital, and the two become fast friends just before his death, after which his will is found to leave her a large fortune on condition of her living two years in M. Louis Cantarel's family. She is about to decline this stipulation when Mère Amélie, her aunt, shows her the folly of it, and the action of the book concerns the efforts of the "black army" to keep alive her intention to take vows at the end of her probation in the world, and the efforts of various other people to marry her. Her uncle Louis endeavors to give her to the vulgar son of a marquise whose favors he hopes thus to win, and the executor of her uncle Antonin does his best to bring about her union with a young friend of the latter's, in accordance with his dying wish. She herself falls in love with this young gentleman, but deems it her duty to become a nun, and her conflict with herself becomes one between her and a fanciful vision of her benefactor, who appears to her from time to time. It is in this sort of thing that Cherbuliez discloses a vein of poetry now and then, and it is very prettily managed here. As skilful as this is pretty is the social diplomacy which conducts the external conflict, in which also the author is an adept. The result is satisfactory, of course, it being a pet theory with Cherbuliez that there is altogether too much tragedy in novels to need any augmentation at his hand. Every personage introduced is, it need not be said, completely individualized, having an equal share of the author's artistic interest, and some of them are powerfully conceived. Mme. Cantarel is perhaps the happiest stroke; the type of a woman with refined instincts, mated with a clown whose vulgarity and open infidelity have the effect of freezing her into ironical indifference, can hardly have been better drawn. Here is a bit of her advice to Jetta, who fears being forced into a similar situation:

"'Suivez mon example; on commence par colère, on continue par mépris, ou finit par l'indifférence. Ou plutôt faites mieux que moi, commencez tout de suite par l'indifférence. Oui, c'est presque le bonheur, pourvu qu'on l'accompagne d'une manie, d'une torquade. . . . Voyons, ma chère, ne pourriez-vous pas vous arranger pour aimer les coqs nègres?'"

Jetta is afraid not; whereupon, "'En ce cas, je vous plains,' dit-elle."

M. Cantarel, the type of the rich demagogue who denounces "l'opportunisme," and is floored by a crazy Communard at a fête of his own getting

* 'Noirs et Rouges. Par Victor Cherbuliez.' New York: F. W. Christern.

up to forward his election as municipal councillor of Paris, is scarcely less well done. Mère Amélie is another strong character, though more conventional. Jetta herself is not above Cherbuliez's average, but she is a very charming girl. The hero, as usual, is of small account. Perhaps the book loses something from the attempt to combine politics with romance; though the former is treated romantically enough, it divides the interest. But, on the whole, we shall probably have no novel so entertaining before the next by the same writer.

'The Lost Casket' belongs to the exciting order of novels, and is as profitless reading as stories which the novel-reader threatens to lay down at every chapter, but doesn't until the last is finished, can be. In distinction from the kind of entertainment above spoken of, this may be described as of the lowest class not positively immoral. It contains no character of any interest or drawn with any precision, and the events it narrates are in themselves of trivial consequence. Nevertheless the story, depending for its interest upon intricacy of plot, contrives to mystify the reader successfully. Any one who cares for this kind of thing, however, will find it wise to exhaust Gaboriau and Collins before attempting De Boisgobey, by which time, too, he may perhaps find his interest in it waning. The great difficulty with mysterious novels is not to weave the mystery closely enough, which may be done easily by main strength, as it is here; but to clear it up completely, and at the same time consistently, without casting an imputation upon the respectability of the mystery as a mystery. This the author of 'La Main Coupée' has been unable to do, possibly because he got tired of his over-complicated situation. When he represents his countess managing her fiery steeds with an excess of ease which excites the envy of the young man at her side, the reader, of course, concludes that it is not her hand that was cut off by the man-trap attached to the safe that has been robbed. But as this is a wrong conclusion it is impossible to see how the young man should have drawn it also. He is, to be sure, incredibly stupid, but the author does not acknowledge this openly, so that one never knows what value to attach to any of his discoveries in pursuit of his pastime as amateur detective. Owing to these and similar uncertainties the reader finally feels as if he were occupied with a Chinese puzzle instead of in a labyrinth to which there was a clue somewhere. And when the mystery is finally cleared up it discloses itself as a made-up affair after all—something so factitious that Gaboriau would have scouted it. The first necessity of absurdity in detective stories nowadays is that it should be made to appear real.

Such a book is cleverness itself, however, in comparison with the 'Lady Clara De Vere' of Spielhagen. The story is an expansion, with variations in the Teutonic manner, of Tennyson's poem—admittedly of course, which is the severest criticism to be made upon it. Possibly Spielhagen conceived that Tennyson had wasted his material in making a cherry-stone cameo instead of exhibiting its colossal significance in fit proportions; possibly he considered that, owing to the proverbial pedantry of the English, the poet had taken a superficial and merely emotional view of a subject which has its subtleties, and needs to have them drawn out; possibly he hit upon it as a good nucleus for a moderate amount of hack-work to which his imagination could easily lend itself. There is no means of determining with any certainty, of course, the motive of a writer, and a German writer especially, who takes a theme that Tennyson has finished with to elaborate further and trick out with fancies. But speculation concerning it, however barren speculation may be, is a fascinating pursuit contrasted with the task of examining in any detail the work itself. The hero, it may be said, is not only possessed of a kind heart and simple faith, but, as appears after Lady Clara has scorned him, of Norman blood as well. In fact, he is the real owner of her coronet, besides having latitudinarian religious views and a turn for philosophical mysticism. His name is George.

'A Lazy Man's Work' also stimulates speculation in a mild way. It is one of the legion of novels by young women which one wonders, every time he reads one, why the sociologists do not consider as a class of phenomena by themselves. They certainly add speaking testimony to the reasonableness of the disesteem that has befallen intuitions of recent years. The text-books agree that the intuition which transcends the understanding is found in its highest perfection in women, in witness of which, as every one knows, the Athenians deified wisdom as a goddess. How, then, does it happen that in the novels, where they have it all their own way and do not call upon observation even for purposes of verification, the intuitional sex contrive to illustrate an ideal so unlovely as well as so unveracious; and, moreover, that they are so substantially unanimous in favor of this ideal? Miss Sparhawk's is essentially that of Mrs. Augusta Evans Wilson, though it must be admitted she would never forgive any one who should say so, and would doubtless point out the superficial absurdities of the author of 'Beulah' and 'St. Elmo' as incisively as any one. But at bottom 'A Lazy Man's Work' is very like 'St. Elmo.' It is encrusted with a veneer of New England cleverness, and displays everywhere an acquaintance with the condition of current thought in such matters as religion and æsthetics, and generally exhibits a much higher stage of development than the elementary encyclopædism of the Southern author; but the pith of each book is the fight of a noble and gifted pedant against a heartless world over which she finally triumphs, not without agony, but definitively. Of course Miss Sparhawk's Helen is a cultivated as well as a sympathetic creature, and her hero not a ridiculous knight-errant out of a melodrama; still they take things, it strikes us, far too seriously in a world admittedly frivolous, and it is difficult to reconcile them and their actions with known facts of life. The mistake writers like Miss Sparhawk make is in attempting the modern novel at all, since it has so much to do with life and it is so difficult to treat life transcendentally. The old-fashioned novel, such as 'The Three Spaniards,' offers a better field, and one in which there is no temptation to make pedants and pass them off for ideal women. Miss Helen Bell concludes a monologue to an audience of ladies and gentlemen in this vein:

"The Mount on which the Sermon was spoken is filling the whole earth. It was intended that in its Speaker—our Divine Leader in all movements toward the freedom of righteousness—all classes should meet. He was born in a manger, a carpenter by trade, yet He was descended from a line of kings. But His throne was built upon deeper foundations; His nobles were to be not from Judea alone, but from every nation, etc., etc."

Suddenly "some cruel reminder of the present" recalls her and she leaves the room, the hero opening the door for her with a very pale face. The book is dedicated to Mr. Whittier, and is also a "detective story."

On the other hand, Mrs. A. W. Hunt has used her very sharp eyes to good purpose in 'The Leaden Casket,' though she falls into the pitfall of inappropriate melodrama in the tragic elements of her book. It is, however, a novel of various excellences, and the story is of sufficient interest to give continuity to the several episodes which form its main merit. The *dramatis personæ* are, for the most part, a collection of character-sketches, and the incidents are studies of different London society crazes, from the vagaries of the "æsthetes" to the extravagances of the "professional beauties." These somewhat disjointed fragments are deftly woven into the semblance of a whole along the thread of a needlessly improbable plot, principally by the skill of the author in keeping her pictures in a low tone. The heroine, the daughter of an East-Indian Englishman, is brought up in the family of her uncle, who, finding that she has been left to her own devices through the neglect of a novel-writing aunt, and is better acquainted with sensational novels than with studies suitable to her age, despatches her to his sister in the country. Here, too, she is her own guide, and at the age of ten is seriously in love with her only companion, a little boy of about her own years. The study of a young girl whose imagination has been over-stimulated by romances, with no supervision and in complete ignorance of the world, is one of the best things in the book, and though often enough attempted has not been better done. Recalled to London, she develops into a sensible young woman. Her aunt introduces her into society, but only into the literary and "æsthetic" portion of it, and when her mother suddenly appears from India she finds her daughter wearing the costume of her great-grandmother. All this is quickly changed, however, and Lady Brooke mortgages to a fashionable dressmaker her daughter's chances of a wealthy marriage for the necessary wardrobe for court circles, precipitates the young woman a last time into the æsthetic whirlpool, in order to carry off the only eligible man, a rich young lord, and then launches her daughter as a professional beauty. The latter proves refractory, and finally, after the melodrama alluded to, chooses the "leaden casket," and is appropriately happy. The "nincompoopiana" is admirably done for light satire.

'Under Slieve-Ban' is an Irish story of the last decade of the last century. As it is related in some degree to the stirring events of those times, it is naturally a little over-loaded with material. This oppresses the author and makes his work slipshod in places, and at the end hasty and incomplete. The plot is one of the several "Enoch Arden" variations. Kate Calleen is engaged to Phil Ryan, who is supposed to be drowned at sea, whereupon she marries Michael Fay. On the wedding-night Fay meets Ryan returned from imprisonment, and, pledging him to secrecy, throws his hat into the lough and enlists in the navy. Of course, he believes Kate and her old lover reunited and happy, and solicits death in action unsuccessfully. While in West-Indian waters a stowaway is found on his ship, who attaches himself to Fay and follows him to France, where he helps him to escape from prison. Shipwrecked anew, Fay discovers his faithful companion to be Ryan's half-breed wife, who, in disguise, has attached her fortunes to his, in the hope of in this way finding her husband again. When she learns that the latter has remarried she proposes to kill her rival, and escapes with that motive from Fay, who follows her to prevent harm to the woman he has done so much to make happy. It turns out, after many woodenly-contrived miscon-

ceptions, and much manufactured suspense, that Fay's wife has remained faithful to him, and that Ryan is not a bigamist. It will easily be seen that something might be made of this by a writer who really cared enough for the scheme to take pains with it, but Mr. Francillon only illustrates without fulfilling its possibilities. The Irish local color is well done, and a whimsical old schoolmaster named Dionysius Rooney is a good character.

"Ilka on the Hill-Top" is the title of the first story only of the book so-called. There are five others of equal interest and similar qualities. These last are curious. They have many outward resemblances to the usual qualities of ordinary magazine stories, yet they have an absence of flavor quite their own. There seems to be in each story a deficiency in point and substance, together with excellent English, adequate observation, literary acquaintance, and the best of intentions. How any writer could make them so good without making them better it is difficult to see, and equally difficult to conceive of the enthusiasm which the author must have felt in order to be able to pursue equably, and with no sign of flagging, threads of such extreme tenuity leading in such purely arbitrary and inconsequent directions. In the course of following each of them we have experienced the fate of Tantalus, simply by supposing that something organic would be reached to explain the elaborate, and in many respects excellent, circumstantiality preceding. This is the argument, for example, of "Mabel and I: a Philosophical Fairy Tale," the fifth in order. A young college tutor with a metaphysical turn is out in the woods with a professor's daughter, with whom he is placidly in love. He wants to "see things as they are," in the cant phrase current, and especially Mabel. By-and-by he tells her about the gnomes, and they get some "creepy" but poetic sensations out of the subject conjoined with the growing darkness. As he goes home alone he strikes off a gnome's cap with his cane, and in exchange for it the gnome gives him, upon his request to see things as they really are, a pair of spectacles. Through these Mabel's father appears as a parrot, and the young man is so disconcerted thereat that he is adjudged wandering in his wits from over-study, and put to bed. Mabel is such a nice nurse that he does not look at her through his spectacles, which, as soon as he is allowed to go out, he returns to the gnome. Then he declares himself to Mabel, and they both whisper the news to the professor, one in each ear. The qualities of such a philosophical fairy-tale as this cannot be characterized, but have to be felt.

'Buried Alive' is a vivid picture of life in a convict prison in Siberia thirty years ago. It is difficult to see why it should be brought forward now, for the supposed narrator (he had killed his wife in a fit of jealousy) is at pains to remark more than once that even at the date of writing, 1862, many things had been changed for the better. The book has little to say of political prisoners. It may be urged that if it had it would not have been allowed; but the once well-known book of Von Rosen, one of the officers concerned in the revolt at the accession of Nicholas, gives in full the life of political prisoners of the same period. It was published in Germany, and is a frank, authentic narrative, making out their life to have been in many ways better than that of the convicts. If 'Buried Alive' has any present value it is in the light thrown upon Russian nature. The childish, reckless yielding to momentary passion which reappears in every one of the convict's stories, and the dumb indifference to consequences, show precisely the qualities of the men who use the dagger and the bomb. As to the prison and its discipline, hideous and cruel as many of the incidents seem, they are not without parallel. The scene in the bathhouse is not so gruesome as the notorious experience of the "Casual," nor is there anything so horrible as the stories of the *déportés* in Cayenne. The very remoteness makes possible a certain kind of liberty. No western prison ever saw the like of the Lenten prayers in church or the amateur theatricals at Christmas. The description of these last, and the episode of Akoul'ka's husband—the one in humor, the other in intensity of feeling—vindicate the position the author holds in Russian literature. Dostoyeffski is a true Muscovite, a dweller in Moscow, and long connected with the *Russian Messenger* and the *Citizen*, both leading periodicals of that city. Ranking with the men who by not too long an interval stand next to Turgeneff, he has been one of the leaders of the natural school, as they chose to distinguish themselves from the more advanced realists. Their study of actual life, which began with 'Dead Souls' and the 'Notes of a Sportsman,' was still carried on amid the lower classes in all their trades or pursuits after emancipation had made the serfs as such no longer the absorbing interest. It became with Turgeneff the presentation of the contrast between the old and the new. Dostoyeffski devoted himself to the minute portrayal of the life of the small clerks and lesser employees in the large cities, and later to the wretched struggles, the wild dreams of the poorer students. The fidelity of his work has made his portraits "as ugly as reality itself"—praise which this 'Buried Alive' goes far to justify. Such figures as Bazarof and Solomine give us the higher, the enlightened side of the modern reaction. In Dostoyeffski's two novels—'Crime and Chastisement' and 'Ill-conditioned Souls'—we find the pitiable creatures, at war with all law and order, from whom the Nihilists are recruited. If this translation lacks style—and what translation does not?—it is still an interesting example of what clear, correct English may exist without any use of idioms either in words or construction. Never were so many simple predicates strung along after so many simple subjects. Now and again comes an odd proof that the translator is not using a mother-tongue—hexangle, delator, room-fellow, egotism (for selfishness). In general the Russian has such exactness, or rather such power to differentiate by adding a syllable or a letter, that the attempt to render it fully in English leads to a diffuseness that fatally weakens.

It were ungracious to surmise that the *mise-en-scène* of 'The Tsar's Window' was made up from Gautier, eked out by the *Court Circular*. Yet assuredly, if the author has veritably seen St. Petersburg and Moscow, then never had the famous pussy-cat who went to London to see the queen a worthier rival in scant narrowness of view. If the city and its life were crowded out by the development of a plot or the portrayal of character, well and good, but there is neither of these. Six or eight people go in and out, not one of whom says a beautiful or a clever thing; the heroine loves one man and does not love another; the wrong man takes himself conveniently out of the way—and that is all. It might just as well have been quite the reverse, for any logic in the book. The one thing not in Gautier, the one bit of original force, has turned out to be what all are at this moment saying—the impression made by the sad, burdened face of the Tsar.

The Human Body: An Account of its Structure and Activities, and the conditions of its healthy working. By H. Newell Martin, D.Sc., M.A., M.B., Professor of Biology in the Johns Hopkins University, etc. (New York: Henry Holt & Co. 1881. Large 12mo, pp. xvi.–606. Appendix 33. American Science Series.)—As is stated in the Preface, this work "professes to be merely a compilation." The author trusts, "however, that it will be found throughout imbued with the influence of my beloved master, Michael Foster." The force of the *however* is somewhat difficult to assign in view of the fact that Foster's own 'Text-book of Physiology' is itself a compilation, based chiefly upon the latest German investigations, and not at all, so far as appears, upon any researches of his own. The two works may fairly be characterized as follows: Foster's presents to the student and the specialist an admirable *résumé* of the leading facts and principles of physiological science, clearly and logically arranged, but in purely technical form, so as to be adapted rather for the advanced student and specialist than for the general reader; both sides of most mooted points are given with commendable impartiality, and the references to authorities are fairly complete. Martin's is an attempt "to give an account of the structure and activities of the human body which, while intelligible to the general reader, shall be accurate and sufficiently minute in details to meet the requirements of students who are not making human anatomy and physiology subjects of special advanced study. . . . The introduction of constant references to authorities would have been out of place." So closely is the book modelled upon that of Foster that, in very many respects, it may properly be regarded as almost the same work in a popular form; the arrangement, however, is less happy than that of Foster.

The author has not failed to realize the difficulties of his task, and is prepared to be accused of dogmatism on the one hand, and of indecision on the other. The instances of unwarranted affirmation are certainly very few, the most serious being the statement at the top of page 18 of the Appendix; and the author is probably right in holding that "general readers and students are only bewildered by the production of an array of observations and arguments on each side of every question, and, in the majority of cases, the chief responsibility under which the author of a text-book lies is to select what seem to him the best supported views, and then to state them simply and concisely." Upon the other point, Dr. Martin's answer embraces some admirable remarks which we should like to quote in full. He concludes as follows:

"The opportunity to arouse the receptive mental attitude apt to be produced by the recognition of the fact that much more still remains to be learnt—to excite the exercise of the reasoning faculties upon disputed matters—and, in some of the better minds, to arouse the longing to assist in adding to knowledge, is an inestimable advantage, not to be lightly thrown aside through the desire to make an elegantly symmetrical book. While I trust, therefore, that this volume contains all the more important facts at present known about the working of our bodies, I as earnestly hope that it makes plain that very much is yet to be discovered."

The author urges that man should be classified with and among the other mammalian Vertebrates according to the resemblances and peculiarities of his body, and without reference to the mental superiority of civilized peoples, "for zoölogical groups are defined by anatomical and not by physiological characters." Allusion is made to the ambiguity of some terms commonly

'The Tsar's Window.' [No-Name Series.] Boston: Roberts Brothers.

employed for the designation of the position or direction of parts in different animals. The author adopts *dorsal* and *ventral*, *proximal* and *distal*; but he adds that "anatomists give the words *anterior* and *posterior* definite arbitrary significations in all cases," and hence decides to refer to the head end as anterior and the opposite end as posterior. It would be easy to show, on the contrary, that anatomists are very far from agreed upon this use of the terms in question, and that there is, at present, a decided tendency toward discarding them altogether in favor of some such terms as *cephalic* and *caudal*, which are not only wholly devoid of ambiguity, but capable of desirable inflection. Circulation and respiration are treated most satisfactorily, while the functions of the various brain-parts are almost ignored. Doubtless there is the most profound uncertainty as to the significance of the facts respecting Cerebral Localization which have been accumulated since 1870; but the facts themselves are indisputable. They are regarded by some as constituting a "monumental acquisition to physiological science," and we think most readers will be disappointed to find only the fraction of a page devoted to the matter, with no exact statement, with no diagrams of the so-called "motor centres," and without even a reference to works where these may be found. One who has himself tried the experiments will, moreover, object to the characterization of the electric currents employed as "tolerably powerful." Dr. Martin frankly confesses that "what the use of two hemispheres is cannot at present be said," and adds, "a good deal may, however, be said for the view that a good deal of brain in every one's skull is never used." The statement on p. 164 as to the greater number of cerebral gyri in man is very commonly made, but none the less incorrect, as is shown by the brain of the porpoise.

Typographical errors are very few. Under this head may, perhaps, be placed the statement near the head of p. 447, as to the relative calorifacient power of fat and starch, since the author is of course aware that a given weight of starch, when fully oxidized, produces less than *half as much* heat as the same weight of fat. The illustrations are mostly clear and well selected; the only really poor one is Fig. 50, but several others might be much improved, and it is probable that few besides professional anatomists will learn anything from Fig. 143, representing the ear without the only familiar feature, the concha. The constant use of a capital as the initial of *Body* is, to say the least, an unattractive feature of the book. The metric system is employed throughout, the approximate equivalents in American weights and measures being added in brackets. That bugbear of physiological writers, the treatment of the Reproductive Function, is both met and avoided in the present work. The subject is briefly presented in an Appendix of thirty-one pages which has its own paging and index, and may be omitted, if desired, from the book. With the exception of the matter alluded to in another part of this notice, this difficult topic is perhaps presented as well as it could be in so limited a space. The author's hygienic recommendations are scattered through the work, in connection with the various functions. As a rule they are sound and well expressed, as may be seen from the extract here given:

"The knowledge that every weak yielding degrades our brain-structure and leaves its trail in that organ through which man is 'the paragon of animals,' while every resistance makes less close the bond between the thought and the act for all future time, ought surely to 'give us pause.' On the other hand, every right action helps to establish a 'path of least resistance,' and makes its subsequent performance easier."

Upon the whole, the present volume may be regarded as embracing an unusually correct and attractive account of the human body from the physiological side, and it may be recommended either for reading or for use as a text-book in schools and in the more general classes in universities.

Report of the Cruise of the United States Revenue Steamer "Corwin" in the Arctic Ocean. By Captain C. L. Hooper, U.S.R.M. 8vo, pp. 73, cuts, tables, and a map. (Government Printing-Office, Washington. [April], 1881.) —Since that September day when the *Jeannette* was seen boldly steaming into the pack, public attention has been more frequently directed to the portion of the Arctic basin she intended to explore and which still holds its secrets fast. This has arisen partly from that natural reaction of the human mind against mystery in any form which has formed the chief incentive to all Arctic research, and partly from feelings of humanity awakened by doubts of the fate which has befallen the stout hearts who manned her. The United States revenue steamer *Corwin* was last summer, in addition to other duties, authorized to use every endeavor to succor the *Jeannette* party, if they could be found, or to obtain any information bearing on the subject of her fate and that of the two whaleships which, later in the same season, were beset and have not since been heard from. The report of this cruise is before us.

The *Corwin*, after suitable fitting-out for the peculiar character of the voyage, left San Francisco May 22, 1880, and Unalashka June 8, first encountering the ice on the 11th near Cape Romanzoff. After a week's struggle, part of which was passed drifting helplessly in the pack, the trading post of St. Michael's, Norton Sound, was reached. On the 23d it was decided to make for the Asiatic shore of Bering Strait in order to work into the Arctic. On the way several points on the north shore of St. Lawrence Island were visited for the purpose of investigating the stories of wholesale starvation among these natives which had been reported in 1879. The tale was fully confirmed, and it appeared that some four hundred natives had perished in the winter of 1878–9; many of the bodies still lying in the deserted huts or on the ground where they fell. A gruesome sketch by Captain Hooper illustrates one of these desolated habitations. The cause of this destitution was not fully determined, but appears to have been, at least in part, the whiskey supplied by illicit traders, which occupied the attention of these people when they should have been laying in a winter's supply of food. The *Corwin* then kept on her way, touching at Plover Bay, Eastern Siberia, and passing the Straits on the 28th of June. July, August, and part of September were occupied in cruising in the Arctic Ocean and the vicinity of Bering Strait, the *Corwin* leaving the Arctic, finally, September 13. During this time two whiskey-traders were captured, and nearly all the rest prevented from carrying on their traffic on the American side. The *Corwin* succeeded in reaching Point Barrow, through a narrow lane of water, on the 25th of August; on the 15th of the same month she attained a nearly equal latitude near Herald Island, and from that time to the 20th was in its vicinity. On the 11th of September Wrangell Land was seen at a distance of twenty-five miles, with impenetrable pack between the ship and the shore. The "ice-cliffs" of Kotzebue Sound were visited by Captain Hooper, who also found a good quality of coal near Cape Lisburne, on the American shore, in sufficient abundance to be mined for the steamer's use. Nothing was seen or heard of the *Jeannette* or the missing whalers, but Captain Hooper expresses little anxiety on their account. During all this period continuous sea-temperatures, current observations, and many soundings were taken, the meteorology faithfully recorded, and many ethnological and natural-history notes obtained. The little pamphlet represents a solid addition to knowledge, creditable to all concerned, and will be of great use in discussing the characteristics of this region in future. Some opinions, perhaps, are stated with a positiveness which further experience may tend to modify, and the list of Arctic animals would have benefited by submission to an expert; but these are small matters. The report is enriched by a number of sketches of noted landmarks, among which are Herald Island and Wrangell Land; by a condensed transcript of the log and meteorological record, and by a small but well-executed map. Altogether it is a subject for congratulation that Captain Hooper revisits the same region during the coming season.

In connection with this subject a recently published article in the *Deutsche Geographische Blätter* (Heft 1, Bd. iv. pp. 54–7, Bremen, 1881) has attracted some attention. For the first time we learn that Wrangell Land has been visited by white men, though fourteen years have elapsed since that interesting occurrence. Skipper Dallmann avers that in 1866 he visited Norton Sound and the Arctic in the schooner *W. C. Talbot*, on one of those illegal trading voyages which Captain Hooper has been endeavoring to suppress; that he traded in Norton Sound in July, passed through the Straits and along the coast of Northwestern Siberia to Cape Jakan, buying, among other things, musk-ox horns from the natives; that thence, favored by a fresh breeze and unimpeded by ice, he sailed to the southeast corner of Wrangell Land, where he found a bay, in which he anchored, and on landing in a boat found tracks of bears, foxes, and musk-oxen. On the following day he sailed again, landing a second time on a low point to the northeast, and thence sailing between Plover and Herald Islands (the former of which he reports seeing on both days) he proceeded along the edge of the pack (which for this occasion only assumed a nearly true east and west direction) to Point Franklin; thence to Point Barrow, after which he left the Arctic.

This may be all true. Sceptics, however, might assert as reasonable grounds for doubt the following facts: In 1866 no trader except Captains Fish and Redfield are known to have visited Norton Sound. The parties of the Telegraph Expedition were there and heard nothing of any others in the Sound. It is well known that musk-oxen are not found either recent or fossil in Siberia, nor can it be assumed, without better grounds than we yet have, that the worthy skipper is so familiar with musk-ox tracks as to be able to recognize them at a moment's notice. No other human being (and there were many in the Arctic in 1866) has ever seen Long Strait and the region of Herald Island free from ice. Plover Island has been expunged with good cause from nearly all charts. It was given up by its original discoverer as an "unfortunate mistake," and Captain Hooper in the best of weather and within a few miles of its asserted position, while sketching Wrangell Land at twice the distance, asserts that "the atmosphere was very clear, and we could easily have seen any land above the horizon within a distance of sixty or seventy miles, but none except that described could be seen from the mast-head." Lastly, with the known currents of this part of the Arctic basin, a pack with a margin extending in a nearly straight (or slightly northerly-concave) line from Herald Island to Point Franklin, as delineated by Dallmann, would be an almost

miraculous phenomenon. Altogether, it is less a subject for wonder that Herr Dallmann's modesty should have retained this surprising information fourteen years hidden in his own bosom than that he should have been persuaded to make it public at all. Were it not that his story appears with such respectable sponsors as the members of the Geographical Society of Bremen it might have been left with the above-mentioned discrepancies unnoticed, to find its own level, perhaps, with the equally remarkable geographical discoveries of Mr. Trafford of Lausanne.

In conclusion, it may be noted that the United States Coast Survey schooner *Yukon*, in charge of Mr. W. H. Dall, with a scientific party, visited the Arctic during the past summer, and accumulated a considerable store of information on the currents, magnetism, and geography, the data of which are in process of digestion. A part of the preliminary report, relating chiefly to the currents and to the ice-cliffs of Kotzebue Sound, appeared in the *American Journal of Science* for February, with a map.

The History of Boxford, Essex Co., Mass. By Sidney Perley. Illustrated. (Boxford: S. Perley.)—The population of this country village, some twenty-odd miles north of Boston, was 989 in 1776, and has never since been so large: in 1875 it numbered 834; in 1880, 824. It is an agricultural community, with a few mechanical industries, and is possessed of a soil and climate so favorable to health that it has no settled physician. "Dr. George Moody, who was settled here for a few months, said: 'I might as well practise in heaven.'" Contagious diseases are rare; casualties are mostly by drowning. Forty-one persons have died above the age of ninety. The public tavern has disappeared. For a century and three-quarters two constables have sufficed to keep the peace—"one for the North and one for the South district." The witchcraft delusion troubled Boxford less than many of the neighboring towns. Rebecca Eames, a married woman of fifty-three years, witnessing the execution of the Rev. George Burroughs on Gallows Hill, in Salem, incurred suspicion herself, and, her general reputation not helping her, was tried and sentenced to death; but being reprieved, she lived to adorn Boxford's annals of longevity, passing away from natural causes at eighty-two. Mr. Perley perhaps shares the belief in a connection between the early witchcraft "manifestations" and those of modern spiritualism, for he says: "These dreadful affairs are generally thought to be the result of the superstition of the times; but there are incidents connected with them which must be ascribed to some invisible power of the lower regions." To Boxford were assigned fifteen of the hapless Acadians, some of whom, as was the custom, "were let out to the highest or lowest bidder, according to their ability to work." Such people of color as were in the town in 1799 had the privilege of a separate seat in the gallery of the meeting-house, at a good distance from the white worshippers.

The political weight of the town may be inferred from the following proposed improvements to the Massachusetts Constitution of 1780:

"First remark, or addition: That settled ministers of the Gospel shall not have a right to a seat in the Council, Senate, or House of Representatives.

"Second remark: That the House of Representatives shall at least once a month lay before their constituents the several votes that may be determined by yeas and nays in said House, that the people may be able to judge who are friends to their country and who are not.

"Third remark: That the towns may have authority to recall their representatives at any time when they shall act anything inimical to the liberties of this Commonwealth, and to choose others to succeed them.

"Fourth remark: That the House of Representatives be subjected to a trial by jury for any failure of their promises to the people of this Commonwealth."

In this ultra-democratic community lived the ancestors of George Peabody, the Rev. A. P. Peabody, Nathaniel Peabody Rogers, of Joe Smith, Governor Andrew, A. R. Spofford, General W. B. Hazen, Senator Eugene Hale, and Thomas Sherwin, all men of mark in their various callings. Boxford was also the birthplace of Samuel Holyoke, a music-composer of some distinction at the close of the last century; and, in the present century, of the inventor of the Peabody rifle. Scarcely any phase of the New England character is absent from the traits for which these names stand.

Life, Stories, and Poems of John Brougham. Edited by William Winter. (Boston: James R. Osgood & Co. 1881. Pp. 461.)—This volume is peculiarly compounded. It opens with an autobiographical fragment, which unfortunately breaks off just at the time of Brougham's first appearance on the stage. After this comes a synopsis of Brougham's career, written by himself at the request of Mr. Winter. Next we have the report of an interview with him, in which he talked about the past, followed by a few brief jottings from his ill-kept diaries; and with the reprinting in full of his will, the more or less autobiographical part of the volume closes. Then the editor reprints two occasional poems written by himself for banquets given to Brougham, and two obituaries contributed by him to *Harper's Weekly* and the New York *Tribune*. It would have been better to have combined these two parallel essays, and to have woven into the same continued narrative most of the "Recollections and Relics" with which they are supplemented. Perhaps even Mr. Noah Brooks's letter to Mr. Winter upon "Brougham in his Club Life" could also have been made part of a more coherent biography. The effect of these hundred and fifty pages of disjointed and ill-digested matter is not a little disappointing. The material for a straightforward telling of the chief events in Brougham's life is all here, but the reader is nowhere saved the trouble of having to construct it for himself. Worse even than the biographical deficiencies are the bibliographical: there is no full list of the plays Brougham wrote, nor of the books and plays he published, nor of the parts he acted, nor of his portraits. Among the illustrations are three portraits—one in youth, a second as he looked shortly before his death, and a third as *Shylock* in his own burlesque, "Much Ado about a Merchant of Venice," a fac-simile of his manuscript, a view of Brougham's Lyceum, and a reproduction of one of his facile caricatures.

The final three hundred pages of the volume are filled with selections from Brougham's writings in prose and verse. There are thirteen stories and sketches and twenty-three poems. They are very well chosen, and bear out fully the apt words of the editor in the brief preface, to the effect that Brougham's "best faculty as an author was that of dramatic expression; his finest personal quality was his humanity. The latter is felt in all that he wrote; the former, of course, must be sought in his plays." It would have also been found in his autobiography had he lived to complete it, as the fragment here printed shows. Nor is it to be doubted that this work would have been a most entertaining addition to the list of histrionic biographies as well as his true testament to posterity. It is worth noting that Brougham left on record (p. 63) his claim to the joint authorship of "London Assurance," and we may as well say also that the foot-note (p. 455) to the Opening Address delivered at the Fifth Avenue Theatre, September 13, 1875, declares a certain "much-disputed play" to be "Our Boys," whereas from the context it is obviously "Rose Michel."

On the Wing through Europe. By a Business Man. (Columbus, Ohio: H. W. Derby & Co. 1880. 16mo, pp. xx.–297.)—The author of this book, Mr. F. C. Sessions, spent the summer of 1878 in a trip through Ireland, Great Britain, France, Switzerland, and Italy, taking glimpses also of the Rhine and the Netherlands. He followed the "beaten" routes, and saw little that has not often been described by American tourists. But his book has a certain interest from the writer's notes as a business man rather than as a tourist—the successful competition, for instance, of American leather and other commodities in the Irish market, or of American beef and petroleum in the English and elsewhere. Mr. Sessions tells one entertaining story, of a lady who was asked, on her return home from Italy, whether she had seen the lions of St. Mark's, and who said: "Oh! yes; we arrived just in time to see the noble creatures fed." Our author distinguishes better than this, but he has a naïveté of his own; as when he meditates, in Rome, upon "the names of Cæsar, Cicero, etc., who took a prominent part in the world in their day." The book is made up from the author's newspaper letters, and is full of the inaccuracies that come from hasty travelling and writing; but it is easier to read than many books of its kind.

BOOKS OF THE WEEK.

FRENCH GRAMMAR

FOR PUPILS STUDYING

LATIN.

EUGENE'S ELEMENTARY FRENCH Lessons. Edited by L. H. Buckingham, Ph.D. (Harvard), of the English High-School, Boston. 12mo, 75 cents.

EUGENE'S FRENCH GRAMMAR. Revised and edited by L. H. Buckingham, Ph.D. (Harvard), of the English High-School, Boston. 12mo, $1 60.

☞ Copies sent to teachers, post-paid, for examination, with a view to introduction, upon receipt of one-half the retail price.

HENRY HOLT & CO., New York.

A REVISED EDITION OF THE

NEW TESTAMENT

Is in press. It may, therefore, be appropriate to look back 1,600 years to the time of a former revision by the Council of Nice, A.D. 325, and enquire:

After the writings now contained in the New Testament were selected from the Gospels in existence in the fourth century, what became of the rejected books? In answer,

The Publishers are glad to be able to say that they now offer the

APOCRYPHAL BOOKS OF THE NEW TESTAMENT,

Being the Gospels and Epistles rejected by the Council of Nice. Illustrated with 32 engravings from old missals. 1 vol. 8vo, cloth, $1 50. Mailed free.

GEBBIE & CO.,
No. 619 Sansom Street, Philadelphia.

HELIOTYPE.

PERMANENT PHOTOGRAPHIC BOOK ILLUSTRATIONS.

THE HELIOTYPE PRINTING COMPANY

Are producers of illustrations by the most approved Photo-Mechanical, Photo-Lithographic, and Photo-Engraving Processes. Employed by the United States Government in illustrating Scientific and Medical reports; by Scientific, Historical, and other learned Societies; by the leading Publishers, and for illustrating Town and Family Histories, Trade Catalogues, Show-Cards, etc. Fac-similes of Medals and Coins, Ancient Manuscripts, Paintings, Drawings, Sketches, and Autograph Circulars, Views and Portraits from Nature, Medical and Scientific Objects, Antiquities, etc.

Estimates and specimens furnished on application.

THE HELIOTYPE PRINTING COMPANY,
Near Boylston Street. 211 Tremont Street, Boston.

New English Books

At 25 cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

AUSONIA. A Collection of Fac-simile Drawings by leading Italian Artists, mostly taken from their works exhibited at the Esposizione Nazionale di belle arti, Turin, 1880, and published for the benefit of the sufferers by the inundation of Calabria. Price $8.

F. W. CHRISTERN, 37 W. 23d St., New York.

BACK NUMBERS AND VOLUMES OF

The Nation

More than five years old will not hereafter be kept in stock. A few single numbers in Vols. I. to X. may be obtained of Mr. J. W. Christopher, 47 Dey Street, New York.

We have on hand a few odd *bound* volumes (second-hand, in good order), in various styles of binding, as follows: Vols. VIII., X., XII., XIII., XIV., XV., XXII., XXIII. Price $1 25 each, post-paid.

Also, two volumes bound in one, as follows: Vols. X. and XI. (1879), XIV. and XV. (1872), XVI. and XVII. (1873), XVIII. and XIX. (1874), XX. and XXI. (1875). Price $2 50 each, postpaid.

Address *THE NATION*, Box 25, New York.

A Nameless Nobleman.

The initial volume (16mo, price $1) of the

ROUND-ROBIN SERIES.

"An interesting and picturesque story, weaving together history, tradition, and fancy, and giving to the whole a convincing air of truth. . . . The characters of the two heroines, the luxurious and passionate Valerie de Montarnaud and the calm, strong, and devoted Mary Wilder, are well contrasted. There are comparatively few persons; the plot is romantic but simple; the controlling motive of each life is well sustained; the incidents are well grouped."—*Boston Advertiser.*

"A fresher, sweeter, more delightful book we have not read for many a day."—*N. Y. Mail.*

"A remarkably entertaining novel."—*Boston Traveller.*

*** *For sale by all booksellers; or sent, post-paid, on receipt of price by the publishers,*

JAMES R. OSGOOD & CO., BOSTON.

The Portable Bookcase.

We invite the attention of all Book Owners to the Portable Bookcase (Patented), Eastlake Pattern, manufactured solely by us, in various kinds of wood, with leather trimmings, to match other furniture. These cases have received the universal commendation of all who have seen or used them, and it is the first successful attempt to make a bookcase which is at once portable and permanent, useful and elegant. Send for our descriptive circular containing our special offer to deliver cases, freight free, to any town or city east of the Mississippi River.

Orders by mail will receive prompt and careful attention.

LOCKWOOD, BROOKS & CO.,
381 Washington Street, Boston.

Kissena Nurseries.

PARSONS & SONS CO.
(LIMITED),

FLUSHING, N. Y. (NEAR NEW YORK CITY).

Send three 3-cent stamps for large new Descriptive Catalogue.

"Look to Your Drains."

Do not lease or buy or live in a house without an examination of its sanitary condition by an expert.

CHAS. F. WINSLATE, Sanitary Engineer.

NEW YORK, THURSDAY, MAY 5, 1881.

The Week.

BOTH Brady and Dorsey are showing a good deal of skill in their mode of meeting the charges against them. They deny everything, and defy their accusers. This may seem absurd, but it is not. A correspondent of the New York *Times*, apparently a close observer of Washington life, when the news of Brady's dismissal came, called attention to the fact that no wrongdoer in official or political life has been in recent years brought to justice in Washington, citing the notorious escapes of the Grant period in proof of his assertion, and predicting that the Star-route criminals would also get off for the same reasons. He might have added that one rascal of the Grant period, Belknap, did come to grief, but it was solely owing to his own weakness in confessing, and his fate has ever since operated as a warning to transgressors that they must stand their ground and brazen it out, which is what Brady is doing, and Dorsey is trying to imitate him. Brady has written to the *Tribune*, asking for a "suspension of judgment," and with a certain skill trying to divert attention from the real charges against him, by reciting the history of *one* Star-route in which there was irregular increase of pay without fraud, hoping, of course, that the reader will infer that this is a fair specimen of the way all the routes were managed. He also pleads patriotism, and a desire to aid in the material development of the nation. Dorsey is more impudent, and has written to Mr. James, demanding, as a "right," that "with him and whoever (*sic*) he may bring to him, he will make such an investigation as to every contract with which his name has been connected as will enable him [Mr. James] to give him in writing the true status of each case." Mr. James, we believe, will take no notice of this communication, and is pursuing the investigation himself. It is to be hoped that Dorsey will learn "the true status of each case" in a criminal court, and have an opportunity of examining it there with the aid of "whoever he brings with him"—namely, his counsel.

Gorham, the Republican candidate for the Secretaryship of the Senate and the editor of Brady's paper, the *National Republican*, is, we believe, the only editor in the country who pronounces Brady's letter "sensible, strong, complete, and unanswerable." But he is getting himself into trouble by his editorship, for the Republicans in the Senate seem to be rapidly reaching the conclusion that he is not a good person to use to break up the "Solid South" with, and they will probably drop him before long. They are already making preparations to bring the deadlock to an end long enough to confirm the Chinese Treaty and pass on the nominations now lying before them. A very powerful address is reported to have been made to the caucus which was considering the subject by Mr. Conkling, in which he demonstrated the objectionable character of Robertson's nomination, as both insulting to him and perfidious. A "harmony committee" was subsequently appointed to wait on the President and propose a sort of compromise to him, by which, if he would agree to withdraw Mr. Robertson's name they would agree to confirm all the other nominations. He, naturally enough, peremptorily refused. Robertson's nomination was, on many grounds, a mistake, but the withdrawal of it now as part of a bargain would be a far greater mistake. The mere proposal of such a thing by the "harmony committee" shows how completely the Senatorial view of Senatorial duty has been distorted by "politics." The general expectation as to the result of the failure to agree is that there will be "war," that Mr. Conkling will make a terrible speech against the Administration in executive session, surrounded by piles of law-books, will invoke "the courtesy of the Senate" to secure Robertson's rejection, and then will fall into the same attitude towards President Garfield which he so long held towards Mr. Hayes, and engage in profounder study than ever of the rights of Senators in the matter of offices.

The difficulty of bringing persons of the Brady-Dorsey type to justice in Washington furnishes one of the strong objections to the practice, to which the country now seems irrevocably committed, of making political capitals, or seats of government, separate from the social and commercial—or, in other words, real—capitals of the nation and the States. The result is not only to isolate the class engaged in the work of legislation and administration from the rest of the country, but, by throwing its members mainly on each other for society, to intensify their prejudices and dulness and ignorance. Their mental condition becomes very much that of the garrison of a remote fort, or of the crew of a man-of-war. They get to have an *esprit de corps*, and a morality of their own, and a scale of proportion of their own. Their own controversies assume enormous dimensions in their eyes; the objections of the outside world to practices with which they are familiar seem finical or "Sunday-schoolish," and they secretly resent an attack on a man in office as a sort of impertinence, and make common cause with him, as a soldier might with a professional brother who had got "into trouble" through a youthful escapade. Public opinion is represented to them by the correspondents of distant newspapers, and they are not much troubled by it, because it seems to them to express simply the personal feelings of Smith or Jones of Newspaper Row, whom they know well and don't like. The illustrations of all this afforded by the Senatorial "deadlock" in Washington, and by the action of the Assembly at Albany on the street-cleaning question, are very striking. Neither of them, undoubtedly, would have occurred if the legislators in either case sat in a real capital, and were in contact with the currents of public thought and feeling, and when they left the Capitol, instead of brooding over their own performances with brother politicians in their hotels and boarding-houses, mingled with men of other callings and occupations, and got glimpses of the great legislative "crises" from the ordinary taxpayer's point of view. Massachusetts is better off in this respect than almost any other State. Its legislature sits in the moral and social and commercial centre of the State.

The Boston *Advertiser*, commenting on Mr. Curtis's address on civil-service reform, in Boston, the other day, says: "The civil-service reform suffers from the circumstance that it is for the most part merely destructive," and further, that "the masses of the people will not be moved until they have been furnished with a complete, intelligible, and practical plan." This is an objection which has a touch of the humorous in it, because it has been produced against every reform ever made in any country. The people *have* been furnished with "a complete, intelligible, and practical plan," but they are prevented from trying it on a large scale by the allegation of the politicians and their newspapers that it is "theoretical" and "visionary"—two epithets which they apply to everything which they do not like and have not tried. It *has* been tried on a small scale in the New York Post-office and Custom-house, and in the Department of the Interior at Washington, and has succeeded admirably in all three, and the *Advertiser* could not do better, to qualify itself for writing on civil-service reform, than to enquire into the practical working of the plan in these places.

The difficulties the reform has to encounter in the way of mere human perversity and stupidity has been well exemplified in the Department of the Interior. Mr. Kirkwood, when he came into office, found the new plan at work there, and thoroughly successful after four years' trial. But he was old; it was novel to him; he had never seen it or heard of it "in politics"; it seemed "visionary" and "literary," so without examining its operations for one week even, he abolished it and went back to the old corrupt, demoralizing, dishonest, embezzling system of allowing Congressmen to fill the places with their henchmen as a means of paying their political debts. He soon plunged the department in confusion, found himself overwhelmed with office-seekers, and is to-day a

sadder and wiser man, and is pretending that he has not abandoned the system completely but only partially; and he does not say that it did not work well in practice, but that it gave persons living near Washington an unfair advantage over "the men of the mountain and the prairie" living at a distance. This is true, but the remedy for this is simple—*i.e.*, to vote a little money to send examiners to or keep examiners in each State, and thus save candidates the expense of going far from their homes. As an excuse for abandoning the whole experiment there is a savage absurdity about it. The fact is there has grown up around the spoils system, as around every abuse which has lasted more than one generation, a prodigious amount of cant, and it sounds, strange to say, in spite of the change of time and men, precisely like the cant by which the ancien régime in France and the Tory régime in England were defended. There is the same fatuous, doubting air, the same melancholy, senile shaking of the head over "novelties," the same demand for proof that the thing will "work" before it is even tried, accompanied by the same mulish dislike to having it tried.

Although gold imports have ceased, at least for new transactions, the New York money market is becoming plethoric with loanable funds. The surplus reserve of the banks is nearly $11,500,000, against less than $3,500,000 a year ago, and all domestic influences tend towards lower rates for money. This week the Treasury began the payment of about $5,750,000 May interest, and has given notice that it will prepay at Washington all the unpaid 5 per cent. bonds included in the 101st call. The amount called was $25,000,000, and about $16,000,000 remain unpaid. The Treasury is daily receiving applications for the extension of 6 per cent. bonds into 3½ per cents. Whatever amount is not so extended will be paid in cash July 1. Although the Treasury payments were large during April, amounting to $14,700,000, exclusive of those on account of the public debt, the debt was nevertheless reduced during the month by $9,660,000. United States bonds have been in large demand during the week, and the 4 per cents, the floating supply of which is small, have been bought up to 116¼, the highest price ever paid for them. At this price they yield the buyer about 3⅛ per cent. annual income. The present and prospective abundance of loanable money is having its influence on speculation at the Stock Exchange, and although prices of railroad securities are very high, and there are good reasons why there should be at least no further advance, yet a "bull speculation" was begun; but at the close it showed symptoms of weakness.

The reply of the Mayor, Comptroller, and Corporation Counsel to the petition of the Manhattan Elevated Railway Company for a reduction of taxes is perfectly conclusive and brings out very neatly the coolness of the proposal. No error, it says, is found by the company in the principles upon which it and other corporations are taxed, and it is only alleged that the business done at present does not warrant the amount of taxation imposed. But it points out that the petitioner is paying dividends of ten per cent. upon the capital stock of both the roads it leases, "a small portion of which," if it had been devoted to paying taxes, would have prevented the accumulation of arrears now complained of. The payments of such dividends may have given a fictitious value to the stock, which value was thus taken as a basis of valuation, but "the Tax Commissioners were justified" in supposing the dividends to be "net earnings," and so the responsibility for over-valuation must rest with the directors. Moreover, the taxes have been relied upon to pay for city disbursements, bonds having been issued in anticipation of their payment, and the city officials have no right under such circumstances to surrender any just claim. As to future taxes, the report says very simply: "If they [the elevated stocks] have the value current they must represent property, and should be taxed as such. If they do not they will decline in value and the tax will decline proportionately," so that the relief desired will be brought about "by the operation of natural laws." This is a hard saying, and the only way to get around it is to say that in consideration of distinguished public services the operation of any natural law which makes the stock's market value correspond with the tax valuation ought to be suspended. As yet, however, the company has offered no rejoinder.

We infer that the better class of Democrats in Maryland would be glad if the State Constitution provided for a trial of the Legislature by jury. Two years ago the party platform was noticeably sincere in tone and excellent in its demands for pure government, particular stress being laid upon official economy, the holding of public office as a trust for the general advantage, and the need of a registration law to ensure fair elections. The reformers who drew it up succeeded in nominating their candidate for governor, who stumped the State, platform in hand, and was elected by a cheering majority. It would now seem as if the regular managers had outwitted them by yielding on an unessential point and quietly "fixing" the Legislature to suit themselves. This body paid so little attention to the fine sentiments of the platform that Governor Hamilton had to remind them of it, and then they paid as little as before. The cost of the session was suggestive of anything but retrenchment, while the voting of $200 apiece to all the newspaper correspondents at the Capitol is alleged to explain the extremely unsatisfactory report of the Legislature's proceedings that was served out to the press. The reformers have determined to forestall the next elections by exposing the shortcomings of the Legislature of 1880, and have called on the Governor for hitherto inaccessible information with regard to it. He has accordingly published the items of its expenditure, in connection with a letter rehearsing the expectations justified by the platform and disappointed by the General Assembly. The savings he points out as possible do not appear large, but his complaint is that the law regulating expenditure has been purposely left incomplete, and that bills establishing a definite system, abolishing useless offices, providing for registration, and putting primary meetings "under legal protection against fraud and violence" failed, almost without exception, to pass. We wish the reformers success in their efforts to find some one who will be responsible for the platform after the election. The discovery would rank among the greatest of the age.

The way in which the Solid South dissolves if left to itself is shown in such a movement as is now agitating North Carolina, where a prohibitory law has been enacted, with a reference of the penal section to popular vote for acceptance or rejection. No matter what one's views may be on the policy of such legislation, the well-known relation between drunkenness and crime and misery everywhere, and especially between whiskey and violence at the South, must cause a temperance revival in that section to be viewed with satisfaction as a sign of moral recuperation. All the more should we rejoice at it when we see all classes engaged in it in the most fraternal manner. The convention held in Raleigh last week, at which Governor Jarvis and Judge Merrimon made speeches in hearty sympathy with the law and with the contemplated campaign, adopted an address from which we make the following significant extract:

"2. We also regard it as an occasion of profound congratulation that now, for the first time, perhaps, in the history of our commonwealth since the days of the heroes of '76, the people of all parties, religions, and colors can meet on one common platform to advance a great public measure without any conflict of interests whatever, without creating any party friction, awakening any religious prejudice, and without begetting any race-antagonism. . . . We have only one aim; we are animated by only one motive—namely, the advancement of the material and moral prosperity of *all* the people of this broad commonwealth, the promotion of their health, wealth, liberty, and happiness, without any distinctions whatever."

The convention apportioned sums of money to be raised in each county for the purpose of disseminating tracts on prohibition and sustaining speakers, and expressly recorded its judgment "that not one cent should be used in any way not justified by the highest ethics, private or public." On the other hand, in order that the liquor interest might not use its wares "for the purpose of perverting public sentiment" before the election in August, county commissioners were entreated to use the option allowed them by the Legislature and grant no licenses after May 1, when most if not all of the present licenses expire. Prohibition takes effect on the first Monday in October.

The history and present condition of the public schools of Charleston were made the subject of a special report last week by Mayor Courtenay. The historical portion was not extensive, since the free-school system in South Carolina dates only from 1811, but it appears that in 1856 a great

improvement was made in it, and that in 1860 there were 4,000 white children in the city schools. After the war came the carpet-bag governments, making liberal appropriations for education and squandering the money in Scott-Parker fashion. In the last year of that régime, viz., in 1876, the State school fund was nominally $189,352; the number of schools 2,483; and the number of scholars—white, 46,444; colored, 55,952. Last year the figures stood—fund, $351,415; schools, 2,973; scholars, 61,219 white and 72,853 colored—a significant increase. In Charleston alone, the total of white and black together barely exceeded the white attendance of 1860, indicating, aside from the increase in the population, that half of the children of both colors are now without the means of instruction. Mayor Courtenay shows that this defect is not owing to any unwillingness on the part of the city to tax itself, since the educational tax-rate is higher even than Boston's, not to speak of voluntary contributions for the upper schools. The rest of his report is an argument for national aid, and very effectively summarizes the appeal of the trustees of the Peabody Educational Fund to Congress, which was endorsed by President Hayes and justified by President Garfield in his inaugural. It is well to have it repeated by Southern officials alive by bitter experience to the perils of ignorant suffrage. We do not doubt that Congress will eventually give a favorable response, though we have seen that Mr. Hoar's measure barely succeeded in passing the Senate. The present is a fit time to remind him that the miserable obstruction in which he has been engaged since March 4 tends to destroy the legislative sense of perspective, and to invite neglect, postponement, and defeat for matters of far-reaching national concern and obligation, in favor of party intrigue and personal aggrandizement. He is himself now acting under the delusion that it is more important to bolster up repudiation in Virginia than for every child at the South to be furnished instruction, in accordance with his own scheme of national assistance.

The Seventeenth Assembly District Republican Association last week adopted resolutions in favor of the Carpenter Street-Cleaning Bill, and denouncing the present agitation in the severest terms as "unwise and un-Republican." According to their view of the case the doctors and newspapers and Democrats have formed a conspiracy to "damage the Republican party," and "destroy the purity and freedom of elections in this city"; to remove the Police Commissioners "on evidence evidently manufactured for the occasion by our political enemies," and in furtherance of "base partisan purposes"; and to place in the hands of one man millions of dollars to be expended in reducing the Republican city vote, "now happily on the increase." This last is unnecessarily alarming, for the failure of Governor Cornell to pardon Balbo, the Italian murderer, has already, we believe, "alienated" a large part of the street-cleaning vote; besides which, two of the Police Commissioners are Tammany Democrats, and their removal ought not to be publicly spoken of as a Republican loss. But it appears that what the Seventeenth District Association really objects to is, the insidious centralizing tendency and corresponding danger to our municipal institutions involved in letting the Mayor clean the streets unaided. This is mentioned as an example of "one-man rule," which they say experience has demonstrated to be "against the best interest of the people." The association makes all these loose statements in its capacity as a body "representing the Republican electors of this district," but this assumption, too, we must distrust if the results of a careful statistical enquiry by Mr. George Bliss, the accused Police Commissioners' counsel, are to be relied upon. He had a very poor opinion of these "associations" eighteen months ago when he complained to General Arthur that of 13,335 names on their rolls, half of them were those of dead men and "not 6,000 should be there," whereas the Republican vote of the city was about 50,000.

It is proposed to spend $25,000 on a monument to Lord Beaconsfield in Westminster Abbey, but it is pleasant to see that Mr. Labouchere has announced his intention of opposing the vote, and that his notice was loudly cheered by the Radicals. If the Liberals appropriate money for any such purpose, after the accounts they gave of Lord Beaconsfield's life and works during the late canvass, they will stultify themselves before the world in a very remarkable way. A debate on the subject will be useful if it produces some definition of a politician's title to posthumous honors of this character at the public expense. At present it seems as if nothing could warrant such honors but great achievements in the public service, or universally recognized greatness of character. Neither of these claims is put forward for Lord Beaconsfield. His fame rests on his novels, and on his skill as a party manager. He was the author of no legislation of note, except the Reform Bill of 1867, which he really borrowed from his adversaries and passed himself as a clever political trick, in order to "dish the Whigs," as the late Lord Derby said. His latest achievements were the Treaty of Berlin and the Afghan War, which, as described by Mr. Gladstone and Mr. Vernon Harcourt, almost merited the penitentiary. If the Ministry propose the vote they ought to be forced to state in detail in what manner Lord Beaconsfield deserved well of his country. In any event, it would seem as if no one whose right to it was disputed by any considerable body of his own countrymen ought to have a memorial in "the great temple of silence and reconciliation."

The French persist in denying all intention of doing anything more in Tunis than chastise the Kroumirs and make their own territory safe, and their declarations are evidently believed in England. The Bey has sent out a solemn protest against the violation of his territory, which he says is really Turkish territory, and to enter on it in hostile array is, therefore, to assail what Lord Beaconsfield used to call "the integrity and independence of the Ottoman Empire"; but the Porte does not seem disposed to adopt this view or assert its suzerainty, although there is no doubt that it is technically correct. The French military operations do not seem likely to present any difficulty. The Kroumir territory is a quadrangle, with the sea on one side, settled Tunis on another, Algeria on another, and a newly-completed railroad between Tunis and Algeria on the fourth. Consequently there is no difficulty in surrounding them. Their territory is not large—that is, not over twenty miles broad by a hundred long. A more disadvantageous "location" for robber tribes it would be difficult to find, and the wonder is that they have been left unmolested so long. The Bey sent his brother Ali to the scene of action with some five thousand wretched troops, who have been exciting the merriment of the correspondents. Ali being a good Mussulman and hating modern improvements as much as Mr. Ruskin, refused to transport his army by the railroad and piously performed an eight days' march instead. It is now reported that he has gone back to Tunis, disgusted both with the French and the Kroumirs, whom he considers altogether a bad lot.

The benefits of the Irish Land Bill will be enjoyed by all tenants against whom final judgment in an ejectment process has not been obtained before its passage. But there are now thousands of tenants against whom such judgment has been obtained already who are just as much entitled to its benefits as the others. It was to protect the former against eviction pending the introduction and passage of the bill that Mr. Forster brought in the Disturbance Bill which was thrown out by the House of Lords in the last session of Parliament. The Land League subsequently did the work which this bill would have done, by the process of "boycotting" and passive resistance. But the Coercion Bill having placed overwhelming force at the disposal of the landlords, evictions on a great scale have been resumed, and are causing an exasperation among the peasantry which bids fair to neutralize the soothing influence of the Land Bill, and is leading to a renewal of savage outrages in various parts of the country. It is, of course, expecting too much from human nature, and certainly from Irish human nature, to expect peaceable submission to what the Government has acknowledged to be oppression, and what pending legislation proposes to forbid. This state of things has led to increased violence of language on the part of Dillon, the most violent of the Land-Leaguers, and to his arrest, and the "proclamation," as disturbed, of Dublin city and county. Dillon is the first member of Parliament who has been arrested under the Coercion Act, and was arrested on his way to the House. The whole affair is a very disagreeable one, and is exciting a good deal of uneasiness among the Radical Liberals, whose fears about the whole policy of coercion it is confirming. They said it would not produce tranquillity, and it has not done so. They said, too, it would prevent the Land Bill from proving a "healing measure," and it seems likely to do so.

SILVER AND GREENBACKISM.

MOST persons who hear of the silver question without following it in all its details will find some difficulty in believing that there is a humorous side to it, and yet when one reads the articles and protests of the French opponents of the proposed International Silver Convention one perceives it distinctly. To these gentlemen we occupy the position of great producers of silver who have a large stock on hand, to which we are constantly making additions, and which we have in vain offered on very favorable terms to our own population, who will none of it. Under these circumstances, we are supposed to be looking about to see whether there is not some simple-minded people in Europe whom we can persuade into allowing us to "unload" on it. The French are themselves in a worse predicament than we are as regards the quantity of silver in store which they cannot persuade their own people to use. They have about $230,000,000 of it in the Bank of France which they cannot get rid of, while we have only about $89,000,000 as yet. But then they are better off than we are as regards the future. France is not a silver-producing country, and therefore has no powerful mining interest at work pressing the Government and operating on public opinion for the purpose of creating a market for its wares. The French are, therefore, naturally somewhat anxious as to the amount of silver which, if they enter into a bi-metallic agreement with us, we may take occasion to impose on them by way of saving the world from the horrors of a scarcity of metallic currency. M. Leroy-Beaulieu, who is lifting up his voice on this subject with much effect, supposes the following very diverting conversation between the United States and M. Magnin, the French Minister of Finance. Say the United States:

"We are producing enormous quantities of silver. New mines are every day discovered in our territory, in Arizona and other places. But silver has fallen fifteen or twenty per cent. in value. This is very disagreeable to us. Our mine-owners are disgusted with it. They are the more disgusted because our own people refuse totally to use silver as money. We have coined some tens of millions of dollars of our fathers, but these had hardly left the Mint when our people sent them back to the Treasury. We are thus very much embarrassed, because we produce a great deal of silver, which is depreciating and which our people, who are very 'cute (*très-fine*), will not turn to account. We must export it. Now, France is a nice country. She has already about $250,000,000 of silver. We will give her $200,000,000 or $300,000,000 more, if she pleases. That would be very advantageous for us, and very obliging on the part of France; for in this way we can get rid of our silver product, which our citizens are very willing to send abroad but obstinately refuse to make use of at home."

To this M. Magnin, according to M. Leroy-Beaulieu, should answer:

"We have already $250,000,000 in silver, and are very much burdened with it. We dare not, as I have just told the Senate, pay our Senators and Deputies even partially in this metal, through fear of a parliamentary rebellion. Now, how much silver coin have you Americans? Have you $250,000,000 of it, like us? No; you have not the third or the quarter of this sum. Very well; begin and coin for yourselves $250,000,000. When you have this amount, look in again and we will talk the matter over with you. Until then it is for you alone to go on coining, because, compared to us, you are behindhand with your silver dollars."

It is quite evident, of course, even to the most simple-minded European, that if there were an international agreement to deliver gold at all the mints at a fixed ratio in return for silver, the principal result would be the creation of an admirable market for the products of the mines of the silver-producing countries, of which the United States are the chief. The other countries could only exchange the silver they draw from elsewhere in return for their products, but the United States would be every year producing considerable quantities of new silver for which they have no use themselves, and which they would rapidly forward to Europe to be exchanged into gold at the mints of the other members of the union. It now takes eighteen ounces and a half to buy an ounce of gold. It would, under the bi-metallic Convention, be possible to get an ounce of gold for fifteen and a half or sixteen ounces, and the silver business would thrive apace. If it be said that the Europeans would retaliate by sending their silver to our mint and drawing gold for it, the answer is that if the members of the union attacked each other's mints in this way in order to procure gold it would show that the competition for gold which is now said to be threatening the world with a great disaster had not ceased, that the eagerness of the great commercial nations to do business by a gold standard was unabated, and that the effect of a scarcity of gold in raising prices, which the bi-metallic movement is intended to prevent, was unavoidable. In fact, the nation whose supply of silver was steadiest and largest would speedily get all the gold there was in the pockets of foreigners. There is nothing in the bi-metallic movement more curious than the confidence of its promoters that by its aid they can bring about something which the world has never witnessed—the use of two standards simultaneously in the same country. As a matter of fact, no nation has ever bought and sold and promised to pay in gold or silver indifferently. Every nation has always, when there were two legal tenders, exported the more valuable metal, and done its business in the cheaper one. Each nation would do so still under the proposed bi-metallic convention; that is, some countries would use the silver standard and some the gold, as they do now. Sellers of commodities would stipulate for payment, not in whichever metal the buyer pleased, but in whichever the seller pleased. "Oh! but," the silver-man will say, "the seller would not need to make any such stipulation, because if he were paid in silver he could always carry it to the mint and obtain its value or more than its value in gold, and, knowing this, he would *not* carry it to the mint. He would be satisfied to keep and use it." To which we make answer, that the very reason which makes it impossible to keep silver in circulation in this country and in France at this moment would impel him to carry it to the mint and exchange it for gold—viz., the enormous bulk of it which would be needed in such great transactions as those in which the business of the leading commercial nations is now carried on. If there were a widespread desire to conduct this business on a gold basis, and to make prices in gold, the strain on the gold-supply of the world, of which we hear so much, would continue, and probably be worse than ever. Heretofore the strain has been relieved by some nations resigning themselves to the cheaper metal altogether, and giving up all claim to the dearer one. But if the proposed universal monetary union were brought about, and every mint was bound to pay out gold for silver to all comers at a fixed price, there would be no such relief. The demand for gold, instead of being partial, would be universal.

There is so little probability that any such union will be brought about that discussing its consequences is very like discussing a chimera. But the probable futility of the movement does not make it harmless. It is doing mischief every day by shaking popular confidence in the great, if not the greatest, defence of monetary soundness in this and all other democratic countries—the doctrine that true money must have intrinsic value, and that that value is regulated solely by the laws of trade, and not by the Government stamp. It is with this doctrine that all the great money crazes of modern times have been successfully combated. It is the only adequate defence against Greenbackism and all cognate schemes of inflation. To abandon or weaken it is to open the door to the embodiment in legislation of almost every form of financial folly. Now, in sending national delegates to Paris to maintain and propagate the theory that we can by law or treaty give silver a higher permanent value than it has in the market—that is to say, a value independent of the demand for it and the cost of producing it—we do undoubtedly give countenance to the notion that there can be such a thing as Government money without intrinsic value, and that the purchasing power of money can be made matter of Government regulation. This is all that the Greenbackers ask us to concede, and, with a little adaptation, it can be made to give General Butler's stamped leather the character of a very respectable coinage. When he asks that his "fiat money" be made exchangeable for gold or any other commodity by law, at a fixed ratio, what answer can we give that will not make our silver movement seem absurd? If we can permanently raise silver above its market value, and make its price independent of supply and cost, by international agreement, why not leather? why not copper? Why have anything so expensive as silver for our second legal tender, when a short treaty making copper exchangeable for gold at a fixed rate will give it all the steadiness which it now lacks, and qualify it to relieve the strain on gold?

The sooner the Paris Conference breaks up and the bi-metallists begin

to turn their attention to natural instead of artificial modes of escape from the dangers they anticipate, the better will it be both for our financial and political future, if, indeed, the two things are separable. There is no reason why silver should not be brought into more extensive use by all the leading nations of the world. This could be accomplished by the very simple expedient of raising somewhat the amount for which it is a legal tender in the gold countries, and by excluding bank-bills for small amounts for circulation in all countries. This done, the Government should confine itself in its dealings with the relations of gold and silver to simple recognition, by appropriate machinery, of the market price of the metals. They should exchange, and must always exchange, and always have exchanged in the long run, for what they were worth. There is no reason why an individual should not be permitted to settle his debts in silver, as in broadcloth or molasses or grain. It is a commodity like another. The Government ought to indicate the quantity contained in a coin by its stamp, but all attempts to fix in this way the amount of some other commodity it ought to purchase serves to propagate the idea, of which we probably have not yet seen the whole fruit, that the value of money is the creation of law.

THE FRENCH OCCUPATION OF TUNIS.

THE last act of the understanding that secured Cyprus to Great Britain, and a large part of European Turkey to Austria, is now apparently being consummated by the occupation of the Regency of Tunis by a French army. The protests of the Bey and his suzerain, and the probability of a war with Italy, have availed nothing. Under the pretext of an apprehended uprising of the discontented tribes in Algeria, one army corps was quietly but rapidly transferred from the southern ports of France across the Mediterranean to the eastern ports of Algeria and concentrated on the Tunisian frontier; and while this one is moving in three columns towards the capital of Tunis, another is being transported more openly, and with equal vigor, to take its place in Algeria. The French have been quietly preparing for this *coup* for years; circumstances have delayed its execution, and doubtless France would much have preferred the Bey's consent to a French protectorate. But it has been evident that the Bey could not, even if he would like to, consent to any such arrangement, for the Italian and German influences have been exerted to the utmost to prevent it. No nation is so well prepared for transporting an army by sea as France. While the fighting ships of her navy have been changed from the old-fashioned wooden ships-of-the-line and frigates to the modern machines called iron-clads, the former have been all systematically transformed into transports, with every preparation imaginable for rapid embarkation of all grades of troops and branches of an army with their appurtenances. The transports are maintained in a thoroughly efficient condition for immediate service; some of them are fully equipped, with even the provisions, stores, and coals on board, and the officers and crew detailed, while others equally efficient are moored at their arsenals alongside of storehouses in which their full equipments are kept carefully sorted and marked ready for instant transfer. The arrangements for embarking and transporting cavalry are a marvel, and in this the French have excelled themselves as organizers. As if to obviate any possible omission, an army is occasionally prepared for service, concentrated in the vicinity of the arsenal, and the programme carried out up to the very point of embarkation. Ask French officers what all this means, and they will answer by pointing to the map of the Mediterranean, and explain that their position demands such preparation no less to protect their African possessions than to occupy neighboring territory should circumstances demand it. The mountain barrier that separates them from Italy is fortified so admirably that the best of generals and most powerful of armies would find it difficult to reach the plains of Italy. Hence reliance is placed on naval superiority, and every disposition made to move a large army by water. On more than one occasion incipient insurrections in Algeria have been nipped in the bud by the celerity with which a regiment of cavalry has been carried, ready for an extended campaign, from Toulon to the port in Algeria nearest to the scene of disturbance. Artificial harbors have been built all along the Algerian coast, so as to ensure prompt disembarkation within striking distance of any part of the territory.

All this preparation is now made available for adding the Regency of Tunis to the French colony of Algeria. The excuse for such a step is that the tribes who inhabit the border have made raids into Algerian territory and plundered French subjects, and, as the Bey cannot or will not punish them, the French Government must do so. We must not expect a better when a powerful nation desires to absorb the territory of a weak and semi-barbarous neighbor. The truth is that the tribes for whose punishment a French army numbering sixty thousand has invaded Tunis hardly number twenty-five thousand souls of all ages and both sexes. They are nomadic Arabs, fanatical Mohammedans, and notoriously vicious and piratical. Possessing large herds of camels, cattle, and sheep, chiefly stolen from the more peaceable tribes, they steadfastly resist the occupation and development of their territory by European settlers, defy the authority of the Bey to collect taxes, and enjoy a semi-independence which is unquestionably their right. That their raids are often across the border, and that the tribes occupying Algerian territory are the greatest sufferers, there can be no doubt; and that the former deserve to be summarily dealt with, every one must admit. But a regiment of French cavalry could inflict on them a punishment so severe as never to be forgotten: they are practically unarmed, their weapons being rifles and pistols of the type so eagerly sought after by collectors of bric-à-brac as interesting objects of antiquity. Without artillery or ammunition, with only tribal organization, and devoid of the means to prepare for defence, the French troops have only to guard against ambuscade and they may occupy the whole territory with hardly any loss of life, provided Italy remains inactive.

When it is remembered that there are at least thirty thousand Italian colonists in Tunis, and that the greater part of the commerce and industries of the Regency are in Italian hands, national interests should make any Government in Italy desirous to prevent at all hazards the establishment of a hostile power in a territory so near to her own, separated by seventy miles of the placid waters of the Mediterranean. Sardinia is further from Italy proper than Tunis is from Sicily. The surplus population of Italy would freely migrate to the fertile regions of Tunis, and there remain subject to military service, if Tunis were an Italian colony; were it a French colony the emigration would be the same, but the emigrants would be beyond the reach of Italian conscription. As an Italian colony the freedom of intercourse would stimulate the commerce of Italy with Tunis, while as a French colony the restrictions that are now so destructive to the trade between Italy and France would annihilate the existing trade between Italy and Tunis. Endless are the arguments that might be brought forward in favor of active Italian opposition to an extension of the French African colony, and if Italy passively submits to it no greater proof of her internal weakness could be given to the world.

To suppose that she would accept Tripoli as compensation would be to pay a poor compliment to the intelligence of her statesmen. Tripoli is a desert. The small population it now has find it difficult to maintain life in the oasis they occupy, and are slowly but surely diminishing. Tripoli is not worth occupation; while Tunis, especially that part so much coveted, now occupied by the Kroumirs, is among the most fertile regions bordering the Mediterranean, and unquestionably the richest in mineral deposits. Oak forests which yield an almost unlimited supply of cork—now so scarce and so much more valuable than it was ten years ago—occupy a large tract of the western part of Tunis; iron ore, equalled in percentage of mineral only by that of Elba, may be mined on the hill-slopes bordering the coast and in many accessible places inland; argentiferous ores are known to abound in the mountains of the interior and western part of the Regency. Moreover, unlike Tripoli, northern Tunis is well supplied with perennial streams that furnish abundant water for irrigation; and the yield of grain, considering the methods of cultivation, is far above the average. French capital has vainly sought the development of Tunis. The inhabitants have opposed it by every means in their power, knowing that the annexation of their country to Algeria must inevitably follow such an investment. The construction of the railway through the Regency to connect with the Algerian system was only a link in the chain of events that have ended in the occupation now in progress, and the piratical raid of the Kroumirs only the excuse that has hastened it.

There is a possibility that Germany may have given assurances to

France of non-intervention in case Italy offers active opposition, whether welcoming a vent to French warlike aspirations or from a rational belief that in a war between France and Italy the latter would not necessarily be worsted. To be sure, it has been reported that Germany sought to possess that part of Tunis in the vicinity of Biserta (port and lake), in order to have a naval station on the Mediterranean, and it is well known that German officers explored the region and mapped it. When the German navy has grown to an equality with that of other first-class naval Powers, a naval station on the Mediterranean would be desirable; until then it would be a source of weakness. It is, therefore, probable that Germany regards with equanimity, at least, the possibility of war between France and Italy on the Tunisian question.

IMPRESSIONS OF HAVANA AND CUBA.

HAVANA, April 10, 1881.

THE impression that besets the traveller in foreign countries, in the early stages of his visit, that he is being fleeced on account of his ignorance of the manners and customs, may pass away at Havana, as elsewhere, but the demands in which it had its origin here are likely still to remain. Havana is so expensive a city that its ordinary prices have a quite sufficient air of extortion. It costs thirty-five cents for a ride in the horse-cars; forty cents for a couple of diminutive eggs in a very inferior restaurant; thirty-six dollars for a modest room (unfurnished), such as a clerk might require, by the month; and at that rate. These prices are in paper, it is true; but, reduced nearly one-half to our standard, they are very pretty figures still. The minor currency—one recognizes it in his first transactions on landing with a hearty sigh of self-congratulation and of wonderment at what we have gone through—is of the same soiled and ragged sort used among ourselves in our "shin-plaster" period, only, as a rule, more repulsive through the universal use here of the café, and the accounting on the wet tops of its small marble tables.

The rewards of labor, at least in the smaller commerce, on the other hand, are not in proportion. Since we have commenced with the minor clerk let us continue a moment. There are those who receive but thirty and forty dollars a month in paper. One of some importance at the "Diana," the A. T. Stewart's of Havana, in the Calle del Obispo, will get say thirty dollars in gold. He will have in addition his board, which is taken in the store with his fellows, breakfast at half-past nine and dinner at five, the shutters being put up for that purpose; and his lodging, which is on or under the counter. He will have to work for that from six in the morning till ten at night, the customary hours in the retail trade; though in the wholesale trade, and especially in the foreign houses (of which there are many), both the labors are lighter and the pay better. The Cuban clerk, too, has a greater competition to meet than with us, owing to a peculiar feature of business worthy of note, perhaps, by some enterprising purveyor of novelties for introduction among ourselves. There is a custom of sending goods to the houses of patrons for inspection, if it be too warm, or if for any other reason they do not wish to come in person. If a lady desire a fan, a dress-pattern, or any other article whatsoever at her hotel or private residence, she may have half the stock of the establishment sent to her, and with it an attentive employé who will wait an hour or two while she pulls it over and selects, or returns the whole without purchase if such be her mind.

How, then, our little clerk, with his scanty horizon, his long hours, and small wages, can pay eighteen cents, gold, to ride in a horse-car, dress very well, and have money to dash gaily about in the cafés, is one of those problems which it seems one could never remain long enough in Havana to find out, till he cast his eyes by chance upon the lottery. He has had great difficulty at first to cast his eyes anywhere else, since it is the most obtrusive thing in the country; but beginning with the ingrained American prejudice against lotteries as something extremely disreputable, he has not considered it worthy of attention. If it be not a lottery ticket-seller who accosts you the first on the very lowest step of the landing stage when you are set ashore from your steamer, at the venerable old convent which is now the custom-house, in one of the half gondola-shaped harbor boats, it is very strange. Lottery ticket-dealers swarm. I have seen four, one seated in each corner of the two doors of a small café, and three others circulating among the guests within. They are of many types—men, women, and children, with one-legged soldiers, probably victims of the insurrection, largely represented. They are not repulsed with scorn; they are not hurried off by vigilant police to be fined and imprisoned. On the contrary, they gain from a percentage on their sales a tolerable livelihood for themselves, and are looked upon, for what I know, with a certain veneration as the agents through whom the fortune and ease which the Government, making itself the beneficent *deus ex machinâ* of its subjects, has to bestow upon those born under a lucky star, are to be received. The Cuban in humble circumstances buys hope. If he have no savings in the bank, and no policy of life insurance, he can always have in his pocket at an inconsiderable price the possibility of a brilliant gain from one of the twenty-two drawings, with their numerous prizes, conducted annually, and with that he rests content. He has nothing to do, then, with his surplus but dash it out in the cafés, or, better yet, to buy more lottery tickets. It is a system that cannot sufficiently be reprobated—my own number is 11,014, and I am looking forward with no small interest to see what it will do in the drawing, with the first prize a million in paper, which takes place to-morrow; and its abolition, as a foe to honest industry and economy, is a reform in comparison with which those just now coming over to the island and printed in the papers these last few days—the new constitution enacted by the Cortes—are unworthy of mention. There is to be liberty of the press, liberty of religion—which will no doubt result presently in the establishment, for the first time, of some sort of modest Protestant chapel at Havana—and a fair distribution to Cubans of the offices which have heretofore been too much the perquisite of the Spaniards of the mother country. It is really, in fact, an important moment at which we are arrived, and it is worth waiting to see, now for a little time henceforward, what we shall see.

Momentous, too, during the last two months the time has been and still continues, in the insight which has been afforded into the conduct of affairs in a most wretchedly maladministered island, by the discovery of enormous frauds in the Marine Department. These are of an extent to discountenance those persons at home who are continually telling us that they manage these things better in France, and quite to warm the cockles of the hearts of such members of the Tweed Ring in New York as may still survive. It is estimated, in the retrospective light thrown through these scandals upon the past, that not less than forty millions in hard money have been stolen outright during the course of the insurrection, beginning in 1868. The Morro Castle is full just now of prisoners of distinction, marquises and counts (titles of the island), officers of rank, and wealthy contractors, undergoing trial. The proceedings have been by court-martial, and not too fully spread before the public, nor are the sentences yet made public; but I hear only this morning, from a somewhat inside confidential source, that Antonio Gassol, the principal operator in this species of lottery, as it were, in which he has been unhappy enough to draw at last a penalty after drawing so long rich prizes, has received, or will receive, two years' confinement in a fortress, and a number of others of a secondary rank four months each. It is known that Admiral Berenguer, the head of the station, was fiercely disposed, and had threatened to tear the shoulder-straps from his uniform unless justice were done upon the culprits. Whether this be such very great severity after all is a question, but it is certain that they have got a touch of punishment of a kind such persons can particularly appreciate, in the fines and restitutions imposed upon them, as far as might be, in addition, which in the case of Gassol amount to a million. The system was a conspiracy between contractors for supplies and officers of the commissariat, auditors, and others in authority, and was carried on by the good old method of "addition, subtraction, and silence," with which we have been more or less familiar at home. Thus, Señor Gamez, for example, would have an original bill of $375 for coal, which would be raised at second hand to $3,750, certified by a third as $37,500, and thus paid.

One is assured by very intelligent persons, on many hands, that this weary ten years' insurrection, which straggled so unintelligibly through our own newspapers, ruined plantations by the score, loaded the island with debt, and gave it its present depreciated, filthy rags for currency, might easily have been put down with a little vigor, and was purposely kept alive. The motives were numerous, but spoliation by rings of contractors for supplies, and desire for advancement by the unscrupulously ambitious of the army, the principal. They tell you that Dulce was secretly traitorous, through his Cuban wife, and wished the rebels well; that De Rodas when asked, at a given point, for reinforcements, sent and withdrew part of the troops already there instead; that Pieltain was intriguing for the Republican cause in the mother country; that Concha was an ease-loving person, who paid nobody, but was greedy of money, and desired to use part of it in the interest of King Alfonso. So these, and many more, in a long line of captains-general, rapidly succeeding each other, are analyzed, until Martinez Campos and Jovellar came out together, the one in the cabinet, the other in the field, and, yielding at last to the general weariness and complaints, made an end of it.

This is the version of persons naturally discontented with the state in in which they find themselves, and should, perhaps, be taken with a grain of salt. The island is not large, it is true; facility of communication with Spain in these days of steam is easy; the insurgents never succeeded in holding any town, and could get little assistance from without. On the other hand, there are no railroads of consequence, the high roads of the country are bad, and there was the refuge of the savage half-swamp, half-forest, the *manigua*, with which a large part of the island, date from Christopher Columbus though it does, still abounds. I have had a glimpse of the *manigua*, in a small way, on a journey to Matanzas, the second city in size of Cuba, where an attempt at an international exposition is now being made. It looks even sentimentally pretty from a distance, the *manigua*, with its masses of laurel

and cypress and graceful palm-trees rising above it, but within it is a thicket of cactus, thorns, and intertwisted vines through which a way must be cut, step by step, with the *machete*, the formidable half-knife, half-cleaver, used in the sugar plantations and commonly carried by the peasants.

Hardly a prosperous American county fair but would make as good a showing for an exposition as that at Matanzas, though it should be said that it is still in a very unfinished condition; but I trust I am not so unreasonable as not to feel fully repaid for the three hours and more of a hot and dusty journey, in a ramshackle train, driven by a Chinese engineer, by the first deep draught of novelty in the heart of a tropical country, and the glimpse of Cuban villages and a Cuban provincial town. The fences are of cactus and dwarf or "mouse" pine-apple, with a pollarded tree like the olive growing out of them. There are cocoanut orchards, mangos, guavas, *guanabanas*, *mami*, *caimeto*, unknown fruits too numerous to mention. The tall palm-tree, the stem whitish, bulged in the middle, seeming to stand as a pot or receptacle for the green, new portion which springs from the top, is scattered over all the landscape, in groves, in avenues, on the knolls and by running brooks. There seems an incongruity in a palm-tree on a hill or by a brook; they should stand, one thinks, only on the plain. There are scarlet flowers, bananas, and cocoanuts in small enclosures about the station. Venders come into the train to sell white cheeses, guava jelly; if not that, a live hen or partridge; if not that, and all the time, lottery tickets.

The peasant proprietor is in a house of one high story, with a liberal porch which would do no discredit to the agriculturist, say in Arkansas, to select at random. It has a roof thatched with palm. One recalls Paul and Virginia. There is the *cabane*, with its palm-thatched roof; over it bends the banana, from which the couple will take a broad leaf to shelter themselves from the sun. A great *ceiba* tree casts its shade upon it. There in the door is the faithful negro Domingo, and in a cup of the hills a glimpse of the sea. Here is a country where they have what Sydney Smith professed himself willing to be satisfied with, the luxuries of life, though he could not have the necessaries. By force of association, seeing the splendid tropical vegetation around the poor huts, one fancies a boor who indulges himself in the taste for a conservatory.

The display of a collection of very poor drawings from the antique, at Matanzas, led me to hunt up at Havana an excessively battered small gallery, of which no one but myself in the place seemed ever to have heard. The few pictures, perhaps a hundred, seem to have served as targets for every wanton missile, and not more than half of them are hung. There is a noble Spagnoletto, and two or three others of the old masters, apparently genuine, and of the best sort, fast falling to pieces. The rest are copies. They are in charge of a custodian who conducts the school of art the specimens from which I had seen. Nor are there pictures of merit, either ancient or modern, in the churches or the private houses. A few good copies from the European galleries, at most, are hung along the walls.

The houses and churches themselves, the interiors of the former and the façades of the latter, and the whole manner and paraphernalia of life before one's eyes, are worthy to arrest attention, from the point of the picturesque, with a striking interest. I can hardly see how a visit to Havana for the lover of this kind of pleasure could fail to be anything less than delightful. I said to myself on landing, "There is nothing so foreign in all Europe," and I have hardly seen reason since to change the opinion. There are subjects for the painter on every hand, and entirely of an unhackneyed sort. It would be especially, perhaps, the water-color painter, since the profuse tinting of all the out-of-door objects is prevailingly in the lighter and airier tints. Walls are pink, green, yellow, lees-of-wine color, and azure blue. I have seen the interior wall of a courtyard so near the color of the sky of a dazzling bright morning that the two seemed to blend into one plane. The fronts of the churches are charming. They are of a robust rococo architecture, well proportioned, irregular, and grandiose. They are built of a calcareous grey stone which cannot be brought to a smooth surface, and perhaps accounts for the noble breadth of the parts, and takes with age a most venerable, time-stained, and blackened appearance upon its large scrolls and sculptures. Santo Domingo has a dome covered with ancient glazed tiles of a Moorish pattern, and a bell-tower, in a crevice of a corner of which, a hundred feet in the air, is a hardy tree of some size, sprung, no doubt, from a seed dropped by some passing bird. One side of the little plaza of the Cathedral is closed by an arcaded building freshly tinted in pink, the other by one in blue, which contrast coquettishly with its ancient greyness. At the Belen is a heavy garden-wall cut into a kind of *grille* in the stone, through which vegetation is seen. Attached to them all are delightful arcaded cloisters—bananas, cocoas, and the other tropical plants growing within. There is no glass in Havana windows, which are very wide and high, and protected instead, besides shutters within, by the greatest quantity of lovely wrought-iron work and by gratings, painted of a refreshing green, of turned wooden posts which would delight the eyes of partisans of our present Queen Anne revival. The arcade system is enforced for the buildings put up now in the newer parts of town, so that there is a certain Rue de Rivoli effect, only lighter, and the foot-passenger can go from point to point completely under cover. The houses of the best sort, built around spacious marble courts, are of a size and palatial arrangement, so far as mere proportions go, one would hardly deem credible. On the top is an American windmill for raising water.

Then there are the peculiar shops; the narrow streets in some parts wholly canvassed over with awnings; the old castellated forts, the Morro and Cabaña; the gay parks, opera-house, and clubs; the villas in the suburbs, and the sugar plantation at no great distance, out of the convent-like barranca of which issues in working-hours a swarm of slave life, clad in coffee-sacks and gay calicoes, and armed with *machetes*, as strange as a dream. I could not enumerate here half the unsuspected curiosities of a worthy sort to which I have been able to attain in a voyage of less than four days from New York, in the luxurious steamer *Newport*, and which, having had a hint of their existence so near, I could not forgive myself, I think, if I had not seen. I will stop to enumerate yet, however, another of the excitements of Havana, of a certain patriotic sort, in the American Gas-light Company. This enterprising corporation, with American capital in its coffers and a very energetic American business man as its president, has established itself here with improved processes, and is engaged in what seems a very plucky hand-to-hand conflict with the old Spanish monopoly, for which one cannot but wish, and predict as well, the best results. It hardly seems promising in the picturesque to visit a gas-works to hear that it has thirty miles of pipes and a capacity of 1,000,000 feet in twenty-four hours, and such like statistics; and yet there are much less curious places than the American Gas-works at Havana. Its light, well-made buildings of iron and brick are a couple of miles from town on an abandoned estate. The hands shovelling coke into its furnaces have cocoanut and palm trees waving around them, and in the view in front the mediæval-looking castle of Altares. W. H. B.

A NEW DISCOVERY FOR EGYPTOLOGY.

CAIRO, March 17, 1881.

IN the East trivial incidents often become the turning point for great events. The Crimean War was immediately caused by a squabble about the keys of the Holy Sepulchre. The last war between Russia and Turkey was precipitated by the mere fact of the Sultan Abdul Aziz happening to kill one of his wives who had formed a guilty intimacy with his Grand Vizier; and during the past few months Egypt has been the scene of a politico-archæological imbroglio, in which the Emperor William, the pyramids of the Pharaoh, Kings *Pepi* and *Merînd*, and Bismarck, Gambetta, Dr. Henry Brugsch Bey, and Maspero were the chief factors. The recent "unpleasantness" has thus far only resulted in the recall of the French Consul-General, but it is impossible to conceal the fact that Egypt, as well as the rest of the Ottoman Empire, is like a tinder-box, and very slight friction may at any moment put us all in a blaze.

On the 18th of January last Mariette Pasha, the renowned Egyptologist and director of the Boulak Museum, died. A scramble at once ensued for the vacant post. Brugsch Bey and M. Maspero were already in the field, and both were in Cairo. Riaz Pasha, the Egyptian Prime Minister, proposed that Brugsch should be appointed director of the Museum. Meanwhile Baron de Ring, the French Consul-General, called upon the Khedive and said to his Highness: "The appointment of any European who is not a Frenchman to succeed Mariette Pasha would be regarded as an *act of hostility on the part of Egypt towards the French Republic*." The Khedive was thus forced to appoint M. Maspero; but, in doing so, he took occasion to remark: "This is a striking example of the great necessity of popular education in Egypt. If there were any Egyptian competent to succeed Mariette Pasha, national jealousy would be avoided, for important posts under my Government now falling vacant are claimed by Europeans as a *right*." The strong language used by Baron de Ring was at once cabled to Berlin by Baron de Saurma, the German Consul-General. Prince Bismarck replied that any ill-feeling should be avoided as far as possible, and that the matter had already been communicated to the French Government by the German ambassador in Paris. Dr. Brugsch Bey soon afterwards received an autograph letter from the Emperor William acknowledging his great services to science as a German Egyptologist; and the Khedive raised Brugsch to the rank of pasha. Maspero was, however, retained in the coveted position of director of the Boulak Museum and chief of archæological excavations in Egypt. Baron de Ring was recalled to Paris by his Government. It is here only fair to state that the cordial personal relations between Maspero and Brugsch Pasha were not in the least affected by the political situation.

The relations between Brugsch Pasha and Mariette Pasha may be best appreciated from the following letter from the former to the Egyptian Institute, in which the most important archæological discovery made in Egypt since Mariette discovered the Serapeum, or tombs of the Sacred Bulls, in 1850, is announced to the world. This discovery will revolutionize many of the accepted ideas of Egyptology. The letter was written while Brugsch

was accompanying the Crown Prince of Austria in his voyage up the Nile. The following is an exact translation:

"ON BOARD THE *Ferouz*, NEAR SIOUT, EGYPT,
"March 2, 1881.

"I have the honor to present to the Egyptian Institute the following communication:

"Fifteen days before his death, Mariette Pasha, the late president of the Institute, summoned me to his bedside in order to request me to render him and the science which he loved a service, the true importance of which was unknown to himself.

"Last summer, before his departure for France, Mariette Pasha received one day the good news that one of the pyramids (Mariette, in the letter which he addressed to me, called it *mastaba*) situated on the plateau of the desert to the west of the village of Saccara had just been opened by the Arabs employed by the Museum in making excavations. These worthy fellows, under the able direction of their chief, Sheik Roubi, had brought to light the entrance-gate on the north side, and cleared away the long passage-way leading to the funereal chamber in the interior of the pyramid. For a distance of thirty-six metres this passage-way was covered with hieroglyphic texts which at every step presented, among others, the two names *Merînd* and *Pepi*, surrounded by the royal elliptical circle. Mariette Pasha, to whom tracings of a portion of these texts had been sent, considered them to refer to a high official personage, for the reason that neither of these names was preceded by the titles which are usually prefixed to the proper names of the Pharaohs of Egypt.

"While communicating this intelligence to me, Mariette Pasha also informed me that his Arabs had discovered the entrance to a second pyramid near the first one, and the passage-way and funereal chamber of which, according to the Arabs, were also covered with inscriptions. 'Go there to-morrow,' said he to me, 'study the two pyramids or mastaba, and let me know as soon as possible the result of your examination. Perhaps you will render an immense service to science.'

"On the 4th of January I left for Saccara in company with my brother Émile, assistant-curator of the Boulak Museum. On the same evening, at nine o'clock, I had the pleasure of presenting the following report to my poor friend. I may also be permitted to say that his eyes brightened with joy as soon as I began to read him my communication:

"*First.* The two funereal monuments brought to light near Saccara are veritable pyramids, and not mastaba.

"*Second.* These pyramids enclose: the first one, the tomb of the king *Pepi*, with the official name *Meri-ra;* the other one, the tomb of the king *Hor* (?)-*em-saf* (called officially *Mer-en-ra*), the eldest son of *Pepi*, of the sixth Manethonian dynasty.

"*Third.* The sarcophagi, made of granite, which once contained the mummies of the two above-mentioned kings were discovered in their ancient position. Hieroglyphic texts ornamented the lids and the outside faces of the sarcophagi. They made it certain, by the royal titles which they contained, that the names *Pepi* and *Hor-em-saf* belonged to kings and not to personages of the Pharaonic court.

"*Fourth.* The mummy of the son of *Pepi*, in a good state of preservation, although stripped of ornaments and linen, was found in the pyramid of *Pepi*.

"*Fifth.* The two pyramids in question offer the first examples of royal tombs of the time of the ancient empire ornamented with *hieroglyphic inscriptions*, which not only contain the complete names of the Pharaohs buried there, but which for the first time make known to us a long series of religious texts similar to the 'Book of the Dead,' of a later period.

"*Sixth.* These texts also mention the star *Sothis* (Sirius), the constellation *Saho* (Orion), the planet Venus, and furnish unimpeachable evidence of a knowledge of astronomy at a time as remote as the Sixth Dynasty.

"*Seventh.* The passage-ways and the funereal chambers in the interior of these pyramids, including the sarcophagi, mummies, and objects placed there, have suffered great injury, or have been carried off by the robbers who in ancient times entered the pyramids, breaking and destroying everything that opposed their passage.

"*Eighth.* The texts which cover the stele of *Una* in the Boulak Museum have a direct relation to the construction of the two pyramids, and to the making and the origin of the sarcophagi found there. *Una*, once an official of King *Pepi* and of his son, was charged with the execution of several important works, about which he speaks in proud terms on the stele consecrated to his memory.

"*Ninth.* The knowledge of the existence of numerous texts (cut in the limestone and painted green) of the two pyramids is of the very highest importance to science. They reveal to us, for the first time, accurate ideas of the theological belief of an epoch which, until now, had left but few souvenirs preserved in mythological names found in the tombs of Gizeh and Saccara. These same texts contain, also, quite new lessons in the vocabulary, the grammar, the syntax, and the system of representing the spoken and written language of Pharaonic Egypt.

"After listening to my report, Mariette Pasha seized my hand. Pressing it within his, he said, in a low voice: 'A thousand thanks for all that you have just reported to me. It is astonishing, and of equal value to the Serapeum, which thirty years ago you saw and studied with me. But shall I never see these pyramids? *Embrassez-moi et revenez bientôt me voir.*'

"I returned a few days later. He had already lost the power of speech. This was the last time I saw him. He died on the *18th of January.* I had lost a friend whom I had known and loved since 1850. On January 18, 1850, I was with him when he for the first time opened the door of the Serapeum.—Requiescat in pace.

"(Signed) HENRY BRUGSCH."

Correspondence.

'A FOOL'S ERRAND.'

TO THE EDITOR OF THE NATION:

SIR: Referring to the following expression in the *Nation* of April 28: " . . . this is less to be wondered at, considering how the 'historical' novel of Judge Tourgee imposed upon the North as a picture of actualities," we would submit for your consideration an extract from the Lebanon (Tenn.) *Herald*, a Democratic newspaper whose editor was a member of the convention that nominated Hancock. The extract is as follows:

"Judge Tourgee attained prominence by the authorship of a book which attracted general attention and provoked much comment—'A Fool's Errand'—and yet no Southern man untinctured by blind Bourbonism can deny that in the main the book is a just and accurate delineation of the state of society in the South during the period of reconstruction. It tells us some unpleasant truths, not altogether in the pleasantest way; but the truth is always desirable, and the sooner the people of the South get rid of that super-sensitiveness which resents facts as insults, the better for all concerned. The writer of this paragraph was a Confederate soldier and afterwards a member of the much-abused 'Ku-klux Klan,' and he has a right to say, as he does here, that 'A Fool's Errand' is entirely too true to be altogether agreeable."

This is but one of many, both public and private, utterances to the same effect from Southerners, but it is the most recent that has come under our notice.

Trusting that your candor will permit your readers to hear the other side, we are Respectfully yours,

FORDS, HOWARD & HULBERT.

NEW YORK, April 29, 1881.

[This is not the other side at all, but the same side. The *Herald* says the 'Fool's Errand' "is a just and accurate delineation of the state of society in the South *during the period of reconstruction.*" This is why we called it an historical novel; and the reason we alluded to it as an imposition was because it was designed to persuade the Northern public that the South of 1880 was the same as the South of 1868, and ought to be regarded with the same feelings.—ED. NATION.]

THE SIZE OF THE "EXODUS."

TO THE EDITOR OF THE NATION:

SIR: I have recently noticed an item going the rounds of the daily press to the effect that an officer of the Kansas Board of Immigration has stated that fully 100,000 colored "exodusters" had passed through the hands of the board into Kansas, while 10,000 more had gone to Indiana. To illustrate the absurdity of this statement, as well as to show of how little importance the "alleged" exodus is, I have but to refer your readers to the returns of the late census. In the *ten years* between 1870 and 1880 Kansas gained but 25,988 colored inhabitants, and Indiana only 14,438. The former State lost in proportion in colored population, while the latter State gained slightly. Since the date of the census, June 1, 1880, there has been no movement northward of the colored element, and, as these figures show, the so-called exodus between 1878 and 1880 was a very small affair. The South is in no present danger of losing its labor. H. G.

WASHINGTON, D. C., May 2, 1881.

A SURVIVAL OF THE GRANT ADMINISTRATION.

TO THE EDITOR OF THE NATION:

SIR: Mr. Conkling is evidently spoiling for a fight. Not content with a losing battle against the present Administration, he has gone out of his way to make a new and virulent attack on the last one, through his New York organ, the *Herald*, on an alleged complicity in the Star-route frauds. While editorially speaking of the "hypocritical and sanctimonious Administration of President Hayes," the great "independent" paper neglects to remind its readers that the three men in management of the disgraceful business, Dorsey, Tyner, and Brady, are all strong Grant Machine men; and that the two latter were retained in their positions under the easy-going gentleman whom President Hayes, in an ill-advised attempt to conciliate, had appointed to the Cabinet as a Democrat; moreover, that the abuses were in full swing under that Grant Administration which Mr. Conkling tried so hard to restore, and are really the last remnant of the scandals that made the régime of the Machine so unsavory.—Yours truly, EDWARD J. SHIRNER.

72 WALL STREET, NEW YORK, April 29, 1881.

THE TRUE SITE OF TROY.

To the Editor of The Nation:

Sir: In the editor's reply to "L. R. P." (*Nation*, No. 819) there is a statement which, in a journal of its sobriety and general exactitude, is certainly a little hazardous, especially following the review of Dr. Schliemann's 'Ilios.' You say:

"The case stands thus: Certain poets celebrated *and magnified* a war which they believed their Greek ancestors had waged, three or four centuries before, against a city *the site of which was well known* and which the invaders were said to have captured and burnt. The Greek city is identified beyond question; and we *now know* that it was a wealthy city, with powerful kings, which was at the height of its power *at about* the period assigned to the war in question. We further find another town, evidently rich and powerful, buried in ruins on the site of *the rival city*, and we have proof that it was destroyed by fire. While we have no *direct proof* that this destruction took place at a time when the Greek city was flourishing, there is nothing whatever to prevent us from following the obvious suggestion which brings the two cities into connection, etc."

I quote your reply at length, as it includes the points I wish to raise more briefly than the review, and because your readers may not have No. 819 in hand.

The tenor of both review and reply is to the general effect that Schliemann's discoveries at Mykenæ and Hissarlik mark the epochs of the great kings of the Argive city and the period of Homer's Troy as a conclusion placed beyond reasonable doubt, or at least reasonably to be accepted. With regard to Mykenæ I have no intention of entering into an argument at present, only to say that there are very grave reasons to doubt the identity of the Mykenæ finds with the Agamemnonian epoch, hoping when the excavation of Mykenæ is complete, and perhaps before, to treat the matter fully. As to Hissarlik, I believe that it is perfectly easy to show that the ruins excavated by Schliemann are those of Ilium Novum—which is the opinion of every archæologist I know—and that they date from the period of the early Hellenic colonization. In regard to this point also I live in the hope of some day completing the demonstration (1) of the actuality of the Trojan war and (2) the identity of the site on Bunarbashi with the Troy contemplated by the author or authors of the Homeric poems. I beg now to be allowed to anticipate a complete demonstration by the general statement, as brief as possible, of the reasons for absolutely rejecting any claims of Hissarlik to be the site of "Homer's Troy," in the hope that they may be sufficient to induce some one who has the means to undertake the furnishing the material for filling up the gaps in the demonstration.

The first argument as to the site (2) consists in the entire consistency of all the movements described in the 'Iliad' with the relative positions of the Greek camp and the site of Bunarbashi, and the absolute impossibility of reconciling them with that on Hissarlik. As to this the argument is elaborated at great length, and with what seems to me incontestable success, in the book of Nicolaïdes on the topography and strategy of the 'Iliad,' where, with map in hand, every day's fighting is followed, with every personal movement, with an exactitude and consistency which are a curious instance of the observance of the writers in the poem—Bunarbashi being admitted as the site. That Schliemann himself was impressed with the fact that the poem recognizes Bunarbashi as the site of its Troy was shown by his excavating there first, and abandoning it because *he found nothing*, while he believed in Hissarlik because he *found something*. Looking at it with scientific eyes, I should say that the chance of finding anything on the site of the true Troy, destroyed B.C. 1184 *circa*, was immensely less than that of finding something on that of Ilium Novum, destroyed about 200 B.C., 100 B.C., and apparently several other times, the city founded during the great Lydian Empire having been reduced to a miserable village when the Romans entered Asia and took it. There is nothing amongst the objects found at Hissarlik which we can with probability place before 600 to 500 B.C.; so that we have no archæological proofs except in the walls, of which portions remain in both cities, and whose testimony is that Ilium Novum or Hissarlik is to its very bases of Hellenic construction, while the walls about Bunarbashi are Pelasgic, and, from all analogy, centuries older than those on Hissarlik.

Strabo, who has discussed the question at great length and with the advantage of lesser lapse of time, and knowledge of many historians who are lost to us except for occasional quotation, says distinctly:

"The inhabitants of Ilium Novum from national vanity insist that their city is Ilium Vetus, but the commentators of Homer have taken occasion to examine on this point the evidence of the poet, and according to Homer it does not appear that it was the same city. Let us add that, according to many historians, Ilium had been moved several times before fixing itself [*about the epoch of Cræsus—i. e.*, 550 B.C.] in the locality it now occupies" (Strabo, xiii. 25).

The whole thirteenth book of Strabo is well worth reading by all who are interested in the question, the general effect of his arguments, to my mind, leaving it entirely cleared up. As it is too long for your columns and I propose to enter into the exposition of the claims of Bunarbashi at a greater length elsewhere, I leave these details to be sought for, by those who want them, from Strabo himself, noting only two or three points. After showing that the plain between Novum Ilium and the sea-shore does not afford room for the operations recounted before Troy, and saying "that the Port of the Achaians is only twelve stadia [one and a half miles] from Novum Ilium, without including (in which one would greatly deceive himself) in that distance the extension of the plain which to-day borders on the sea, all that maritime plain situated in front of the city [*i. e.*, the city of his time, Novum Ilium] being the recent product of the deposit of the two rivers, from which it follows that the interval which now is only twelve stadia was then only half as much [*i. e.*, three-quarters of a mile]," he goes on:

"Demetrius of Skepsis invokes even on this question the testimony of Hestiæa, a native of Alexandria, who, in her commentary on the 'Iliad' of Homer, asks if really the neighborhood of the city of Troy could have been the theatre of the hostilities between the Greeks and Trojans, and where in this case we must look for the plain of Troy, which the poet places between the city and the sea, since it is well known that all the land which we see before the present city has been formed at a later period by the deposit of the rivers" (xiii. 36).

Then he comes to the test by which the common (were it not for the example of the *Nation*, I should be disposed to say vulgar) judgment recognizes the validity of Schliemann's theory—*i.e.*, his having found treasures at Hissarlik, while he found nothing at Bunarbashi (as if it were easier to find treasures in a ruin 2,900 years old than in one 2,000!):

"But we shall be asked, Why is there no trace of the Ilium Vetus? Nothing is more natural, because all the surrounding cities having been devastated without being actually destroyed, while Ilium was ruined to the very ground, they took from the latter the materials to be able to repair the others. We are assured, for instance, that it was from Ilium that Archæanax of Mitylene took all the stones which he needed to fortify Sigeum, which did not any the more prevent Sigeum from falling later into the hands of an Athenian army under Phrynon," etc. (xiii. 38).

Confuting the notion that Ilium Vetus and Ilium Novum were always the same city, he says:

"Many modern authors certify to the total destruction of Ilium Vetus. The orator Lycurgus [speaking about 350, and therefore within easy traditional knowledge of the foundation of Ilium Novum], for example, having had occasion to pronounce the name of Ilium, exclaimed, 'Which of us has not heard that from the day on which this city was destroyed by the Greeks she had for ever ceased to be inhabited?'" (xiii. 41).

"It is supposed, also, that those to whom the idea occurred in after times to rebuild Ilium judged that the ancient site had become a place of abomination, either on account of the miseries of which it had been the scene or from the effect of the curses pronounced by Agamemnon against Troy, obeying in this a very ancient custom, which Crœsus again observed when, after having taken and destroyed Sidene, last retreat of the tyrant Glaucias, he pronounced a solemn curse against any who should ever attempt to reconstruct its walls. It was always the case that it was believed necessary to abandon the ancient site of Ilium, and to seek another to construct the new city. First, the Astypaleans of Rhetium chose a site near the Simoïs, and there built Polium, or, as it is now called, Polisma; but the position not being strong enough, the new establishment was soon ruined. Later, in the time of the Lydian Empire, the present Ilium, with its temple, was built" (xiii. 42).

It is, then, scarcely capable of question that the excavations of Hissarlik have uncovered to us the city of Crœsus, which for the rest was much more likely than that of Priam to have given a crop of gold and silver, and that what has been found there dates from not long anterior to 500 B.C. down to the irruptions of the barbaric tribes which came in during the decay of the Roman Empire.

What I wish to arrive at, if practicable, is this: As there is not an argument which can be brought in favor of Hissarlik which cannot equally be invoked in aid of Bunarbashi; and as there are, in favor of the latter, many which are directly opposed to the former, is it not worth while for some of our archæological organizations or volunteers—first, to explore thoroughly the ruins on Bunarbashi, which consist mainly of a nearly complete circuit of Pelasgic wall, only in a few portions brought to light, but in clearing which we must find, to absolute certainty, not gold and silver but fragments of material which can only be attributed to the date of the Trojan war, and may throw some light on it; and, second, to determine once for all if there ever was a camp on the plain before Ilium, by driving a ditch from the locality which Strabo points out as having been the shore in his day, towards the upper part of the plain, which ditch must, if there had been a camp on the plain during not ten but two years, have left ineffaceable indications of its former existence? The finding this kitchen-midden would put the question of the Trojan war at rest practically for all reasonable people.

While on this subject, allow me to say that excavations in Turkey have been made much more difficult by the success of excavators of the class of Schliemann and Cesnola, not so much in finding treasures as in evading the Turkish law, which demands the third of treasure-trove, and, in the latter's

case, by a means which, from regard to our future facilities for archæological pursuits, should have been promptly punished by our Government by the dismissal of Consul Cesnola, and compelling him to submit his finds to the law which he availed himself of his consular position to defy. Such a course would have established our good faith with the Turks and made our way easy for archæological work, while now we find that we have not influence enough to obtain a firman for the simplest work.—Yours truly,

W. J. STILLMAN.

ATHENS, April 5, 1881.

Notes.

HENRY A. SUMNER & CO., Chicago, announce for immediate publication 'Madaline,' a poem in ten cantos, by A. Mabel B. Fitch, or, to use the publishers' account of it, "a novel written in an easy, flowing style of blank-verse."——A general Index to the tables of contents of *Brownson's Quarterly Review*, 1844–75, has been published at the University of Notre Dame, Ind. The preface announces that Mr. Henry F. Brownson, of Detroit, contemplates publishing, as soon as may be, the complete works of his father.——The Young Men's Political Club of Providence have done good service in publishing a pamphlet on the "Literature of Civil-Service Reform in the United States," prepared by Mr. W. E. Foster, the intelligent head of the Providence Public Library. The historic aspect of the question is here strikingly exhibited. We will add a list of the publications of the Civil-Service Reform Association in this city, now procurable of G. P. Putnam's Sons: "Purposes of the Civil-Service Reform Association," with its constitution and by-laws; "The Beginnings of the Spoils System in the National Government, 1829–30" (a reprint from Parton's 'Life of Jackson'); "The Spoils System and Civil-Service Reform in the N. Y. Custom-house and Post-office," by Dorman B. Eaton; Secretary Sherman's Report on the operation of the civil-service rules in the N. Y. Custom-house, March, 1881; and the Pendleton Committee's Report on the regulation and improvement of the civil service, February, 1881. In preparation are "A History of the Spoils System," by Geo. Wm. Curtis; "The Effect of the Spoils System on Party Nominations," by Horace White; "Political Assessments," by A. R. Macdonough; and "The Objection to the Reform that it would produce an Aristocracy of Office-Holders," by E. L. Godkin.——The same publishers announce 'A Popular Dictionary of Architecture and the Allied Arts,' by W. & G. Audsley; 'Contrasts,' a study of society North and South, by R. Grendel; 'Count Agénor de Gasparin,' by Gen. O. O. Howard; and 'Sordello,' an analytical essay on Browning, by Frederick May Holland.——The first number of the Harvard University Bulletin opens with extracts from the official records of the Corporation and of the Overseers, and closes with "University Notes," which exhibit the activity of the body of instructors, and the material and other progress of the University. Thus, under the head of gifts, we have Mr. Emerson's announcement eleven years ago of Carlyle's intended bequest of his Cromwelliana and Friedrichiana, the terms of the will, Prof. Norton's account of the Cromwell mask given him by Mr. Carlyle in 1873 and now made over to the Library, etc., etc. The Carlyle books number about 325 volumes, the Friedrich portion being much the larger. The Bulletin states that Mr. T. S. Perry is editing the 'Life and Letters of Dr. Francis Lieber,' and that Little, Brown & Co. have in press the late Prof. Benjamin Peirce's Lowell Institute lectures on 'Ideality in the Physical Sciences.'——The *Popular Science Monthly* for May gives notice that the fund established by Prof. Tyndall from the net proceeds of his lectures in this country for the assistance of American students in physics desirous of completing their studies in Germany, has now increased sufficiently to make the income applicable to the moderate support of two such students. Prof. E. L. Youmans, President Barnard, and Professor Joseph Lovering are the Trustees.——The latest addition to the associations for private study by means of correspondence is the Hebrew Club, directed by Dr. Wm. R. Harper, of the Baptist Union Theological Seminary, at Chicago. It is not intended for beginners.——The *Newport* (R. I.) *Historical Magazine*, having completed its first volume, is, we are glad to see, to be continued.——Lieutenant Geo. B. Peck, jr.'s "A Recruit before Petersburg" (No. 8 of the "Personal Narratives" put forth by the Soldiers and Sailors' Historical Society of Rhode Island, second series) is a well-written picture of army experience at the very end of the war.——The singular episode in the troubled settlement of Wyoming caused by a controversy between the Susquehanna Company and the Penn Proprietors is related in the newly published Proceedings of the Wyoming Historical and Geological Society (Wilkesbarre.)——The self-made man of the rising generation will be able to tell what he owed to the chance (now offered him) of reading 'Robinson Crusoe' in the cheap edition of the Franklin Square Library.——Some of our theatrical managers have recently improved their show-bills by borrowing designs from Miss Kate Greenaway and Miss Rosina Emmet. Ten years ago, as we learn from a circular of the Messrs. Cassell, an English artist, Frederick Walker, designed a poster for the dramatized 'Woman in White' of Mr. Wilkie Collins, and did so in the hope that he was laying the foundation of "a most important branch of art." Mr. Hubert Herkomer has succeeded him in this mission of popularizing art by pictorial advertising, and the *Magazine of Art* for May contains a miniature reproduction of his first essay, with an account of the "movement."——The Third Annual Exhibition of the Philadelphia Society of Artists is announced to be held during the month of November. Blanks will be sent out in September by the Secretary, Mr. Newbold H. Trotter, No. 1520 Chestnut Street.——The Fourth Annual Exhibition of Black and White Art under the auspices of the Salmagundi Sketch Club, will be held at the National Academy of Design in this city in December. Blanks will be furnished in October by Mr. H. P. Share, Secretary, University Building.——*Le Livre* for April reports the recent publication of vol. xv. of the 'Literary Correspondence' of Grimm, Diderot, Raynal, and Meister, and that vol. xvi. will conclude the work, being provided with an elaborate index. A large number of unpublished letters of Cardinal Richelieu, says the same periodical, will be included in a volume which the Public Printer has in hand for the Minister of Public Instruction as part of the historical series issued by his department.

—Professor Wilder writes us from Ithaca:

"Permit me to thank you for the kindly notice, in the *Nation* of April 21, of my articles on Anatomical Nomenclature in *Science*, March 19 and 26, and to suggest that those who may be interested in the subject should read Dr. Spitzka's letter in the same journal for April 9."

—An interesting contribution to social science has just been made by Dr. Rachel L. Bodley, Dean of the Woman's Medical College of Pennsylvania, and also Professor of Chemistry and Toxicology. On occasion of the twenty-ninth Commencement in March, Dr. Bodley delivered a valedictory address consisting of a summary of replies to a circular sent by her to the graduates of the institution in the form of eight questions. The exact language of these enquiries is not given, but the substance will appear in what follows. Out of 276 alumnæ but 32 have died since 1850. Responses were received from 189 of the survivors, and of these the large proportion of 166 reported themselves as "now engaged in active medical practice." In regard to the kind of practice, we are informed: "Gynæcological practice predominating, 32; obstetrical, 10; medical, 10; surgical, 3; general practice, without discrimination, 37; gynæcological and obstetrical, 23; gynæcological and surgical, 6; gynæcological and medical, 29; obstetrical and medical, 9; surgical and medical, 7." In other words, two-thirds of them administer principally to their own sex. The great majority (150 out of 166) "report cordial social recognition." No less than 60 are engaged as resident or visiting physicians in hospitals, etc., or as physicians in female schools and colleges. One is physician to the State Industrial School at Lancaster, Mass.; one was City Physician for one year in Springfield, Mass.; one is now Health Officer to the city of Charlotte, Mich. Many are physicians without salary to various philanthropic establishments. Of 55 who teach or lecture upon medical subjects, 7 are professors in medical colleges in Philadelphia and New York. Membership in medical societies is the privilege of 68. The average income of 76 is nearly $3,000; that of 10 being under $1,000, and the highest (four cases) from $15,000 to $20,000. Three-quarters of them do not earn more than $3,000 per annum, and, on the other hand, three alumnæ have earned enough to retire from active service. The eighth question reads: "What influence have the study and practice of medicine had upon your domestic relations as wife and mother?" Of 52 married ladies who respond, 45 answer "favorable," 6 "not entirely favorable," and 1 "unfavorable." Practice admittedly in several cases interferes with good housekeeping in the broadest sense. "Of the 54 who have married since graduation only 5 have desisted from practice on account of marriage." The death-rate speaks for the healthfulness of the occupation. We miss some vital statistics that would have had a peculiar value—*e.g.*, the number of children, with their mortality.

—The semi-annual change of weather probably occurred on Sunday, April 24, and the six-months' summer has commenced throughout the Northern hemisphere. This event has thus happened ten days ahead of its average time, perhaps in some relation to the fact that last fall the opposite change occurred three weeks before its average time (on October 17). The present is, therefore, a suitable occasion for noticing the success thus far of Mr. Vennor's predictions published in his Almanac for 1881. The majority of these announcements are phrased in a diction so loose that entire non-fulfilment would be impossible. Of such it is idle to treat. In this category we include the following extract from the "probabilities" for January last: "The second quarter will open with heavy snow falls and terminate in a cold snap." Now, since snow or cold snaps occur every three or four days in our winters, and the word quarter is a designedly *safe* method of predicting, it would be almost impossible to refute such a forecast for any "quarter" whatever. But *definite* announcements possess a test value, for in these a guesser would be correct exactly half the time. Now, in this class of forecasts Mr. Vennor

has not had the luck of an average guesser, as will appear from what follows: "I expect blockades of snow in the United States about the 7th and 8th of January." Both these days were fair. The announcement for February contains the most signal failure which ill-chance could concoct. "Thaw (which will be interrupted by a brief [!] cold spell) will extend from about [!] the 18th of January up to the 12th of February, with balmy, spring-like weather prevailing in many parts, and snow rapidly disappearing." In many winters the cunning ambiguity of "brief" and "about" would have saved him; but the past winter had no mercy on prophets who prated of thaws and spring-like weather, located they their warm spells definitely or indefinitely. We doubt whether anybody whose avocation called him out of doors during the above twenty-five days will have any hesitation in asserting that a grosser error could by no possibility have been committed. Recurring to the actual figures of the thermometer, as recorded daily at sunrise, we find that from January 15 till February 7 the mercury was not above freezing on a single day; and on no morning during January, February, or March did it reach 40°. So much for the long thaw and the balmy, spring-like weather. "This term will be followed about the 16th by storms, previous to the setting in of a colder term." The coldest day in February was the 2d.

—For March most of the announcements are vague, and in ordinary times would, therefore, be accepted as correct by persons disposed to be lenient. But not even Mr. Vennor's cautious "the month probably will end lamb-like" contained a particle of truth. There was not one mild day in the month; and on the last two days snow fell. "On the 9th and 10th gales are probable." Almost any breeze or weather, except a drizzle, might somewhere be thought a gale, "probably"; but on the 9th and 10th of March it drizzled. The only day on which a gale actually occurred was the 27th, of which day Mr. Vennor said nothing. "There will be sharp frost in the beginning of April." (There was nothing else from the 1st to the 13th but frost.) "But the spring will open favorably, and everything will be pretty well advanced by April 15." Farmers say differently. "Floods may be expected in Chicago about the first week in April." Rivers are usually high in April. The only question is, which week, and the freshet in Chicago dates only from April 20. "There will be warm weather just following the 20th." The weather became warm on the 24th; so this might have been claimed as an approximate hit had it not been spoiled by the mistaken prediction of snow on the 25th and 26th. The season changed for good, we believe, on the 24th, rendering snow-storms out of the question for six months.

—Census Bulletin No. 117, just issued, illustrates the distribution of the population of the country in accordance with temperature. There are five tables, showing, in groups of 5° of temperature each, the distribution according to mean annual, midsummer (July), midwinter (January), and the maximum and minimum temperatures. From the first table, which is undoubtedly the most important, it results that nearly 31,000,000, or 61 per cent., of the population have a mean annual temperature between 45° and 55° Fahr., and that 98 per cent. live between 40° and 70°, leaving but a very small proportion to be distributed among the other sections. The greatest relative gains in population during the decade have been made in the higher and lower temperatures, while the greatest absolute gains have, of course, been made in the medium temperatures. Of the several groups, those from 55° upwards embrace the entire cotton region; those above 70°, the sugar and rice regions; while the tobacco region is mainly comprised between 50° and 60°. The prairie region of the Mississippi Valley lies almost entirely below 55°, and the great wheat region of Minnesota and Dakota is mainly below 40° of mean annual temperature. The hottest part of the country, the year round, is the southern extremity of Florida, while southern Texas and southwestern Arizona come next in degree of annual temperature. A rough computation shows that the mean annual temperature of the country is about 53° Fahr., with which the location of the population agrees almost exactly, differing from it by only a fraction of a degree.

—The second table shows that no less than 97 per cent. of the population live in a region where the mean of the temperature of July is between 65° and 85°, and that 71 per cent. are between 70° and 80°. Within the latter limits, which comprises nearly every large city, the density of population is greater than in any other class, reaching about 24.5 to a square mile. Examining the regions which fall within the several classes, it is found that the cotton belt is comprised between 75° and 85°, the sugar and rice regions between 80° and 85°, the prairie region between 70° and 80°, the wheat region of the Northwest between 65° and 70°, while the country specially liable to epidemics of yellow fever is between 75° and 85°. The extremes of heat are in the southwestern Territories and States, as Arizona and southeastern California, while northern New England, Michigan, Wisconsin, Minnesota, and parts of the high Cordilleran region are the coldest regions in July. The third table shows a range, within the United States, of mean January temperature from 0° to 70° Fahr. Over most of this the population is grouped quite uniformly, 90 per cent. being located between 10° and 55°, 69 per cent. between 20° and 40°, and 58 per cent. between 20° and 35°, in which class are included most of the large cities. The wheat region of Minnesota and Dakota has a mid-winter temperature below 10°; the prairie region of the Mississippi Valley lies between 10° and 30°; the lower limit of the cotton region appears to be the curve of 35°, and that of the sugar and rice regions the curve of 50°. The fourth classification—that by the highest observed temperatures—shows a high degree of uniformity in the humid, well-settled parts of the country. In this section a higher maximum than 105° is practically unknown, while the areas in which the maximum temperature never rises above 95° are very limited, and are sparsely settled, being confined almost entirely to the loftier parts of the Appalachian mountain system. No less than 89 per cent. of the total population is found in the classes whose maximum temperature is between 95° and 105°, while in 1870 the same classes contained 93 per cent. The whole Atlantic coast from Penobscot Bay to the mouth of the Rio Grande, and the whole coast of the Great Lakes, besides a considerable portion of the Pacific coast, are found in the class 95° to 100°. The influence of the ocean in lowering the temperature is very markedly shown. Class 100° to 105° comprises the Atlantic plain stretching from the eastern base of the Appalachian system to the neighborhood of the coast, and nearly all of the Mississippi Valley. As we approach the plains, whether in the northern or southern part of the country, the maximum temperature increases, so that the line of 105° maximum temperature is not far from a north and south line. The fifth table, showing the distribution of the population in accordance with the lowest observed temperature, contains eighteen groups, ranging from 55° below zero to 30° above, an extreme range of 85°. The largest single group is that between 15° and 20° below zero, which contains 24 per cent. of the population; that between 20° and 25° below zero contains 17 per cent. The great bulk of the population, amounting to 95 per cent., are in the groups between 35° below zero and 10° above, a range of 45°. The smaller groups outside of this are confined to the Cordilleras and the Pacific coast.

—The American Meteorological Society has issued two circulars on the subject of standard time. It is proposed to adopt meridians each a round number of hours from Greenwich and refer the times of all intermediate stations to one of these meridians. The most forcible objection to this system is that it is unnecessarily going across the ocean for a meridian. Nothing has been productive of more confusion than the habit to which our geographers have adhered with extraordinary pertinacity in reckoning all longitudes from Greenwich even on local maps. The difficulty will increase in the future as greater accuracy is sought for. The main cause of the confusion is that a transatlantic longitude of Greenwich has until within a few years been an unknown quantity which every surveyor and maker of maps has fixed to suit himself, so that there is no correspondence of meridians on different maps by different persons. All any map-maker could do has been to determine the longitude of the point from some known station in his own country, and then assume a longitude of that station from Greenwich. As the matter stands, our objection to the proposed system of time is founded less on any inconvenience in choosing the hours from Greenwich than in the perpetuation of the bad habit of sacrificing practical convenience to some supposed scientific universality. It is the same way of thinking which induced the French to take the ten-millionth part of the quadrant of the earth as a unit of measures, a way of thinking which we should be sorry to suppose was common among our scientific men. If some one of the old meridians—either Cambridge, New York, or Washington—were chosen as the standard, all the advantages of the proposed system would be secured without the disadvantage of disarranging all our ordinary nomenclature of time. Besides, the system will stand a much better chance of adoption if some familiar meridian, say that of New York, is taken as the standard.

—Another circular of the Society on the same subject makes known the terms and conditions on which the Chief Signal Officer will maintain public standard time-balls at various stations in the country. We hope that in carrying out any arrangement of this sort the Society will take care that there is no such conflict between branches of the Government service as frequently occurs, to the detriment of scientific interests. Many of our readers know that an arrangement was made some time since between the Naval Observatory and the Western Union Telegraph Company by which time-balls should be dropped wherever certain conditions were complied with, and that such a ball is now dropped regularly every day in the city of New York. The question whether the Signal Office or the National Astronomical Observatory is the one to be entrusted with the work, is one on which we do not propose to enter; but we do earnestly trust that a clear understanding on the subject will be had before any steps are taken which may lead to a conflict between the two branches of the service.

—Most of our readers will remember Mr. B. F. Isherwood, who was chief of the Bureau of Steam Engineering in the Navy Department after the war, and whose engines were the subject of an embittered contest both with line-officers of the Navy and with some civilian engineers. Mr. Isherwood was the author of very elaborate experimental researches into the action of various engines and their economy under different conditions, and was so gene-

rally recognized as thoroughly acquainted with the subject that it might have been a question whether, after all, he was not in the right, though the world generally was opposed to him and he was summarily displaced from his official position. This question he has now settled himself by his official endorsement of a scheme by Mr. John Gamgee, well known as an inventor of refrigerating processes, for the construction of an engine which shall run without the expenditure of fuel, and derive all its heat from the ocean and atmosphere. Instead of steam the engine is to be driven by the vapor of ammonia, the boiling point of which is far below our ordinary temperatures. The obvious difficulty that the ammonia is to be recondensed and used over again is to be avoided by using the refrigeration produced by the expansion of the vapor as a source of cold for recondensing it. At first sight the affair looks like a simple perpetual-motion machine, but it is only just to the inventor and promoter to say that they do not expect to make their force out of nothing, but to withdraw it from the heat already in the ocean. Hence Mr. Isherwood pronounces the scheme in perfect accord with the laws of thermodynamics, to which we fear educated engineers will reply that this only proves his lack of acquaintance with thermodynamics and the untrustworthy character of his judgment on any question involving the application of mechanical force. The chief significance of the affair is that the ex-chief has actually recommended in his elaborate report to the Navy Department the prosecution of experiments upon the proposed engine. Whether this recommendation has been received with favor we are not advised, but steam-engineers both in the Navy and out of it will look with interest for the result.

—A singularly rounded type of the New-England character at its best has just passed away in the person of John Gorham Palfrey, the historian *par excellence* of New England. He died at the great age of eighty-five, and while his unfinished work links him directly with the present generation of men of letters, his political career (certainly his noblest monument) belongs to a distant past—how distant may be judged by any one who seeks his parallel among the "statesmen" of to-day. Dr. Palfrey was a graduate of Harvard College in 1815, and, shortly after reaching his majority, succeeded Edward Everett as pastor of the Unitarian Church in Brattle Square, Boston. Like Everett, he passed from this pulpit to the service of the State, but there the similarity ended. While the popular orator sided with Webster in the futile endeavor to uphold "Liberty and Union" by making every concession to slavery, Palfrey not more prophetically than boldly met the disunion menaces of the Southern fire-eaters with the declaration: "If they insist that Union and slavery cannot live together, they may be taken at their word; but it is the Union that must stand." That was the true voice of Massachusetts, too seldom heard in the House of Representatives when these words were uttered. They had the added weight of Mr. Palfrey's example in having given freedom to a large number of slaves bequeathed him by a relative at the South—an act involving considerable pecuniary sacrifice. His opposition to the election of Mr. Robert C. Winthrop to the Speakership was effective in widening the breach between the "conscience" Whigs and the regular party, and it also cut short his Congressional service (1847–49), after a remarkably stubborn contest in his (Middlesex) district. But, as Lowell says in the fine poem which commemorates him, he was one of those

> "Who can put on defeat as 'twere a wreath."

He headed in Boston the opposition to Webster's course on the Compromise measures of 1850, and was among the founders of the Free-Soil party, again exhibiting his independence by discountenancing the coalition which sent Mr. Sumner to the Senate in 1851. There was in him a wholesome pride incompatible with fear, or temporizing, or doubt as to the line of duty, or any concealment of principle. In an age of doughfaces he was a man. That he maintained his scholarship in those stormy years is, perhaps, most remarkable of all. He became successively, after quitting the ministry, Professor of Sacred Literature at the University, a writer of theological works, a public lecturer, the editor of the *North American Review*, a representative in the General Court, secretary of the Commonwealth, a writer for the press ("Papers on the Slave Power"), member of Congress, and then, when he might naturally have sought repose, he planned and entered upon the tremendous task of writing the history of colonial New England, and took his place in the front rank of native historians. It is worth noticing that, whereas Sumner pleaded for peace in his discourse on "The True Grandeur of Nations," Palfrey, who had also been a Fourth-of-July orator, published in 1835 his "Plea for the Militia System." But this was almost an hereditary bias, for he was grandson of Col. William Palfrey, one of Washington's aids in the siege of Boston. His children, too, have achieved both military and literary distinction.

—Mr. Thomas's benefit concert at Steinway Hall was in every respect a great success. It opened with the same selections of scenes from Gluck's "Orpheus" which were given the week before at the Brooklyn Philharmonic. Miss Cary was again the soloist, and was well supported by about two hundred members of the New York and Brooklyn choral societies. The most interesting number for many present was Beethoven's Fantasia for piano, chorus, and orchestra. This delightful composition, which has not been heard here for many years, is in a measure a foreshadowing of the great Choral Symphony. Mr. Joseffy admirably played the piano part. The chorus sang, in the *à capella* style, an old Latin hymn by Gregor Aichinger, which was also given at the last Brooklyn Philharmonic. The remaining orchestral numbers were well-known favorites—Wagner's great Funeral March from the "Götterdämmerung," and Beethoven's Seventh Symphony.

—Mr. A. V. Dicey, of London, contributes to the May *International Review* a portrait of Sir Alexander Cockburn which is a model of analytical, and at the same time suggestive, criticism. In the course of it he relates an anecdote which dramatic forensic orators ought to keep in their hearts or paste in their hats. "Cockburn was, in truth, a dupe to his art; he believed in effects. 'Do you think, Mr. Cockburn,' said one of the hardest-headed judges on the bench, 'that you can affect my mind by sinking your voice a quarter of an octave?'" Mr. Brooks Adams reviews the laws and decisions regulating "Taxation of Interstate Commerce," and succeeds perfectly in showing that the subject is in an unsatisfactory state, out of all proportion to its importance. Mr. Wm. G. Low discusses the proper distribution of "The Balance of the Geneva Award," and dismisses peremptorily the claims of the insurance companies, "distinctly on the ground that they are not sufferers in need of indemnity," and desires Congress to "rise above the narrow view which looks in a retail way, as it were, at the wrongs done," and "consider the whole state of things caused by Great Britain allowing the *Alabama*, *Florida*, and *Shenandoah* to escape to the high seas." This is as if an agent who had recovered damages for his principal should pocket the proceeds on the ground that the latter had more money already than was good for him, and that his claim was a small affair after all. The notion of morality exhibited in the course of the discussion of this subject has been one of the most singular phenomena of the day. Mr. I. N. Ford considers "Constitutional Tendencies in France" with the result mainly of showing that it is a large subject, though his exposition of the present situation is doubtless popularly instructive. A paper on George Eliot, by W. Fraser Rae, will be followed by another; probably this one will prove the more valuable as it is chiefly biographical. "Recent Changes in Japan," by K. Mitsukuri, is good popular reading.

—Recent French adventures in Africa make specially interesting two articles in the *Revue des Deux Mondes* for December 1 and February 1, by M. Paul Bourde, on "France in the Soudan." The expedition in which Colonel Flatters lost his life was his second expedition, undertaken with a view to surveys for a trans-Saharan railway. In the first, accomplished in the early part of 1880, he had penetrated by way of Wargla as far as Lake Menkough over a flat road, but for eight hundred kilometres without meeting more than one sedentary old negro and eighty nomads. All along this route "the eye discerned nothing else than sand and rocks calcined by a sky of fire, desperately monotonous lines of a denuded soil." His second expedition was begun in the fall of 1880, but the notion of the writer quoted, that a troop of one hundred and five well-armed men, which was Colonel Flatters's first force, could go anywhere in the desert unmolested, appears to have been too confident. The whole of his force has been massacred by native tribes, it is said, stirred up by Mohammedan fanatics. This route by way of the east of Algeria over the desert has the least to recommend it. It traverses a long reach of desert, from which neither traffic nor subsistence could be expected and where no water is found, although, on the other hand, it comes nearer the heart of the Soudan by a direct route. The route by way of the province of Oran, in the west of Algeria, skirting the dominions of the empire of Morocco and tapping the fertile oasis of Toula, "which alone would justify a railway," as well as other oases, appears, on the contrary, to offer large prospects of success. There is even some hope that wells and streams of water may be found at frequent intervals the whole way. This is to be confirmed by explorations now in progress, but the testimony of travellers seems to justify an expectation of such a result. Some of these districts owe a nominal allegiance to Morocco, but if Morocco does not easily submit to reason, we may expect to hear soon of French difficulties with Morocco, as there are now with Tunis.

—Our foreign advices, also, for some time have informed us of Italian competition by way of Tunis in a trans-Saharan railway. French desires towards Africa are pretty large; the republic sees there its only prospect of founding a great colonial empire to rival England. But both these routes are in expectancy. Only explorations for them are now proposed, or have had funds voted for them by the Government. The route by way of the Province of Senegal, on the other hand, is already begun, and has the advantage over the Saharan of being shorter by a half. Algeria is reckoned to be 2,600 kilometres from the Niger in a straight line, while Dakar is only about 1,350, following the deviations of the projected track. The country, also, which this road will traverse is more accessible, better known, much better peopled, and vastly more fertile, and the expense of the road can be calculated with some certainty. The first section of 260 kilometres, from Dakar to St. Louis, skirts the coast, and is rendered

necessary by the fact that the harbor of St. Louis, the capital of the colony, is often inaccessible three months in the year on account of a bar at the mouth of the river. Dakar, just below Cape Verde, has become, consequently, the port of the colony, and affords a draught of water for the largest vessels and a secure roadstead. The contract for this portion of the route has been let to the Batignolles company; the estimated cost is 16,234,400 francs. The second section will branch off from the first at M'Pal and extend to Medina, and is not fully surveyed, but the route will be about 580 kilometres long, and be contracted for by different companies. The third section, from Medina to the Niger, about 520 kilometres, will be undertaken by the state. The estimated cost is 54,183,800 francs, which will be distributed over six budgets. The first instalment, it is supposed, will be paid out of the loan of 100,000,000 francs lately negotiated by the French Government. The first section will probably pay the interest on its cost from the outset from the local traffic. The French plan is to open up the whole Soudan as far as Lake Tsad, the country beyond the Niger being richer and more populous, so that other roads will follow speedily upon the completion of the Senegal line. But this, though the more urgent, does not render the trans-Saharan route unnecessary. The reason for this lies in the fact that the Senegal route leaves products nine days from Bordeaux, while the track over the desert will bring them within a few hours of Marseilles. Another project soon to be carried out is a telegraph line from Dakar to the Cape Verde islands. A cable is already laid from Lisbon to Brazil by way of the islands, and it is estimated that 300,000 francs will connect the islands with Dakar.

—About a year ago the *Temps*, which already received the reminiscences of M. Legouvé, the literary criticisms of M. Taine, M. Scherer, and M. Mézières, the art essays of M. Charles Blanc and the dramatic reviews of M. Sarcey, engaged M. Jules Claretie to furnish a weekly "chronique" or column of literary, histrionic, historical, or art *causerie*. For this task no one is better fitted than M. Claretie, who, although he has made a special study of the French Revolution, and is perhaps best known to English readers as the biographer of 'Camille Desmoulins,' is also a popular novelist, an occasional dramatist, and an acute dramatic critic. The thirty-three articles which he contributed to the *Temps* last year are now gathered into a volume, 'La Vie à Paris, 1880' (Paris: Havard; New York: F. W. Christern), announced as the first of a series, to follow from year to year. Any one with a taste for gossip and a desire to know what is going on in Paris will find the book amusing and instructive reading. Upon the death of Flaubert, M. Claretie gives many interesting details of his career and anecdotes of his works, among others this one of Bishop Dupanloup: "I think 'Madame Bovary' as true as truth itself," said the bishop once. "Yes, you see I have lived long in the provinces, and I have heard so many women's confessions" (p. 134). Another anecdote (p. 398) relates that as Courbet and Gambetta were breakfasting together at the latter's house, in which was hanging one of the former's first pictures, his host took occasion to praise it; whereupon Courbet tossed his head and exclaimed, "Superb? I should think so! It's astounding! Why, neither Velasquez, nor Titian, nor Rembrandt, nor I myself could do it again!" From page 206 we see that the so-called fifteen-puzzle also devastated Paris. It was to a remark of our author's that M. Dumas replied in his recent pamphlet on "Les Femmes qui tuent et les Femmes qui votent"; and the touching story of the model of David's statue of the young Greek girl—a story which has gone the rounds of the American press in a more or less mutilated form—was first told by M. Claretie (p, 371). It is a pleasure to be able to praise the printing of the volume, which is freer from misprints than most French books; "teatotal" (p. 288) is apparently M. Claretie's own blunder, for he follows it by an allusion to British tea-drinking. There is a full table of contents and an index of proper names filling eighteen double-column pages. The work has reached an eighth edition.

RECENT POETRY.*

THE number of volumes of verse issued every year in America is not small, but how many of them can one who has been led to look into them commend to the mere passing perusal of the idlest reader? The reflection is trite enough, and it is impossible to examine an accumulation of newly-issued "poetry" without mentally making it; but it is not the flimsy quality of the major part of this that surprises one—as, indeed, how should it?—so much as it is the dulness and barrenness of it. Much of it contrives to win applause, more or less perfunctory but often sincere enough, as the fly-leaves testify. But, surely, whatever its "poetical" merits, as they are viewed by kindly critics, it can hardly find a reader among all the different people who turn the leaves of books. So, if Mr. Weeks were an unknown poet, a better way of acknowledging the distinction that belongs to his 'Poems' would scarcely occur to us than that of calling them interesting, and saying that no serious reader to whom true poetry is anything at all will fail to find the slightest and the gravest of them delightful to read, and even to read again. Mr. Weeks is not an unknown poet, and the present volume is made up of selections from his first two volumes and of the entire contents of one posthumously issued; but, aside from the fact that his work is far from being as well known as it should be, the quality we have mentioned is worth pointing out for its absolute as well as for its comparative significance. That is to say, it not only distinguishes him from the mass of contemporary versifiers, but it establishes his position among the minor poets. And it is largely due to a very charming and, let us add, a very rare faculty, which one perceives in nearly all his pieces—the faculty of keeping well within one's limitations and, though far from shrinking from aspiration, yet cherishing always the sense of measure which tells one when he is passing beyond that province of fine-art which belongs to him, into the region of mere effort and contortion. Mr. Weeks himself expresses something of this, with a musical and sentimental felicity which it is needless to characterize, in these verses, entitled "The End":

"The sweetest songs are those
That few men ever hear
And no men ever sing;

"The clearest skies are those
That furthest off appear
To birds of strongest wing;

"The dearest loves are those
That no man can come near
With his best following."

At least the lines indicate a perception that the ideal is unattainable, which it is almost as important for a minor poet to recognize as it is for a poet of any quality to perceive that the ideal exists. They are the best in the volume, to our mind, and illustrate very truly the measure and character of the poet's genius. This we are not disposed to overrate to the point of lamenting his death some years since as the loss of a poet of promise rather than of performance. Mr. Weeks was thirty-six when he died, and the present judiciously-edited volume shows sufficiently that what he did so well was just what he could do. His death is a loss to be lamented, because had he lived he would doubtless have given us more of this. It is far too common a practice to associate a poet who dies before fifty with the arrested genius of Chatterton or of Keats; besides being idle, it withdraws attention from the qualities of their product by considering them merely as potentialities. The deaths of Chatterton and Keats were a loss which no one is likely to exaggerate. Byron's is often referred to in the same way, but it was in reality a loss to poetry only in bulk. It is as accomplishment that what we have of Mr. Weeks's work should be judged, at any rate, though we have far too little of work so delicate, so refined, so simple on a high intellectual plane. To find fault with it one is confined to noting its shortcomings, all of which are to be recognized at once and summed up in saying that the work is what it is. Intensity of emotion, tragic power, or the serene and lofty philosophy of life is excluded from its scheme. Perhaps, if we have not so abused the word as to dissociate the notion of dignity from it, "pretty" is not a bad epithet for most of it—for the verses above quoted, for example. At the same time there is a marked absence, it should be understood, of the *vers de société* fastidiousness and air of dilettantism that are so agreeable in the polished trifles of its best practitioners. Mr. Weeks's verses are no more like Mr. Austin Dobson's than they are like Milton's. The refinement which is very noticeable in them is not the refinement of burnishing, but antedates this, so to speak, and resides wholly in the conception, mentally contemplated until it issues naturally and in true lyric fashion. Some of the "Early Poems" show a familiarity with and fondness for the manner of living English poets, as has heretofore been mentioned in these pages, but it is also a repetition of what has been before said here to add that his inspiration is as genuine as that of the writers between whom and himself the relation is that of correspondence rather than imitation. His range, we need not say, is nothing like Mr. Tennyson's, but it is seen in this volume to be wider than any single volume of his works would indicate. His blank-verse is handled very easily, and has, if not a majestic, certainly a dignified movement as well as an obvious musical grace. Witness the following from "Andromeda's Escape," a poem of sustained power and admirable character-portrayal:

"So I did the deed,
And, veiling close the intolerable face,
Henceforth a help, and yet a terror too,
Fled none too fast, till over shone the sun
And under laughed the waters of the sea.
How glad I was! But not so glad as when
I saw Andromeda, whom—had I known
That there was such a one in all the world—
I would have gone to look for thro' the world."

Nowhere in this poem, nor in the early "Protesilaus," is there to be seen anything of the spirit of Greek tragedy. (For the matter of that, *pace* Mr. Swinburne's admirers, where is there in nineteenth-century English poetry?) The spirit of both and of "The Return of Paris" (not a wholly unworthy

* 'Poems. By Robert K. Weeks.' New York: Henry Holt & Co. 1881.
'The Vision of Nimrod. By Charles De Kay.' New York: D. Appleton & Co.; London: Sampson Low, Marston, Searle & Rivington. 1881.
'Poems of Many Years and Many Places. By William Gibson, Commander U.S.N.' Boston: Lee & Shepard. 1881.
'Idyls and Lyrics of the Ohio Valley. By John James Piatt.' Cincinnati: W. E. Dibble. 1881.
'The King's Missive, and Other Poems. By J. G. Whittier.' Boston: Houghton, Mifflin & Co. 1881.
'Thirty Years: Poems New and Old. By the Author of 'John Halifax, Gentleman.'' Boston: Houghton, Mifflin & Co. 1881.
'The Welded Link, and Other Poems. By Judge J. F. Simmons.' Philadelphia: J. B. Lippincott & Co. 1881.

pendant to "Ænone") is modern enough, and the feeling Mr. Weeks's own; but each piece is treated as objectively as a nice artistic sympathy can contrive, and each is Greek in this, that it trusts to suggestion for its highest effects, yet makes its suggestion inevitable. An excellent illustration of this is to be found in "In Corinth," the climax of which is a fine instance of reserve without obscurity. Good as is his blank-verse, Mr. Weeks's ballad-measure is quite equal to it, even if he be not still more at home in it. The ballad-measure, indeed, with its freedom and rapidity, seems the fittest medium for one who can secure these advantages without danger from the peril of perfunctoriness and doggerel, and who, whatever his accomplishment in blank-verse, has in it as competitors the greatest poets of all times. "How Roland blew the Horn" and "Gudrun" do for their middle-age legends precisely what Macaulay tried to do, and miserably failed, for those of ancient Rome. The middle-age spirit, so far as poetry is concerned, is not so far out of reach as the classic, and it is here caught with life-like vivacity. We must give the last stanza of the latter poem:

"So died Gerlinta. Much she loved,
Much may she be forgiven;
But if love alone can save from Hell,
Few folk will fail of Heaven."

And, in taking leave of the volume, we may add that no collection of *Lyra Americana* will be complete without "A Song for Lexington," which is a thoughtful as well as a stirring patriotic ode.

To speak as well of some of the other volumes on our list as certain of their qualities deserve requires that the standard of interest be laid aside in judging them. Mr. De Kay's 'Nimrod' is, for example, a *tour de force* of various merits, but it would be stretching a point to call it interesting. It is a singular work. Something like five hundred stanzas, each of two quatrains, with single and double rhymes, ended by a short couplet, comprise the poem, which is a narrative of the vision of Nimrod appearing to the Persian reformers, Ali Sayid and Gourred-oul-Ayn. In this, as a prologue says, Nimrod describes "the birth of things from soulless matter," and much else beside of similar moment. The poem concludes *in mediis rebus*, the reformers having had one lesson from Nimrod, and having made an appointment with him for another. Whether this, too, will be versified depends, we gather from an epilogue, upon the reception of this. If his friends wish to hear more

"Of Ali and his Gourred—who more glad
Than Charles De Kay? But should ye find it bad,
Right well he can content himself, be sure."

The framework of the tale, the epilogue further says, is "history learned from scholar-statesman Gobineau," and, to our taste at least, the framework of such a story goes fully as far as the filling-in towards satisfying a poetic craving. There is not much filling-in of any original value possible at this date, one may say. Byron and Moore exhausted the possibilities of such framework so far as romance is concerned, and what metaphysic has to do with poetry is better exploited in other directions. Mr. Edwin Arnold's popular poem is to some extent—less, we think, than is popularly imagined—an exception; but we do not understand Mr. De Kay's work as analogous to 'The Light of Asia.' It is, however, somewhat obscure, and we have found no small difficulty in grasping the precise intention of it. This, at least, may be set down as one of its faults, as well as its failure to convey the impression that the obscurity is worth the trouble involved in dispelling it for one's self. On the other hand, it would argue misappreciation to dismiss the poem as lightly as all this seems to warrant. It is the product of great industry, in the first place, and, considering its length and material, it is less remarkable that it nowhere rises into poetic inspiration than that it does not oftener sink to positive prose. The author has a great deal of fancy, whose natural exuberance, however, he appears occasionally anxious to stimulate instead of checking. This is, for example, such laborious imagining that it reads a little like burlesque when one takes it, as it is meant, for a description of one stage in "the birth of things from soulless matter":

"About his neck when from the wave he rose
Were coral gills, through which he sucked the vapor
That filled the hollow vale. From stunted nose
All down his back to where his tail was taper
A fringe of wavy, blotchy hummocks shivered";

and there is a whole division of the poem not dissimilar. As horror, it is as little affecting as the stanzas on page 217 are as female loveliness, of which the harem-like inspiration makes it actually impossible to do more than refer to them, with wonder that the mere notion that he is writing poetry does not save a man from writing such. Mr. De Kay's fancy is, nevertheless, often really poetic, and it is a great pity that he does not subject its fertile growths to the wholesome pruning of good taste and good sense. With his excellence of ear, also, there is no excuse for even the few halting lines he himself must have discovered, and, with his facility in phrasing, still less for such rhymes as "spirit" and "merit," "profit" and "scoffèd," "anger" and "clangor," "ripple" and "people," "trial" and "royal," and so on.

Neither are Mr. Gibson's poems to be called entertaining, though they miss being so by an over-elaborateness of thought and expression rather than by emptiness or exuberance. In fact, though not the kind of hard reading which Sheridan declared to proceed from easy writing, some of them yield their import only to persistent importunity. One has also to struggle against wandering attention in the process. "Persephone," "Sibylla Cumana," "Alf and Alfhilda," "Empedocles," "The Valley of the Yumuri," "St. Francis of Assisi" are titles which suggest an order of themes of which Mr. Gibson is perhaps fondest and handles best, and the matter of these may be assumed to be familiar to his readers. Mere verbiage almost nothing in his unambitious little volume can be called. The reader who finds cloying sweetness, already overdone by various contemporary poetasters, in such lines as these, descriptive of the Sibyl's youth, will recognize also the successful effort for compactness:

"And liberal hair the hue of starlight waves.
. . . . . .
The Graces, the wise Hours, and Harmony
Modulated her mien.
. . . . . .
and sleeveless arms,
A moulded music lessening to the hand."

The imagery is not of a novel order, but it is characteristic of Mr. Gibson's verses that for the most part they contain imagery and not statements in versified prose. At times one finds one of the latter, as the following in a poem entitled "Castellamare"; Lucia is poisoned and suffers torture—

"While—all the world being witness, as it were—
Prompt aid was given, and skill, and patient care."

The poem has a pungent infusion of Keats, and is one of the many tales in verse that would never have been written, or written otherwise, if Keats had not embalmed the story of "poor, simple Isabel." It is the modern poets with whom Mr. Gibson, too, is most in sympathy; so that, after Mr. Arnold's "Empedocles," one is surprised to find him making the philosopher as he looks into the crater screw his courage to the sticking-point by soliloquizing, "Cheer up, Empedocles"!

Mr. Piatt's 'Idyls and Lyrics of the Ohio Valley' is a collection of verses already published, most of which are widely known and esteemed. It is only necessary here, therefore, to chronicle their issue in this form, though it may be added that the campaign verses assuring General Garfield that the "Boys in Blue," dead as well as alive, are marching to vote for him, and those composed for the Philadelphia reception of General Grant upon his return from abroad, have no logical place in the volume; nor is there any merit in them to overcome the obvious reason for leaving them out.

Mr. Whittier's volume assembles the poems he has published since his last collection, and contains some of his best work, and though, of course, this is in a vein which he has abundantly illustrated heretofore, the fact does not make the book the less agreeable reading. "The Minister's Daughter," for example, is nearly "The Eternal Goodness" over again, and the lesson it preaches is the poet's favorite; but only those who require what Mr. Whittier could never in any event give them will tire of the variations of so gentle a gospel. The titular poem has provoked a controversy which, however, has nothing to do with its moral or its poetry. Among the rest are the eulogy of Webster, which is likely to last, and short poems on Garrison, Dr. Holmes, Lydia Maria Child, and Bayard Taylor. Mr. Whittier's sympathies are as catholic as they are keen. The frontispiece is a pleasant portrait on steel of the poet.

Mrs. Craik's poems are of the quality illustrated in her prose, a quality which easily accompanies great voluminousness without losing anything essential by so doing. If she had written one-third the nearly three hundred here contained they would probably have gained nothing. Moreover, thirty years is a long time, and ten short poems a year is not a large average for poets of Mrs. Craik's inspiration. They are, however, to be read in as leisurely fashion as they were written. In hundreds of homes the book will be "a welcome guest," and may be read with impunity upon Sunday afternoons. It is easier to compose an encomium upon such verse, accepting its own standards, than to make any effort at analysis, which is surely superfluous in the case of the author of 'John Halifax, Gentleman'; but the following lines from a poem written "after reading Renan's 'Vie de Jésus,'" among the best in the volume, may be added as showing the writer's piety and illustrating her poetic force:

"Art Thou Redeemer, or a mere schemer—
Preaching a kingdom that cannot come?
On the shore standing, mutely commanding,
'Let down your nets!'—And they draw them up—full!"

The poet of 'The Welded Link, and Other Poems,' who is an ex-chancellor of the Mississippi judiciary, assures his readers in a frank and modest preface that he has not "rushed unadvisedly before the public in the rôle of author." He has, on the contrary, many misgivings as to his "ability to afford that sort of mental pabulum and entertainment which is sought and enjoyed by the intelligent and refined in feeling and thought," whose approval he especially desires. The responsibility for his book rests upon others, some of them strangers to him and some of them children, whose solicitations he has heeded. One of these, in whom he has great confidence and highly respects "both for his religious principles and his intelligence,"

has been particularly insistant in advising him "to write a book of poems." For some time he hesitated, though from time to time writing and publishing "short poems'" (as others have chosen to call them), but finally yielded, and we have the result. When it became known that he contemplated the volume several persons sent him copies of stray verses of his own; but, as he says, "a great deal of what I have written and published I never preserved. I think that some of the best verses I ever wrote are lost or beyond my reach." He adds, however, that this is of little consequence, as he has "already far more than are needed to make up a volume of the size contemplated," so that indeed "a great many tributes to personal friends and other short poems are necessarily excluded for want of space." One cautious friend, it seems, feared charges of plagiarism owing to the employment of "Gray's measure and style" in some instances. But this was needless; as Judge Simmons points out, plagiarism is "an uncredited use of the thoughts, language, or expressions, not the style, of another," and measure is common property. Moreover, "elegiac measure is not only a favorite one with me, but it is the *only one* adapted to a certain class of poetical writing." "If I have even seemed to *imitate*," he goes on, "it is simply because my mind and thoughts happened to flow in the same channel in which flowed those of the one whom I unconsciously followed. I *do not think* I have imitated. I am quite sure I have in no instance *intended* to do so." And where he has used any expression he has ever seen before it is properly indicated. This we can testify is perfectly true, though the judge has, we think, been needlessly sensitive to the suggestion of his cautious friend, of whom we have our own opinion—*e.g.*, p. 114:

"No 'curfew tolls the knell of parting day,'
No 'lowing herd winds slowly o'er the lea,'
No 'ploughman homeward plods his weary way,'
Soft, lingering daylight still remains with me."

So when the poet, leaving "elegiac measure," indites a poem upon "Tears" he not only sets Tennyson's line above it, but scrupulously varies the words and sentiment, as:

"Tears, sparkling tears, that lightly course their way
Adown the young and fair or furrowed cheek,
Are they unmeaning, hollow, idle? Nay;
But in the tones of thrilling joy they speak."

If we were to pick flaws we should rather select certain idiosyncrasies peculiar to the judge's style. Such syncopations as "th' willow-trees," "wid'wer," "rapt'rous," "civ'lization" may be rhythmical necessities, but they are expedients at best, and in a revised edition should be abandoned. In the sentiment, however, of each poem no one with appreciation will find anything that is not admirable. That of the "Welded Link," for example, relates the history of America up to the post-bellum period, and shows how then the divided sections were welded by Southern gratitude for Northern sympathy during the yellow-fever epidemic of 1879. Indeed, it is pathetic to trace to the havoc of that period so much of Judge Simmons's inspiration; to quote the preface once more: "The most of them [his poems] are emanations more from the heart than from the head," and we only wish that every poet could say with as much truth: "Such as they are I give them to the public with no blush of shame for any sentiment that I have promulgated through them."

GINO CAPPONI.*

VON REUMONT'S book, as he himself remarks in his preface, has more the character of memoirs of the times of Gino Capponi than of a complete biography of this illustrious man, who has left such a mark on Italian literature and culture. Tabarrini's more detailed account of his career, prepared from family papers and documents, was published while the present work was well advanced, and would furnish any zealous enquirer into the subject with what may seem here lacking. To us Von Reumont's narrative of his friend's life is ample, keeping as it does to the main facts, describing at greater length his connection with the literary men of his time, his part in the continual change of politics his country was undergoing, and his unceasing efforts from earliest youth to the very end of his long life to promote historical research in Italy, not only by his own labors but by the generous aid he accorded to all earnest students. Von Reumont gives us sketches of the literary men of the time as they became known to Gino Capponi, and although most of these were personal friends or acquaintances, the narrator neither indulges in the personalities nor in the superabundance of anecdote with which most of our nineteenth-century biography is infested. He is neither diffuse nor dull, though now and then we catch him repeating himself.

Gino Capponi, the only son of Pier Roberto Capponi and Maria Maddalena Frescobaldi, was born in 1792, in the Capponi palace of the Via San Sebastiano in Florence. The father was at this time grand chamberlain of the Grand Duchess Luisa Maria, married to Ferdinand III., to whose interests the Capponi family had always been devoted. In 1800 the Capponi family followed their exiled princes to Vienna, where they remained for three years, returning to Florence when Gino was eleven years of age. Gino Capponi, although surrounded by the traditions of a family so devoted to the ancient system of government, received a very liberal education. He attended lectures in the neighboring convent dei Serviti, and also in San Giovannino, in addition to the instruction he received at home. Tommaso Puccini, of Pistoja, director of the Uffizi Gallery, seems to have had great influence in directing his studies in ancient and modern literature, and also in art, and Capponi in his later days never failed to mention him with gratitude, as also Giovan Battista Zannoni, a distinguished Tuscan archæologist, who succeeded Lanzi as antiquarian to the museum. Capponi describes his studies in the cell of San Giovannino, with Zannoni, with great retrospective affection after the lapse of sixty years, and his acquaintance through this master with Luigi Lanzi, the great authority in Etruscan matters, at that time a confirmed invalid. No Florentine noble of his time received so complete an education as Gino Capponi. At the early age of nineteen he was elected president of the Società Colombaria, founded in the latter days of the Medici; he filled this post to the end of his life, receiving each year the new members. In 1812 Gino published his first literary work, a defence of two compatriots, Amerigo Vespucci and the Padre Canovai, the latter having been posthumously attacked by Galeoni Napione, a Piedmontese, on account of his work on Florentine navigators. Gino always maintained the opinion that Vespucci was the first to discover the continent of America; in his old age he found a supporter of this theory in the Brazilian, F. A. von Varnhagen. He much rejoiced when A. von Humboldt proved that Vespucci had no part in the choice of a name for the new continent.

It was in 1811 that the marriage of Gino Capponi took place with Giulia Riccardi del Vernaccia, a descendant of the Riccardi family who gave their name to the palace of the Medici. The bride was two years older than Gino. According to the prevailing custom it was a marriage entirely arranged by the parents, which left but a brief remembrance in the life of the young man, for at twenty-two he became a widower, and his two baby-daughters were placed under the care of his mother. It was during his married life that Gino Capponi had, with four other Florentine nobles, to go to Paris to offer the devotion of the "buona città" to Maria Louisa. The Emperor Napoleon was particularly well disposed to the Florentines and to the Romans; he treated the Genoese deputies with derision. They were all present at the inauguration of the sittings of the Corps Législatif. The Emperor was pale and uneasy. When Capponi was presented to Napoleon, on this occasion, he said to him: "I know your family. It has incited revolutions." "In past times, sire," answered the young man. "Certainly, you Florentines are quiet now; you are my best subjects!" The return of Ferdinand III. as Grand Duke of Tuscany, after the fall of Napoleon and the expulsion of the French from Italy, was a joyful event to Gino and the Capponi family. Most of the men who were in office in 1799 were recalled in 1814; among these Fossombroni, Neri Corsini, Frullani, Baldelli, Fabbroni, and others. The old state of things was as much as possible resumed. The difference in the feelings of the younger generation, and the new wants which had arisen, are well defined by Gino Capponi in his memoir of Fossombroni, written after the death of this statesman, who for thirty years had held the reins of government under two different sovereigns. All the important posts were now filled by the elder men who had already served before the revolution; there was, therefore, no career open for young nobles—diplomacy and military service not existing, and the church being looked upon in Tuscany as a mere means of existence. Gino Capponi himself suffered from want of the hard schooling of an active life, which even the long series of trials that had befallen him could not replace.

A journey to England in company with Cicognara, author of the well-known history of sculpture, did much towards the political education of Gino Capponi. It was in the year 1819—a troublous time for the country. He recognized the strength of a government which could hold its own against the unpopularity of the Regent and the many difficulties it had to contend with. Capponi's predilections for England were very great; he remained eight months studying the manners and institutions of this country, and also visited Scotland and Ireland. About this time he made the acquaintance of Ugo Foscolo, whose great talents he appreciated and whose help he desired for the execution of a literary scheme he was then cherishing. This scheme was the organization of a critical periodical somewhat on the plan of the *Edinburgh Review*. The poverty of literary products in Tuscany especially was very great, and he thought it would be well to counteract the Austrian influences at work in the *Biblioteca Italiana* of Milan. Many years afterwards, in a letter to Cesare Cantù, he acknowledged his unfitness to conduct this scheme, which Vieusseux carried out soon after in his *Antologia*. Reumont gives a very just account of the services rendered to literature in Italy by Jean Pierre Vieusseux, of Geneva, who about this time opened a reading-room in Florence, where the best European periodicals were to be found and the literati of Florence used to meet. The review which was thus started was a great success, developing itself in time and having the ablest men of all parties as contributors under the editorship of Vieusseux.

After being elected member of the Crusca Academy in 1826, we hear

* 'Gino Capponi. Ein Zeit- und Lebensbild. Von A. von Reumont.' Gotha: 1880.

of Capponi's essays on agriculture in Tuscany and on the spoken language; but in the many years during which he published nothing he collected material and manuscripts for two great works he was never destined to finish—the one a 'Civil History of the Popes' and the other the 'History of Peter Leopold.' No part of the former work was completed, not even the introduction, which was to have been an account of Christianity during the first two centuries. The fragments, rich in material, were only made public after the author's death. From 1829 to 1834 Capponi worked almost incessantly at the 'Life of Peter Leopold,' for which he had ample documents collected from the state archives. The introduction alone was left complete. The most important historical fragment of this work tells of Leopold's policy with relation to the Church, the reforms he instituted in religious bodies, sometimes somewhat violent and imprudent, but exacted by crying abuses. Leopold's projected constitutional reform Capponi also wrote of, even after he had abandoned his 'Life.' A fresh impetus had just been given to historical study by Giuseppe Molini, the grand-ducal librarian of the Palatinate, who had gone to Paris in search of documents relating to Benvenuto Cellini and Machiavelli. In his fruitless search in this direction letters and papers came under his eye relating to the history of Italy during the fifteenth and sixteenth centuries. These were part of the collection of Philip, Count of Bethune, left by his son to Louis XIV., 950 volumes in all, an important fraction of the manuscript treasures of the National Library. Two hundred volumes were copied by Molini, up to the period of the death of Francis I.—all the French and Italian documents, in fact, which seemed of importance to him for the history of his country. Few related to the fifteenth century, only certain fragments narrating the arrival of Charles VIII. in Italy, up to the death of Louis XII. It was the decisive epoch, between 1520 and 1531, during which the fate of Italy was fixed for several centuries, for which there was rich material, and no one so competent as Gino Capponi could be found to revise, arrange, and annotate these valuable documents. It was for this work that he put aside his own history, and it was at this time, while occupied with Molini's manuscripts, that he felt his eyesight declining rapidly and foresaw the great calamity, total blindness, which soon after overtook him. He was also revising, in company with Becchi, Niccolini, and Giuseppe Borghi, the Della Crusca edition of Dante's 'Divine Comedy' of 1595. The new edition was published in 1837, and called that of the four Academicians. Although it is not now accepted as faultless, it shows a progress in the study of the great poet. It was at Capponi's request that F. L. Polidori undertook the publication of Cavalcanti's 'Storia Fiorentina,' rendered so difficult by the state of the manuscripts. He also instigated and formed a society to purchase and publish in one collection the reports of the Venetian ambassadors. The first volume appeared in 1839, beginning with the reports of the sixteenth century from foreign countries, and in 1863 the fifteenth volume ended the series.

Soon after he became quite blind his beloved daughter Catherine died, at the age of twenty-nine. He felt her loss very keenly, for she was the only person who seems to have understood him completely. These terrible afflictions did not stop his work, though all enjoyment in it had ceased through his helplessness. The first volume of the 'Archivio Storico' soon appeared, compiled by G. Capponi and F. L. Polidori. It contained the history of France by Jacopo Pitti, which Capponi considered very important. These labors were interrupted for a time by Capponi being named minister. Of the changes which took place in Italy in 1847 and 1848, and of the men who took part in the Government, the second part of Von Reumont's book gives a brief account, and Gino in his 'Settanta giorni di Ministero' and in his 'Ricordi' a more detailed one. Although a fervent patriot, one who sought the true progress of his country in lieu of the accomplishment of his own favorite schemes, Capponi did not particularly distinguish himself as a statesman. His sympathies were naturally Tuscan, but the course events had taken led him to believe in Italian unity, and to this Tabarrini also bears witness. Capponi outlived most of his colleagues and friends, and the last ray of sunshine seems to have been the success which greeted his 'Florentine History' in 1875. He himself corrected the proofs at the age of eighty-three. The manner with which the public received this work seems in a measure to have compensated for the bitterness of his life. He died, after a few days' illness, in 1876, lamented by all Florence.

One cannot but regret a want of system in the arrangement of the material Von Reumont presents us with in this work, which has already been translated, and is published also in Italian.

Early Spring in Massachusetts. From the journal of Henry D. Thoreau. (Boston: Houghton, Mifflin & Co. 1881.)—Mr. Henry James, jr., has said of Thoreau, somewhat curtly, that "he was more than provincial, he was parochial"; but the word, if its slighting subaudition be disregarded, Thoreau would have acknowledged to be accurately descriptive, and he would have been quite willing to admit further that in early spring Concord was a parish of parishes. "He must have a great deal of life in him to draw upon," he writes, "who can pick up a subsistence in November and March"; and certainly it is only Thoreau's spirit that will make interesting to the ordinary reader these minute descriptions of the coloring of bark and bud, the track of muskrat and woodchuck, the tint of melting ice and drying dirt, and the other naturalist's notes that form the main body of this journal. These things, as well as the broader aspects of sky and flood, are seen reflected in Thoreau's senses, and, like all reflections, this surpasses the reality. In themselves they are trifles such as Mr. James thought Hawthorne jotted down in his note-books unnecessarily, but they engaged Thoreau's interest; parochialism had its compensations for him in enhancing the value of the boy's woodchuck-skin cap and even, *risum teneatis, amici?* of the skunk ("I respect the skunk as a human being in a very humble sphere"), as objects of fancy and of observation. As a man of thought, however, Thoreau was conscious of the triviality of his habitat—"it is short commons and innutritious; surely I might take wider views"; and elsewhere he calls his life an "ignoble routine." The supplement he desired was not Paris; the fields were a better Louvre, the morning walk a better fête than any there, "the sight of a marsh hawk in Concord meadows worth more than the entry of the Allies"; but he missed the treasures that disappeared with the Indian, "the wildest and noblest quadrupeds, the largest fresh-water fish, some of the wildest and noblest birds, the fairest flowers," and he exclaims at last, "the Indian's earthly life was as far off from us as heaven is!" Yet, on the other hand, though he was no applauder of our century, he found some things the white man had brought an advantage. Mr. Ruskin might be astonished to find a born lover of rural nature writing thus, in a strain so exceptional in our literature (we know of nothing similar except the singular sonnet of Jones Very) that we make room for the whole extract:

"The railroad is perhaps our pleasantest and wildest road. It only makes deep cuts into and through the hills. On it are no houses nor foot-travellers. The travel on it does not disturb me. The woods are left to hang over it. Though straight, it is wild in its accompaniments, keeping all its raw edges. Even the laborers on it are not like other laborers. Its houses, if any, are shanties, and its ruins the ruins of shanties, shells where the race that built the railroad dwelt; and the bones they gnawed lie about. I am cheered by the sound of running water now down the wooden troughs each side of the cut. The road breaks the surface of the earth. Here is the dryest walking in wet weather, and the easiest in snowy. Even the smoke from the shanty excites me to-day. Already these puddles in the railroad, reflecting the pine woods, remind me of summer lakes. When I hear the telegraph harp I think I must read the Greek poets. . . . This sound is the poetry of the railroad."

But, after all, the intrinsic poverty of the objects he writes about is such that one's interest is engaged rather by the thought, sentiment, and mysticism slipped between the notes, remarks usually upon love, friendship, and the conduct of life, which are a literary gain but add nothing to what had been already published. The nature of his genius has been so much discussed that, in the absence of any new light, it is not necessary to go over the analysis again; but a few words in the line of what has been said may not be out of place. It must be confessed that a parish life was best for him. Destitute of the power of compromise, he could not have put himself in harmony with man's larger existence; swayed by the mystical temperament, he could not have reaped much from wider knowledge and experience, which yield their principal gain through the intellect; shy and solitary by nature, avowing that he had never given a friend "the culture of his love," his feeble social instinct could never have become that unifying power which alone is able to save the life of the cosmopolite from distraction, while, as it was, he had the consent of all his faculties to his life and found it easy to carry out his resolve, "I will be unanimous." His argument on this matter betrays him: "At best Paris could only be a school in which to learn to live here, a stepping-stone to Concord, a school in which to fit for this university"—a reflection true enough, but not leading to his conclusion. Again, more strikingly: "Ah! when a man has travelled, and robbed the horizon of his native fields of its mystery and poetry, its indefinite promise, *tarnished the blue of distant mountains with his feet*, when he has done this he may begin to think of another world. What is this longer to him?" The mystic, taking the poetic imagination for the reason, the enchanting metaphor for the logic, is plain to see. We take refuge in the cosmopolitan maxim *Chacun à son goût*, and confess we find in Thoreau's strangely-compounded individuality—the transcendentalist with Yankee sagacity, the naturalist with a *penchant* for poetry, the Indian-hearted hunter who "named all the birds without a gun," the hermit whose speculation was mainly of love—something better worth having because he was never seized by the cosmopolitan spirit. He is, indeed, the best illustration of his own words, "A genius would make the history of his parish more interesting than another's history of the world."

History of the Free-Trade Movement in England. By Augustus Mongredien. Fifteenth thousand. (London: Cassell, Petter, Galpin & Co.; New York: G. P. Putnam's Sons.)—This little volume, published under the auspices of the Cobden Club and presenting one of the most interesting

phases of nineteenth-century progress, nominally treats of free-trade. But that is, in fact, by no means the most important lesson which it has to teach, and it is because its true import differs from its apparent that it and kindred publications have so little effect in this country. The gentlemen who, in honor of the memory of Richard Cobden, have founded an association for the spread of the principles which he upheld have made this country a special missionary field, and are filled with sorrow at the want of practical result. They do not see that the question is not financial, but political; that it is not whether the people of the United States have a blind and obstinate attachment to a tariff which is full of the most monstrous inconsistencies and absurdities, but of how they shall make a beginning to accomplish any change. For there is no question that there never has been and never can be anything like absolute free-trade. When the British Government places an import duty on liquors and then offsets it by an excise on the manufacture, or when it gives a subsidy to steamships under color of payment for carrying the mails, it departs from the letter of free-trade in kind, though of course not in degree, as much as when it prohibited the import of foreign corn. It is all a question of the wisdom of certain expedients. Nor can these expedients be adopted all at once, justice to vested interests requiring that the work should be done gradually and with a careful hand. Irrespective of the repeal of the Corn Laws, it required thirty years for Sir Robert Peel, succeeded by Mr. Gladstone, to change the tariff from twelve hundred articles to fifteen, and there is this peculiarity common to all the English reforms—that while the steps forward are very slow, there is never a step backward. One of the greatest difficulties of the English reform we are certainly free from. The pressure of expenditure upon income was so great that Sir Robert Peel was obliged to impose an income-tax in order to escape the risk of a deficit in changing the tariff. With our enormous national revenue the only difficulty is to decide what interests shall be compelled to submit to a reduction. Whatever interests may be selected, they are sure to make a fierce rush and to turn the whole weight of the lobby upon the committee of Congress having charge of the matter; and as there is nobody to exercise equal pressure on behalf of the public, we see year after year the impossibility of touching the tariff at all, unless by a sharp lobbying trick such as a year or two ago succeeded in abolishing the outrageous monopoly in the manufacture of quinine. If anything is to be accomplished it can only be by the application of a strong hand; and that strong hand England possesses, and we, as yet, do not.

But the strong hand in England differs again from that in Germany and Russia in being subject to the impulse and control of the popular will, at least when that will takes a decided and persistent form. The executive power is the instrument and public opinion is the force. In this country a reformer addressing the public not merely urges the necessity of tariff reform, but tries to secure aid for the details. It is very much like expecting a trip-hammer to forge a delicate piece of iron-work without other intervention. There must be a workman to turn the iron so as to receive the blow at the proper points. In none of the English reforms related by Mr. Mongredien, nor in many others which have been carried, has the agitation taken the form of forcing any details originated outside of Parliament, nor yet of any pressure on Parliament to originate a bill. The first step always is to secure a ministry who will undertake to do the work. Then all sides wait to see what that ministry will propose. If that is not such as to command popular confidence another ministry must be sought for. If otherwise, an appeal is made for support both of measure and men. The process is impossible where action must be had first through an irresponsible committee and then through an irresponsible majority of Congress. Note that the strength of despotism may, through its irresponsible ministers, effect a popular reform against powerful private interests, though it is not very likely to do so; but that a popular government which has no real executive head will be fleeced as helplessly as the lamb in the hands of the shearer. It is the combination of strength of administration with responsibility to public opinion which has enabled the English nation to win so many pitched battles with private and class greed; and while we commend Mr. Mongredien's book to our readers we think they will derive more profit from it if they try to read between the lines.

Divine Guidance. Memorial of Allen W. Dodge. By Gail Hamilton. (New York: D. Appleton & Co. 1881.)—Mr. Dodge would hardly have been honored with a memorial of these dimensions if it had not been his fortune to enjoy a certain relationship with Gail Hamilton, the exact degree of which is not revealed and need not be sought out. The book was evidently written for the satisfaction of immediate relatives and friends and the townspeople of Hamilton, Mass., where Mr. Dodge was an imperious magnate for the best part of his life. But it is not on this part that his biographer has dwelt most faithfully. The emphasis of her treatment is on an episode of morbid piety which followed the death of his first wife, and which is illustrated by more than one hundred pages from a journal, the decline and fall of which marked the return to a more natural and healthy condition. When the space allotted to a day at first became sufficient for a year, the end of the journal was evidently near at hand. The final entry records his melancholy neglect to pray for the absent pastor at Marblehead, where he was preaching for a day. Mr. Dodge, having made a failure in the ministry, went back to the farm at Hamilton, and before long fell in love with the rosiest girl in the vicinity, though but a little while before he had been indifferent to all things human, and especially to all things feminine. He became a thrifty farmer and a useful citizen, fond of having his own way, but full of public spirit, with an eye to good roads and shade-trees and other improvements in the town and country. The changes in his life, "from grave to gay, from lively to severe," but in the opposite order, afford his biographer an opportunity for certain reflections which are in the main distinguished by admirable common sense. It is a pity that Mr. Dodge's father, who was quite heart-broken by his morbid and intolerant pietism, did not live to see that it was almost entirely a matter of stomachic or cerebral derangement. Not the least interesting part of this biography is the sketch of Mr. Dodge's ancestry.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Barrett (E.), The Carlyle Anthology, 2d ed	(Henry Holt & Co.) $1 25

The Critic

Out to-morrow (Friday) will contain a full-length portrait of Dr. Damrosch, by Robert Blum, accompanying an exhaustive criticism of the Music Festival. Walt Whitman will describe his recent trip to Boston, and tell what he thinks of Emerson, Bryant, Longfellow, and Whittier. Mrs. Julia Ward Howe will write of the new 'Life of Laura Bridgman'; Mr. R. H. Stoddard, of the late Epes Sargent's 'Cyclopædia of Poetry'; Dr. Philip Schaff, of Max Müller's 'Dhammapada'; and "H. H.," of Burroughs's "Pepacton." Other works, of more or less importance, will be reviewed by specialists. Single copies, 10 cents; $2 a year, in advance.
Address 757 Broadway, New York.

Wedding Stationery, from plates engraved in the correct style and on the finest stock. Samples and estimates promptly sent. Address Lockwood, Brooks & Co., Stationers and Engravers, Boston, Mass.

Kissena Nurseries.

PARSONS & SONS CO.

(LIMITED),

FLUSHING, N. Y. (NEAR NEW YORK CITY).

Send three 3-cent stamps for large new Descriptive Catalogue.

New English Books

At 25 cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

HAVERFORD COLLEGE, under the care of the Society of Friends (Orthodox). THOS. CHASE, LL.D., President. For catalogues apply to Prof. ALLEN C. THOMAS, Prefect.

PENNSYLVANIA, Philadelphia, 1350 Pine Street.

MISS ANABLE'S BOARDING and DAY School will reopen September 15.

PENNSYLVANIA, Philadelphia, Summit St., Chestnut Hill.

MRS. W. D. COMEGYS and Miss BELL'S Boarding and Day School for Young Ladies and Children reopens Sept. 15. Number limited. Early applications requested.

Wants.

A HARVARD GRADUATE of experience wants a pupil to coach for the admission examinations in June or Sept. '81 or '82. Address A. B., 25 Holyoke St., Cambridge.

A HARVARD SENIOR, intending, after graduation in June, to study abroad for two years, would like one or two pupils. For particulars and references address T. Y., Cambridge, Mass., M. 29.

*AN experienced College Teacher of Classics de-*sires a re-engagement for the coming academical year. Specialty, Latin. Satisfactory reasons given for removal. Address LUCRETIUS, office of the *Nation*.

A PROMINENT PUBLISHING FIRM would like to correspond with authors and teachers with reference to school and college text-books. Liberal arrangements will be made for the publication of text-books reasonably certain of success. Address TEXT-BOOKS, care of the *Nation*, New York.

A RECENT Harvard Graduate, who intends to go abroad next July, would be willing to take a pupil with him on reasonable terms. Best references given as to scholarship, character, and experience in tutoring. Correspondence solicited. E. R. P., care of the *Harvard Register*, Cambridge, Mass.

*AS BUSINESS ASSISTANT in a first-*class school. Can teach; and invest a trifle, if, etc. Address Miss J. E. P., *Nation* office.

MENTAL, MORAL, AND POLITICAL Science.—A college professor, moving to New York, wants engagements for next year to teach private pupils or in ladies' schools. Lectures on the above subjects. Address LOCKE, *Nation* office.

TRAVELLING TUTOR.—College graduate, lately returned from extensive tour in Europe, wishes charge of several young men or of a select party travelling in Europe. ARCHITECT, 364 W. Thirty-fifth Street.

SHORTHAND AMANUENSIS — College Graduate—desires evening engagement. Address J. F. SCOTT, 136 East Eightieth Street.

WANTED by the advertiser, a young man who intends making law a profession, position as attorney's clerk in New York law office. University graduate. Highest recommendations. Address K. T., care *Nation*.

In my experience as a sanitary expert I find only about one house in ten with good plumbing.

In nothing does the ounce of prevention yield greater results than in making homes healthful.

Expert advice is always desirable in such matters.

CHAS. F. WINGATE, Sanitary Engineer,
No. 79 Fourth Ave., New York.

The Tsar's Window.

The *Nation's* opinion of this book:

"It were ungracious to surmise that the *mise-en-scè* h Tsar's Window' was made up from Gautier, eked out by the *Court Circular*. Yet assuredly, if the author has veritably seen St. Petersburg and Moscow, then never had the famous pussy-cat who went to London to see the queen a worthier rival in scant narrowness of view."

Well, it is nothing new for good critics to differ with the *Nation*. Mrs. Margaret J. Preston pronounces 'The Tsar's Window' to be the best illustration of the life, manners, customs, and society of the Russian capital we have had since Théophile Gautier's 'Winter in St. Petersburg.'

Mrs. Caroline H. Dall says:

"I do not know any one who could write it, unless it be the author of 'The Colonel's Opera-Cloak.' Both these books show the same delicate touch, and are filled with the same humorous consciousness, and both subserve the truest purpose of the novel, which is to cheer and amuse. I remember that I was ill when I read 'The Colonel's Opera-Cloak,' and I laughed so heartily alone in my bed at midnight that my old housekeeper came down stairs to see if I was delirious. I caught myself at the same trick as I looked out of 'The Tsar's Window.'"

The *Christian Intelligencer* says:

"The interest Russia now excites lends a peculiar charm to this volume. It consists in the main of bright, fresh descriptions of life in St. Petersburg, as a pair of American eyes saw it when having special opportunity to mingle with the higher circles of Russian society. The thread on which these descriptions are strung is a delightful love-story, in which an American girl has to choose between an expatriated Englishman and a Russian count."

'The Tsar's Window' is the eighth volume in the "No-Name (Second) Series." Price $1.

ROBERTS BROS., Publishers,
BOSTON.

HELIOTYPE.

PERMANENT PHOTOGRAPHIC BOOK ILLUSTRATIONS.

THE HELIOTYPE PRINTING COMPANY

Are producers of illustrations by the most approved Photo-Mechanical, Photo-Lithographic, and Photo-Engraving Processes. Employed by the United States Government in illustrating Scientific and Medical reports; by Scientific, Historical, and other learned Societies; by the leading Publishers, and for illustrating Town and Family Histories, Trade Catalogues, Show-Cards, etc. Fac-similes of Medals and Coins, Ancient Manuscripts, Paintings, Drawings, Sketches, and Autograph Circulars, Views and Portraits from Nature, Medical and Scientific Objects, Antiquities, etc.

Estimates and specimens furnished on application.

The Nation.

The Office of THE NATION *has been removed to No. 115 Nassau Street, near Beekman Street.*

NEW YORK, THURSDAY, MAY 12, 1881.

The Week.

THE "deadlock" in the Senate was broken on Wednesday, the 4th inst., by a retreat on the part of the Republicans from the position in which they have cut such a sorry figure during the past six weeks. Upon Mr. Dawes devolved the melancholy and delicate task of moving that the Senate take up the business for which it was called together on the 5th of March, by going into executive session, and he performed it in one of the most mournful speeches ever delivered in any legislative body. It appears, according to him, that the question whether Gorham should be Secretary and Riddleberger Sergeant-at-Arms was of "graver import and importance, and scope and consequence, to the institutions of the country than any other which had come up for consideration in that hall." The reason was that if the majority were prevented by the minority from having their way in that matter, a blow would be inflicted on the Senate which would "paralyze," "change," "cripple," and "destroy" it, and "reveal to dissatisfaction, to faction, and to rebellion a method, an instrumentality, and a power for the destruction of the institutions of this country" far more potent than open war in the field. Nevertheless, he admitted that the nominations and treaties ought to be confirmed, so he moved to postpone the resistance to this awful danger to some future time not specified, and to "proceed to the consideration of executive business." His observations, we regret to say, have been received with derision by the licentious press of both parties, whose attitude must remind him painfully of Nero's fiddling while Rome was burning. Mr. Dawes is, however, not really as gloomy a man as he seems, and will go home to Massachusetts and pass a very comfortable summer without any alarm about the future of his country. He puts his misery into his rhetoric and leaves it with the printer of the *Congressional Record* when he goes off for his holiday. We presume Riddleberger and Gorham must have been convulsed internally on hearing his description of the crisis of which they were the heroes.

The Republican Senators have had another caucus to decide what course they will adopt with regard to the Robertson nomination. Mr. Conkling is reported to have made one of his great and exhaustive speeches, the subject being one which always calls forth all his power. He spoke for two hours. He is said to have given a "history" of the Robertson nomination, and a "comprehensive statement" of the reason why the nomination was particularly obnoxious and objectionable to him, partly owing to Mr. Robertson's behavior in New York "politics," and partly owing to the perfidious conduct of the President with regard to the nominations in general. The Democrats are said to be of opinion that under the Tenure-of-Office Act the President is bound within thirty days after the commencement of each session of the Senate to nominate for all vacancies existing when the Senate met; that the New York vacancies existed when the Senate met; that the nominations were, therefore, made in obedience to the law, and that the limit of thirty days having expired on the 5th of April, he has no right to withdraw them, or that if he withdraws them he must simultaneously substitute others. The muddle seems to grow deeper as the weeks roll on, and we would call our readers' attention particularly to the fact that it has no connection whatever with any improvement in the administration of the Government or with the public business. It arises out of the fact that the offices are being used as counters to mark the number of tricks won by different politicians in the little game they have invented for themselves.

The *Times* makes some interesting disclosures as to the details of the way in which the "Star-route" frauds were conducted, giving histories of several contracts as specimen illustrations. These are all spread upon the records of the Post-Office Department, and it is difficult to decide which is the more remarkable, the candor which makes the ring's methods so easily discoverable or the fact that they have remained so long undiscovered. The form of procedure was in brief as follows: The ring-contractor would put in the lowest bid for the desired route, which could, of course, be easily contrived, and, after a decent interval, upon the receipt of numerously-signed petitions, endorsed by the Congressmen representing the district concerned, the service would be raised—*i.e.*, the number of trips per week would be doubled, and the time allowed for each trip reduced, involving, of course, the raising of the pay. The increase was figured by the simple modes of multiplication and proportion based on an affidavit of the contractor as to the increased expenditure needed. The petition for increasing the service, the contractor's sworn estimate of his increased expenses, and the figuring of the additional pay earned were all essentially fraudulent. The first was obtained by appealing to the local public spirit of influential men ignorant of the frauds contemplated. The second was grossly deceptive, and the last openly dishonest. At the same time there was color of law for every detail of the transaction on the part of the Government officials, the law failing to provide that the latter should not be thieves.

The Louisiana route between Shreveport and Red River Landing furnishes a sample illustration of many cases. The contract was awarded to B. H. Peterson, the lowest regular bidder, for $11,700. He sub-let it to N. L. McGinnis for $9,000, thus netting himself $2,700 for simply getting the contract. Soon after, the service was doubled by an order of Brady, and the pay also, making Peterson's receipts $23,400, and McGinnis's $18,000. Then the running time was reduced from sixty to forty-eight hours, giving Peterson $28,561 additional, *pro rata;* McGinnis's share for doing the work being $21,970. Peterson's pay at this point stood on the Department's books as raised from $11,700 to $51,961, and by sub-letting his contract his net earnings were $11,991. This was insufficient, however, and he reduced McGinnis's stipend to $33,894, and his profits for putting in the original bid finally amounted to $18,067. How much of this he had to pay out, the records naturally do not show. It is indeed surprising that they show so much. One of Dorsey's Star-route operations has just got into a court of law in Colorado, owing to his quarrelling with one of his confederates, and it appears that he engineered the whole fraud himself from beginning to end. It looks now as if he must get into the hands of criminal justice.

Brady has been giving out for some days that he had a letter from the President, received during the late canvass, of a compromising character, and on Thursday he published it. It must be admitted it is not pleasant reading, even with the President's explanations. It is addressed to "my dear Hubbell," the chairman of the Congressional Committee for campaign purposes, and asks him "to say to Brady that he (the President) hoped he would give them all the assistance possible." Brady wishes it to be believed that this meant that he should get money for the canvass from every source within his reach, including the Star-route contractors; but the President says it meant that Brady, having made a fortune out of the Bell Telephone stock, was to contribute handsomely out of his own pocket. Be this as it may, the following sentence has a disagreeable sound: "Please tell me how the departments generally are doing." The natural interpretation of this is that, having encouraged Brady to get what he could out of his department, the President wished to know how the other departments were contributing. We do not think it will bear any other. The "doing" of a department during the canvass meant, of course, the payment of a heavy "assessment," in fact, a number of assessments, to the campaign fund, under intimidation of one kind or another from "dear Hubbell" and his like, by poor clerks out of salaries already insufficient for the support of their families, thus furnishing a temptation of the strongest kind to dishonesty and debt. The revelation of the fact that General Garfield countenanced such practices at that early

date will be a painful surprise to large numbers of persons with whose support and good opinion he can ill dispense. There is little doubt that Brady kept the Bell Telephone stock for himself and contributed to the campaign fund out of Star-route contracts.

The Pennsylvanian anti-Grant men of 1880 have taken some steps in Philadelphia towards the formation of a new party under the auspices of Mr. Wharton Barker, by starting a "National Republican League" with Mr. Rotch Wister as president. The platform of the League proposes to "elevate and purify" the Republican party; to "stimulate the moral sentiment of the people" in the political direction; to uphold the United States Government, the public credit, and a policy of protection to native industry; to introduce into the civil service a good-behavior tenure and pensions for the superannuated; and to maintain the independence of the different branches of the Federal Government, within their respective spheres. This is a good platform, but it must be observed that the protection and civil-service planks are the only practical parts of it. The rest is simply an exhortation to the practice of virtue, for which all politicians already express great admiration. Conkling is in favor of virtue, and so, for that matter, are Brady and Dorsey.

There seems to be some strange, and we hope not wilful, misunderstanding about the part played by "probation" in the plans of civil-service reformers. Mr. Kirkwood is trying to excuse or defend his conduct in abolishing competitive examinations in the Interior Department and shoving in 140 unskilled nominees of Congressmen, without any test, many of them into highly-paid clerkships, over the heads of men who have been long in the service, by professing to have introduced "probation" in place of the examination. If these new men, he says piously, do not prove equal to their work in three months they will be sent home; and all the old jobbers, on hearing this, roll their eyes, and say how practical this is, and how superior to Schurz's pedagogy. Now, the truth is that probation is a prominent feature in the reformers' system everywhere. In the New York Custom-house and Post-office, and in the Department of the Interior, the competitive examination simply ascertained who should be admitted to probation. So that Mr. Kirkwood has introduced nothing new; but *his* probation will not work, for the simple reason that a man once put into the service by a Congressman cannot be summarily dismissed, even if he proves incompetent on trial. His "influence" would resist it with all his might, and in most cases would resist it successfully.

A large majority of the holders of the $196,000,000 of 6 per cent. bonds which the Treasury has given notice that it will pay on July 1, or will extend at 3½ per cent. annual interest, have applied for the extension; and it now looks as if there would remain to be paid, July 1, less than $20,000,000 of these bonds, some opinions being that not more $10,000,000 will have to be so paid. The foreign holders of these bonds have until the 20th instant to say whether they will extend or take their money. Foreign banks have been buying the extended 3½ per cents., the London and Westminster having taken $1,000,000 as an investment; and as no other bonds of the Government pay as much interest (the 4 per cents. now selling at a price which pays the holder to maturity about 3⅛ per cent.), it is likely that only such bonds will remain unextended as are out of reach of current information respecting comparative market prices. While this negotiation is a success, it by no means follows that if $196,000,000 of bonds, which may be paid off in a year or which may run many years, had been offered at par they would have been taken; but so great is the difficulty now in getting good, sound investments at even 3½ per cent. that the holders of the 6 per cents. have taken new bonds willingly. The new Secretary of the Treasury is entitled to credit for having adopted a scheme which has proved to be so successful and satisfactory to both sides. He has given notice that the same method of reducing the interest on a large part, if not all, of the 5 per cents. will be resorted to.

Both British consols and United States bonds have advanced during the week to the highest prices paid—the former to 102¾, and the United States 4s, in this market, to 116½. These prices, while they reflect the high credit of the respective governments, are more indicative of the prevailing belief that money is, for the next few months, to command very low rates, a belief which has advanced to unprecedented figures the prices of all first-class securities here and in London. The movement of gold to this country has been checked during the week on account of the return of United States bonds which are called in for redemption; and the receipts of these are larger than the amount of securities going to Europe in the same time, although the export of American securities, good, bad, and indifferent, is large and steadily increasing. The New York money market has been plethoric with loanable funds, and bids fair to become still more so. At the Stock Exchange the market for securities and shares was a rising one during the week. The plan for uniting under one management and that the management of Jay Gould, the five thousand miles of Southwestern railroads, has undergone several changes, but it is now expected that instead of creating a new company to lease these lines, all will be absorbed by the best one, viz., the Missouri Pacific. General business is improving with the appearance of seasonable weather, and the crop outlook is considered encouraging, particularly in the Northwestern States. The price of silver bullion in London closed at 51⅛*d.* per ounce, and here the bullion value of the "buzzard dollar" at the close of the week was $0.8729.

The questions drawn up for consideration at the opening of the Monetary Conference indicated clearly enough that the discussion was going to be what Prince Bismarck called "academic" and refused to engage in with Mr. George Walker. They were five in number, and were in substance: Have the recent fluctuations in the value of silver been injurious? Have they been due to increase of production or to legislation? Would stability of relation between gold and silver be obtained by unlimited coinage under agreement between "a large group of states"? If so, how should this be brought about? Would it be well to compel banks of issue to take gold and silver at a fixed price? If bi-metallism be thus adopted what should be the ratio between the weights of pure gold and silver contained in the monetary units? That it should have been thought necessary to produce these questions once more for debate by a body composed as the Conference is, considering that every point of importance in them has been thoroughly examined by the leading experts of the world during the last five years, and was ably handled after full enquiry by the British Silver Commission of 1876, is of itself sufficient to show the unpractical character of the present attempt at bi-metallism. It was not surprising, therefore, that at the sitting of Friday last, the third, the German delegate should have announced the adhesion of his Government to the gold standard; that the English, Indian, and Canadian delegates should have refused to take any part in the proceedings beyond listening and giving information; that the Russian, Norwegian, Swedish, Swiss, and Greek delegates should have "made reservations," and the Norwegian, in fact, defended the gold standard. As the "academic discussion" can be perfectly well carried on through the press, it seems as if Messrs. Evarts and Thurman and Howe might as well go off on their hard-earned holiday.

The proceedings were enlivened on Monday by a proposal of M. Cernuschi to make up an international subscription of $20,000,000 to compensate Germany for her losses in selling silver. This appears to have caused laughter among the cold and heartless enemies of silver, and it will perhaps confirm the suspicions of the Cincinnati *Commercial* about the state of M. Cernuschi's mind. Moreover, if every country which has lost money on silver is to be compensated by subscription, and there is such a thing as moral responsibility connected with silver, there are two editors in the West who ought to make a very handsome contribution to the people of the United States.

We are sorry to see that the English public still continues to be imposed upon by persons and societies engaged in looking after the welfare of the Southern freedmen. Last year we had occasion to call attention to the use they were making of old "outrage" stories, got up for the political canvasses here, to procure contributions for the relief of imaginary victims of mutilation, banishment, and arson. We find in the London *Daily News* of April 13 a statement emanating from the

above source that "up to the end of last year no fewer than 60,000 negroes had taken refuge in Kansas, a State about the size of Scotland, now comprising about a million of inhabitants." Three-fourths of these immigrants, it is added, required assistance from the State. It is sufficient in answer to this to remind our English readers that the census returns of this year show that in the ten years between 1870 and 1880 Kansas only gained 25,988 colored inhabitants. Indiana, another State of the negro "exodus" to which equally wonderful accounts have been given, only gained 14,438 within the same period. We trust the *Daily News* will mention these figures. Many of the stories of the "exodus" were undoubtedly prepared for the last Presidential campaign when the "murder" stories had ceased to produce any effect. It would be very unfortunate if the authors of these things could find a market for their wares in England after they had ruined their business in America by their recklessness.

The anti-Jewish movement seems to have extended to Russia, where there has been a rising against the Jews at Kieff and formidable riots, which had to be suppressed by military force. According to a Russian correspondent of the *Pall Mall Gazette*, the movement extends through the Ukraine, where the Jews are very numerous, and are, as usurious money-lenders, detested by the peasantry. In this country the numerous announcements of summer hotel-keepers which have already appeared refusing to receive Jews have led to the introduction of a bill into the State Legislature prohibiting these distinctions in hotels, theatres, and conveyances. The bill is now before the Senate Judiciary Committee. Its author, Mr. Seebacher, is, we believe, a Jew, but if he is wise he will not press his measure. He is attacking something which legislation has never cured and cannot cure, and may aggravate. It is not possible, as everybody knows, to open hotels to which people resort for anything more than bare food and shelter to any particular class or grade of persons by legislative enactment. No Jew who feels the present hostility of hotel-keepers would care to make his way into any hotel by the aid of the sheriff, or could enjoy himself after he got there. He is, in fact, a poor adviser of any race or class which is suffering from social obloquy who urges it to right itself by more social "push." Any energy there is to spare for the matter ought to be devoted to the cultivation of the arts on which social success depends, and the art of making one's way into circles where one is not wanted is not among the number.

The Rev. Joseph Cook has, according to the London *Medical Press and Circular*, been outdoing in Scotland his best performances in the Boston "Monday Lectureship." In a lecture in Edinburgh the other day he actually illustrated the effects of liquor on the albumen in the human system by showing the effect of alcohol on the white of an egg and laid it down that in hardening the albumen in the body the alcohol left scars on the brain and nerves which are as permanent as scars in the skin. The *Medical Press and Circular* declines to characterize this little experiment and the deductions therefrom, on the ground that it would be "insulting to the sense of its readers."

Mr. Gladstone, whose absence from Lord Beaconsfield's funeral excited some surprise, but was probably due to physical indisposition, has performed what must have been a very difficult and delicate task in moving the vote of money for the monument to his old adversary in St. Peter's Church, Westminster. His speech, as well as can be judged from the telegraphic summary, was, all things considered, a well-planned and well-delivered eulogy, in which he gave credit to Beaconsfield for the qualities of head which no one can deny him, and covered up his errors of policy by reminding the House that however great they were, and however severely the country may have since condemned them, he was, as minister, the product of the same suffrage as the Liberals. The Radicals, led by Labouchere, however, to their credit, held firm, and voted against the resolution, 54 to 380. The lament over the deceased statesman is very distinctly a "society" affair, and shows what a powerful hold he had secured on the court and upper classes. Curiously enough, the only papers whose analysis of his character and career since his death are worth much are two "society papers," *The World* and *Truth*, which distinctly live by the constituency which adored Disraeli. They explode with much pungency many of the little ornamental legends which have been got up about him since his illness. Most of the newspaper articles on him are not bad specimens of the extent to which the cultivated can carry gush when gush is fashionable. The sermons of the London clergymen are more than usually fulsome in their praise, and paint a character comically unlike the "Dizzy" who was known to the British public during the last forty years as an unusually clever, cynical, unscrupulous political juggler.

The feeling excited in England by the Carlyle 'Reminiscences' has led his niece to publish something which the telegraph describes as a copy of Carlyle's instructions, dated in 1866, "solemnly forbidding the publication of his 'Reminiscences' without the strictest editing." As this is a direct blow at Mr. Froude, he has retorted by a letter to the *Times* acknowledging the receipt of the instructions along with the manuscript of the 'Reminiscences' in 1866, but says that Carlyle then, after conversation, left the whole matter to Mr. Froude's discretion, and that two years later he confirmed this discretion in his will and never said anything to the contrary. Mr. Froude closes by threatening "further explanations" in case he is pressed. One cannot speak positively as to the effect of all this before seeing the full text of the correspondence. But all that it seems to amount to is that Mr. Carlyle thought in 1866, when he wrote the 'Reminiscences,' that they ought to be carefully edited, and that he left it to Mr. Froude to decide what this editing should be, and that Mr. Froude decided that the best editing consisted in publishing the manuscript just as it stood. It is this decision, however, which has caused all the trouble, and it will not do anything either for Carlyle's memory or Mr. Froude's reputation to show that Mr. Froude had the right to make it. Moreover, even if Carlyle's family could show that Mr. Froude had abused his authority, it would not in any way modify the public judgment of Carlyle's character formed in consequence of the 'Reminiscences.' The fact is now revealed that Carlyle felt and talked in a certain way about people and things, and no public disputes of the propriety of making the revelation will do away with it. Mrs. Alexander Carlyle, the niece, has answered Mr. Froude's threat by asking him to submit her uncle's papers to the examination of competent third persons in order to decide the question of Mr. Froude's discretion; but he replies that they are his personal property; that he will submit them to no one, and will publish what he pleases. This is rather a hard saying for the unfortunate relatives after Mr. Froude's use of his "personal property" has ruined their uncle's reputation.

Mr. Bradlaugh is finding out that, in England at least, the "infidel in politics" has a hard road to travel, harder even than the "scholar in politics" in this country. He refused to take the oath when first elected from Northampton, on the ground that it was to him an empty form, but offered to affirm. He was, after much confusion, allowed to affirm and keep his seat. But suits were at once begun against him to recover the penalty of $2,500 attaching to each vote cast in the House of Commons by a person not properly qualified to sit therein, and the total amount for which judgment was given against him in the court below was something like $125,000—a crushing sum for a poor infidel. He carried his case up and argued it himself with remarkable ability in the Court of Appeals, but was again beaten. The Court decided that he, as he had described himself, did not belong to the category of persons who were in the House of Commons allowed to substitute an affirmation for an oath as the law now stands, and that therefore he had voted without the qualification. A new writ was accordingly issued for Northampton and he was again elected, but this time resolved to take the oath as it stood, alleging that it would bind his conscience; but the majority of the House, led by Sir Stafford Northcote—Mr. Gladstone declining to interfere—refused to allow him to be sworn. He now presents himself at the bar occasionally, but with the same result; and the Ministry have brought in a bill admitting persons in his case to affirm, but the Conservatives are opposing it by every means in their power, and Bradlaugh has issued an address to his constituents calling attention to the way he is being treated. What the motive of his opponents is, beyond punishing him for avowing that he is an atheist, it would be hard to say. His want of respect for the oath, of course, follows naturally from his atheism. His readiness to take it is, however, damaging him with his brother-infidels.

THE PRESIDENT'S MODIFICATION IN THE SPOILS SYSTEM.

THERE can be no question that in the course the President is pursuing with regard to the New York nominations he is acting, as his organs in the press have frequently pointed out during the last few weeks, strictly within the sphere of discretion assigned to him by the Constitution. It is, according to that instrument, his right to nominate for office whom he pleases; nobody shares with him in any degree the legal power of nomination; it is only to the subsequent appointment that "the advice and consent" of the Senate are necessary. The practice of dividing the power and duty of nomination with the Senators of particular States, or the still commoner practice latterly of divesting himself of this power and duty altogether and transferring them completely to the Senators of particular States, was recognized in 1876 as a very gross abuse by the Republican Convention which nominated Mr. Hayes. The fifth section of the platform censured it and described the true rule in the following terms:

"Under the Constitution the President and heads of departments are to make nominations for office; the Senate is to advise and consent to appointments; and the House of Representatives is to accuse and prosecute faithless officers. The best interests of the public service demand that these distinctions be respected; that Senators and Representatives who may be judges and accusers should not dictate appointments to office. The invariable rule for appointments should have reference to the honesty, fidelity, and capacity of appointees, giving to the party in power those places where harmony and vigor of administration require its policy to be represented, but permitting all others to be filled by persons selected with sole reference to efficiency of the public service, and the right of citizens to share in the honor of rendering faithful service to their country."

President Hayes adhered to this doctrine in the fitful way in which he adhered to everything in the way of reform—that is, he made some of the nominations himself, and some he allowed the Senators to make. It was the general belief, however, during his Administration that he was, on the whole, making an effort to break up the usage which the Convention denounced, and to resume and exercise the duty imposed on him by the Constitution of using his own judgment in the selection of candidates for Federal offices.

It was, too, undoubtedly the expectation of all that class of Republicans known as "Independents," without whose support General Garfield would probably never have reached the Presidency, that, owing to his greater experience in political life, and the strong sense of the evils of Congressional interference with the patronage which he had expressed in speeches and articles almost up to the time of his nomination, he would resume the constitutional duty of selecting executive officers, refuse to allow Senators to share it with him, and perform it with more firmness and consistency than Mr. Hayes. His letter of acceptance, however, was generally received as a repudiation of any such intention and as a concession of the Senatorial claim to share in the nominations, and was, therefore, a good deal of a surprise both to his friends and enemies all over the country. He said: "To select wisely from our vast population those who are best fitted for the many offices to be filled, requires an acquaintance far beyond the range of any one man. The Executive should, therefore, seek and receive the information and assistance of those whose knowledge of the communities in which the duties are to be performed best qualifies them to aid in making the wisest choice." By this General Garfield was understood to mean, and doubtless did mean, that he would continue the old practice of allowing Senators and Representatives to control the patronage of their respective States. There was not a hint during the canvass or in his inaugural address that he meant anything else; and his organ, immediately before his inauguration, evidently believed that he meant to pursue the old course, which the Cincinnati Convention had condemned.

He did, however, depart from this course when he resolved to restore what is called "harmony in the party" by recognizing not only the "claims" of the New York Senator, but the claims of those who are opposed to him. He therefore nominated a certain number of persons who were known or supposed to be Conkling's men; and, having done this, proceeded to "recognize" the anti-Conklingites by nominating their leading man for the Collectorship of this port. Now, the objection which Mr. Conkling makes to this is, from the Machine point of view, as it seems to us, unanswerable. He says to the President: "You have acknowledged, both in your letter of acceptance and in your private conferences with me, my right as Senator, under my system, to be consulted about the New York appointments—that is, to name to you the persons whom I wish to fill them. You have never pretended that I was bound to satisfy you that they were the persons best qualified to fill them. What you sought to know about them was my wishes with regard to them. Now, you have in two or three cases followed my wishes, or what you supposed to be my wishes; and if in the remaining cases you had thought simply of what the theorists call the good of the service, and made your own choice on purely administrative grounds, I do not know that I should have had any good reason to complain, or that I should have complained. Merritt, who is now in the New York Custom-house, is not my man. I did not ask to have him put there, and I don't want him kept there (d—n him!), but if you had said that you were determined to keep him because he was doing the duties of the place efficiently, and because you were pledged by your inaugural address not to disturb efficient officers in the middle of their term, I should not have had a word to say. But you have not only departed from the theory of your inaugural and removed an efficient officer in the middle of his term, and departed from the theory of your letter of acceptance and nominated a man in his place without consulting the Senators or Representatives, but you have nominated a man who has no claim to the place under any theory of office-holding, either yours or mine, except what arises out of the fact that he is my enemy. If he had not opposed me violently, and thwarted me, and tried to deprive me of my influence in State politics, you would not have nominated him at all. Judge Robertson is not now in the Custom-house service, and never has been. He has no experience of its duties. He has, I understand, not sought the place. He has not been urged for it by the featherheads called 'Civil-Service Reformers,' of whom you were yourself one a year or two ago. There is no pretence that he would be a better Collector than that man Merritt. In choosing, therefore, for a place which, under the usage whose validity you have yourself formally acknowledged, I and my colleague are entitled to fill, a man whose political distinction is drawn mainly from his opposition to me in State politics, you are starting an entirely new system, of which no one has ever heard till now. You actually propose to divide the offices between the Senators and anybody who manages at conventions to make himself conspicuous as their enemy; and this you call restoring harmony in the party. The truth is that you are offering a reward for discord; you are telling every sorehead in politics that all he has to do in order to be able to share the patronage with the accredited representatives of the State, is to harass and worry and gainsay them at the party conventions. Now, I know what my system is, and I know what the system of the Civil-Service Reformers is; but what do you call this? Is every obscene bird who bends his bow at me and gibbets me for nothing on the cross-roads of public condemnation, and drags me through the hurricane and surfeit of mire and detestable accusation, and raises a cry against me at the kneading-troughs, to become, *ipso facto*, entitled to a Federal office of trust and emolument?"

The truth is that the "spoils" system, which our politicians seem to recoil from touching with the same fatal timidity which they displayed towards slavery before the war, but which will in the long run bring the same ruin on "doughfaces" and trimmers, only permits the distribution of the offices under the direction of the official party chiefs in each State. It is based on the theory that the Senators represent the party in all divisions of the spoil, and are entitled to say absolutely and finally who are entitled to it. To attempt to administer it on the theory that every faction of the party, every band of revolters against the Senatorial lead, are entitled to share in it *quâ* revolters, is to reduce it to complete absurdity even from the spoils point of view. As weapons of "war" the offices are only available against the common enemy—the Opposition; they are not available for intestine quarrels; they cannot be used in any such way without ruining the whole system. The condition to which the President is seeking to reduce Senator Conkling is one which the spoils system makes no provision for and does not recognize in any way. It knows nothing of a

Senator who only controls part of the offices and has to give some of them to his bitter enemies, any more than of a Senator of the party in power with no offices at all in his gift. Under it such a Senator would be a contradiction in terms, like a peaceable soldier, or a godless minister, or a waterless river. It follows from this that the offices are not available for the restoration of "harmony." To attempt to use them for any such purpose is to put a premium on strife. Their proper object, considered as spoils, is to strengthen the bonds of discipline, to secure implicit obedience to the majority in caucuses and conventions, and to protect the influence and ascendency of recognized party chiefs, whether Bosses or Senators. If General Garfield has reached the conclusion that the old system is a bad one, that Senators are not fit dispensers of patronage, and that the public offices ought not to be treated as part of their personal baggage, there is but one course to follow, and that is to fall back on the old, natural plan of filling the offices simply with a view to the proper conduct of the public business. If he means to fight Conkling or any other Boss, he cannot fight him successfully as the leader of a rival faction in the party. He can only fight him successfully in the character of a business man, charged with the receipt and disbursement of the revenue, and the faithful execution of the laws of a great nation. In that character alone can he "slaughter" his enemies. This is something better than a "war-club" or "scalping-knife." It is the breechloader and rifled artillery of civilized politics. He has been in office now for two months trying to restore "harmony," and satisfy "claims," and "recognize" "wings" and "sections" by making appointments without regard (or with only secondary regard) to fitness, and he has simply produced deadlock and confusion and disappointment among politicians, and disgust among the taxpayers, and has made Republican defeat this fall all but a certainty. It is not yet too late for his own fame and success to retrace his steps and abandon the plan of governing through the corrupt use of the public service. The way to ruin Conkling permanently is to administer the New York Custom-house on the system which Conkling most abhors—that is, as a business house. To administer it simply as the old concern, with "the controlling interest" in new hands, is to perpetuate the view of the public service which breeds Conklings, and which, as long as it is allowed to operate, will make men of Conkling's peculiar talents seem so respectable and powerful that they will never be completely overthrown or brought to naught. Harmony in a party, the President ought to remember, is harmony of opinion and feeling about the ends of government—the *idem velle, idem sentire de republicâ*—among the voters. It is not and cannot be the satisfaction of a few thousand needy men with the salaries of small offices, because that is unattainable. Needy men never have enough money, and there are not offices enough in the world to satisfy the needy men of the State of New York. "Harmony" through that channel is in politics what the squaring of the circle is in mathematics.

THE CONSERVATIVE SUCCESSION IN ENGLAND.

THE English Conservatives have practically settled the question of leadership by electing Lord Salisbury to that office in the House of Lords, and Sir Stafford Northcote will apparently continue to lead as hitherto in the Commons. Who will lead the party as a whole does not yet appear, but probably for the present no one in particular. There is nothing of moment to be decided immediately except the treatment of the Irish Land Bill, which is slowly making its way through the Commons, but has not yet got into the Committee of the Whole. Lord Cairns will do for his party in the Lords all that can be done in the way of depreciatory or obstructive criticism. In this Lord Beaconsfield could have given but little assistance. Where he will be missed is in deciding how much weight with the party hostile criticism ought to have. There seems to be a general impression in London that had he lived he would have persuaded his followers into passing the measure without much change, so as to avoid making land-tenure the subject or apparent cause of a fierce controversy in which the Lords would appear almost alone as the champions of an unpopular cause. In discussing his value to his party there appears to be a more general agreement as to the service he rendered of late years in preventing their becoming irreconcilables than as to any other. He had the art of getting them to accept things which without him would have been revolting, and then finding excuses for them which saved their self-respect. The great danger the Peers run now is that of taking away the exceptional and peculiar character of the Irish land question, and making it seem part and parcel of the English land question by putting too much feeling and persistence into their opposition to it. He would probably have disposed of it somewhat lightly; and in so far as he resisted, have resisted in an apparent spirit of kindness to an unfortunate body of men, the Irish landlords; and would have carefully refrained, and made his followers refrain, from dealing with it as an attack on the rights of property. There is much reason to believe that Lord Cairns and Lord Salisbury will not be so wise, and may send the bill back to the Commons so mutilated that it will be impossible for the Ministry to accept it. This would probably lead to a dissolution, and if it did, the discussion in the canvass preceding the general election would certainly not be confined to the Irish Land Bill. It would include the value of the House of Lords as part of the legislature, and the bearing of the principles of the bill on the relations of landlord and tenant all over the kingdom—topics which the Conservatives can at present ill afford to discuss. The accounts which are already flying about of the social and economical changes going on in the rural districts are not by any means reassuring for "the landed interest." The ballot, the cheap newspapers, the schools, and the facility of travel are doing much to diminish the old recognition of the squire as part of the order of nature; and the abandonment of farming as an unprofitable business, which in some counties has taken place to a somewhat startling extent, is pushing more and more to the front the question whether English land can maintain more than two classes—the laborer and farmer. The great holders are meeting the crisis with much judgment and good temper by making large reductions in their rents. The lesser ones, whose margin of income over and above their liabilities is apt to be small in view of the style of living imposed on them by the size of their house and the family traditions, find any reduction difficult or impossible without a great change in their habits and a distinct descent in the social scale, from which they naturally recoil.

The more the Conservatives come to consider home questions from their own point of view, the more excusable the enterprising foreign policy which the late Premier made the principal feature in his administration will appear. It did undoubtedly divert attention from questions for which the Tories are not ready, and with better luck abroad he might have made a diversion which would have lasted for ten or fifteen years. But his failure was so complete that this chance of escape is probably for ever cut off. They have tried to make Russia do for them what the French Republicans did between 1793 and 1815, and which postponed for fifty years reforms that were actually impending under Pitt when the Revolution broke out. They have failed, not so much, as the Jingo excitement showed, because of any change in the national character as because English resources are no longer what they were in proportion to those of the rest of the world. Other countries have greater armies, and nearly as great navies, and nearly as much command of money. There are more "great Powers" than there used to be, who have to be reckoned with and cannot be subsidized into subordination or acquiescence. Under these circumstances the party will have to settle now what its attitude is to be on the large bundle of domestic changes which the Liberals are getting ready. Mr. Gladstone described in a magazine-article two years ago the methods in which the old Tories under Peel met the desire for domestic change. The chief of them were a resolute avoidance of conflicts on questions involving, or apparently involving, popular rights, and extreme purity of administration. Under Lord Beaconsfield the Tory temper has, however, been modified a good deal. He labored to exalt the Sovereign, was somewhat open in his contempt for public opinion, snubbed the House of Commons, and greatly enlarged what may be called the spectacular features of the Government. Purity of administration may now be said, thanks to their civil-service system, to be a source of superiority to its opponents from which an English party is cut off. It is almost impossible for one administration to be, as we say, "cleaner" than another or more free from scandals. Each side carries on the Government, when it comes into power, with just the same machinery, and has to rely mainly for its triumphs over the Opposition on its general

policy either in legislation or in the management of its foreign relations.

Of course the Conservatives just now, being out of power and not likely to regain it speedily, are exempt from the necessity of providing a constructive policy of any kind, and in the Commons are really exempt from all responsibility beyond that of judicious criticism, which they are certainly providing on the Land Bill. A recent speech of Mr. Gibson, their late Attorney-General for Ireland, in examination of the measure, was an overhauling which apparently was of considerable use to the Ministry in clearing their own minds as to the working of certain portions of it. Sir Stafford Northcote's task, therefore, is not likely to be one of great difficulty. It is in the House of Lords that the great troubles of the party are likely to arise. Their majority there is large and very unmanageable, and whether anybody can manage it now that Lord Beaconsfield has gone has yet to be ascertained. There appears to be some apprehension that it will take the bit in its teeth and go off into "intransigeance," like the French Legitimists, refusing to treat or be comforted, and resting on the belief that the country is going to the dogs and that the Radicals are capable of any crime. There was an unpleasant forecast of this in the singular letter which even so amiable and on the whole so enlightened a man as Lord Carnarvon addressed to Mr. Bright some months ago from Madeira. He was evidently on the edge of that fatal political despair in which aristocracies have so often perished, and in which they fight against change simply because they owe it to themselves, and not with the expectation of arresting it or with the hope of saving anything. If this temper should spread it might give a most unfortunate precipitation to English political progress.

COMMANDER GORRINGE ON CLEANING THE STREETS OF NEW YORK.

[As it clearly appears from the legislative proceedings, or non-proceedings, at Albany, that a non-partisan administration of the street-cleaning service in this city is not desired and will not be tolerated, Lieutenant-Commander Gorringe has dismissed all idea of letting his name be used in connection with the superintendency. He has, therefore, felt free, at our request, to communicate to the public his views on the nature of the task and the mode in which it may be successfully achieved.—ED. NATION.]

THE essential feature of the organization for cleaning and removing the refuse from the city would be the division of the thoroughfares into sections of suitable lengths, and the assignment of certain men and apparatus to each section, for the perfect cleanliness of which the individuals thus assigned would be held responsible. This organization is identical with that adopted on all vessels of war, where each officer and man has a definite duty assigned him for every possible contingency that experience has suggested, from engaging an enemy to abandoning the vessel in the event of collision or other catastrophe. For this purpose there is made a "station-bill," containing the name of each man and the rôle allotted him in all the different evolutions, and to each one is given a slip of paper on which his duties are clearly set forth. A "station-bill" for street-cleaning would be a much more simple affair, as there would be but one or two evolutions, if the term is applicable; whereas, on a man-of-war there are an indefinite number, depending on the class of vessel, and the qualifications of each man for the varying duties required of him must be carefully studied and averaged, as it were, in order to get his best out of him.

It may be said that such an organization would be impracticable in any civil service, and would require some form of military discipline to make it efficient. The answer to this lies in the fact that on a vessel of war the men are enlisted for a definite period, and, good or bad, they must be retained and made the most of; whereas, in the matter of cleaning the streets, the men employed may be retained or discharged at the pleasure of the head of the department, if only it can be absolutely divorced from what is termed "politics." No possible organization can succeed unless this divorce is made perfect. An employee, confident that his position was secure as long as the work assigned him was properly executed, and that no influence under heaven could secure his retention unless it was properly executed, would be sure to do the work faithfully and well, for it does not require any mental effort.

The public themselves would be the *inspectors*. A complaint from any quarter, of any nature, would call for an examination of the section, and if it were found that the individuals assigned to it had not performed the work, dismissal should follow promptly. But, in order to relieve the public from what might to some be a disagreeable duty, the sections should be grouped into divisions, not exceeding twenty, just large enough to enable the inspector of each to walk all over it in a working-day. And in order to prevent collusion between the inspectors and other employees the division that each was to inspect should be changed each day and assigned to them by lot in the morning at the central office, where they should be required to report the result of the previous day's inspection on regular forms.

The length of each section would have to be determined by circumstances—such as character of buildings, width of street, traffic, and distance from place of deposit. By actual experiment it is safe to assume that the *average* length of each section would be about three thousand yards; some would be much less and some much more. Assuming that there are three hundred and fifty miles of streets to be cleaned daily, this would give two hundred and eight sections, to each of which there would be assigned three men, two horse-carts, and one hand-cart. One of the men would be assigned to sweeping, and be required to collect and remove the material that could be used as a fertilizer to a certain spot, there to be disposed of or further removed by the horse-carts as circumstances might dictate. The sweeper would have the hand-cart. The two other men and horse-carts would also be assigned to removing the ashes and garbage. The carts would have compartments in each so as to keep these substances separate. The barrels in which ashes and garbage are now deposited *mixed* should be abolished and suitable receptacles substituted for them, marked with the words *ashes* or *garbage*, so as to induce the depositors from buildings to comply with the law and keep them separate. Such receptacles are actually in use in several places in the city, mounted on rollers for facility of transfer. By a simple device they might be made easy to empty into the cart by the driver alone.

The watering of streets, now the exception and not the rule of the present organization, is a matter of grave importance, not only to allay the dust but to diminish the radiation from the heated pavements in summer. Assuming that there are three hundred miles of streets to be watered and that the rate would be only one mile an hour, it would require thirty watering-tanks and drivers and sixty horses to perform this work. By constructing these tanks of iron with flues passing through them, and substituting for the sprinkler, used in summer for watering, a *simple furnace for melting the snow in winter*, it might be possible to save the labor and expense of transporting it to the river. Snow is from nine to eleven times the bulk of water. The men who were sweepers when the snow was not on the ground could be reinforced by temporary labor, always available in winter, to collect the snow and shovel it into the water-tank, where it would be melted, and when so melted the water could be run into the nearest trap or man-hole and pass off through the sewers. A very small supply of fuel would be necessary to raise the temperature of the tank above the freezing point, and this could be carried in the hand-cart. If this plan of disposing of the snow should be found effective, an extra number of watering-carts should be kept on hand ready for winter use as melting-tanks. Thus far no more economical and effective method has been suggested of disposing of one of the most embarrassing conditions of winter street-cleaning.

It cannot be disputed that of the refuse collected from a city at least ninety per cent. has a commercial value. Instead of throwing this equivalent of money into the bay and its adjacent waters, to return with the flood-tide and form shoals and breed disease, it should be sold or disposed of for an equivalent in labor or material. The sweepings should be dumped into box-cars on railway barges, which should be towed to the different railway termini and the cars run out on the roads to suitable points for distribution to farmers. It is believed that the value of the sweepings is ample to defray the expenses of removal from the wharves, and there is every reason to believe that contractors could be found ready to undertake the removal from the wharves without cost to the city, and willing to bind themselves to provide the cars and barges. It is probable that in time they might even pay for the privilege of doing this work.

The ashes should be used for filling in shoal ground or levelling hollows. In the beginning it would be well for the city to bulkhead some shoal in the harbor, leaving an entrance for the scow to be floated in at high water, allowed to ground, and unloaded at low water. This would hardly be necessary, for there are many places where the owners of water-front property would pay something for the ashes regularly dumped, and be willing to build the bulkhead, with the understanding that they should have the ashes.

The garbage should be burned. Apparatus for this purpose is easily designed and might be placed on the scows for removing ashes, or at certain points on the outskirts of the city. Although garbage is eagerly eaten by hogs and may be utilized for this purpose, it is a question that can only be determined by actual experiment whether it would be the more economical to have furnaces to burn it or hogs to eat it; and whether or not the hogs fed on garbage, always more or less in a state of fermentation and decay, are fit for human food. Under no circumstances should the garbage be mixed with sweepings for fertilizing. Decay must take place before it can become a fertilizer, and in the progress of the decay of the animal and vegetable matter of which garbage is composed diseases are generated.

All business parts of the city should be swept at night. Sweeping-machines should be used, wherever possible, by grouping the sections and assigning one machine in lieu of a certain number of sweepers, having enough sweepers, however, to remove the dirt. Owing to the ruts and holes so common in our streets, and the prevailing kinds of pavement, sweeping-machines are not available for general use. The decaying matter in the ruts and holes and between the stones and blocks that form the pavements is passed over by the machine, but would be removed by hand-brooms.

It cannot be expected that such a radical change of system would be reduced to its most economical working immediately, and that the length of sections and other duties assigned to individuals would be the best at first. But these matters are easily adjusted after a few weeks of trial. It is probable that three horse-carts would be found ample to remove everything from two sections, instead of two for each section, after the streets have been once thoroughly cleaned.

This organization would require an executive force, including inspectors, of about forty persons, at an aggregate annual salary of about $55,000; a mechanical force of about thirty persons, with an aggregate annual pay of about $25,000; a laboring force averaging not more than six hundred per day, including the extra men employed for snow and taking account of the grouping of sections for sweeping-machines, with an annual pay of $250,000 (it may be well to estimate this item at $300,000), and 750 horses, the cost of whose maintenance would be about $30,000 per year, including stable-room. If this aggregate sum of $410,000 were increased to $600,000, so as to include all possible contingencies for fuel and tools and material, it would seem ample to cover the cost of cleaning and keeping clean and removing the refuse, *after an adequate plant had been provided.* If the result were a clean city with a greater expenditure, there would be no reason for complaint when comparison was made with the past condition and expenditure.

It would be possible to have the city cleaned by contract by enacting a law that should give to any property-holder or lessee the right to have the street swept and the refuse removed at the expense of the contractor if he neglected to do it, the bills for doing the work to be paid out of the amount of his contract by the accounting officers of the city after proper investigation. Unquestionably there are responsible men ready to bid for the work of street-cleaning; and there is hardly a doubt that these men could do the same work for less money than it could be done under any city organization, chiefly owing to the indisputable fact that city, State, and national employees of the lower grades are disposed to do as little work as possible for the pay received, and habitually do less than they would be obliged to do if employed by contractors. Herein lies the secret of the universal seeking for public office in almost every civilized country.

BEACONSFIELD.

LONDON, April 21.

FOR the last month Lord Beaconsfield's illness has been followed with the keenest interest and sympathy by all classes and parties in England, and now the news of his death is received with unfeigned regret even by his political opponents. So lately as a year ago very hard things were said of him at the general election, and would, no doubt, have been said of him again if a similar occasion had arisen. But while his own party had become more and more loyal to him, their own recent success had softened the hatred of the Liberals; and when it was known that an old man, who had been associated with the history of the country for fifty years, and had played a brilliant part in it, lay on the bed of pain and weakness, the sorrow evinced was perfectly sincere. Though there is a good deal of heat, there is little personal bitterness, in English public life. There is an indulgence due (and given as much as it is due) to age as well as to youth; and when the old man has shown some really great qualities, and has borne himself with dignity even in the hour of defeat—when his disappearance leaves a great void in the public world, it is natural that the impression made should be profound and sympathetic.

Lord Beaconsfield's career and character have been full of strange contrasts and puzzles. He is the most singular figure that has ever filled an equally conspicuous position in the history of this country; and having been himself conscious of this, he often seemed, partly for his own amusement, partly with serious objects, to have deliberately adopted a mysterious language and demeanor. Without any advantages of family connection or wealth, with the suspicions to overcome which in England attach to a new man who has no recognized profession, he forced his way into Parliament, and ultimately to the leadership in the House of Commons of the Tory party. He acquired a complete dominion over the mind of the late Lord Derby, then the head of that party in the country, and through him dictated its policy for a long period. He baffled all the conspiracies formed among his followers to dethrone him. He made people rid themselves of the prejudices which his first performances had created till few remembered that the Conservative chief had been first known as a Radical. In 1867 he performed the surprising feat of inducing his party to disavow their previous declarations and pass a Reform Bill stronger than one which they had joined in rejecting the year before. In 1874 he came into power at the head of a compact majority, soon rose into unprecedented favor with the sovereign, who, if rumor is to be trusted, had previously disliked him, and has ever since received from her quite unusual marks of confidence and regard. For six years, till his fall in April, 1880, he was so much the most conspicuous member of his Cabinet that the others were almost entirely ignored; and though he was known to be in failing health, and averse to labor, all their greater enterprises were set down to his initiative. The jealousies and murmurings which had in earlier days made his position in the Tory party insecure were now so absolutely stilled that he had become to it a sort of tutelary deity, who was supposed to possess an all but superhuman foresight. Whatever he said or did was right because he said or did it; he was followed blindly into courses which the independent judgment of the wisest members of the party disapproved, just because it was under his banners that, after so many years of wandering in the deserts of Opposition, they had entered the promised land of office and royal favor. What was still stranger was that errors were forgiven to him which would have damaged or destroyed the credit of other statesmen. The vagaries of his earlier years, when he first coquetted and then quarrelled with O'Connell and Joseph Hume, were forgotten, and the envenomed attacks on Peel, by which he first rose into notice, forgiven except by Peel's surviving disciples. The frequent inaccuracy and occasional audacity of his statements, placing well-known facts in a light different from that in which every one else saw them, excited only merriment. His own changes of opinion, or rather of policy—for at bottom he was very constant to the same ideas—caused no great surprise. People only asked, How will he justify it? with an anticipating admiration of the cleverness that would be shown in proving that if black was not white it was, at any rate, an exceedingly light grey. Even his outbreaks of cynicism, his apparent indifference to the ordinary sentiments of humanity and justice, shocked the public much less than might have been expected. In them, too, there seemed to be something unreal and dramatic; they were not taken as expressing personal hardheartedness or want of principle. In short, he had become, at least to a large part of the nation, a privileged person, who was taken in a different sense from other people, and for whom special allowances were made.

How is this curious ascendency to be accounted for, so unlike what one would have supposed the English likely to accord to a foreigner—for the Jews are really foreigners in England—deficient in those very qualities which are held to be the solid foundation of British character? Out of many causes that might be suggested I will take three.

The first lies in the nature of the party which he led. Partly by chance, partly by his own discrimination, he became a member of the Tory party. It differs from the Liberal party in two very important particulars. It is very much more of a party; that is to say, it has, usually and regularly, a coherence, a loyalty to its chiefs, a vehement corporate spirit, which hardly ever exist (though just at this moment they do exist) in the Liberal party. Being the party of resistance, the party of property-holders, animated by interest as well as by doctrines or sentiments, the Tories have always clung together with a far closer tenacity than the Liberals, who might better be described as three parties generally acting together, but separated by differences both of view and of interest. Hence, as soon as any man obtains a conspicuous place in the Tory party, he acquires a right to the support of its members, and when he becomes its leader he is followed with a devotion, an unquestioning submissiveness and confidence, which Liberal chiefs secure only in seasons of unwonted enthusiasm. The whole feeling of the party takes shape in applause of his words and attachment to his person. Once Mr. Disraeli had established his supremacy, all this party zeal was enlisted on behalf not only of his policy but of himself. Then, further, the Tory party is unlike the Liberal in having had, during the last fifty years, a much smaller number of able men in its ranks. When J. S. Mill called it the stupid party, it characteristically did not repudiate the name, but pointed with some force to its strength and earnestness as proving how many more things than intellect went to the making of greatness. Hence it has always been easier for a man of brilliant gifts to rise to eminence in the Tory party. He has fewer competitors; and the rarity of the possession makes it more prized. This was never so markedly the case as during the critical period of Mr. Disraeli's career. Towards the end of Sir Robert Peel's government, the Tory party had been exceptionally strong in ability, but all his leading colleagues followed him in adopting free-trade principles, and thereby severed their connection with the rest of their party, leaving it with hardly a man in the House of Commons either of oratorical capacity or official experience. This was Disraeli's opportunity. First as the prompter of Lord George Bentinck, then in his own right, he stepped into the vacant space, and had become firmly established before any competitors appeared.

In the second place, he unquestionably possessed certain rare and striking aptitudes for success. He had a keen eye for character, or, in other words, for human weaknesses, and therefore great power in knowing how to deal

with individuals, or with an assembly whose temper he had enjoyed opportunities of observing. No such finished parliamentary strategist has been seen in our time. Without being an orator in the higher sense of the term, he had a singular knack of saying the right thing, and seldom sat down without having given his hearers some happy phrase—perhaps a sarcasm, perhaps an epigrammatic embodiment of a political doctrine—to carry away with them. He combined constant wariness with a power of occasional dash and *verve* which inspirited his followers and frightened his antagonists. Though he had some dislikes, he had no prejudices; consequently his mind was kept cool and clear, able to judge things by the dry light of calculating interest. To his party and his followers he was eminently loyal, always ready to reward service and promote merit, never abandoning a friend nor retreating before a foe, identifying himself with the traditions and adopting the watchwords of Toryism with a heartiness that always pleased, and pleased scarcely the less when it could hardly be supposed sincere. There was something so peculiar about him, such an interesting stamp of individuality on his character as well as his intellect, that as men unconsciously came to judge him (as already remarked) by a different standard from that which would have been applied to an ordinary Englishman, they hardly blamed him for deflections from truth which in others would have seemed grave. He had, so to speak, given notice that he was not like other men, that his words must not be taken in a natural sense, that he was to be regarded rather as the skilful player of a great game, the consummate actor in a great part, than as one who was fighting for a cause he believed in. He sometimes went near to intimating that politics were a game in which, as in love or war, deception fairly came within the rules. Finally, he had a fortitude, tenacity, patience, constancy under defeat, unwavering self-confidence, which, while they impressed every one's imagination, made him a tower of strength to his followers. These are among the rarest gifts, rarer than mere intellectual power, and they deserve the influence which they bestow. Nothing so fascinates mankind as to see a man equal to every fortune, unshaken by reverses, indifferent to personal abuse, maintaining a long combat against apparently hopeless odds with the sharpest weapons and a smiling face. They fancy that he must have great hidden resources of wisdom as well as of courage. When some of his predictions come true, they believe that he has all along been right and the rest of the world wrong. When, after twenty-four years of battle, victory at last settles on his crest, even his enemies can hardly help applauding a reward that seems so amply deserved. It was by this quality more than by anything else, by this serene exterior with an unfathomable reserve below, that he laid his spell upon so large a part of the English people.

Thirdly, he had the great good fortune of living long, an advantage less weighed than it deserves to be. Many a statesman has died at fifty leaving only a second-rate rate reputation who might have become world-historical with twenty years more of life. If Lord Beaconsfield's career had closed in 1855, he would be remembered only as a party gladiator who had produced a crude budget and some brilliant political squibs. Of course a man must be strong to stand the test of long life. Some are found out, like Louis Napoleon; some are disheartened by misfortune and either lose their stamina or run into extravagances, like Lord Brougham; some show no power of growth and development, like Lord Russell or (to take a different and inferior example) Prince Metternich. Lord Beaconsfield is fairly entitled to the credit of having stood it well as a politician, though as a writer he fell off sadly from the level of his earlier years. 'Lothair' and 'Endymion' may be read, but in life and force and fertility they cannot compare with 'Vivian Grey,' or 'Contarini Fleming,' or 'Coningsby,' still less with those admirable classical burlesques, 'Ixion' and 'The Infernal Marriage,' in which Lord Beaconsfield's wit and gaiety show at their very best. As pamphlets and pieces of political satire, his earlier novels will continue to be consulted by historical students, but their purely literary merits as pictures of human life and character are far too slight to give them a permanent place among English classics.

We have been interested in observing how completely wide of the mark most organs of opinion on the Continent have been in their remarks on Lord Beaconsfield's death. Frenchmen and Germans never seem able to understand English personages or English politics, although many of their papers have correspondents resident among us. They mostly praise Lord Beaconsfield for his eloquence, which is just the gift that he did not possess. He could fire single shots that told admirably, but his speeches as a whole were heavy and labored, and he wanted the born orator's most characteristic power, that of touching the emotions. And these Continental critics regard his loss as a terrible, perhaps a fatal, blow to the Conservative party. This is so far from being the truth that it may be plausibly argued that the party will actually gain by the removal of one who excited the gravest distrust in the minds of very large and influential sections of the nation, such as the Nonconformists and the artisans, and that his departure will furnish a good opportunity for a new departure, or rather for a return to the older tendencies and policy of the Conservative party, as they existed in the days of Peel, and as they might exist now under men of such moderation and caution as Sir Stafford Northcote or the Duke of Richmond. Of course the withdrawal of so considerable a personage, who had exercised so unquestioned a sway, must cause some disorder in the Conservative ranks. There will be a difficulty in choosing his successor from among several aspirants of different though nearly equal claims. But for purposes of active political warfare Lord Beaconsfield had grown too physically weak to be of any real service to his cause; no one supposed that he could have again taken office; and it is chiefly in the way of counselling them when and how to yield to popular pressure that he could have been, and doubtless would have been, of real value to his friends and to the House of Lords. In this way it is possible that his absence may make a practical difference. He might have been able to judge better than those who survive him will whether the Irish Land Bill ought to be resisted to the death. Y.

Correspondence.

TIME-BALLS AND STANDARD TIME.

To the Editor of The Nation:

Sir: In your comment in this week's *Nation* on the circulars sent out by the American Meteorological Society you quite wisely, in my opinion, point out the desirability of choosing, for our Eastern seaboard at least, the time standard of Cambridge, New York, or Washington. Of these meridians that of New York possesses the great advantage of being now the one from which time is reckoned for, roughly, eight millions of people. Cambridge (or, more correctly speaking, Boston, because the Cambridge time-signals are sent out on the local time of the Boston State-house) has little to recommend it as a meridian for this purpose, being too far east to allow of its time being convenient to use as far west as Buffalo, and the choice will naturally lie between New York and Washington, with the commercial advantages in favor of the former. Later in the growth of our public time-systems it may be a wise thing to alter the time used in the New York system by the three or four minutes necessary to make it exactly five hours west of Greenwich, but that is a question whose discussion now would only injure the prospects of a public time-system at any early date, and which may safely be left to the future. The Legislature of this State passed, at its last session, "an act establishing a standard of time," of which the first section provides that "the standard of time for the meridian of the City Hall, in the city of New York, shall be and is hereby made the standard of time for this State." If the example thus set should be followed by the legislatures of Massachusetts and the other New England States they will have made a considerable progress toward settling the question for the Atlantic seaboard.

The succeeding paragraph in the *Nation* refers to a possible conflict between the Signal Service and the Naval Observatory in the matter of dropping time-balls. Such an idea must originate in a misconception as to the part the Signal Service offers to perform. It is only in those places where the local Observatory desires to drop such a ball, and where the Signal Service discipline would be of the greatest utility to the public interested, that the offer is made to co-operate. It is hardly possible to suppose that any other time-ball than the one in New York would be gratuitously dropped by the Western Union Company, and the action of the Signal Service is very commendable in offering to aid in the establishment of time-balls more generally throughout the country than they are at present.—Yours truly,

Leonard Waldo.

Yale College Observatory, May 6, 1881.

[In the paragraph last alluded to we overlooked the fact that the proposal of the Signal Office was restricted to transmitting time-signals to be furnished by observatories. With this restriction, we see nothing in the way of friendly co-operation.—Ed. Nation.]

A LITERARY OUTRAGE.

To the Editor of The Nation:

Sir: In the last number of a paper called *Quiz*, published in Philadelphia, I find in the Contents, "Beaconsfield—N. F. Davin." On turning to the article, which is signed with my initials, I find it to be made up of a few paragraphs taken at random from a brief sketch of Lord Beaconsfield published by me in Toronto on the occasion of Mr. Disraeli assuming a title. The article is full of ignorant blunders, and in one paragraph an opinion is expressed for which no warranty would be found in the pamphlet.

No one connected with *Quiz* had any authority to use my name.

The publishers of the slight brochure have a house in Chicago, and a considerable portion of the edition was sold in the United States. May I ask you to publish this repudiation?—Yours, etc., N. F. Davin.

Ottawa, May 3, 1881.

THE POLITICAL FUTURE OF THE RAILROADS.

To the Editor of The Nation:

Sir: When Franklin made his famous contribution to science through the medium of his kite the French Academy at Paris wrote to him for particulars, and especially his deductions as to future possibilities and results in the harnessing of the subtle fluid. His reply was that he entertained no doubt of the ultimate utilization of electricity largely in the interest of human affairs, but in what way or in what time was a point in which he was discouragingly at sea.

The above thought occurred to me when I read your editorial of April 21, 1881, page 273, No. 825 of the *Nation*, under the caption of "Thurber *versus* Fink," in which the nerve-centre in the solution of the railroad problem is more completely reached than in any other outgiving that has fallen under my observation.

"As we look at it," says said editorial, "Mr. Fink is quite right, from a public point of view, in seeking to check discrimination, and regulate competition, through a systematic, organized combination of railroads. We doubt very much, however, whether he sees equally clearly the ultimate results to which his efforts tend. The thing will not stop here. The forces at work are too deep-seated to be finally disposed of in this way. *They will work to the distinct end of some sort of direct political responsibility. Exactly what this will be we do not pretend to divine.* The course the telegraph is now taking foreshadows that of the railroad. From its inherent conditions the latter consolidates more slowly, but it does so equally surely. It is a law of development. Statutes may check, but they cannot prevent it. Those interested in the outcome of the railroad problem can, therefore, now most profitably watch that of the telegraph problem."

Nothing could more clearly forecast the ultimatum of the railroad problem; and railroad men and statesmen cannot employ their time more usefully than by carefully studying the lesson here laid down. And it is the interest of the whole country that this view of the subject should not be lost sight of.

J. D. J.

May 1, 1881.

Notes.

NOTHING need be said of the three-volume reprint, by Dodd, Mead & Co., of the second English edition of Rawlinson's 'Five Great Monarchies,' except that its outward aspect is very presentable, and the typography defective only in the printing of the woodcuts. But more care here would probably have meant a higher cost to the purchaser. This is much less the case with the same publishers' cheap edition of Lübke's 'History of Art,' which answers every purpose of the student as well as the dearer.——A recent event has prompted Henry Holt & Co. to bring out a second edition of Edward Barrett's 'Carlyle Anthology,' published in 1876 with Carlyle's sanction. The grouping under the head of "Portraits and Characters" is the most striking and perhaps the most useful portion of the book. It embraces judgments (not posthumous) of a certain number of the writer's contemporaries.——The same publishers have issued a new edition of 'Otto's Conversation-Grammar,' thoroughly revised and in some important particulars rewritten by Professor William Cook, of Harvard.——Professor Wm. H. Rosenstengel's 'German Reader for High Schools' (St. Louis: G. I. Jones & Co.) is marked by selections in excellent taste.——Ginn & Heath will publish, May 20, 'Metrical Geometry,' by George Bruce Halsted, Ph.D., Princeton.——A. D. F. Randolph & Co. will publish immediately 'The Recognition of the Supernatural in Letters and in Life,' Dr. R. S. Storrs's Phi Beta Kappa oration at Cambridge last year.——C. W. Sever, Cambridge, has brought out a metrical version of the "Œdipus Tyrannus" by the Rev. W. W. Newell.——To the "Art at Home" series of Macmillan & Co. Mr. Andrew Lang will contribute a volume on 'The Library,' with a chapter on English illustrated books by Mr. Austin Dobson.——Bulletin No. 57 of the Boston Public Library furnishes ample bibliographies of Russia and Nihilism, Thomas Carlyle, William Blake, and the Theatre of the Greeks. New catalogues announced to be ready this month embrace the books in foreign languages in the Lower Hall, and additions to the previously catalogued (1871) books in the arts and sciences.——Parts 3–4 of vol. xvii. of the Essex Institute Historical Collections contain a report of the celebration, last June, of the arrival of John Winthrop at Salem, on occasion of the 250th anniversary; and a genealogical account of Henry Silsbee and some of his descendants.——No. 17 of the *Pennsylvania Magazine of History and Biography* begins an interesting series of papers, by Mr. Townsend Ward, on "The Germantown Road and its Associations." No less than four views of old buildings, etched by Mr. Joseph Pennell, accompany it, and twelve more are promised. A limited set of India proofs is procurable.——The May number of the *Magazine of American History* is devoted to Lafayette. General H. B. Carrington extols the Frenchman's generalship in the Virginia campaign.——A game resembling croquet in its implements but not in its play—"pall mall," namely—is described by Henry B. Wheatley, with illustrations, in the May number of the *Antiquary* (J. W. Bouton).——A new work, 'Colonel Gordon in Central Africa,' 1874–9, edited by Dr. George Birkbeck Hill, just appearing in England, relates largely to the attempts made by that energetic commander to suppress the slave-trade.——The current annual issue of the Society for Photographing Relics of Old London includes twelve views, mostly of inn yards, but also sundry old houses and St. Mary Overy's Dock (Southwark); Sion College, London Wall; and Oxford Market. Letter-press, which has hitherto been wanting for this interesting and artistically beautiful series, is now supplied from the beginning to subscribers. The secretary is Mr. Alfred Marks, Long Ditton, Surrey.——Mr. Bouton is the American agent for the French monthly, *L'Art de la Mode*, now entering upon its second year. The literary equipment is not ponderous—books, the theatre, short tales, a summary of prevailing styles without patterns, etc. The colored plates reflect current fashions and recall ancient, and are occasionally meritorious copies.——L. W. Schmidt has received the first number of 'Rom in Wort und Bild,' a sort of glorified guide-book or tourist's vade-mecum for Ancient Rome, Early Christian Rome, Papal Rome, and Modern Rome—the text in large English letter, and the engravings (of temples, scenery, statuary, etc.) of that solid German character hardly equalled in the wood-cutting of our day. The editor is Dr. Rudolf Kleinpaul, long a resident of Rome, who expects to bring his work within the compass of thirty-six parts, adorned with 368 illustrations, large and small. When completed it cannot fail to be a very desirable possession. Mr. Schmidt also sends us a still more remarkable first number, viz., of Georg Hirth's 'Kulturgeschichtliches Bilderbuch aus drei Jahrhunderten'—in plain English, a picture-book showing the progress of civilization for three centuries. In this scheme, a text would be an impertinence. What we have is fac-simile reproductions from the splendid engravings of Dürer, Lucas Cranach, Hans Schäufelein, Burgkmair, Hans Sebald Beham, Eberhard Altdorfer, D. Hopfer, J. Hopfer, Lucas van Leyden, M. Ostendorfer, and many anonymous artists, which, whatever their subject, throw light on the manners, costumes, morals, physiognomy of their times. Here are already the well-known portraits of Luther by Cranach and Hopfer, Elector Frederic, Dürer's Kaiser Maximilian (double-page), and other notable heads. Praise of this series will seem superfluous to any one who turns the first leaf. It is intended for the young, but they must compete for it with their elders.——Simultaneously with the appearance in England of a sumptuous work on Palestine, a German free version of the text, with additions, will be published under the editorship of Georg Ebers and Hermann Guthe by Eduard Hallberger, Stuttgart (New York: Westermann.) 'Palästina in Bild und Wort' will, however, contain all the illustrations on steel and wood of the English enterprise.——The twenty-fifth volume of Kuhn's *Zeitschrift* has just been completed by the publication of the fifth and sixth parts. This volume and the preceding are of especial interest to students of Iranian antiquities, since they contain, besides Hübschmann's revolutionary articles, four instalments of Geldner's valuable translations from the Avesta. These four now cover Yashts 5, 6, 8, 10, and 13, and chapters 2, 3, 5, 8, 13–17, and 22 of the Vendidad—that is the parts on which we most need enlightenment.

—Vol. xii. of the 'Encyclopædia Britannica' (Little, Brown & Co.) contains, we believe, fewer articles and more books than any of its predecessors. "Hydromechanics," by Professors Greenhill and Unwin, would, if separately printed, form a very respectable octavo volume; and not much smaller are "India," by no less an authority than W. W. Hunter; "Horticulture," by Dr. Masters and T. Moore; and "Ichthyology," by Dr. Günther. All these works, excepting "India," are richly illustrated, and so is Professor Lankester's "Hydrozoa"; but less so are "Horse," by three authors, and P. Cameron's comparatively very brief "Hymenoptera." Surprisingly brief are the articles "Hydrogen," by Professor Armstrong; "Homœopathy," by Dr. Glover; and "Huguenots," by Rev. G. W. Kitchin; and both brief and inadequate are the notices of Alexander and Wilhelm von Humboldt, the latter by Professor Sayce. Professor Robertson contributes a notice of Hobbes, Dobson of Hogarth, Crowe of Holbein, Gosse of Holberg, Professor Adamson of Hume, Garnett of Leigh Hunt, Professor Fowler of Hutcheson, and Professor Geikie of Hutton; but the number of interesting lives in this volume is comparatively limited. Of the small number of Biblical articles Cheyne's "Hittites" and Professor Robertson Smith's "Hosea" are the most important; both are marked by critical tact and ample erudition, the former embodying the latest results of archæological research in an almost entirely new field. Lord Selborne's "Hymns" is a very extensive treatise. Of articles of both geographical and historical interest, Hunter's "India" is the weightiest, though rather defective in some of its descriptive portions; "Hungary," by E. D. Butler, is remarkable for fulness and accuracy; and "Holland," the history of which is credited to the same hand which, as we pointed out at its time, so egregiously blundered in the additions to the "France" of former editions, may be said to have been left historically as it might have been given some thirty years ago, with the exception of the biblio-

graphical summary, which is fresh enough—as are also the statistical and literary portions of the article, by more diligent hands. The articles on Illinois, Indiana, Indian Territory, and four other American topics, are copyrighted in the United States. "Indus" concludes the volume.

—The annual report of the operations of the Life-Saving Service for the fiscal year ending June 30, 1880, is a voluminous résumé of this branch of the Government service. In the detailed statement of the doings of the life-saving crews we find many instances of exceptional courage and daring. That portion devoted to the service on the Lakes is the more prolific in acts of this character, owing to a difference of conditions. The introduction of the new gun for throwing a line across a stranded ship, and the subsequent rescue of its crew by means of the breeches-buoy, has on the coast somewhat superseded the use of the surf-boat except in moderate weather. On the Lakes dependence is more commonly placed on the lifeboat, the cases being exceptional when the shot-line can be used. More judgment might have been used in editing the rescue-record. For example, the following silly and puerile incident is printed on page 141 of the report:

"*May* 9.—A man out rowing for pleasure attempted to step from his boat to another, opposite Station No. 15, Eleventh District, Lake Michigan, and capsized. The crew of the station were quickly on hand, but the man had clambered into the other boat. The crew righted the capsized boat, took it ashore, and bailed it out."

Considering the independent spirit of the men composing the crews, and the entire absence of restraint in respect to the term of enlistment, the officers of the Life-Saving Service have managed the material at their command with great judgment and discretion. Reforms in discipline and in habits of precision and order have been effective and lasting, if cautiously and slowly undertaken. Much remains for them to do, and doubtless the future will witness a great improvement in this direction. A first step should be the adoption of a suitable uniform to be worn by the men at all times during the months when on duty. From this and, on official visits, the appearance of the inspecting officers in the uniform of their rank, a higher *esprit de corps* may result. Our space forbids detailed criticism of the work of the service. By careful experiment a thoroughly satisfactory gun has been perfected, by means of which the life-line is made effective at much greater distances than when fired from the mortar formerly in use.

—Census Bulletin No. 118, by Mr. Jos. D. Weeks, contains the statistics of the glass manufactures in this country for the year ending May 31, 1880. The following table gives the general facts for the whole country:

Classes.	*Number of establishments.*	*Capital.*	*Number of furnaces.*	*Total number of pots.*	*Number of employees.*	*Total value of materials.*	*Total wages paid.*	*Total value of product.*
Plate-glass	6	$2,587,000	10	116	956	$438,457	$292,253	$868,305
Window-glass	56	4,873,155	86	747	3,890	1,849,530	2,139,536	5,047,313
Glassware	82	7,169,278	154	1,459	12,387	3,289,064	4,446,217	9,534,020
Green glass	50	4,766,166	80	493	6,589	2,414,252	2,234,295	5,563,826
Total	194	$19,415,599	330	2,815	23,822	$7,991,303	$9,112,301	$21,013,464

In the above table are included 34 establishments, with 44 furnaces and 369 pots, which made no glass during the year; while, in addition to the above, 25 establishments, containing 27 furnaces and 238 pots, were in process of construction during the year. Comparisons with the condition of the industry in 1870 cannot be made in detail, on account of the imperfection of the classification in that year. The following table, however, shows the comparison by totals:

	1880.	1870.	*Per cent. of increase.*
Number of establishments	194	154	26
Employees	23,822	15,367	55
Capital	$19,415,599	$13,826,142	42
Wages paid	9,112,301	7,589,110	20
Materials used	7,991,303	5,904,365	35
Value of product	21,013,464	18,470,507	14

In this branch of manufacture Pennsylvania heads the list, with no less than 72 establishments, having a total capital of $7,564,700. Following this State is New Jersey, which has 26 establishments and an invested capital of $2,718,000; and New York, with 33 manufactories, in which $1,960,600 is invested. Massachusetts has 10 establishments, representing an investment of $823,000; while Connecticut has but one, and the other New England States none. In the States of the Upper Mississippi Valley there are 35 establishments; while south of Missouri, Kentucky, and West Virginia there is none whatever. There is but one establishment on the Pacific Coast—in California, namely.

—About a year ago the Boston Society of Natural History celebrated its semi-centennial by a jubilee-meeting, and decided to commemorate the event by publishing a memorial volume consisting of memoirs from those among its present associates, eminent in various departments, whose circumstances enabled them to contribute. The result is the magnificent quarto now offered to the public, containing nearly fifty plates and some six hundred pages of separately paged memoirs. These are divided into "Society Annals" and "Scientific Papers"; the former comprising a list of officers and prefatory note, together with an historical sketch of the Society, a notice of the Linnean Society of New England which preceded it, and biographical notices of the more eminent past members, officers, and patrons of the society, by the retiring president, Thos. T. Bouvé. This portion of the work, to members and friends of the society, to sociologists and to the general public, is the most interesting and by no means the least valuable paper of the volume. It is enriched by six heliotype portraits of past presidents, of whom George B. Emerson, Amos Binney, and Jeffries Wyman bore a cosmopolitan reputation; and of Dr. W. J. Walker, whose munificent gifts and bequest supported the Society in times of trouble, and placed it finally on a secure and permanent foundation. There are also excellent steel engravings of Drs. A. A. Gould and D. H. Storer, with ground-plans and a view of the fine building erected in 1863 and now occupied by the Society. The first organized effort to instruct and interest the Boston public in natural history was the result of a meeting held at the house of Dr. Jacob Bigelow, December 8, 1814. Among the names of those present we notice those of Shaw, Pickering, Channing, Cushing, Hayward, Ware, Dana, and others, neither unhonored nor unfamiliar at the present day. This resulted in the formation of the Linnean Society of New England, whose rolls included many names distinguished not only in science or medicine but also in politics, literature, and theology. This society, though afterward incorporated and existing in an active form for nearly nine years, at last succumbed. Its ill-success was directly due to the inability of its members, engaged in their several professions, to support a large and increasing museum by their private subscriptions and volunteer work. This lesson is clearly taught in the history of the second and present Society of Natural History, formed on the 28th of April, 1830. Were it not for the munificence of Dr. Walker and others, a similar fate would doubtless have overtaken the latter also. Fortunately for Boston the Society was preserved to celebrate its jubilee, suitably, if not extravagantly, housed, with a half-century full of honors behind it, a present activity of educational usefulness, and every prospect of an honorable future. The tact and kindliness with which the development of the Society is described, the frank acknowledgment of errors which the march of time has revealed in its past policy, the biographical sketches which preserve for the younger members precious memories, personal as well as historical, of the veterans now gone from us, are highly creditable to the author, whose services to the Society, as attested by his colleagues, have been of the most valuable kind. At the time of his writing four original members survived; now, we believe, but two remain.

—Of the scientific papers we can speak but briefly. Professor Shaler discourses of the classification of lavas with reference to the circumstances of their extrusion; Hyatt describes the genesis of the tertiary species of *Planorbis* at Steinheim, and shows the bearing of the variations perceived in the specimens found in the successive beds of marl on the general theory of evolution. Scudder treats of the Devonian Insects of New Brunswick collected by the lamented Hartt, to which Dr. Dawson adds a note on their geological relations. Dr. Farlow tells of the "Cedar Apples" (*Gymnosporangia*), curious uredine fungi found on trees and bushes; and Lyman describes a new structural feature in deep-sea ophiurans or "brittle-stars," consisting in certain remarkable parasol-shaped spines heretofore unknown. From Professor W. K. Brooks we have a brief but solid paper on the embryology of the squid, which, he thinks, clearly shows its fundamental similarity of type with other molluscs, while it affords us no information as to the mode of its present differentiation; from Packard, a comprehensive paper on the anatomy, histology, and embryology of the king crab; while another excellent anatomical paper relating to the "Milkweed Butterfly" (*Danais archippus*), by Mr. E. Burgess, is followed by S. F. Clarke on the development of a double-headed vertebrate, C. S. Minot on the anatomy of the tongue in reptiles and birds, Morse on the identity of the ascending process of the astragalus, in birds, with the intermedium, Lucien Carr on the crania of New England Indians, and, lastly, by William James on "The Feeling of Effort." Criticism of these memoirs belongs elsewhere, but it is evident that in their publication the "golden wedding" of the Society has received a worthy commemoration.

—Mr. Gaston L. Feuardent has appealed from the judgment of the committee which examined his charges against Gen. Di Cesnola, to the public, in a series of "cards" containing photographic evidence in support of the writer's allegations. The second relates to Charge No. 39, involving the Egyptian statuette of a man, as to which the Director of the Metropolitan Museum of Art declared that "no line or portion of the statuette has been retouched, or engraved in the slightest degree; no alteration has been made; . . . no portion of the knees has been cut off," etc. Mr. Feuardent puts side by side a photograph of the image made

in London in 1872, and one made in 1880 at the Museum in Central Park by Mr. Cox; and refers to the corresponding cut in Cesnola's 'Cyprus,' p. 154, from all which it appears that there is a serious discrepancy between the facts and the Director's denials. We cannot here go into details further than to say that the alterations are apparently such as, but for the original photographic memoranda, would destroy the archæologic and artistic value of the sculpture, and that they are obviously more numerous than Mr. Feuardent (who confines himself to substantiating his former statement) points out. He alleges that the statuette is withdrawn from exhibition, so that the public is unable to decide on the authenticity of the 1880 photograph. We have said this card is one of a series, and the Director and Trustees of the Museum and the examining committee ought not to suffer another to appear before vindicating the trustworthiness of the collection by an adequate explanation of the existence of these photographs.

—For the purposes of instruction, the recent acquisition of the Metropolitan Museum of Art in the collection of drawings by old masters presented by Mr. Cornelius Vanderbilt has an obvious value that cannot be exaggerated. Neither does the Museum contain anything that can be considered equal to them from the point of view of real interest. The galleries are nevertheless attractive, and some pains have been spent upon their summer arrangement, with which the public was made acquainted last week. Chief among the temporary accessions of the East end are a "San Diego de Alcalá" and an "Esther before Ahasuerus," attributed to Murillo and Rubens respectively. The former was "picked up" at a sale in this city by its present owner, Mr. Charles B. Curtis, a connoisseur whose leisure for some years has been devoted to a *catalogue raisonné* of the works of Murillo and Velasquez, and whose conviction of its genuineness is based upon extrinsic evidence as well as intrinsic. It may be said that its genuineness is the most interesting quality of the picture. The reverse is perhaps true of the supposed Rubens, lent by Mr. Hill, of Montreal—a difference, indeed, that would be apt to distinguish two works by these masters. The rooms of the West end are hung with modern pictures, as heretofore, and the loan collection contains some fine works. The arrangement, also, which seeks to display the equality of American and foreign pictures by main strength, has been preserved. A particularly fine "Fête Champêtre" by Watteau, for example, is challenged by a landscape of a similar motive and manner from the studio of Mr. David Johnson—a juxtaposition that is almost actionable. A child's portrait by Mr. Beckwith, of which the abundant background is an unrelieved ultramarine, dulls the retina and renders it insensitive to all delicate impressions in the immediate neighborhood; and we observe that Mr. Eaton, who sends this season a solemn "Forest—Evening," which is one of the important American pictures of the past few years, suffers the fate of his last season's contribution in the relentless proximity of one of Mr. Loop's classical works. The hanging, in general, visitors should be warned to make allowances for, in order to avoid misconceptions which the merit of some of the pictures would make unfortunate. There is no way of properly seeing Mr. Whistler's "White Lady" without a step-ladder, owing to its peculiar perspective; this is of course a great pity, the work being an exceedingly impressive one. Millet's "Bather" and Henner's "At the Fountain" do their best to kill each other, and seem to owe their contiguity to a wager between the partisans of the respective painters. The latter is a striking piece of flesh-painting by the most skilful painter of flesh living, possibly, but the grave and poetic Millet next it unduly emphasizes a theatricality which otherwise would be obscured by so much that is admirable. Jules Breton's "Le Soir," a simple scheme, but perhaps a little empty, fronts Bastien-Lepage's "Joan of Arc"; and there are, of course, many Corots, one of which is a superb one, many landscapes and figure-pieces by Diaz varying widely in merit, and, in fact, good, bad, and indifferent canvases by most of the modern painters of celebrity. A vigorous landscape by Munkácsy and another by Courbet are worth mentioning particularly, on account of the comparative rarity of works by these painters in American collections.

—The display of competitive designs for the various prizes for embroideries offered by the Ladies' Society of Decorative Art, now to be seen at the American Art-Gallery, is not particularly inspiriting. It leaves very much the same impression of feebleness of invention and conventional notions of art betrayed by the Prang Christmas-Card Exhibition at the same place a few months ago. Most of the designs seem composed with little conception of the possibilities in embroidery which lie beyond machine-work. A *portière*, apparently by a well-known and evidently by a practised hand, on the East wall, is the most striking exception. Some formality of line may be found unpleasant, but this is more than counterbalanced by the beauty of color-design, which is as near opaline as anything, and the delicacy of the workmanship. Opposite it hangs an imitation of tapestry, half painted and half embroidered, and so neither one thing nor the other, without succeeding in rendering the third thing which it is compensatingly attractive. The rest of the *portières* exact no attention. The same may be said of the outline work with hardly an exception. Of the designs for screens one of the four seasons, signed "M," is in many respects admirable and the work of an instinctive as well as an accomplished artist. Among the single panels a nymph in the manner of Mr. La Farge, very agreeable in both action and color, and with a face of individual beauty, alone deserves mention. Several of Mrs. Holmes's landscapes, by no means equal to those recently exhibited, are nevertheless accentuated agreeably by two or three works of the same general kind, but of which ingenuity is the only distinction. The Society itself ekes out the display with a number of rich embroideries, chief among them being a curtain, which is a harmony of delicate yellow and other hues in the same scale, by Mr. Colman. The long (and rather dark) gallery on the Broadway side is hung with a loan collection of embroideries dating from the fifteenth century, which is altogether the most interesting portion of the display.

—Dr. Damrosch must feel amply rewarded for many months' hard work and anxiety by the brilliant result of the festival which came to a close on Saturday night. About the popular and financial success of the undertaking there can be no doubt. From the first to the last performance the vast hall was crowded to overflowing. On Friday evening and at the Saturday matinée it is estimated that about twelve thousand people were assembled under the arched roof of the armory. The artistic success, it must be admitted, was somewhat inferior. The legitimate object of these large gatherings is to produce works that gain in effectiveness by being executed by a larger vocal and instrumental body than can be brought together on ordinary musical occasions. And it is in just this respect that anticipations were not met, since the effects produced were by no means so novel and striking as to make one overlook almost unavoidable shortcomings. Both Dr. Damrosch and Mr. Thomas have given in Steinway Hall and in the Academy of Music performances in every respect superior to those of the festival week. It is not difficult to assign two principal causes for this: in the first place, the very defective acoustic properties of the hall, and, secondly, the strange manner in which Dr. Damrosch arranged his orchestra. Instead of concentrating it in a compact semicircle it was stretched in two narrow ascending files to the right and left of the conductor. Thus the brass instruments, which were placed at the extreme ends, were about two hundred feet distant from each other, and the consequence was that in many instances well-known powerful passages were lost in a confused, indistinct noise. The faulty acoustics became most evident at the first afternoon performance, when Beethoven's Symphony in C Minor was given. In the famous trio of the scherzo, where the double-basses and violoncelli begin with that powerful fugato movement of which Berlioz says that "it makes the orchestra tremble as under the tread of an elephant," the effect was entirely spoilt, and the beautiful theme did not become audible until the first violins took it up. Many such failures occurred during the seven performances, and, naturally, in those cases where the largest number of instruments were employed.

—As regards the programmes, those for the evening performances were of great interest and merit. The two novelties of the festival excited considerable curiosity. Rubinstein's sacred opera, the "Tower of Babel," which was produced on the opening night, is not his best work, but it is full of dramatic power and sure to please a general audience at a first hearing. A short orchestral introduction representing the break of day leads to a recitative, with accompaniment, by the master workman, who calls the sleeping people to their day's task. This was beautifully sung by Mr. Remmertz, whose rich voice sounded full over the powerful accompaniment of the bass-tubas and trombones. Among the choruses three especially deserve mention. After the destruction of the tower the nations divide, and the descendants of Shem, Ham, and Japhet go forth to seek their new homes. The music of the three choruses as they leave their old home is exceedingly characteristic. The Shemites sing in solemn measures, strongly resembling those which are heard in Jewish synagogues to this day, the praise of Jordan and the rustling of the branches of the cedars of Lebanon. The Hamites, with a wild melody in unison, accompanied by tubas and drums, wander forth into the burning desert. The sons of Japhet go to settle by the sea or seek the rocky heights to hunt the eagle and the deer. This chorus, in C sharp, is a perfect gem. It was admirably sung, and no number displayed to greater advantage the careful training of the chorus. The concluding chorus for twelve parts, with a strong orchestral accompaniment, is also very impressive. Berlioz's "Requiem," of which so much has been written and said during the last few months, was a disappointment. It contains several numbers which for overpowering vocal and instrumental effects have never been approached. True, Berlioz uses means which no other composer before or since has ever attempted. He multiplies six and eightfold the orchestra which Beethoven uses in his Ninth Symphony. Sixteen trombones, sixteen trumpets, sixteen large drums, all in different keys, four ophicleides, and so forth, with every instrument in proportion, are employed to proclaim the terrors of the *Dies Iræ*, the *Tuba Mirum*, and the *Rex Tremendæ Majestatis*. It is impossible to give a description of the phrase, "And He will come again to judge both the living and the dead." The thunder of the sixteen big drums, the blast of a brass orchestra of over sixty trumpets,

horns, and trombones, and the full chorus of bass voices intoning on the high E flat the words, *Et iterum venturus est*, combine with tremendous weight. The remaining parts, however, are very monotonous in their doleful phrases of prayer and fear. They are all written in the gloomiest minor key and in exceedingly slow tempo. This woful music, lasting for some two hours and a quarter, becomes exceedingly wearisome. It contains, moreover, many eccentricities that can scarcely be forgiven even to so erratic a genius as that of Berlioz. An orchestral accompaniment consisting of nothing but three flutes in the highest pitch, supported by eight trombones in a long and dragging movement, comes as near a burlesque as possible. In spite of these innate defects, the public owe a debt of gratitude to Dr. Damrosch for having made them acquainted with this strange masterpiece, which, on account of its astonishing difficulties, has not been performed more than three or four times in its entirety since it was composed, nearly fifty years ago. The remaining evening concerts were distinguished by a performance of the "Messiah," which attracted the largest audience of the week, and of the Ninth Symphony, both of which have been heard to greater advantage on former occasions with smaller forces. The afternoon performances were a medley of music of the most heterogeneous kind—Bach, Handel, Beethoven, Berlioz, Meyerbeer, Liszt, and Verdi all in one matinée concert. A brilliant array of solo artists, including Mme. Gerster and Campanini and Miss Cary, made these performances the most popular of the week.

OLIPHANT'S LAND OF GILEAD.*

So far as we are aware, Mr. Laurence Oliphant is the only Englishman who has felt the burden of the national obligation, to effect reform in Turkey, assumed by Lord Beaconsfield in connection with the acquisition of Cyprus. This is all the more to his credit because he is a Jingo, with a keen eye to "British interests" and a proper dread of "Russian intrigue," and an unconcealed contempt for those of his countrymen who are moved by Christian sufferings in Turkey, whereas, if they did but know it, the Moslem subject suffers much greater hardship under Turkish rule than the Christian. He shares, also, the naïveté of his political sect in proposing popular representation as the remedy for Turkish misgovernment, and in expecting the favor of the Porte for a scheme of decentralization in the provinces, designed to show how easy reform is and how well it would pay, and to be tried on a very humble scale by a privileged colony in Moab or in Gilead. One even suspects a lurking humor in the assumption that Turkish statesmen at Constantinople will watch the growth of the infant settlement and study the census of its increase and production, and in the course of a generation or two be shamed or encouraged by the example into granting autonomy to vilayets generally throughout the empire. He thinks it "worthy of note" that when he "submitted a scheme for colonizing this region to the Government at Constantinople, the difficulty of dealing with the Arabs was never once suggested as an objection, nor did the nomad population seem in the eyes of the Government to possess any prescriptive rights which should interfere with the purchase of this country by immigrants." This was indeed a revelation of Turkish regard for prescriptive rights.

However, though his plan had the approval of Salisbury and Beaconsfield, and Midhat Pasha in Syria promised him his hearty co-operation in event of its being authorized, and Khaireddin Pasha would have urged it had he remained in office, "the ring" triumphed, and nothing has as yet come of Mr. Oliphant's disinterested activity except this book. The originality of his conception lay in selecting a class of colonists either already subjects of the Turks and accustomed to live amicably with them, or else aware by hard experience that Christian rule is much more oppressive; a class whose departure on the one hand, and introduction on the other, would excite no political jealousies, and whose flocking to Palestine would answer the aspirations of the race—of course, the Jews. The objection that they are not agriculturists, while the main object of the colony is to develop the soil, is fairly met by showing that successful Jewish farming is not unknown in Europe, and is to be found already in Palestine; further, a Bucharest "Society for the Colonization of the Holy Land," seeking aid in London to effect the removal of a hundred families, announces that "every one of the members is experienced in the work of cultivating the soil, and it is our intention to journey to Palestine to 'till the ground and to guard it.'" Still, taken in connection with its political purpose, the choice alike of Palestine and of Jewish settlers by Mr. Oliphant has the peculiar quality of the speculation of the late chief of the Jingos.

The story of his tour to spy out the land, and haply to find some nice deserted village fit for his purpose, is such a mixture of observation, archæology, and political disquisition that it is oftentimes hard to read and altogether hard to criticise. As in his own experience—"There seemed no limit to the waste of desert upon which we had now entered, till suddenly, by one of those freaks of natural conformation which characterize the country, we came unexpectedly upon a ravine through which flowed a small stream, fringed by a margin of green corn-fields"—so the reader passes from fatiguing topographical expositions to gay and graphic pictures of the road, the mountain, the house-top, the domestic interior. That Mr. Oliphant has some right to join those whose pastime it is to identify Scripture places wherever they move in the Holy Land, we would not deny; but conclusions reached in a hasty journey by one not a professed scholar or antiquarian, and incidentally declared in the midst of a diary of adventure, inspire the same distrust as etymological guess-work, which much of this identification of course is. They have, too, a certain impertinence in a work whose aim is to promote a movement sentimental, to be sure, but practically unaffected by the history of any square foot of ground inspected by Mr. Oliphant. He himself remarks on Tel Asherah, after taking a hand in the dispute over its relation to the Scripture Ashtaroth: "I could only regret that, the object of my journey being in no way connected with the past, and the time at my disposal limited, I had neither the previous knowledge nor the conveniences necessary for exploration of this kind, and that my observations are therefore cursory and superficial in their character." A deeper sense of his deficiency, it seems to us, would have resulted in the suppression of many pages, to the great advantage of his narrative. He is quite capable of omissions when traversing familiar routes, and so far as concerns the descriptive portions of the book his self-restraint has been admirably exercised. 'The Land of Gilead' serves, without overlapping, as a complement to Canon Tristram's 'The Land of Moab' for all the country immediately east of the Jordan and as far north as Damascus and Baalbec, excursions to both which places furnish some very charming chapters, and take the reader into the midst of unfamiliar and most romantic scenery, not very difficult of access from Beirut, but hardly ever visited by foreigners.

Our reformer, for his good-will to the Turkish Government, deserved at least a safe-conduct and all his expenses paid; but though as an Englishman he fared well at a time when the Syrian populations confidently expected an English occupation, or at least protectorate, he took the precaution to veil his philanthropic mission. The best chance of avoiding blackmail from the Arabs "seemed to be to travel in the humblest and most unostentatious manner possible, to take scarcely any money with us, to throw ourselves upon the hospitality of the natives, and to trust to the chapter of accidents and our appearance of poverty to carry us through safely" (p. 32). This policy was naturally adopted in a country where, we are told (p. 172), the peasants "lose all heart; for the result of their industry is only that they become more squeezable for taxes than if they remained poor, and they content themselves, therefore, with producing just what is absolutely needful; while the more squalid and miserable is the aspect which they present, the more immunity do they secure from the tax-collector." Mr. Oliphant's account of their oppression is but a repetition of what Commander Cameron, to take the latest instance, has related in his 'Our Future Highway to India.'

Without further comment we subjoin a few random extracts. First as to Jerusalem (p. 266):

"It is a fact worthy of notice that the city which stands more in need of reform than any other in Turkey after Constantinople itself, is the one in which the Turkish Government is most powerless, a foreign influence most predominant, and which is called by a figure of speech 'holy!' and that the people whom it would be found most difficult to reform, so far as toleration and orderly conduct are concerned, are the bigoted and fanatical Christians who have established themselves there as the guardians and representatives of its sacred character, or who frequent it for religious purposes."

In a lighter vein is the following (p. 339). The scene is the Christian village of Aithi, on the road to Damascus. "A dirty Greek priest" offered to produce an interpreter, a Syrian schoolmaster:

"He shortly returned with a very ill-favored and unhealthy youth, who, on the strength of his advanced state of civilization, seized me by the hand and loudly exclaimed, 'Good-morning!' though the sun was just then setting; then, pulling out an English and Arabic pocket-dictionary, and studying it for some time, he said, in a peremptory tone, 'Can you eat a hen?' I had already, before his arrival, expressed my willingness to attempt this feat; but he was too proud of the tremendous effect his learning had produced on the bystanders to hide his talent under a bushel, and kept on repeating the question from time to time. It was his supreme effort. . . . He afterward became so troublesome by his insistance that I should communicate with him by means of his dictionary, which he had great difficulty in reading, that I requested him to return to his pupils, if he had any. So far from his taking the hint, he established himself in my room for the evening; and even after I had politely pointed out the word 'kick,' as a hint that there were several ways of leaving a room, he resolutely declined to move until I showed him the point of my boot, and indicated, as good-naturedly as I could, by signs, the method of its application, when he went out in high dudgeon, and I heard him abusing me all down the street."

A worse than Turkish vandalism is described on p. 362 as perpetrated on the monuments of ancient Baalbec:

* 'The Land of Gilead, with Excursions in the Lebanon. By Laurence Oliphant.' New York: D. Appleton & Co. 1881.

"The modern tourist, probably animated by a sentiment of spite at the consciousness of being such a pigmy as compared with the giants of art in those days, has taken to practising with a revolver at that more delicate tracery which is so far above his reach that he cannot destroy it with a hammer. Why he should of late have become consumed with a passion for putting fragments of Baalbec upon his mantelpiece when he gets home, it is difficult to conceive, for the mind of the Cook's tourist in these matters is unfathomable; but certain it is that within the last three years there has been such wholesale destruction with pistols going on that most of those exquisite medallions which, a few years ago, formed the chief glory of Baalbec are completely effaced. The capitals of the Corinthian columns seem to make good targets for practice of this sort. You can aim at a particular fluted leaf, and have the pleasure of chipping the others all round until you bring down with a crash the particular piece of moulding you want. Then carved architraves are nice things to blaze away at, and the nose of an empress on a medallion forty feet above your head requires good shooting. I made enquiries on the spot as to the kind of people who were the best shots, and was informed that the American tourist carried all before him. This, however, I cannot speak of from personal knowledge; but I think the old practice of decorating the magnificent remains of a civilization so superior to ours with one's name, was a more touching way of paying homage to them than battering them to pieces with fire-arms, and carrying off fragments as the evidence of one's æsthetic tastes."

This is not the same thing as saying that Americans take a chief part in the work in which they are allowed to excel; and we believe the national reputation for carrying concealed weapons is not conspicuously maintained by American tourists either in the Levant or in any part of Europe.

SAINTSBURY'S DRYDEN.*

MR. SAINTSBURY'S book, coming as it does immediately after Mr. Ward's anthology, is something of a surprise. The "General Introduction" to that work asserted that "there are many signs to show that the eighteenth century and its judgments are coming into favor again," but the work itself did so much to render such signs insignificant as to lead one to believe the day of eighteenth-century judgments about poetry definitively past. This book, however, essays a rehabilitation of them and may count as one of the signs aforesaid. But no rehabilitation can be more than transitory, and must soon become discredited, for the reason that the mass of both expert and popular criticism is arrayed so decisively on the other side as to make it a more or less factitious work of literary *dilettanti*. Mr. Saintsbury is one of these, and, many as are his merits, the circumstance is fatal to the enduring value of a work in which he humors his natural inclination. To describe as *dilettanti* the small but alert and industrious body of English critics of whom he is one of the ablest may appear at first thought misleading, they have such a pungent tincture of Philistinism. It is true that nothing in Mr. Saintsbury's outward manner suggests the usual qualities we associate with dilettantism. Nothing, for example, could be more business-like than his style. It is rapid without great vivacity, curt rather than concise, peppery at times rather than animated, and has the air of a brisk young lawyer dispelling the cobweb mistiness of a fogy opponent before a jury of practical men. In controversy it is especially at home, and has a knack of converting criticism into controversy with great cleverness and promptitude, and thereupon displaying resources of intolerance, summariness, and surprised contempt that are considerable and effective, being in general judicial and deserved and the reverse of urbane. The conscious absence of nonsense is, perhaps, its main characteristic; its allusions are pat, its statements direct, its inferences plain, and, to be logical, you feel as if the party of the other part must be either incredibly ignorant or incredibly absurd. So far it is evident enough to whom belongs the credit of its invention. It is, however, an evolution rather than an imitation of Lord Macaulay's style, and though there is rarely absent from the latter a sound of the "rattling of dry bones" which in criticism was a favorite occupation of Macaulay, it has a rhetoric of its own so marked as to captivate the imagination of the hundreds of thousands in whose breasts it awakens a responsive thrill. Rhetoric is a stranger to the style of Mr. Saintsbury and his "set." It is as foreign to it as poetry or pliant grace. Straightforwardness is pursued to the verge of sterility, and the only affectation that remains is the "affecting to be unaffected"—as Congreve happily phrased it, Mr. Saintsbury might himself observe.

Affectation, nevertheless, owing to the constitution of the human mind and heart, is a constant peril; no sooner has a writer whose disposition inclines towards it freed himself from its more familiar manifestations than in subtler disguises it attacks him anew, and perhaps at the present day it is in its paradoxical and disarming semblance of unconsciousness that it is most insidiously dangerous. In this form it overlays the most forbidding foundation with an incrustation of dilettantism. Mr. Saintsbury's manner has often behind it matter whose superficial and whimsical character is precisely what it is because of an ingrained dilettantism, apparently unlike what we usually mean by the term, but unlike only in appearance. It is, no one can dispute, competent and respectable. That, indeed, is its distinguishing mark. Its criticism lacks no qualification of excellence, except a fundamental sincerity obtainable by no study and the reward of no direct research.

> "He drain'd from all, and all they knew,
> His apprehensions quick, his judgment true,
> That the most learn'd with shame confess
> His knowledge more, his reading only less,"

Dryden says of Charles, and, as Johnson justly remarks, the praise might be transferred to himself. This is, to be sure, high praise only when the quality eulogized is contrasted with the "reading" that is not accompanied by "judgment true." And even then it is a commonplace, as Mr. Saintsbury, whose reading, in *belles-lettres* at least, is great, very well knows. But, unhappily, it is not yet a commonplace that a fundamental sincerity is the one thing that can unite mere erudition with soundness and a sure discrimination; otherwise the pedantry which is out of date, and which Mr. Saintsbury would blush to be guilty of, only gives place to the new dilettantism he frequently illustrates. The superficial faults of this book may nearly all be traced up to this mistake. The abundance of literary slang, much of which is as unfamiliar to "those who have to run as they read" (for whom, as Mr. Morley announced, the series to which the work belongs was designed) as it is hackneyed in the author's "set" of littérateurs; the similar assumption of familiarity upon the part of the reader with a score of allusions whose labels are a part of the writer's stock in trade; an air of wearing better apparel than one's neighbors, as it were, satisfied with the circumstance that it is real and not pinchbeck; in fine, the attitude of addressing esoterically the few people whose sympathies and accomplishments are also one's own—all these symptoms of a provincialism not the less unmistakable because it is intelligent are to be ascribed to an unconscious affectation, to be found only in the recent high development of the journey work of English literature. To the same cause also are attributable the vital blemishes of the work. Mr. Saintsbury observed recently that the essence of criticism was "to be able to appreciate what you don't like." A better way of formulating the theory of his practice could not be imagined. It is a statement which has certainly a taking sound, though one cannot fail to remark on reflection how little valuable criticism has been written upon this plan. But the truth is that the essence of criticism is to see that what you like is worth liking, which is not the converse but another plan altogether. It is difficult, doubtless, and often impracticable, and rather deficient in explicitness; sometimes, too, it involves a humiliating self-effacement, a "getting one's self out of the way and letting humanity judge," very different from the straightforward plan of appreciating what you don't like; but if one thinks of it a moment, almost all the criticism that is worth having will be found to proceed in this way, because it is the only way in which one can be quite sure of really meaning what he says.

This is why, to take the specific matter in hand, Johnson's life of Dryden is a better work than Mr. Saintsbury's. Of course Johnson owes his reputation as "the greatest power in English letters in the eighteenth century" to a natural tact and discernment in criticism which any one who is born without them can never supply, and in this respect it would be needless and ungracious to say whether the comparison is fair or unfair to Mr. Saintsbury. But whether the peculiarities that mark the work of the latter are the cause or effect of natural equipment, which is apt to be an idle question in most cases of the kind, it remains true that whereas we are sure of Johnson's sincerity we are in doubt as to Mr. Saintsbury's, and that this makes an important difference between them. Does Mr. Saintsbury like Dryden, or is he only endeavoring to appreciate him? is a question that occasionally recurs and mars the effect of his criticism. Does he really think Dryden the great poet he argues him to be, and is he really disgusted with the definition of poetry "which regards it wholly or chiefly from the point of view of its subject-matter," as he seems to suppose (p. 189) some persons do? Or did he perceive in his task opportunity for a *tour de force* in which he might rescue Dryden from the slight esteem in which as a poet he is sometimes held, and, by the arts of literary discussion so familiar to him, make a brilliant plea in a case in which a less clever writer would hesitate to accept a brief? This, at all events, is what he has accomplished; and he seems to acknowledge as much in concluding: "This general estimate, as well as much of the detailed criticism upon which it is based, . . . will no doubt seem exaggerated to not a few persons, to the judgment of some of whom I should be sorry that it should seem so" (p. 189). The book reads throughout like an apology; and as, in our opinion, the case is desperate, we cannot speak too highly of the accomplishment of the writer in making so ingenious a showing. The case is, however, hopeless, except in certain generally undisputed details which it seems to us the advocate wins with, after the manner of advocates, a little unnecessary ostentation—Dryden's moral hypocrisy, for example; and for primer purposes the ingenious defence of a hopeless case is wholly unfitted. Indeed, the more ingenious it is the more out of place is it. For example, Mr. Saintsbury says that "when we want to see whether a man is a great poet or not let us take him in his commonplaces," and he selects four of Dryden's lines which he thinks "any poetical critic worth his salt" would,

* 'Dryden. By George Saintsbury.' [English Men of Letters.] New York: Harper & Brothers. 1881.

"without knowing who wrote them, but merely from the arrangement of the words, the rhythm and cadence of the line, and the manner in which the images are presented," ascribe to "a poet, and probably a great poet"; finding "the same touch" almost invariably present in works by the same author, he would "be justified in striking out the 'probably.'" The verses are the following:

> "O daughter of the rose, whose cheeks unite
> The differing titles of the red and white,
> Who heaven's alternate beauty well display,
> The blush of morning and the milky way!"

Now, "any poetical critic worth his salt" might say in regard to this that a great poet's greatness is not usually to be argued from his commonplaces, but that this is a particularly favorable way of judging Dryden; that these verses are not especially commonplace as conceits go in the ten-syllable couplet order of poetry; that the lines are the expression of a pretty fancy by a skilful versifier; and that, finally, this "same touch" is by no means either almost invariably present in Dryden or even so much so as to be called characteristic, whereas the particular "touch" which marks his poetry at its best—*i.e.*, dignity combined with flexibility—Mr. Saintsbury nowhere remarks. But among those who have to run as they read, a poetical critic worth his salt is, as Mr. Saintsbury would say, "a rare animal." The majority of these are in no way benefited by dialectics of the kind to which a poetical critic, whether he is worth his salt or not, has to resort in order to appreciate what he does not like and convince himself as well as his readers that "the poetical virtue which is present in Dryden is the same poetical virtue that is present in Lucretius and in Æschylus, in Shelley and in Spenser, in Heine and in Hugo," and that "Dryden's peculiar gift, in which no poet of any language has surpassed him, is the faculty of treating any subject which he does treat poetically." What this means, if it has any precise meaning, it is difficult to see. To find it in the work of a poetical critic who is at the same time an enthusiastic admirer of Mr. Swinburne and Mr. D. G. Rossetti and Walt Whitman is at least confusing. But when we get this explanation—

> "My natural man may like 'Kubla Khan,' or the 'Ode on a Grecian Urn,' or the 'Ode on Intimations of Immortality,' or 'O World! O Life! O Time!' with an intenser liking than that which it feels for anything of Dryden's. But that arises from the pure accident that I was born in the first half of the nineteenth century, and Dryden in the first half of the seventeenth"—

it becomes clear that the critic is in pursuit of catholicity of judgment, and so enamored of the ability to transport everything of himself but his "natural man" into the seventeenth century by the sheer force of erudition, that the feat itself enthralls all his attention and transforms the critic into the dilettante. We cannot do better than to advise the reader of Mr. Saintsbury's critique to re-read the essay on Dryden in his Johnson's 'Lives,' where he will, at least, be able to appreciate, even if he does not like, the "natural man" of the critic.

Memoir of Major-General George H. Thomas. By Richard W. Johnson, Brigadier-General U.S.A., retired. (Philadelphia: J. B. Lippincott & Co. 1881.)—This is hardly a personal memoir of General Thomas. A few paragraphs comprise all that is said of his early life, and all that belongs to his more intimate and personal relations. The rest is a résumé of his campaigns compiled from his official reports, supplemented by copious extracts from published notices of Thomas found in essays and histories, together with a full account of his funeral and the unveiling of his statue in Washington, including the oration delivered, and even the formal responses to the letters of invitation sent out by the Committee of Arrangements on that occasion. The editor's work adds nothing to the value of the compiled material, either in the production of new facts or in instructive criticism of the campaigns. What is added is mostly the warm and rather extravagantly expressed admiration and regard for General Thomas which all who knew him felt, but which would be more telling in a book of this kind if it were made to appear from a skilful handling of facts rather than in highly-colored phrases.

The character of Thomas was of so solid a sort, his modesty and his reticence were so marked, that his is a case in which a judicious use of private correspondence, personal confidences, and the incidents of his home-life and unofficial intercourse will be necessary, if we are to know anything more of him and of his motives and modes of thought than appears in any full history of the campaigns in which he participated. If his family are not yet ready to take the public into such confidence as to his inner life, an adequate memoir of him cannot be written. In any other sense than this the history of the Army of the Cumberland is his history; and this had already been given so fully by Chaplain Van Horne, from material furnished by Thomas himself, that it cannot be said that any more distinct or individual picture of the worthy soldier appears in the briefer book before us.

English in Schools: A Series of Essays by Henry N. Hudson, Professor of Shakspere in Boston University, etc. (Boston: Ginn & Heath.)—The title of this book is a misnomer, and the contents, it must be confessed, are disappointing. The volume is mainly made up from scattered prefaces originally prefixed to single plays of Shakspere and to the complete edition of his works which is now in process of publication. English in schools is but one of many subjects touched upon in these prefaces, in which the author gives expression to his views on agricultural colleges, the dignity of labor, the superiority of Webster, the system of cramming, and other points of general interest to the human race. Many of his opinions are just; but it is certainly trying to the feelings to have principles which have long been regarded as definitively settled, freshly announced with much exuberance of diction, as if they were novel and startling contributions to the theory of education. A very laudatory life of Mr. Hudson, for which a place is found in the middle of this volume, and from which we learn, with equal regret and alarm, that he is "the American Carlyle," informs us that he is a man who has to a tremendous degree the courage of his convictions. For a writer this is unquestionably a desirable qualification, but to the reader the all-important considerations are, first, whether the convictions were worth having; and, secondly, whether they were worth uttering. The frequent protests contained in this book against turning the study of English authors into mere grammatical and philological exercises may be, perhaps, needed in some quarters; and in this negative way the volume may be of service. But the only positive contribution of the author, that is at all novel, to the theory of teaching English is his account of his own method of instruction. "I have never had and never will have," he says, "anything but simple exercises; the pupil reading the author under the teacher's direction, correction, and explanation; the teacher not even requiring, though usually advising them, to read over the matter in advance." Exceptional pupils under an exceptional instructor might, perhaps, profit by this Otaheitan method of education, which looks upon the intellectual food that one man has to swallow as not fit for taste or digestion until it has first been chewed by some one else; but under ordinary circumstances no surer way could be devised of destroying the mental independence of the student, of depriving him utterly of any disposition to investigate, to think, and to decide for himself.

Mr. Hudson has won for himself a most honorable name as a critic of Shakspere and commentator upon his works. His edition of the poet is an admirable one, because he has studied his subject not merely with singular enthusiasm and fidelity but with singular thoroughness. If he will discuss education with the same knowledge, as well as zeal, with which he discusses Shakspere, his abilities will be sure to give to his criticism of the former the same weight that they justly hold in the case of the latter; but they will certainly then vary widely from some of the crude opinions advanced in this volume.

Turkish Life in War Time. By Henry O. Dwight. (New York: Charles Scribner's Sons. 1881.)—Mr. Dwight was in Constantinople from 1876 to 1879, and from there wrote letters as correspondent to the New York *Tribune*. These letters he has now corrected and enlarged, and published in book-form, with the addition of two chapters on the antecedents and probable results of the war. Despite its fragmentary style—which is inseparable from everything in the nature of a diary—this book is the most vivid and faithful sketch of Turkish character that we have ever seen. It is not a history, nor a thesis, nor a statistical memoir, but a series of daily photographs of the various races living "under the shadow of the Sultan." It is filled with instance after instance of the corruption, the imbecility, the deficiency of moral sense, the childishness of the Turkish officials—the utter lack, in short, of every element of good government, which is characteristic of the present Turkey, and which is so incredible that even one who has lived in the midst of it remembers it in after years only to doubt if his memory is accurate, if such things are really possible. Side by side with this we have constant evidence of the greed, the selfishness, and the brutality of the subject Christian races. It is only too true at present that "to all the Christian nationalities of Turkey freedom means the Turkish political system, changed only in the nationality of the ruling power"—*i.e.*, freedom to them means the power to treat not only the Turks but Christian races other than themselves in the same manner that the Turk has treated them. But, as the author justly observes in another place, "these people have been brought up to believe in the law of retaliation," and the examples of their brutality "prove nothing whatever against the character of Bulgarians as subjects for education and civilization" Surrounded with the atmosphere of wild gossip, which during the war pervaded Constantinople, where "the existence of a story does not necessarily imply its foundation in any morsel of fact"—it is not unnatural that the author should overestimate the stories of "Russian intrigue," should hardly mention the profound sensation produced throughout the civilized world by the Bulgarian massacres, and should attribute the origin of the war to the "propitious opportunity," when, by reason of political friendships and complications in Europe, Russia was safe in picking a quarrel with Turkey. The favorable moment was undoubtedly a factor in the course of events, but the war owed its origin to deeper feelings than this, and

would not have been necessary or even possible but for the culmination of the rayah's miseries in the massacres of 1876.

The author's opinions, which, with this exception, seem to us eminently just, and the result of careful thought and a thorough knowledge of the people and of their language, are, however, but a small portion of his book. It is mainly a series of most interesting notes and sketches, giving those little details of life and thought from day to day, in a time of great excitement, which are so essential in order to gain an accurate knowledge of any people; and it has the merit, as distinguished from English books which treat in any way of the Turks or the Eastern Question, of being written by an impartial observer, who has no cause to plead either for or against the Turks. Mr. Dwight tells us at the close of his book that "it has been written in vain if it has not brought home to the reader a deep sense of the complications which surround every undertaking to produce a solid reconstruction of Turkey." We can only say that the book has not been written in vain, and we heartily commend it to any one who desires to gain a knowledge of the Turkish character, and of some of the elements which have a bearing upon the most ancient but at the same time the most important and most threatening question of European politics of to-day.

A History of Greece, from the Earliest Times to the Present. By T. T. Timayenis. With Maps and Illustrations. In two volumes. (New York: D. Appleton & Co. 1881.)—A history of Greece by a native Greek has an inviting sound. The Greek nationality has had a continuity of existence on its proper soil with which that of Italy cannot be compared; the Greek language, too, has never been a dead language, and it has often been felt that scholars of modern Greece had a certain advantage in the fact that they approach the history of ancient Greece as peculiarly their own—that they are not under the necessity of taking an unaccustomed point of view, and of regarding their subject through the medium of a foreign tongue and a foreign set of associations. The book before us has just the freshness of interest that one would expect from its authorship. It has a peculiar animation and directness which make its narrative uncommonly attractive; and this is especially remarkable because it is the work of a foreigner. Certainly Mr. Timayenis has mastered the English language in an unusual degree; we do not remember meeting a single expression that would betray a want of familiarity with the language, and, on the other hand, one would call the style decidedly easy and idiomatic. This is the especial merit of the book. When the author leaves the field of narration he is less fortunate. The chapters upon religion, constitution, etc., are rather lacking in insight and in appreciation of the results of recent scholarship. The author, indeed, frankly states that his aim is to follow contemporaneous authorities—Herodotus and Thucydides—rather than their modern commentators; and this, undoubtedly, is a source of easy and agreeable narration. But it is impossible to comprehend subjects like those we have mentioned without the aid of modern scholarship; the materials for their study are not found in classical literature.

An illustration of the meagreness of this part of the subject is found on page 88 of the first volume, where it is said that "the Athenians were anciently divided, as were usually the Ionian communities, into four political and social classes—the hoplites, the artisans, the farmers, and the goatherds. Some authorities record a somewhat different division, namely, noblemen, farmers, and manufacturers." This statement is singularly incomplete and even misleading. The reader would naturally suppose that the three-fold division was as much *Ionic*, or at least as primitive, as the four-fold; whereas it was the division attributed to Theseus, and distinctly later than that of the four Ionic tribes. Moreover, the four *tribes*, if, as is probable, they were industrial classes in their origin, became purely hereditary groups at a very early date. The three *classes*, on the other hand, were real historical divisions of the people; the noblemen, *Eupatridæ*, were a ruling class; and the *Geomoroi* (husbandmen) and *Demiourgoi* (mechanics rather than manufacturers) were the laboring classes. On the same page it is said that one who had held the office of archon was entitled for the rest of his life to a seat in the court of the Areopagus—a rule which was not established until the time of Solon. The later constitutional history, on the other hand, the changes made by Solon and Cleisthenes and afterwards, and in general the political history, are on the whole well told.

The least satisfactory part of the book is, therefore, the beginning. It is not until he reaches the strictly historical stage of his task that the author does his best work. We are, however, disappointed in the modern portion. We expected to find that a native of Greece would dwell with especial interest upon those events which are most nearly connected with the modern nation, and that we should have, what does not exist in English except in Mr. Finlay's voluminous work, a good and complete history of Greece since the time of the Diaduchi. But this part of his work is far inferior to President Felton's supplementary chapters to Smith's 'History of Greece.' It is true that the most recent history is related with considerable fulness; but, on the whole, the author's interest seems to have ceased with the career of Alexander the Great, after whose death the work is meagre and perfunctory. We find no allusion, for instance, to the Duchy of Athens, so often mentioned in the Middle Ages. The only part, indeed, of this modern history which appears to enlist the writer's sympathies is the establishment of Christianity and the triumph of Athanasius over Arius. Constantine is made out to be a much nobler character, and a much more earnest Christian, than we suppose to have been the case. He was a great man, who left his mark strongly and beneficently upon history; but he can hardly be called a good man, neither does he appear to have been very much of a Christian, either in convictions or life.

It is hard to see upon what principle the illustrations are selected—a portrait of Constantine and picture of the Church of St. Sophia; maps to illustrate the Retreat of the Ten Thousand, the Siege of Rhodes, the battles of Salamis, Platæa, Mantinea, and Issus—all useful, but not all such as would be picked out as the most important ones in these two thousand years. The book is dedicated to Dr. J. H. Vincent, President of the Chautauqua Literary and Scientific Club.

A Treatise on Pruning Forest and Ornamental Trees. By A. Des Cars. Translated from the seventh French edition, with an introduction by Charles S. Sargent. (Boston: Published by the Massachusetts Society for the Promotion of Agriculture. 1881.)—This little handbook has the merit of treating of a subject which is practically a new one to Americans; in fact, there has not before been any special treatise on the subject in the English language. Tree-planting and timber-growing are yearly becoming more important to this country, and the value of growing timber may be so much enhanced by a scientific system of pruning which gives better shape to the tree, increases the value of the timber, and promotes rapidity of growth, that Professor Sargent's work is most opportune.

It is not probable that there will be any considerable pruning of American forests until the public is more informed on the matter and timber-culture becomes more imperative. The rapid destruction of our native timber will soon compel more attention to be given to its artificial production—how soon, will depend on the activity of "business." With a few years of "good times" the timber problem will be a serious one. Doubtless our magnificent native forests, when cut down, will never be replaced by artificial ones of similar grandeur. We cannot replace our oaks of two centuries' growth, pines of three or four, and redwoods of eight or ten centuries, but *timber* we must have, and it must be produced, in part at least, by cultivation. In a small way the work has already begun: forests have been planted in the West, and self-planted ones are increasing in some parts of the East. If we have not heretofore pruned our forest-trees as we have our fruit-trees, it has simply been because we have had the one ready grown to our use, while the other we have had to plant and grow; so soon as we have to grow both we shall prune both. This work tells how to do it, clearly, scientifically, and plainly, with suitable illustrations, some of which are very effective. It is a standard French work, founded on experience in tree-culture in Europe, and has gone through repeated editions there.

It is worthy of note that this volume is published by the second oldest agricultural society in the country, whose publications extend back nearly ninety years, and which yet shows its vigor by giving information so new to the majority of our people.

The Gulistān; or, Rose-Garden of Shekh Sādī of Shīrās. Translated for the first time into prose and verse, by Edward B. Eastwick, of Oxford. Second edition. (London: Trübner & Co. "Trübner's Oriental Series." 1880.)—In our first volume (p. 658) we noticed at some length an American reprint of Gladwin's version of Sādī's 'Gulistān,' with preface by Mr. Emerson, giving some account of the history of Persian literature, and pointing out the place occupied by Sādī in it. It is sufficient to say here that the latter is, by general consent of East and West, to be ranked among the half-dozen foremost Persian authors, and that his 'Gulistān' is his favorite work, and more generally read than any other text-book in the Persian literature. It is a collection of brief stories, with morals and maxims, in mixed prose and verse. Of four English versions, Professor Eastwick's is the last and the most scholarly; it is the only one that renders faithfully the form as well as the substance of its original, distinguishing the metrical parts by turning them into English verse—verse which, if not so melodious as the admired strains of Sādī, is at least acceptably good. Its author reckons Gladwin's as the best of the remaining three English versions. His own was first brought out in 1852, in luxurious and costly form, and is now for the first time made generally accessible, apparently without any noticeable alterations. A preface and a brief (and rather barren) life of Sādī by a native hand are prefixed to the volume.

The Easiest Way in Housekeeping and Cooking. By Helen Campbell. (New York: Fords, Howard & Hulbert.)—Mrs. Campbell offers very good reasons for presenting one more cook-book. Her experience in cooking-

schools has shown her that something different from the old books is needed. She has made a collection of recipes for simple, inexpensive, and yet attractive dishes, to which are prefixed a few chapters upon familiar questions of household hygiene and comfort. It was a happy thought to unite the two, for the first will be studied while the cake is baking by more than one who never would have looked at it if bound by itself. A few useful directions for teachers complete the book. The intelligence and good sense of the writer have certainly led her to the wisest as well as the easiest way. Not a few persons will be all the more pleased with her work to detect in it the flavor of the old, inimitable Southern cookery. Pray heaven it come not to be a lost art!

Philip Doddridge, D.D. By Charles Stanford, D.D. [Heroes of Christian History.] (New York: A. C. Armstrong & Son. 1881.)—Much in the life of Dr. Doddridge had only a local and temporary value, however great that may have been. Yet, with a proper historical setting or background, his biography might have been made specially interesting and instructive. Dr. Stanford's point of view is, however, too narrow. The present volume is not an account of the life of the man Philip Doddridge, or of the religious teacher eager to bring men back upon eternal laws and principles as distinguished from their transitory forms, in an age which seemed to be in danger of involving both, if that were possible, in a common ruin. It is mainly a record of the more important outward incidents which characterized the life of Dr. Doddridge as a Nonconformist minister. Viewed thus, his life was comparatively uneventful. The story of it from his birth in London, 1702, to his settlement at Northampton, as pastor of the Nonconformist church, and till his death in 1751, differs little from that of many of his contemporaries. It is this story which, with occasional uninteresting digressions, historical and speculative, is fairly well told in the present sketch.

Dr. Doddridge fully shared the intense intellectual activity of his age. His custom was to rise at five o'clock, and, when possible, to work twelve hours a day. He does not seem to have been much perplexed with intellectual difficulties. The Deist controversy left him thoroughly orthodox, although his biographer finds fault with some of his scientific statements of the doctrine of the Trinity. Nonconformists being then excluded from the national universities, their students were educated at private academies, of which the most noted was the one under Dr. Doddridge's charge, at Northampton. Besides the Latin, Greek, and Hebrew, and the series of two hundred and fifty lectures on ethics and divinity, of the regular curriculum, he taught mathematics and several of the natural sciences. Thoroughness or originality was thus impossible; and of necessity the volumes containing his lectures on divinity are now "sapless as the shelves they stand on." But his activity was not confined to the study or the lecture-room. He threw himself heart and soul into the great religious movement which Wesley and Whitefield were agitating. From first to last he was thoroughly evangelical, in the specific and restricted application of that term. He took a prominent part in social affairs, and especially in philanthropic works. He was a zealous supporter of the House of Hanover. During the alarm caused by the rebellion of 1745, and the march of the Highlanders towards London, Dr. Doddridge was first in the field trying to raise volunteers for the defence of the country, and urging the Government to energetic action. Although Nonconformist from principle and conviction, he was catholic in his sympathies, and stood on friendly terms with distinguished members of the Church of England and dissenting churches. He was no great preacher, we are told. His students once complained to him that, though his academical lectures were admirable, he was not a sufficiently correct model of pulpit composition; "whereupon the meek and candid man thanked them kindly, and was more careful for the future." As a writer he was "far too wordy," remarks his biographer, mindful of the fact that during the twenty-one years of his life at Northampton he prepared for the press "twenty-five thick tomes, besides thirty-seven thin treatises, such as pamphlets and single sermons." That Dr. Doddridge should have written hundreds of hymns—he generally composed one after finishing the writing of his sermon—is no evidence that he was a poet. But the hymn "O God of Bethel," still fresh and beautiful as ever, shows that he had a deep and genuinely poetic vein in his nature.

Dr. Doddridge did not leave his mark upon either the thought or life of his age. Dr. Stanford's estimate of him is that "he was a pioneer in several great enterprises of social and evangelical beneficence. He was a great pattern of charity. He was a great instrument of conversion—if not in his own lifetime, yet ever since. Few men have been more useful by the power of those 'indirect influences which distil from a life, rather than from sudden, separate, brilliant efforts.'" By many this may be regarded as an insufficient reason for the appearance of the present volume in a series of "Heroes of Christian History," comprising the names of Wycliffe, Knox, Baxter, and Chalmers. And, in any case, a biography of Dr. Doddridge, such as Dr. Stanford has produced, can at this day appeal only to a limited number of the reading public.

The Spirit of Education. By M. l'Abbé Amable Béesau. Translated by Mrs. E. M. McCarthy. (Published for the translator by C. W. Bardeen, Syracuse, N. Y. 1880. 12mo, pp. xv.–325).—*The Art of School Management.* A Text-book for Normal Schools and Normal Institutes, and a Reference Book for Teachers, School Officers, and Parents. By J. Baldwin, President of the State Normal School, Kirksville, Missouri. (New York: D. Appleton & Co. 1881. 8vo, pp. 504.)—*Lectures on Teaching.* Delivered in the University of Cambridge during the Lent Term, 1880. By J. G. Fitch, M.A., Assistant Commissioner to the late Endowed Schools Commission, and one of Her Majesty's Inspectors of Schools. (Cambridge: at the University Press. 1881. 8vo, pp. xviii.–436.)—There is nothing in the contents of M. Béesau's book to indicate that it is the work of a Roman Catholic, for it is entirely free from sectarianism. The translation is apparently well done. It seems especially adapted to the female mind, and mothers who care to have systematic ideas in regard to the education of children will be edified and instructed by its perusal.

Mr. Baldwin's book affords abundant evidence that there is nothing, from the selection of a site for a district school-house up to fitting a teacher to put into it, which he does not thoroughly understand. If the State of Missouri is not blessed with good schools and good teachers it is certainly not his fault. Superintendents, trustees, and teachers of public schools can hardly fail to be assisted by referring to Mr. Baldwin's work in almost any case where they may be in doubt. But not every able teacher can make an attractive book, and Mr. Baldwin evidently understands the art of teaching much better than the art of book-making. The manner of his work is tiresome, often repulsive. It is divided into ten parts, and each part into several chapters, each chapter into several sections, and so on, until one is at a loss for characteristic words to apply to the minuter subdivisions. These are all duly designated by headings, Roman numerals, Arabic numerals, numerals in parentheses, etc., until the mere appearance of the page makes the reader nervous. When we get at the substance it is generally expressed in a series of short sentences which any young scholar in grammar would find easy to "diagram." For example, Part III., chapter i., Section x., subdivision 2 (p. 135):

"2. *Persons with good teaching power generally govern well.* They exert a power which magnetizes the pupils. To teach well means power to secure attention and study. The pupils catch the enthusiasm of the teacher. Cheerful, earnest work makes it easy to maintain order."

And just over the leaf (p. 136):

"Remarks . . . *Teaching is incomparably the greatest work on this earth.* Minds only are immortal. The noblest creations of art fade and crumble. Cities and nations and worlds grow old and pass away. The teacher's work alone endures."

Often these little sentences would be just as apposite on almost any page of the book as where they happen to be placed. They may all be very true, but to read page after page in the same manner produces much the same effect upon the mind as reading in succession the copies in a writing-book. Mr. Baldwin might say, not without truth, that his book was not principally intended for consecutive perusal. But for any of the purposes mentioned in his preface his book would have been more effective had it been more attractive. To show how much style contributes to the value of even purely scientific works, it is only necessary to refer to Helmholtz's physiological treatises and to Tyndall's on physics.

Mr. Fitch's book goes over much of the same ground as Mr. Baldwin's. Many who look into it will read more than they intended on account of the agreeable manner in which he tells them what they perhaps already know. The different conditions of English society, and the different organization and traditions of English schools, render many of his observations inapplicable to our schools and teachers. Many of the methods which he recommends, apparently as improvements on the existing English practice, have long been used in our public schools. But it will certainly be of advantage to our younger teachers to read the arguments advanced by a foreign scholar in favor of methods which they have practised merely because they found them already in operation. Mr. Fitch's chapter on the study of languages is particularly good. We would call attention to that part of it in which he combats the notion that the best teacher of a foreign language must necessarily be a native of the country where it is spoken. The book presents the usual material excellences of the University Press.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Alger (Rev. W. R.), The School of Life	(Roberts Bros.)	$1 00
Art, L', vol. xxiv., swd	(J. W. Bouton)	
Beard (Dr. G. M.), Sea-Sickness, new ed	(E. B. Treat)	1 00
Boyd (G. R.), Resources of Southwest Virginia	(John Wiley & Sons)	3 00
Briggs (C. R.), Elements of Plane Analytic Geometry	" "	1 50
Brodrick (G. C.), English Land and English Landlords	(Cassell, Petter & Galpin)	5 00
Cook (C.), What shall We do with our Walls?	(Warren, Fuller & Co.)	
Cooper (H. J.), Art of Furnishing	(Henry Holt & Co.)	75
Hirth (G.), Kulturgeschichtliches Bilderbuch, Part 1, swd	(L. W. Schmidt)	
Holub (E.), Seven Years in South Africa, 2 vols	(Houghton, Mifflin & Co.)	10 00

Newell (Rev. W. W.), Œdipus Tyrannus of Sophocles, metrically translated, swd.	(C. W. Sever)	50
Rhodes (Rev. M.), Life Thoughts for Young Men, 2d ed	(Lutheran Pub. Soc.)	1 50

The Nation.

The Office of THE NATION *has been removed to No.* 115 *Nassau Street, near Beekman Street.*

NEW YORK, THURSDAY, MAY 19, 1881.

The Week.

THE principal financial event of the week was the notice of the Treasury, issued on Thursday, to the holders of United States 5 per cent. bonds, on which the Government option to pay has already matured. This notice was (1) that all the coupon 5 per cents, in amount $120,000,000, would be paid on August 12, provided the holders of them did not apply before July 1 for their extension at the rate of 3½ per cent. annual interest; and (2) that of the $325,000,000 registered 5 per cents the Treasury would permit the extension at 3½ per cent. of only $250,000,000, provided application was made for such extension before July 1; the remaining $75,000,000 will not be extended on any terms, but will be paid from time to time out of the surplus revenues of the Treasury. This management of the 5 per cent. debt promises to be fully as successful as that which has reduced the interest on the 6 per cent. bonds. At last accounts less than $25,000,000 of the 6 per cents remain unextended at 3½ per cent., and the time for extension in this country has been put forward to May 20 to place holders of these bonds on the same footing as foreign holders; and it is now doubtful if the Treasury will be obliged to pay cash for more than $10,000,000 of the 6's. Already about a third of the holders of registered 5 per cents have applied for extension at 3½ per cent.; and probably long before the day fixed the entire $250,000,000 of registered 5's will be renewed at 3½ per cent. Altogether it must be said that the management of the public debt since the present Administration came in has been brilliant; and there is every reason to believe that before Congress meets, the interest will have been reduced to 3½ per cent. on all of the $650,000,000 of 5 and 6 per cent. bonds, which, in round numbers, were outstanding when the last Congress adjourned—less, of course, the amount of the debt which the Treasury intends to pay absolutely, principal and interest.

This very successful action of the Treasury has advanced the public credit in the markets of the world to much the highest point ever attained, the 4's having risen to 117⅞. Its effect on business has been wholesome, and on speculation at the Stock Exchange enlivening, the latter for the reason that the Treasury has been committed to applying at least $75,000,000 of the surplus revenues of the Government, which for the most part are already in the Treasury, to the purchase of bonds. This money, added to the already swollen volume of the currency, naturally stimulates speculation. Early in the week foreign exchange rates further advanced to near the gold-exporting point, for exceptional reasons, since modified, so that it is not now believed that any considerable part of the $30,000,000 of specie imported since January will be returned to Europe this season. The New York banks are gaining steadily in reserve, and the rates for loans have fallen to 2 to 3 per cent. The volume of mercantile business is larger than a year ago, as measured by Clearing-House payments. Railroad traffic is better than was expected, and is larger than a year ago. Immigration never approached in numbers the present movement. Silver bullion in London fell during the week to 51½*d.* per ounce, and the bullion in the "buzzard dollar" was worth at the close of the week $0.8681.

The resignations of Senators Conkling and Platt were presented on Monday in the Senate, and on Tuesday they published the letter containing their reasons, addressed to Governor Cornell. The reasons are that the President made certain nominations, involving certain removals, which were not called for by the good of the service; that one of the nominations was that of Mr. Robertson to "the great office of Collector of the Port of New York," as a "reward for making the nomination of General Garfield possible"; that these Senators had no idea that any such nominations were going to be made; that they thought them "unwise and wrong"; that they wrote the President a private letter, signed by themselves and Messrs. Arthur and James, asking him not to make them; that they expected that on receiving it he would withdraw them, were disappointed, but bore their disappointment with patience and dignity, and in silence; that remonstrances against the nominations were sent in from leading mercantile firms in New York, and from sixty of the eighty-one Republican Assemblymen; that when the President then withdrew all the nominations except Robertson's his design was to "control the action of Senators touching matters committed by the Constitution to the Senate and the Senate exclusively"; that they were thus confronted by the question whether they would surrender their "plain and sworn duty" or be assigned the position of "disloyalty to an Administration which they had helped to bring in"; but they knew of no theory of any party which exacted such submission, and they lay down the doctrine that "although party service may be fairly considered in making selections of public officers, it can hardly be maintained that the Senate is bound to remove without cause incumbents merely to make places for those whom any individual, even the President or a member of his Cabinet, wishes to repay for being recreant to others and serviceable to him." They quote the President's civil-service reform utterance in his inaugural message, and twit him with his inconsistency; make a bitter attack on Mr. Robertson for his refusal to abide by the unit rule at Chicago; expatiate solemnly on the responsibility of Senators to the State and their obligation to defy Executive menace, disfavor, or inducement, and conclude by resigning, in order to see what the Legislature thinks of their conduct.

There can be no doubt that their arguments against the removal of Mr. Merritt and the nomination of Mr. Robertson, in so far as they are based on the good of the service and on the President's civil-service-reform professions, are all sound, and coming from any other quarter would be very effective. Coming from Messrs. Conkling and Platt, they are very like exhortations to honest industry addressed to a crowd on the street by faro-bankers whose rooms have just been closed by the police. But at best they contain nothing to prepare anybody for the resignation of their seats, so that the announcement of their intention has all the effect of a ludicrous surprise. They are not, on any theory of the Constitution or of party fealty, responsible for the President's nominations, or even for the action of the Senate on them. They are responsible simply for their own votes and arguments on the motion to confirm. The theory that a Senator must resign and appeal to his Legislature if he cannot get the President or a majority of his colleagues to agree with him about a nomination of which he highly disapproves, would, if generally adopted, make the transaction of business in the Senate impossible. That Senator Conkling should resort to such a mode of expressing his chagrin, and compel Mr. Platt to join in it, is simply another exhibition of the childishness which is said to have caused him to leave an invitation of Mr. Garfield's unanswered, and sent him to his room in anguish because he saw him (Mr. Garfield) riding in a carriage with Mr. Schurz. Persons of this temper are not fit for public life. The proper sphere for them is a monastery, or some solitary pursuit like metaphysics or sheep-herding. Mr. Conkling has, however, the satisfaction of knowing that he has made a genuine sensation, and of course some of the triumph comes to Mr. Platt. The newspapers gave from two to three pages to it, while declaring vigorously that it was of no sort of consequence. The "occasional correspondent" of the *Herald* who writes the blackguard attacks on the President thinks it, however, one of the great events of the age and sees among its probable consequences the resignation of the whole Cabinet and "a new deal." But then the struggle over Mahone was the greatest event of the age, and put the very existence of the Government in peril, and the Conkling sensation will in a few days excite a smile, as the Mahone sensation does.

What will happen at Albany it is hard to tell. The "half-breeds" are represented by the Stalwart correspondents as "frightened out of

their boots" and "stunned by the blow." Their aspect, in fact, was such that "one might have supposed some great public calamity had happened." In various places they testified to their sense of the calamity, and expressed their terror by firing salutes of one hundred guns, probably at irregular intervals and in a panic-stricken manner. They maintain, however, the "bombast" that has hitherto characterized their conduct, and make all manner of threats. They have a substantial majority in the Senate, which is already committed in favor of Robertson's confirmation, and, by a quick adjournment on Monday, before the Governor could notify them of the vacancies, staved off the election one week, thus allowing a fortnight for the cooling of the excitement caused by Conkling's *coup;* and as the Conklingites can only count on sixty of the Assembly Republicans, they ask significantly where the twenty-one additional votes needed are coming from. They may, if worse comes to worst, refuse to go into caucus. This would bring about a deadlock and leave the decision between the two factions with the Democrats, who it is supposed have more interest in breaking up the Conkling machine than in defeating the "half-breeds." A Conkling caucus was held Tuesday night, but is reported to have been very slimly attended. The one thing certain is that anything like a unanimous endorsement of the Senators' action, which is, of course, all that could have vindicated it, is out of the question. To appeal to your constituents and then be compelled to enter the lists and drum up support, and get a vindication only after the most arduous struggle for it, is a sorry anti-climax. Conkling's success, after the exciting contest that seems imminent, would put the finishing touch to a comedy to which his defeat might give a tragic or at least a didactic turn. Platt's course is a suggestive commentary upon the story current at the time of his election, that he had broken with Conkling and was about to set up for himself.

Mr. Conkling before taking himself off made no secret of his feeling of the weight of the severity of the defeat with which he was threatened, and none of the bitterness of his resentment. He dictated or inspired a savage attack on the President in the New York *Herald,* accusing him of having invited him (Conkling) to Mentor, to ask his advice, and of pretending that he would take it, and of having promised the Treasury to Mr. L. P. Morton in return for liberal donations to the campaign funds, and having then tried to put him off with the Navy Department. The letters, which are said to have been put into shape by the estimable Gorham, are excellent specimens of the lowest order of savage vituperation, and contain, in the way of assertion, much that is notoriously untrue, and more that looks very improbable. The account of an evening spent by Conkling at Mr. Garfield's house at Mentor, which must from its nature have been supplied by Conkling himself, if it has hurt Mr. Garfield's feelings, must be considered a not unjust punishment for having brought such a turbulent, ill-conditioned person as the New York Senator under his roof. To pass an evening with him in a bad humor, with his vanity all on fire, and no train to take him away till late at night, must have been an ordeal such as one is rarely called on to endure in peaceable social or political life.

If we were to have no relief from the spoils system, the substitution of a man like Judge Robertson for a man like Mr. Conkling as Boss would, of itself, be a considerable gain. There could not be a worse or less endurable and more charlatanic Boss than the latter. But we are not without hopes that although the authors of the rumpus may not have intended or expected it, the spoils system will receive serious damage from it, inasmuch as it affords a triumphant demonstration of the impossibility of restoring "harmony" through office-jobbing, and it must help to open the eyes of the whole people to the folly of supposing that, as the country and the governmental machine grow, any system can be maintained which takes up most of the President's time in distributing patronage, and threatens "war" between the Executive and the Senate and an arrest of the public business, every time a Senator is dissatisfied with the nomination of a postmaster or collector. If we could only witness the late proceedings from afar, how odd they would look! Fancy the British press and nation and the House of Commons absorbed for months, to the neglect of all other business, in a row between Gladstone and John Bright over the collectorship of Liverpool, or the French Chambers brought to a deadlock owing to a difference between Grévy and Gambetta about the sub-prefecture of the Seine-Inférieure.

Postmaster James did not, as some seemed to expect, follow Mr. Conkling's lead in resigning; neither did Vice-President Arthur, though both united in the Conkling-Platt request that the President would withdraw Judge Robertson's nomination. In either case the act would have been more reasonable than in the case of the two Senators from New York. Mr. James could very well join in the protest against Collector Merritt's removal, which, except for its intimation that the signers ought to have been informed of the President's purpose, might have emanated from the Civil-Service Reform Association itself. "We do not believe that the interests of the public service will be promoted by removing the present Collector and putting Mr. Robertson in his stead. Our opinion is quite the reverse, and we believe no political advantage can be gained for either the Republican party or its principles. . . . No individual has claims or obligations which should be liquidated in such a mode." This is perfectly true, and has the air of being disinterested, as Mr. Conkling meant it should have; and Mr. James did no more than his duty as a member of the Administration in laying the remonstrance before the President. When the second stage of the contest was reached, his duty as a Cabinet officer to stand up for the President's prerogative was equally clear, and it would have required enormous skill in political dialectics to frame an excuse for resigning. It may not be superfluous to point out what a real calamity *his* retirement would have been, in the midst of his vigorous assault on corruption in his own department; whereas, who can name any good cause or public policy that will be injured by Conkling's lapsing into utter obscurity and silence for the rest of his days?

Mr. Stanley Matthews has been confirmed for the Justiceship of the Supreme Court by a majority of one, after an adverse report by the Committee. This is not a very flattering result for a candidate who has himself been a member of the Senate, and aspires to an office which calls for so much public confidence as a place on the Supreme Bench. It has, too, if report speaks truly, been reached after an amount of lobbying on the part of Mr. Matthews himself which was, to say the least, hardly becoming, though we are loath to believe that he was assisted by Jay Gould and some other managers of railroad corporations. It would, however, be unfair to infer Mr. Matthews's career on the bench from his defects at the bar. Nobody denies that he is an able lawyer, and many men against whom worse charges have been brought than any made against him have made very respectable judges. But they found on the bench, as he will probably find, that confidence was a plant of slow growth.

Dorsey's Star-route operations in Oregon were exposed last week owing to a suit brought against him by one of his confederates for compensation for services rendered in carrying out the frauds. This confederate allowed Dorsey's letters to be published in which he gave instructions for the concoction of the frauds from the very beginning, such as directions to have applications from the inhabitants of new postal routes and the expediting of old ones sent in a variety of handwriting, and to have such and such contracts, containing such and such bids, forwarded to Washington, and so on. The confederate has now, it is reported, settled with him and surrendered the incriminating letters to him before the Postmaster-General could get hold of them; but it is said, and we hope truly, that certified copies are in existence which will be useful in bringing this statesman to justice. Another exposure of him has just been made in Arkansas, where he has been engaged, it is alleged, in getting up fraudulent contractors' bonds, and is also accused of forging his brother-in-law's name. If he can be prosecuted to conviction it will do something to stop the practice to which both parties of late have betaken themselves, *i.e.*, of trying which could put the most unscrupulous men in charge of their canvasses. One leading Republican

Rascal lately remarked that it would not have done to send any one out to "carry Indiana" who was "loaded up with the Ten Commandments." If Dorsey should get into the penitentiary we should probably next time have a reputable secretary of the Republican National Committee.

The Brooklyn Young Republican Club is the result of a reorganization of a campaign association formed last fall, which believes that there is work enough for a permanent body having the political aims of the Club. These are mainly of a local character, though in general the Club will endeavor "to resist and expose corruption and promote reform in national, State, and municipal affairs." Civil-service reform in the city government of Brooklyn is, however, its chief object; and to that end it proposes "to arouse public interest in the conduct of our municipal government and make efficient public criticism upon it"; and a large part of its work will be to collect and publish information as to the "record" and capacity of local nominees, to watch the actions of officials, and "to disseminate information as to primaries and caucuses." The members "utterly disclaim any sympathy with the current supercilious expressions of contempt for political positions and political work," and intend to use, so far as they may, "the ordinary party machinery." Nevertheless they will "ask no office for themselves," and only insist that candidates shall suit their views as to character and capacity. A great deal of energy can be expended upon work of this kind in Brooklyn, and, as both parties are about equally responsible for the condition of affairs there, it would have been wise, perhaps, to have invoked whatever assistance young Democrats in favor of good government might be willing to contribute. There is nothing beyond a shibboleth or two in the Club's constitution as it now stands to exclude their co-operation.

The Cincinnati *Commercial* has reached what we trust is the end of its career as a silver prophet by giving up the Monetary Conference as a failure, and advising the President "to recommend Congress to stop the coinage of silver dollars when the sum struck reaches $100,000,000," and to keep the Mint "fully employed on small gold." It appears that its failure as a silver prophet is, however, the fault of England, Germany, and France. They would not take the advice of the Western sages, who "told them in 1878 that they should follow our example, and remove the artificial discrimination against silver," and now the *Commercial* proposes to leave them to their folly. He is not the first prophet who has been brought to grief by the perversity of events.

The French operations in Tunis have taken a very remarkable if not wholly unlooked-for turn. It came out the other day that the Republic had designs on Tunis as long ago as 1878, and in that year, by acquiescing in the seizure of Cyprus by England, M. Waddington extracted from Lord Salisbury the declaration, which has recently been made public, that England did not care what France did in Tunis, even if she went to the point of depriving the Bey of all real authority. Lord Salisbury would not have been true to himself if he had not at the same time assured the Bey and the Italians that they had nothing to fear from France as regarded Tunis, and this he did. Why France did not go to work sooner it is hard to say; probably because she wished to get the Turkish question out of the way. The exceedingly pacific tone of M. Barthélemy St.-Hilaire's despatch to the Greeks, in which he warned them against relying on French aid and drew a most doleful picture of the horrors of war, which took the world so much by surprise, appears now to have been a sort of sedative for European nervousness. Very soon after, the bad conduct of the Kroumirs began to excite deep indignation in Paris, and preparations on a great scale began to be made for their chastisement, and dark pictures were drawn of the difficulties of their territory and their skill in irregular warfare. As a matter of fact their territory has been occupied without meeting with any resistance beyond a little bushwhacking by small parties of mountaineers, uniformed in long, dirty shirts as sole garments and armed with flint-locks. But the operations against them were only supplementary. The Tunisian fort on the island of Tabarca was bombarded and captured, and it soon appeared that the real objective point of the French force was Tunis itself. There was some little pretence of remonstrance with the Bey for not putting down the Kroumirs himself, but it was not kept up very long. He was surrounded in his palace by a party of cavalry on the 12th instant, and the general in command produced a treaty cut and dry which the Bey had to sign on the spot, but added a protest. He had previously addressed a general protest to all Europe, a particular protest to England, and had invoked the aid of his suzerain, the Sultan; but all in vain. England was estopped by the Salisbury declaration from doing anything in the matter; the Sultan was promptly warned that the French did not recognize his suzerainty, and that if he meddled there would be war.

The Treaty provides in substance for a French protectorate. France takes charge of the Bey's foreign relations, and occupies the Tunisian coast, and extorts from him a "war indemnity," and places a minister resident at his court to act as a sort of supervisor. In fact, the arrangement is almost exactly like that which England makes with the dependent native princes in India, and which she tried to force on the Afghans in the late war. The Bey sent a despatch to the Sultan at once informing him that he had signed the treaty under duress, but the Sultan is said to be, nevertheless, very angry with him for signing away the sovereign rights of the Porte, and, in order to mark his disapprobation still more strongly, to have ordered three iron-clads to be got ready for sea. We presume, however, that their operations will be confined to a cruise in the open water.

The performance is viewed with different feelings in various parts of Europe. In England a good many people who approved of the Jingo attack on the Amir of Afghanistan are shocked by the "immorality" of the French attack on the Bey, and the *Times* gives notice that it must diminish the cordiality of the relations of the two countries—why, it would be hard to say. To the Italians it is a terrible blow, and there is great mourning at Rome. Tunis is Carthage, and one of the cherished dreams of the new kingdom appears to have been the seizure of it, and its conversion into an Italian colony or dependency. It was for this, or something like it, that Italy has been building enormous iron-clads like the *Duilio*, and keeping up an army out of all proportion to her financial strength, and doing more or less intriguing for influence at the Bey's court; but the Government has never had the pluck to seize the prize, and now the opportunity is gone, probably never to return, and the Cairoli ministry has again resigned and a loud wail rises from the press. It was not by wailing, however, that old Rome got Carthage. Prince Bismarck, as might have been expected, is delighted, and declines to interfere in any way, first because he likes to have the French army well occupied in Africa; secondly, because he likes to see Italy and France by the ears; and thirdly, because it seems to justify his assertion that the peaceableness of the French since 1870 was simply the saintliness of a sick devil. He has always maintained that they would never let ten years go by without sending an army somewhere, and it looks as if he were right.

Mr. Gladstone, in replying to a question in the House of Commons, deprecated debate on the conduct of a nation with which England had been so long in friendly relations until all the facts were known, which was doubtless intended to prepare the House for a full account of Lord Salisbury's concessions to M. Waddington. The Turco-Greek trouble is not over, as the Turks have begun their old game of delay about handing over the ceded territory, and the excitement of the Sultan about Tunis is said to be likely to prolong it. Should this prove to be the case it will give the Greeks a chance of retrieving their reputation and soothing their wounded honor by a fight. They declare themselves ready to enter Thessaly if the Powers do not arrange with Turkey at once. In France the foreign criticisms on the Tunis affair have been received with the utmost impatience by the press, and in the Assembly the Minister's statement that he had followed the "good old rule, the simple plan" called forth unanimous applause. This, coupled with the hootings and groans which received a committee report against the *scrutin de liste*, seems to show that the Republic begins to "feel its oats," and that lively times may still be looked for in European politics.

THE COMEDY OF THE DEADLOCK.

ONE of the surest marks of the present decadence of the Republican party is its want of humor. Nothing else can account for the persistence of the Republican Senators during the past two months in the ridiculous attitude for which they have invented such solemn and profoundly moral excuses. They have shown an inability to see things as they are, and themselves as others see them, which even the Brigadiers would blush to display. The effect of the war on the Brigadiers was not to preserve them from ever again doing foolish things, but to open their eyes to realities, and so to put them on the high road to ultimate sanity of thought and action. It operated in the first instance by upsetting a code of ethics—that of slavery—which was already upside down. Its effect on their opponents has been quite the contrary: a blinding to the real condition, wishes, and needs of one-half the country, together with such a subversion of moral standards as the party endorsement of the carpet-bag governments and the Hayes returning-boards implies, and such as has just been witnessed, on a smaller scale, in the attempt to throw the blame of the deadlock on the Democrats, and in the subterfuges vainly intended to conceal the motive for the interruption of public business, and to save the humiliation of retreat from an untenable position. No one can review with a sober face the shifting explanations of the undeniable fact that the Republican Senators as a unit were consorting with and making apologies for Repudiators, and of the apparent bargain by which in consideration of Gen. Mahone's vote, giving them a majority, the Republicans bound themselves to find an office for his henchman, Riddleberger, and to make over to himself the Federal patronage in Virginia. Properly punctuated, these explanations would read as follows: There was no bargain; they nominated Riddleberger simply because they admired his noble views about a free ballot and a fair count. (A laugh.) They formed a coalition with the Virginia Readjusters as a means of breaking up the Solid South. (Hear, hear.) They were anxious to restore the *status quo* of March, 1879, in order to lay a foundation for tenure during good behavior, in accordance with the principles of civil-service reform. (Immoderate laughter.) They were not particular about the *status quo* except as regarded the Secretary, Gorham. (Oh, oh!) They were vindicating the sacred right of the majority to do what they pleased in their own time. (Hilarity.) Their point was, that it was revolutionary to insist on first attending to the objects for which the session had been called. (Sensation.) They would have yielded sooner, but for Conkling's desire to force the withdrawal of Judge Robertson's nomination. (Renewed and prolonged merriment.)

When we find the defender of a "great underlying principle" converted at last into a mere cat's-paw for an intriguing politician, the stupendousness of the joke leaves no doubt of Mr. Dawes's simplicity and literal-mindedness, and none as to the reason for selecting him as the executive of the Republican caucus—the "czar of the caucus,' as Mr. Edmunds dubbed Mr. Thurman two years ago. He had the grave face necessary for the perfect delivery of a jest. More than that, in the spring of 1879, in the struggle over United States marshals at the polls, he had joined in the denunciation of the Democratic caucus which directed how the party in Congress should act with regard to the appropriations and what the President must approve. He then (April 16) held it to be a dreadful thing that the Democratic majority had resolved on a line of policy to be taken as a whole, without alteration or modification at any other hand; that the Democratic party would take its measures from a caucus; "that a caucus is hereafter to determine the policy of this Government, and that in the secret conclave of a caucus is to be discovered this purpose, and the future of the legislation and administration of public affairs." He had also been one of the supporters of Mr. Edmunds's resolution confining the business of the Senate to the appropriations—the object of the special session; and he had resisted, with his Republican colleagues, the displacement of Gorham and the other subordinate officers of the Senate. To make him, therefore, the prime minister of "the secret conclave of a caucus" (1) to introduce business out of order; (2) to oppose it stubbornly to the regular and legitimate business; (3) to undertake the removal of officers accused of no neglect or impropriety in the discharge of their duties; (4) to "determine the policy of this Government" about interfering in local politics at the South; and (5) to force the President to abandon his prerogative of making nominations—was a stroke of humor almost Mephistophelean.

But, to do Mr. Dawes justice, he has only been more conspicuous than some of his former colleagues in eating his own words about caucuses. There was Mr. Anthony, who, to save Gorham, was ready with half a pledge of better behavior when his side should regain power—"I do not think I shall ever be found advocating the removal of officers of this body who have performed their duties with fidelity, with honesty, and with intelligence"; who called Mr. Thurman's caucus (April 18, 1879) "this car of Juggernaut which rolls through the Senate, crushing out our venerable precedents, trampling upon our ancient usages, and breaking in upon the freedom of our discussions," and who has nevertheless sat serenely on the Republican car in its obstructed progress over victims of another political faith. There was Mr. Edmunds, opposing changes in the Senate's officers, and alluding satirically (April 24) to the "codicil to the will of the Democratic caucus," and (June 5) to the "secret womb of the Democratic caucus," the "secret tribunal which has decided that this shall be done"—now dumb. Above all, there was Mr. Blaine, who did not object (March 27) to a caucus settling "the order of business, and the order of bills, and the order in which measures shall come up," but shrank from its pretension to "settle the details of any particular measure," thus "binding the views and consciences of men upon particular points of legislation by an outside power." A little later (April 14), his fine point growing finer in the light of recent events, he calls it "the audacity of revolution for any Senator or Representative, or any caucus of Senators or Representatives, to get together and say: 'We will have this legislation, or we will stop the great departments of the Government.' That is revolutionary." And if it be, what will Mr. Hoar, a revolutionary expert, say to his own conduct in hindering the State Department from concluding its treaties, the Supreme Court from having its quota, the President from filling vacancies under the Tenure-of-Office Act? And in what essential particular is the following extract from Mr. Blaine's remarks, on March 27, inapplicable to the situation not yet dissolved as we write?

"The Senator from Kentucky . . . admits . . . that outside and beyond the committees and the organized forms of legislation which have prevailed in this Government so far, there is a sort of committee of safety organized to supervise and overlook the legislative proceedings of both branches." . . . "A new departure in legislation: that a sort of committee of safety, for the meeting of which both branches are adjourned at premature hours in an unprecedented manner, is in existence, preparing, devising, and directing the measures of both bodies—a sort of extra-legislative and extra-constitutional proceeding, which it is merely worth while to note for future reference."

It would be unfair not to compare Mr. Conkling, also, with himself—doubtless, in his own estimation, the only parallel possible. He did not waste much breath over the "edict of King Caucus" (to cite Mr. Blaine's expression), but in speaking (March 24) upon the motion to make John C. Burch Secretary of the Senate, *vice* George C. Gorham, he turned his mind to loftier considerations:

"I supposed there were Senators not Republicans who understood purity, efficiency, and honesty in the civil service to mean what I understand it to mean. I suppose the honest rule to be to select not a scoundrel but an honest man, not a fool but a man who is competent, not a pretender or a sniveller but a man of sincerity, for a subordinate public position; and when you have him there and he does his duty, to keep him there—not to turn him out for even another good man. That, I will say to the Senator from Delaware, who was good enough to refer to me some time ago as a non-believer in his notions of purity in the civil service, is what I understand by efficiency, purity, and integrity in the administration of the public service—to find a man who is honest, who is competent, who is attentive, and when you have found him to keep him, and not to drive him out in order to put some favorite or claimant in his place."

After framing this excellent formula for tenure during good behavior Mr. Conkling indulged in a little outburst, of which we will say nothing more than that, though meant for Mr. Hayes, had Mr. Garfield duly heeded it we should have been spared some scandalous nominations:

"There are people whose idea of purity and reform seems to consist in canting incessantly about purity, in keeping up continuing sensation and proclamation as if they were holier than other people; and

then, when they find themselves in possession of the power to select or cause the selection of public agents, to divide with considerable impartiality their attention between such knaves and such fools as they feel indebted to for adulation and service."

A retrospect like this suggests the curious reflection that the memory of Senators fails them in less than two years from a given event. This would not be singular in the case of Representatives, whose term is for two years, and who, therefore, are not required to cultivate long memories, but only to make hay while the sun shines. But how shall we explain it in the Senate's case? Loss of memory means loss of the power of comparison, which, of course, involves the destruction of the sense of humor. But are not the same forces which thus affect our lawgivers at work upon the popular appreciation of the ludicrous and the counterfeit in politics? Does not the system which produces Conkling the Boss tend inevitably to palm him off as the great Conkling?

STATE INSPECTION AND VOLUNTEER INSPECTION.

A BILL passed the State Senate last week, and is now before the Assembly, permitting the association known as the State Charities Aid Association to visit through its agents the various charitable institutions of the counties of this State, on an order of appointment from any judge of the Supreme Court. The bill has excited a good deal of controversy during the past year owing to the change in the relations between the State Charities Aid Association and the State Board of Charities, the latter being the organization which, in fact, performs the work of official inspection of charities which is in England done by the Local Government Board. The State Aid Association is a volunteer body, composed principally of ladies, which has accomplished a great deal of reform in the conduct of various local charities, and notably in Bellevue Hospital in this city, besides starting the now well-known Training-School for Nurses. For some time its members were armed with the official authority of the State Board, and made their visits of inspection under its commission, but made their reports to the State Aid Association. Last summer, however, the State Board forbade the agents to report to anybody but itself, and in January of this year passed a resolution refusing to delegate any of its powers of visitation to the agents of other unofficial bodies as incompatible with the proper execution of its own duty, and expressing its disapproval of the bill which has just passed the Senate, giving this right of visitation to the State Aid Association. We believe there is no charge of indiscretion brought by the State Board against the agents of the State Aid Association. It is not alleged that they have been over-zealous in the work of inspection, or have gone beyond their powers, or have been guilty of misrepresentation in their reports. About the good they have accomplished in certain directions there does not seem to be any question. But the work of the Aid Association is substantially the same as the work of the State Board—that is, the visitation of the County Poor-Houses, Lunatic Asylums, Orphan Asylums, Refuges, Homes, Hospitals, and so forth, and the making of reports on their condition with recommendations as to changes in their management. The State Board, however, in addition to this collects statistical and financial returns of the various institutions and analyzes and tabulates them, which the Aid Association does not attempt to do. Both of the organizations appear to make recommendations, and the recommendations, as well as one can judge from the reports, are of much the same character. Both find that the great obstacle in the way of a proper administration of the public charities is "politics." The following curious passage, which we commend to the attention of the civilized and humane, is to be found in the last report of the Aid Association, describing a visit to a lunatic asylum in Sullivan County:

"A painful scene occurred in the dining-room during the visit described. A treacherous lunatic, without other provocation than that he had been locked up in a cold, dark cell all day, struck a pauper near him a violent blow across the face with his cane, felling him and giving him a deep, ugly gash on the cheek. He had never done anything of this kind before, but it was election day and the men in authority were away. It was due to the same fact that he had been locked up all day, and was in the unamiable mood which led him to take vengeance on somebody. Improvements, such as the new insane asylum, had been planned and begun by the present keeper. The wife said they had 'been wondering whether they would be allowed to remain to complete them; they had taken so much interest in planning them.' Work had been suspended until 'after election.' Children were waiting to be removed from the poor-house until 'after election.' The keeper's mind and time had evidently been lately fully occupied with the coming election, and it was not to be wondered at. If the then superintendent were re-elected, he would be reappointed; if not, probably not. The man knew that his retention did not depend on his efficiency as an officer, but upon his political influence. Here, we all know, is just where the difficulty in the way of good poor-house management lies. To be a good superintendent or good keeper requires original fitness and long training. As it is now, fitness is seldom considered, and a man has little inducement thoroughly to qualify himself for his place by a careful study of the subject of pauperism generally, or as it presents itself in his own institution."

The testimony of the State Board is to the same effect. In the chapter of the last report devoted to the charities of New York County, drawn by Mrs. Lowell, she says that though many improvements have been made, the experience of the year has been disheartening, for the conviction

"has more and more been forced upon me that no radical change for the better can be hoped for while political influence is allowed to govern the department. So long as the Commissioners of Public Charities and Correction are appointed as agents for the distribution of political patronage no permanent and effective improvement can be made, and the moral tone of the department must continue low, whatever may be the character of individual commissioners.

"The institutions may be cleaner, the buildings may be kept in better repair, the food may be improved, the inmates may be better cared for; all these things are good, and are to be welcomed and rejoiced over; but so long as every officer and employee in the department knows that to do his or her duty is not the only road to promotion and permanence of position; so long as to have a good 'backer' is better than to be efficient and devoted; so long as men and women, put out of one institution because of incompetence or worse, are put into another, so long will the Department of Public Charities and Correction be a discredit to the city of New York, and a place where officers, employees, and inmates are taught to shirk their duty if they can, and to seek their own good at the expense of the city and their fellow-men."

The question which suggests itself at once to any one who knows nothing of the two organizations beyond what may be gathered from their reports is, What is the use of the State Charities Aid Association when there is in existence an official State Board charged with the same duties? If the State Board does not do its duty, is not the proper remedy to be found in making it do its duty rather than in setting up a supplemental corps of volunteers for the very same purpose? Is not the mere existence of such a corps a sort of acquiescence in official negligence and laxity?

We confess to having been for some time staggered by this question ourselves. It does not seem on the surface as if the doing by outsiders of the work which is by law committed to State officers was likely to promote the cause of civil-service reform, and it does seem as if legislation clothing these volunteers with legal authority was unnecessary, to say the least. The fact seems to be, however, that if we admit the desirableness of the volunteers doing any work at all we are forced to admit the need of legislative authority. Inspection of public institutions by wholly unauthorized persons, especially when, as in the case of the State Aid Association, the visitors are principally women, is pretty sure to be resisted wholly or partially, or to be submitted to with such a display of reluctance as to prevent the timid from engaging in it. That this disposition to resistance, which one would expect *à priori*, does actually exist is proved by Mrs. Lowell's report, in which she relates that, although she is a State Commissioner, not only was her right to talk with patients questioned by the Superintendent of the Lunatic Asylums on Blackwell's Island, but he refused to allow her to do so, and she had to fortify herself by an appeal to the Commissioners of Charities and Correction and by a legal opinion of the Corporation Counsel. As to the general question of the need of volunteer inspection we have no doubt that there is such a need, and the reason why is to be found in "politics," and will always be found in "politics" as long as the distribution of offices plays the part it now plays in the administration of public affairs. In every civilized country there exists some machinery for bringing the highest morality and most skilled opinion of the whole community to bear on the management of local affairs.

In most of the countries of Continental Europe this is done by minute and incessant supervision and interference on the part of the central authority. In England it is done through the Government Board, which sees that municipal corporations do not overstep their powers and that charities are properly administered, in part by prohibition and in part by direct regulation. With regard to charities, inasmuch as they concern the poor and helpless and sick there is, of course, need of stricter supervision and more extensive interference than with regard to other branches of administration which concern taxpayers, who are able to ascertain their own rights, and, if need be, put the machinery of justice in motion for their enforcement. All paupers are not as alert and well informed as the tramp of whom the story is told in England that on entering the casual ward of the almshouse and demanding a hot bath he was refused. "Refer," said he immediately, "to Consolidated Order No. —, and you will see I must have my hot-water bath. Give me your name, please [to the officer]. I shall write to the Local Government Board." This supervision and interference of the central power in every case, whether for the benefit of taxpayers or paupers, is based on the idea which is the foundation of national unity—that everybody is wiser than any one person in particular, and that the whole country is not only wiser but more moral than any particular locality.

In this country the central authority has been so much weakened—*i.e.*, the decentralization in all the States is so complete—that there is hardly any official channel through which the general opinion can reach the local management of local affairs. The counties in this State are compelled to report annually to the State Government on the administration of the county charities, and during the past thirteen years there has been a State Board of Charities charged with the duty of inspecting and reporting and recommending. But it has no power of active interference. It investigates, approves or condemns, and advises, but its advice goes to the Legislature, which heeds it or not, and we presume mostly not, as it pleases. There is always a powerful influence working against any action on its recommendations, as illustrated in the extracts we have quoted above. The charitable institutions of the State are made part of the political machine, the officers of which are mostly "workers," and their tenure in a large degree dependent on their political activity. In other words, the State Board, however zealous or high-minded or able its individual members may be, is necessarily in some degree dominated by political considerations. It is allowed to have full swing within certain limits, but beyond these it cannot push its operations with great zeal or energy. It cannot come into too serious collision with the Machine, because to do so would endanger its own existence. Nothing can support a person, or body of persons, in anything like a conflict with the class which controls politics but public opinion, and an official body cannot appeal to public opinion in any way very likely to reach it. Its utterances must be confined to official documents, the number and distribution of which it cannot control, and it must express itself with reserve, and if it errs err on the side of caution and reticence. Public opinion, too, as expressed through the newspapers, unsatisfactory as this form of expression may be, seems to be in this country the thing on which we have definitively settled down as the most effective, if not the only possible, substitute for the investigating and inspecting machinery of more centralized governments, in which official authority is more firmly established. In the matter of preventing and remedying abuses we may be said to have fallen back on the old hue and cry, as something better suited to our needs than detective police. Governors and legislatures have in our time but little habit of initiative. They have to be forced into action by popular uproar; they will not be forced into it by the representations of their own dependents or subordinates. Whenever we set up official inspecting machinery, we find that, as a general rule, we simply add to the number of officers whom we set reporters to watch and denounce. The great defect of this system is, of course, the difficulty of keeping the newspapers well informed, or rather, of giving newspaper utterances proper authenticity, and any body of citizens which undertakes this duty certainly renders one of the most valuable services that can be rendered to the community by volunteer effort. The chief danger of our politics is the growth of apathy among those who have high ideals of government, and the tendency of this class to abandon in disgust all attempts to improve administration in any department. The one mode of overcoming this which the newspapers have yet discovered is exhorting business men to attend primary meetings, which it is now well settled that business men in the great cities, at least, will not do. If it were possible to do for other fields of State administration what the State Aid Association proposes to do and is doing for the public charities—that is, to send corps of competent volunteer inspectors into every public office to report to the public on the manner in which its business is conducted—the result would be, we have no doubt, a great purification. Of course it is not possible; but with regard to the care of the sick and poor and insane it is possible, and it would be very unfortunate, we think, if the services of any body of men or women public-spirited enough to see how these classes were treated "inside politics" were rejected.

THE FRENCH ELECTORAL REFORM.

IN the form of a simple change in the method of elections a subject is now agitating France which involves the most important consequences to the politics of the country, and presents the most interesting questions in constitutional government. In a short time Parliament is to decide between the *scrutin d'arrondissement* and the *scrutin de liste*—between the present system of elections, by which the members of the Chamber of Deputies are chosen by *arrondissements*, or districts, each elector voting for a single candidate; and the proposed system, under which the departments will become the electoral units, and each voter will cast his ballot for a number of candidates. A parallel case in the United States would be to change the method of voting for members of Congress so as to require them to be chosen not by districts but by States on a single ticket, in the same manner as Presidential electors.

A change like this would obviously be one of the greatest moment, and it is a matter of considerable interest to follow out its probable consequences in French politics. The first and most evident result would be greatly to strengthen the Republicans in the Chamber of Deputies. As there is no provision for minority representation, naturally the larger the voting units the smaller the chance that a party decidedly in the minority would get itself represented. Some departments would doubtless be wholly reactionary, but where there are now perhaps three Bonapartist deputies to four Republicans, under the proposed system the Opposition would be wholly without representation. A result like this, according to English or American ideas, would be a plain injustice; but such has been the political education of modern France that the question of justice and of the rights of minorities seems hardly to have come into consideration at all. This, however, is not the only way in which the vote by departments would enable the Republicans to increase their majority in Parliament. As is most frequently urged by supporters of the change, the question would then become one of principles and not of persons. At present it often happens that a popular man of the district—the large proprietor, the local lawyer, or, perhaps, the local doctor—is sent to Paris, whatever his political opinions, by reason of his personal popularity or influence; and among these rich local magnates are very likely to be found men hostile or indifferent to the Republic. Then, too, where, as in France, there are some five hundred and thirty electoral districts, local and personal considerations would in any case have a great importance relatively to national ones; and this importance they will lose if a number of such districts are brought together into one. The ordinary voter who has to cast his ballot for some half a dozen candidates, living perhaps in distant parts of the country, is not likely to know much about them. He will vote for the names recommended to him; and in the great majority of cases a "straight ticket" will be elected. Thus the Republicans will not merely free themselves from hostile local influence, but as soon as the question is put in this form—as one of principles and not of persons—there will be a clear gain to them, because they alone can offer any positive, intelligible programme to the country.

The fact that the Republicans would gain in Parliament at the expense of their opponents would probably, however, be one of the least important results of the electoral reform. Their majority is already large enough, if it were of the right sort. But, made up of a number of

groups, obeying no common leader, united by almost nothing, it is not a body with which much can be done. The great result of the vote by departments would be to render this majority, what it is so far from being now, homogeneous. The *scrutin de liste* would establish something like party discipline. Under that system the candidates, personally unknown to the mass of the voters, unable to rely on popularity or influence to secure election, would be forced to obtain recognition from the party leaders, and in doing this they would put themselves under a certain obligation to give them their support. At present where a candidate offers himself to a district simply in a general way as a Republican, there is no security as to what course he will take in all practical questions with regard to the Government. But if, as would doubtless be the case in the election by departments, there are "regular" candidates presented by the party, or by somebody representing it, there will be a tendency to drive every one seeking election into the position of a supporter or an opponent of the party leaders. A ministry then coming into power would find itself backed by a strong and compact body of followers, a thing which no ministry under the Republic has had yet. Such, there is little doubt, is the kind of support M. Gambetta is awaiting. As the one powerful statesman of France, the only politician with any real hold on the people, it is not surprising that he holds back from wasting his strength, or, as M. Grévy has put it, from "wearing himself out," in a struggle with difficulties which are due very largely to an artificial, undeveloped political system.

Those who have read Mr. Bagehot's book on the English Constitution will remember the striking prediction there made, that, in a parliamentary government with ministerial responsibility, the ministry, if it were not to have the power of dissolving Parliament, would be completely unstable, changing with every fancy of the legislature. This prediction has certainly been confirmed in a manner sufficiently remarkable under the French Republic, and it is a matter of the greatest interest to notice that precisely this defect in the French parliamentary system is likely to be met by the change in the method of elections. There will then be something like a reciprocal responsibility between the executive and the legislature. The executive will be provided with a weapon with which to defend itself. An English ministry, deserted by some of its supporters and defeated in Parliament, has the power to force them, by appealing to the people, to go before the country as its opponents. So a French ministry, under the vote by departments, composed, as it naturally would be, of the leaders of the party, would have a similar way for maintaining discipline among its adherents, as it would be able in a general election to remove their names from the party lists and force them to stand as opponents. By thus going behind the deputies to the people, it is plain that the power of the executive is increased, while at the same time that of the legislature is diminished. At present, where the deputies before their election need commit themselves to nothing at all so far as practical politics is concerned, they hold in their own hands a power which they may use as they please. The authority of the people is delegated to them. But where, on the other hand, a government or a committee representing the party presents and recommends its candidates, and the individual voter casts his ballot for a number of such candidates because they are so recommended, it is obvious that the deputies elected are no longer free to do as they please, but a considerable part of the popular authority has been delegated directly to the government or the party leaders. In this one sees at once there is something very like "official candidature." The term is, of course, an unpopular one, but the thing itself, in the present condition of France, may not be mischievous. The real point of the matter is this: the ministry, which in France far more than the President is the real executive, would remain in theory responsible to the legislature, but in reality it would, in all ordinary times, be responsible only to the people. The Chamber is renewed every four years, and at every election the question would come before the country whether this leader or these leaders should be kept in power or not. That question would be decided by the people, and not, as now, by the Parliament. The power would be conferred on the Executive by a sort of *plébiscite*, not indeed without a resemblance, and that an essential one, to the *plébiscites* of the Empire. Nevertheless, the power of the French Executive would then be very nearly what the framers of the American Constitution intended to give to the President of the United States. There would be a strong directing authority in the Government, one very nearly sure to remain undisturbed for a given term, and able, consequently, to pursue a firm, consistent, and far-seeing policy. In France, it is true, the Executive would possess a very considerable influence over the legislature, and this power does not to-day belong to the President of the United States. But it is by no means certain that some such influence was not contemplated by the framers of the Constitution when they provided that the President shall "recommend" to the consideration of Congress "such measures as he shall judge necessary and expedient."

Whether this most important electoral change is likely to be adopted it is at present impossible to say. Its success is doubtful. Nevertheless, it is known to be the scheme of M. Gambetta, and M. Gambetta, as a practical "opportunist," and a man possessed now of a power very largely due to the fact that nobody has found out its limits, is hardly likely to incur defeat. It is with reference to this statesman that the projected reform must be looked at. Advocates of the change are in the habit of saying, with a good deal of sense, that it must be considered not as a theoretical question but as a practical one; public opinion, they say, demands that M. Gambetta now take power, and this is to prepare the way. Certain it is that the political system of France, as it is now, provides no place for a really strong executive. Neither president nor prime minister is possessed of a power anything like equal to that of Mr. Gladstone in England. Such cannot be considered a normal state of things in the French Republic. The same conditions which demand a strong executive in the other great Powers of Europe will, in the course of time, require one in France. In M. Gambetta the man is already there; it remains to provide the place. The method which has been adopted for this is not without serious objections; but in that it produces the greatest results with the least labor and the least apparent change, it may well be considered masterly. For the mass of the people the whole matter is settled by a statement, the truth of which is perfectly obvious, that the proposed system, by putting the great questions directly before the voters, will be a change in the interest of democracy. Others are satisfied that the reform is republican because the election by Departments was the method adopted after the revolution of '48, while the election by districts has been the method of the monarchies. The attempt to establish the *scrutin de liste* does not come from the men of theories, but, what is rare in France, from men endeavoring to meet the actual exigencies of politics, and as such it has all the appearance of a movement in the direction of healthy, substantial growth. If it succeed, it will mark the entrance on the scene of strong ministries, something which the Republic has not yet had, and if M. Gambetta then takes power under a Chamber elected by the vote of departments, we shall see a new vigor and life in French politics. The *République Française*, the organ of M. Gambetta, has, most significantly, pronounced the *scrutin de liste* "at once the prerequisite and the instrument of all other reforms." "What we want," it has also said, "is action, incessant action. Who will tell us to stand here another four years with folded arms, watching the water flowing under the bridges, and doing nothing?"

THE "ŒDIPUS TYRANNUS" AT HARVARD.

FOR the hundreds who were present at the Sanders Theatre on Tuesday night, or who will witness the subsequent performances of the "Œdipus Tyrannus" at Harvard, there are thousands of the readers of the *Nation* who have followed the undertaking in thought, and it is for these lovers of classical study that I write. Not that I intend to go into an analysis of the play itself, for if any work of tragic art has been carefully studied it is the "Œdipus," and it would seem almost impossible to indicate one novel point in plot, in dialogue, or in chorus. Nor shall I consider here the conditions of the performance, although such a study might have some interest as an independent attempt to solve the problem of setting the antique "Œdipus" on the modern stage, but it would be more modest, and certainly far less dangerous, to learn the limits of the undertaking from the accomplished scholars who have had the matter in hand than to frame a speculative scheme on the possible. What I desire to say now, in connection with this enterprise, has a wider scope. The project itself is a matter of so much interest to all students of classical antiquity that even those who are slow to emerge from the still air of the teacher's life can hardly resist the temptation to tell a larger public why the Harvard play, which is an incident to so many, is an event to

us, the issue of a long preparation and the promise of a better future; and I hope I shall be pardoned for taking the "Œdipus Tyrannus" as an illustration of the advance which has been made in America within the last thirty or thirty-five years in studies which are classed by some ignorant or narrow people as non-progressive. Though a pessimist in all else, a man cannot be a pessimist in his calling, unless that calling be pessimism itself, and then it is a trade and not a calling. So, whatever else I may have despaired of, I have never despaired of the permanency of the ancient classics as an integral part of our civilization, and I think that Mr. Carlyle's testamentary provision as to the lapse of his classical bursaries was needless. Is there a decline in this country? The answer depends on the point of view. Less Latin may be quoted—quotation as a fine art is dead even in England; there are fewer allusions to mythology; our politicians do not stuff their speeches with Greek and Roman worthies; but there is a far better appreciation of Latin and Greek than there ever was before. People do not study Latin now because it is the source of "all the elegant expressions in English," as the young Princess Victoria did, nor Greek chiefly to read the New Testament in the original; and despite the tendency to make a classic author a stalking-horse for bringing down tough etymologies and netting queer constructions, there is a much closer study and a much truer appreciation of the literary art of antiquity now than at the time to which I refer; and this is shown signally by the very drama which everybody is talking of to-day.

Signally by the "Œdipus," because the "Œdipus" was and still is for the majority of college-bred men the play by which Sophocles is chiefly, if not solely, known. Of late years the repertory has been enlarged. The triad of "Prometheus," "Œdipus," and "Medea," by which Æschylus, Sophocles, and Euripides were once regularly represented, is not so stable as it was; and yet the statement will hold good. Why this prominence of the "Œdipus"? The fame of the piece in antiquity? The dictum of Aristotle? Certainly not the theme, unless we can see in the articulation of the play a certain affinity to the grimness of the American temper, which delights in the mechanical evolution of mischief. One should think that the "Antigone," the "Ajax," would be better adapted to the youthful mind than this dread tale of involuntary parricide and unconscious incest, this fearful self-immeshing of an heroic nature in the toils of doom. There is no chorus in the "Œdipus" that appeals to the young heart like the Eros chorus in the "Antigone," and boys hold their breath as they read the last words of Ajax. But in the divorce of scholastic training from real life the theme made very little difference to our fathers. I have recently read that, in a certain French Lycée, Petronius, or some similar classical impropriety, used to be a prize book. For that matter, the second Eclogue of Vergil is still read in schools. But it is not only the unreality of the method of study that neutralizes any bad effect: true poetry purifies of itself. It is only when we attempt to interpret these things to others that we feel the difference of the modern atmosphere. Last summer I was in the Gaiety Theatre waiting for the curtain to rise on Sarah Bernhardt's *Phèdre*, when a man took a seat by my side and asked me if I would have the kindness to give him an outline of the play; he knew no French, had no notion what it was all about, and wanted some clue to guide him in his admiration of the great actress. Often as I had read the "Hippolytus" and the "Phèdre," I felt for the first time the difficulty of putting the matter in such a form as not to shock myself by the crudeness of it. So the prose story of Œdipus is not easy to tell. It does not fit into a 'Wonder-book for Boys and Girls.' But the play still holds its own in instruction. It has always been a favorite despite the theme, and it was this popularity that gave it a place in the 'Græca Maiora,' which was the advanced reading-book in most American colleges for nearly half a century. I have the copy used in my college days before me now as I write. It is the fourth American edition (Boston: Hilliard, Gray & Co., 1839). Such a book could not get itself printed in America now. Shall I say because it is too learned? It is certainly a strange contrast both in cumbrousness and in crudeness to what is current to-day. The commentary is not bad reading to any one who has an interest in the development of study. It is so much behind the time in which this edition was printed that it seems incredible that the book should have held its ground into the second half of the century. I have a certain affection for it; the selections are fair, and it is pleasant to read the compliments to Porson, the reflections on Brunck's audacity, and the cautious references to that flagitious innovator Boeckh. But just now I am interested in trying to represent to myself what image of the "Œdipus Tyrannus" was possible to any youth whose chief reliance was on such a text-book. There is no attempt to develop the plot, none to give any notion of the Greek tragic art. This was supposed to be the duty of the *præceptor diligens*, who is first to learn all about it from Aristotle's 'Poetic,' Mason's 'Elfrida and Caractacus,' Brumoy's 'Théâtre des Grecs' and the 'Voyage du jeune Anacharsis,' and then to impart his knowledge "*viva voce* to his disciples." Instruction in the metres is limited to the iambic, trochaic, and anapæstic verses. The choral rhythms are judiciously passed by. The knotty passages are explained fairly enough, all things considered; but what was the total effect? I verily believe that those of us who had any knack at verse would have thought it no profanation to turn the dialogue into rhymed decasyllabics. Impossible! What is impossible? The feat was performed only last year in Ohio. As for the choruses, they were considered wilful puzzles, to which the Oxford translation, which circulated surreptitiously, gave a very uncertain clue. A "widower bull" and an "enigmatical bitch"—the latter unconventional turn being delicately relegated to a foot-note—were the most vivid figures in the phantasmagory that did duty for the true "Œdipus." Of course most of us felt that there must be poetry there, but the admiration was induced.

My contemporaries may have been more fortunate than I was, but I think that I represented the average lad of the average American college in the fifth decade of the century. The change that has come over our classical study since that time is due to German influence and German training, which were then but feebly felt except at the great centres; and this is a debt which we must not forget even now, when it is our right and our duty to assert a certain independence of judgment, and dare to think for ourselves and investigate for ourselves.

Sophocles is the favorite of the Germans, and it is possible that they have loved him too minutely. A subtle plot like that of the "Œdipus" may be dissected into filaments so fine that the threads will cease to hold. The tragic irony may be so magnified by the microphone of "sympathetic" criticism that the whole play will be a concert of diabolical fleers and flouts. But the deeper the study of Hellenic art, the stronger the conviction that the whole organism is permeated by thought transmuted into feeling; and, on the other hand, the closer the observation of the actual human life, the surer the certainty that the poet's vision and the world of fact are, after all, one. However, the gain of classical studies in America has not been in this direction only. Our progress has been great in the appreciation of form. I am not going to enter upon the subject of pronunciation, though I consider the ejection of the English sounds a great gain; but there are other points in which the progress is less open to cavil. The very words of the Greek language, thanks to the advance of etymological study, glow and glitter as they never did in the olden time, and the Greek chorals sing themselves to us with a music which had been asleep for centuries. We cannot reproduce every detail, but we know enough to discern the principles of a noble harmony. The choruses are no longer straggling centipedes, with every foot different and no forward motion in any, but rhythmic pulses changing their beat with the shifting tides of passion. Nay, even the dialogue masses and deploys itself—not in mechanical puppetry, yet not without law. In the architecture of the drama as a whole it is, of course, possible to carry the study of proportion into absurd detail; but, as it is hard to overestimate the subtlety of the Greek sense, we do not go far wrong in the processes by which we unfold the implication of their works of art. We are only giving mathematical expression to an instinctive jet How much of this advance has made itself felt in the performance of the "Œdipus Tyrannus" at Harvard is known by this time. Something more is expected than the vivid representation of the tragic power of the play. That power could not fail of manifestation by coarser means. Whether the rarer and subtler elements can be fixed by the actualization of the stage is the difficult problem. At any rate, the experiment could not have been in better hands.

B. L. G.

BISMARCK'S STATE SOCIALISM.

BERLIN, April 29, 1881.

OUR home policy is still moving in the same vicious circle of paternal socialism inaugurated by the indefatigable Chancellor. His schemes and experiments, widened or limited, withdrawn to-day and remodelled to-morrow, according to the want of the hour, more and more develop themselves as a means of overawing parliamentary opposition and of controlling the next elections. "The plans of Prince Bismarck," said an American gentleman to me the other day, "are very interesting and instructive, but I am glad they are not tried on my country and my people." The gentleman is right; it is the misfortune of the German people that it must suffer as the *corpus vile* on which the state socialistic experiments are made. All these different schemes steer in the same direction. They differ only in the one respect, that some of them sail under the flag of "protection of national labor," while others pretend to look out for the interest of the poor man—the same poor man whose shoulders have just been burdened with heavy taxes on bread, lard, and other necessaries of life. The mere mention of the most important measures which have already been carried out, or are announced as impending, will give an idea of the great revolution which our economical and social state is undergoing. First, the purchase of the railroads by the Government; next the threat of the tobacco monopoly, which will ruin a flourishing manufacture by which half a million of industrious people are maintained. Then comes the new bill forcing every laborer to insure himself against accidents, which kills all private insurance and makes the Government a huge insurance company. In the background stands Bismarck's proposal to turn over to the Government the care of public instruction and the maintenance of the public schools; and

last, not least, the idea of taking from towns and cities the care of the poor and making the Government a great almshouse. Thus one wild socialistic scheme engenders another; and, what is still worse, the attacks of the Chancellor are not directed against weak and languid private enterprises, but against well-constituted organisms full of vital power and health.

In token of the energy with which Bismarck enters into the coming campaign I translate a few passages from yesterday's article in his official paper, the *Provincial Correspondence*, of which about 200,000 copies are gratuitously distributed in even the remotest village of the Empire. Under the heading, "The Poor Man's Attorney," it says:

"Thus far neither the farmer nor the workingman, with his complaints, interests, and wants, has ever found a sufficient representation in Parliament. It is a matter of course that, occupied as they are by their care for a scanty living, they do not understand how to secure for themselves a representation and a hearing. They confide their wishes to others, perhaps to parliamentarians by vocation, who under the influence of parliamentary routine have a single eye for party politics, instead of looking to them for the ways and means by which to obtain redress for the legitimate grievances of farmers and laborers. Besides such bogus attorneys as the Party of Progress or the Social Democrats, who use the poor man only as a means of gaining political ends, there has not been a single man in the popular representation who has interested himself in the economical condition of the poorer classes, who has tried to penetrate into its causes and has laid it open to the public, because all representatives care above all for their personal and party interests.

"For this reason Prince Bismarck has made himself the attorney of the poor man, and has pledged his powerful influence, not for party purposes, but for the good cause itself. In his late speeches he has elucidated the misery and distress in all its phases, and clearly demonstrated the task involved in alleviating the troubles of the poor. He has laid his finger on the wound of our public life, and shown up the state of things, the natural development of which depends upon the 'aller and laisser-aller' doctrine which has hitherto prevailed.

"Prince Bismarck is looking out for the interest of the poor man, whom he will protect against the Party of Progress and its pernicious [free-trade] doctrines. He has made this care the last great object of his life. Opinions about the means proposed by him may differ and fluctuate among the parties, but this unsettled state and uncertainty of the public mind will not mislead the Chancellor nor turn him from the end which, after deep reflection and fervent conviction, he has proposed to himself. It is his imperative duty to take into his hands the interest and care for the needs of the poor man, thus preserving the basis of the state from convulsions by storms, which inevitably will set in if the duties of practical Christianity towards the poor be set aside."

It is useless to refute these glittering generalities, in which all political parties are equally condemned, but, as far as the Liberals are concerned, the falsity of the charge is proved by the work of our legislative bodies since 1867, as a glance at the statute-books will show.

The Chancellor wages and must wage this war in order to obtain new sources of income. All his plans are but promissory notes, for the payment of which the necessary funds must first be raised. With his attacks, therefore, on the one side, correspond his cajoleries and temptations on the other. In order to win over the middle classes, who do not belong to the manufacturing or landed interest, he holds up to them in the most flattering colors the blessings which the new tariff and tax laws will spread over the country. As you know, Bismarck is not at all a fastidious man. Without being solicited he voluntarily offers his protection to our merchants. Last year he wished to benefit them with a *surtaxe d'entrepôt* and a *surtaxe de pavillon* against the competition of England, France, Belgium, and Holland; but the representative bodies of our seaports politely begged to be left alone, and thanked him for the bait thrown out to them. Lately a memorial has been submitted to the Reichstag specifying the rich subsidies and government bounties which France and other nations bestow on their mercantile marine. In conclusion, it seriously puts the question—"if it does not deserve earnest reflection, whether under the present circumstances German navigation and trade will be able to thrive and to compete with those of other nations aided by state subsidies?" Apart from being a dull repetition of old exploded French blunders—viz., of inveterate belief in the efficacy of state assistance—this official document is of a very poor character, full of mistakes, ignorant of and crowded with distortion of the most palpable facts. I do not understand how the name of the Chancellor could be affixed to such a superficial and light compilation. After having given a translation of the French law of January 29, 1881, for the encouragement of French merchant-shipping, which, as is particularly urged, was passed on the initiative of the legislative body, the document enumerates the different bounties. Thus, the premium on ship-building will for the first two or three years amount to 4,438,000 francs a year, and afterwards to 2,000,000 a year. The navigation bounty to be granted, during the next ten years from the date of the publication of the law, to all French vessels, sailing or steam, will burden the French treasury with 74,600,000 francs, while for mail contracts it pays yearly 23,782,393 francs. This foolishness and absurdity, contrary to sound finance and common-sense, is praised by the German memorial as a patriotic magnanimity, which will double and treble the amount of French shipping and carrying trade. It would have been better for the compiler if he had studied the subject he is speaking of. Thus, he does not know what *petit* and *grand cabotage* is, and confounds the most elementary terms. England is put down for £641,656 paid in 1879–80, by the Postmaster-General, to the different steamship lines; Italy for 8,234,995 lire; Austria for 4,348,088; Belgium for 661,497, and Holland for 265,200 marks; while, on the other hand, Germany pays for postal freight, forwarded by her steamers, only 200,000 marks. The passage concerning the United States I translate verbally. It shows a great mixture of fact and fiction:

"As far as the United States are concerned," it says, "we refer to the act of 1872, by which for five consecutive years a yearly subsidy of $10 per ton may be granted to the builder of large foreign-going ships. [I have searched in vain in the Statutes-at-Large for such a law and have never heard of it. The memorialist has evidently drawn from a French source.] For mail contracts the United States in one of the past few years paid $196,684. Since then, by resolution of the Senate Committee on Post-offices and Post-roads, an amendment has been adopted [the original says 'aufgenommen,' which is nonsense], according to which one million of dollars has been granted for the establishment of American steamship mail lines. [Since when can the United States Senate alone make laws? Besides, a false statement is in this instance circulated under the signature of Prince Bismarck. The memorial is right in saying that the just-mentioned committee adopted an amendment to the Post-Office Appropriation Bill, allowing one million of dollars for additional postal service to foreign countries, to be expended under the direction of the Postmaster-General in the establishment of (Brazilian and Pacific) mail steamship lines; but he omits to add that in the sitting of February 14 the Senate, by the decisive vote of 34 to 14, tabled this amendment of its committee.] More ample governmental measures," the paper concludes, "for the protection and reanimation of the American foreign-going mercantile marine must be expected in consequence of the plan which in January last Senator Blaine, since appointed Secretary of State, expounded to the Senate in Washington." [This calls for no comment.]

Now, the German shipping merchants, who, as Bismarck said the other day in the Reichstag, carry on a noble but very egoistic business, know a little more about their own interest than the Chancellor. Above all, they know that the French mercantile marine is in a state of constant decadence; that the ship-building yards lose their importance every year, and that if the existing system of state bounties continues France will soon be without any foreign-going mercantile navy other than her subsidized postal lines. Instead of having reached a higher state of development the French navy has decreased every year. In 1872 it reckoned 1,089,600 tons, but in 1879 only 932,000 tons, while within the same period the German mercantile marine rose from 988,690 to 1,129,129 tons. Our most important seaports are Bremen and Hamburg. Whatever jealousies may prevail between these two noble old Hanse towns on minor points, in the main point they both agree, and ask nothing from the Government but that they may be let alone in their business. As a sample of their opinion in this respect, I give you the answer of the largest German seaport, that of the Hamburg Respectable Merchant ("der ehrbare Kaufmann"), as this representative body is called in the terms of the old guilds. It has just been published, and reads as follows:

"Thus far German commerce and navigation have been able to compete with those of other nations, and their present strong position is chiefly due to their own exertions. Even if the French Government should extend larger monopolies and subsidies to their national trade and commerce, the Hamburg shipping merchants are not afraid that, if let alone, their own development would be injured or suffer under such adverse legislation. The growth and prosperity of national trade are, before all, created by the natural talent and disposition of a people. Governmental measures, whether they consist in throwing artificial obstacles in the way of foreign competition or in direct support of the national flag, may here and there bring temporary advantages to individual enterprises, but they will never be able permanently to raise and elevate the shipping interest. On the contrary, as experience has shown in France, they paralyze individual energy and endanger the spirit of enterprise, and effect the decline, if not the ruin, of trade. In the interest of German commerce and of the national flag, the Hamburg merchants most earnestly and respectfully pray that all governmental measures for their protection be definitively set aside."

With this dignified answer of Hamburg to the temptations of the Chancellor all our seaports on the Baltic and North Seas agree, with the sole exception of Papenburg, a small and shiftless Oldenburg harbor, which in Germany holds about the same rank as Egg Harbor in the United States. As long as this spirit prevails among the German merchants they will be able to hold their own against French or any other enterprise, both state and private combined. ??

Correspondence.

ALLEGED EXTRAVAGANCE OF THE LEGISLATURE OF MARYLAND.

To the Editor of The Nation:

Sir: In the *Nation* of the 5th inst. you have given an importance to a

pamphlet issued by so-called reformers which a few words of explanation will convince you was undeserved.

In the pamphlet the legislative expenses are set down at		$133,862 01
But you were not informed that of this sum the per diem and mileage of members were provided by the constitution, and amounted to	$57,767 00	
That the unavoidable expenses of an impeachment trial of a judge amounted to	2,331 40	
That the fees of counsel in contested election cases amounted to $432, and expenses of testimony in same to $173	605 00	
That postage, etc., always allowed to members, was	5,729 73	66,433 13
Reducing the alleged extravagance to		$67,428 88

From this sum must be deducted the necessary expenses for officers of both houses, clerks of committees, pages, and I will leave you to set the value and expense of these from comparison with similar items in the legislature of any State, and the remainder will truly measure the extravagance of the Maryland Legislature of 1880. It is proper to add that the "legislative printing" is done under a law which fixes the amount for which all printing of both houses shall be done, and the sum of $38,000, for this purpose, will compare favorably with the same expense in any other State. The *publication of the laws* is also provided by law, and was shared in by the newspapers now engaged in reform without discovering that it was an extravagant expenditure for making known to the people the laws passed by the Legislature.

The hollow pretence of this cry of reform in Maryland would be apparent to you if you knew the facts—that the engineer and stoker on this reform train have been for years notorious in this State, not for purity in politics but quite the reverse, to say the least. That one of them—they are but three—when a member of the Legislature, charged and was paid thirty dollars for serving as President *pro tem.* of the Senate; also that he received extra compensation of one hundred dollars, and also received $50 for serving on the Engrossing Committee; and these are the charges he now prefers against the Legislature of 1880. It is not necessary to wash this dirty linen any further, and I should not have done it so far but for the fact that the *Nation* circulates very largely outside of Maryland, and the importance you have given to this matter may create an erroneous impression against a State which stands pre-eminent for the integrity of her public officers, for the low rate of her taxation, and for the further fact that the managers of the Democratic party have never been charged, even, with misappropriating one dollar of the public funds.

A Constant Reader.

Baltimore, May 10.

THE BESSEMER STEEL "MONOPOLY."

To the Editor of The Nation:

Sir: In number 826 of the *Nation* your correspondent, "Como," calls attention to certain "facts" in regard to what he calls the "Bessemer Steel Monopoly." He states that the Bessemer steel industry in this country is doubly protected: in the first place, by the Government, which is the truth; and in the second place by a number of patents held by the Pneumatic Steel Association, which is not the truth. Had "Como" been in the least familiar with the subject about which he attempts to inform the public, or had he taken the trouble to enquire into it, even in the most superficial manner, he would have seen his doubly-protected monopoly to be a myth. There is, at the present moment, in active operation in this country a company for the manufacture of Bessemer steel which does not belong to the Pneumatic Association. I allude to the Bessemer Steel Company of Pittsburgh, whose works are at Homestead. Besides this there are numerous other Bessemer steel works projected which are to be entirely independent of the Pneumatic Association. In fact, the manufacture of Bessemer steel is as free in the United States as the manufacture of cotton cloth, and if Mr. Thurber, or "Como," or any one else wishes to risk his capital in this industry he is at perfect liberty to do so.

If "Como" would take the trouble to verify his "facts" before giving them publicity his information would be more valuable.—Yours truly,

E. C. F.

Harrisburg, Penn., May 10, 1881.

THE BOSTON "ADVERTISER" AND OUR EXCELLENT CIVIL SERVICE.

To the Editor of The Nation:

Sir: As a conspicuous expression of the stupidity that prevails with respect to our civil service and the commonest elements of political economy, even among those who are in favor of civil-service reform in general, but seem to be always opposed to "this particular measure," I send you the enclosed paragraph, cut from an editorial in the Boston *Advertiser* of the 10th inst., on the subject of "Reforms in Russia":

"The system of making appointments is admirable, much better than ours is, and yet the civil service of Russia is very bad, *while ours is as good as are the German and the English.* And in reforming the civil service of any country the main duty falls upon the executive, not upon the legislature, while a bad civil service is felt more keenly by the administration than by the legislators and the people. For a bad civil service means stealing, and *the money stolen is not taken from the people, but from the public purse.*"

This in the face of all the humiliating exposures of recent years, and of the scandalous revelations that are even now being made in the Post-Office Department. W.

Roxbury, May 12, 1881.

[Our correspondent must not be discouraged. The defenders of the spoils system are growing more moderate in their assertions, because the late Senator Morton, soon after he had put Tyner and Brady into the Post-Office, which he held as a sort of fief, declared that ours was "the best civil service on this planet." Saying that it is only as good as that of England and Germany is, therefore, a distinct descent. "W." must also remember that though this kind of assertion will continue to be made till the end, the number of those who are aware that a person who makes it simply displays his own ignorance of his subject is rapidly increasing.—Ed. Nation.]

MR. VENNOR VINDICATED.

To the Editor of The Nation:

Sir: I think fair play requires that any prophet, and especially a weather-prophet, when his predictions appear to have failed, shall be heard in explanation of the failure, and have an opportunity of showing, as may often be done, that the seeming contradiction between prophecy and fact is in reality no contradiction, but agreement of the most illustrious character.

It is in this view that I think it worth while to call attention to the graceful and unanswerable method adopted by Professor Vennor to meet the questions of friends and the scoffs of unbelievers as to the apparently disastrous break-down of his forecast of "balmy, spring-like weather" during the protracted thaw which we were to have had last January and February. The writer of the note on this subject in your number of May 5 can hardly have noticed the Professor's letter which appeared in the daily papers about the 1st of March. It was there plainly set forth that the bitter coldness of the weeks which should have been "balmy and spring-like" only confirmed the predictions with new and impregnable proofs; for it was a part of the general scheme that this ethereal mildness should be preceded and followed by excessively cold weather; and this was, in fact, experienced, only in even greater abundance and power than Professor Vennor himself had anticipated, so that the warm weeks were "*crowded out*" (I use his own expression) by the extreme and unlooked-for cold.

There has rarely been placed before the public a more triumphant vindication of an unjustly-criticised public man, or a brighter illustration of George Eliot's remark that "almost any difficulty can be met if one only takes broad enough ground."—Yours for Fair Play.

Chicago, May 10, 1881.

MR. JOSEPH COOK'S EXPERIMENT WITH ALBUMEN.

To the Editor of The Nation:

Sir: Mr. Joseph Cook's alcohol-and-egg experiment was first performed by him at one of his Monday lectures in Boston. The neatest answer to it for the unscientific mind is the fact that hot water produces the same effect upon the white of an egg that alcohol does; and that, by the same process of reasoning employed by Mr. Cook, the baleful effects of drinking hot tea and coffee might be inferred.

I am surprised that so careful a journal as the *Nation* should speak of "the Rev." Joseph Cook. Mr. Cook, though he has received a theological education, has never been ordained, and his position in the Church is that of a layman. Pelican.

Atlanta, Ga., May 14, 1881.

Notes.

A FRESH imprint of Wallace's 'Russia' by Henry Holt & Co. doubtless answers to an increase in public curiosity concerning that disordered country.——A. D. F. Randolph & Co. announce 'The Mosaic Era,' lectures by

Dr. J. Monro Gibson.——J. W. Bouton will publish next month 'Evenings with the Skeptics; or, Free Discussion on Free Thinkers,' by the Rev. John Owen.——The April number of the *Library Journal* reports in full the conference of librarians at Washington last February. Dr. S. S. Green's report for the Committee on the Distribution of Public Documents, though somewhat inconclusive, is valuable for its suggestions; and there is novelty in the chief recommendation of Mr. Charles Warren's paper, "The Place of Libraries in a System of Education."——The usual summary of Proceedings of the American Philological Association has appeared for the July session of last year. Individual systems of phonetics are tolerated in Prof. Haldeman's "Note on the Invention of Words" and in Prof. March's contributions —the latter employing a special alphabet.——The Saratoga papers of 1880 are continued in No. 13 of the *Journal of Social Science* (March, 1881). The two most significant are Dr. Henry Hitchcock's "Modern Legislation touching Marital Property Rights"—the amelioration of which for women he traces first in this country to Mississippi—and Mr. E. M. Hartwell's "Study of Anatomy, Historically and Legally considered." In liberally legalizing dissection Massachusetts anticipated "all English-speaking states." ——We have received a prospectus of the Metropolitan Coffee-House Company (limited), among whose incorporators are Dr. J. G. Holland and Mr. F. B. Thurber. But what has become of the New York Coffee-House Company started a year ago with half the capital proposed by the Metropolitan? (See the *Nation*, vol. xxx., p. 194.)——Two letters addressed by Prof. Wm. H. Brewer, President of the New Haven Board of Health, to the Court of Common Council of that city, are stimulating reading. One shows how much has been done in eight years to reduce the local death-rate; the other, how disastrous a single epidemic may be to the material prosperity of any community. Prof. Brewer cites the damage to New Haven itself from its one visitation of yellow fever eighty-six years ago.——The annual report of the Boston Record Commissioners proves that their important labors have been very inexpensive to the city. The demand for their publications has been unexpectedly large, and has led to reprinting and stereotyping.——An extremely interesting essay on Mexican Paper, by Dr. J. J. Valentini, and Notes on the Bibliography of Yucatan and Central America, by A. F. Bandelier, are the salient features of the contents of the current Proceedings of the American Antiquarian Society (volume i. No. 1). ——The last Bulletin of the American Geographical Society contains Commander Bartlett's paper on "Recent Investigations of the Gulf Stream by the United States Coast and Geodetic Steamer *Blake*." A chart of the Gulf of Mexico and the Caribbean Sea accompanies it. Noteworthy is its incidental comparison of the method of deep-sea sounding now in vogue with that depended on thirty years ago, in point of accuracy.——Both a personal and bibliographical interest attaches to the tribute to the late Mr. George Wymberley-Jones De Renne, of Savannah, conveyed in Dr. Charles C. Jones, jr.'s, Anniversary Address to the Georgia Historical Society, delivered in February and now published as a pamphlet by the Society. His private editions of old and new historical documents bore the imprint of his estate, Wormsloe, on the Isle of Hope, and were extravagantly limited in the number of copies.——The beautiful little book of *ballades* which Mr. Andrew Lang put forth a year or so ago has reached a fourth edition, and has grown until it is now 'XXXII. Ballads in Blue China' (London: Kegan Paul; New York: Scribner & Welford).——Volume two of the English theatrical yearbook, 'Dramatic Notes' (London: Bogue; New York: Scribner & Welford), has appeared. Mr. Charles E. Pascoe has resigned the editorship to Mr. William H. Rideing, whose name is familiar to American magazine readers. We have marked an occasional slip, but, on the whole, Mr. Rideing's work is very well done. A list of new plays and important revivals, with the cast of characters, enhances the usefulness of the appendix. 'Dramatic Notes' has not the elaboration or the material of the French theatrical annuals, but it has the advantage over them of being cleverly illustrated by Mr. J. W. Wilson, fifty-two of whose pen-and-ink sketches, some of them full-page, adorn the little book.——Prof. E. Sievers, of Jena, the author of the 'Physiology of Sounds' ('Grundzüge der Lautphysiologie'), the introductory volume in Breitkopf & Haertel's collection of Indo-European grammars, is preparing for early publication in Braune's Grammar Series a new Anglo-Saxon Grammar. Simultaneously with the German, an English edition—Sievers's own translation—will be issued, for which B. Westermann & Co., New York, and Dulau & Co., London, will be the publishers in connection with Max Niemeyer, Halle, who will print both the English and German editions.——An unworthy literary fraud has recently been perpetrated in Germany by Waldemar Kaden, previously known by his sketches of travel in Italy, in his book entitled 'Unter den Olivenbäumen' (Leipzig, 1880). The work contains translations of forty-four popular tales, collected, as the author says, by himself during his journeys in Italy, but which in reality are simply taken (with one exception) from the collections of Imbriani, Comparetti, and Pitrè, noticed from time to time in these columns. The 'Fiabe, Novelle e Racconti Popolari Siciliani' of the last-named collector alone furnished thirty-four, and it is greatly to be regretted that his indefatigable and self-sacrificing labors should meet with anything but the heartiest recognition and widest publicity.——F. W. Christern will receive subscriptions for 'Peintres et Sculpteurs Contemporains,' text by Jules Claretie, and portraits engraved by L. Massard (in some cases a "dessin inédit" will be thrown in); and 'Les Artistes Modernes,' a weekly publication edited by Eugène Montrosier, giving the biography of artists whose works have been most remarked in the annual Salons or in divers exhibitions, together with photogravures *hors texte* illustrating their works—two lives and two pictures in each number.—— *Nature*, for April 28, continues its series of "Science Worthies" with a biographical sketch of Robert Wilhelm Bunsen, and an engraved portrait by the lamented C. H. Jeens.——Dietrich Reimer, Berlin, publishes a timely map of the regency of Tunis, by H. Kiepert, on a liberal scale.

—The June *Harper* has a characteristic table of contents, readily estimated from a bare enumeration of the titles. The emphatic illustrated article is Mr. Samuel Adams Drake's White Mountains, a first paper, with beautiful designs, chiefly by Mr. W. H. Gibson. It is pleasant to find Mr. Drake paying a just tribute to Chocorua. Mrs. L. W. Champney, with the aid of her husband's pencil, gives an attractive introduction to Portugal—"A Neglected Corner of Europe"—beginning with Lisbon. Mr. William Winter's "Edwin Booth" and Mr. James Parton's "Trial of Jeanne D'Arc" call for no special remark. Prof. Luigi Monti writes enthusiastically, and certainly not without reason, of Benedetto Civiletti, a sculptor of Palermo, who has already won distinction in French salons. Two striking examples of his imaginative creations, and his portrait, confirm the reader's interest in this artist. In the nature of compilations are Miss Amelia E. Barr's "Ballads and Ballad Music illustrating Shakspere," and Miss Sara A. Hubbard's "Our Ruby-Throat," a chapter on humming-birds. Mr. Edward Atkinson makes, as he says, a slight return for Southern hospitality in sounding the praises of "Kentucky Farms." As usual, he contrives to give in a few words a striking picture of the possibilities of the region in question, "viz., the mountain sides and valleys of Eastern Kentucky and Tennessee, Northern Georgia, Western North and South Carolina, and South-western Virginia." It is, "we may say, somewhat larger than Great Britain, and contains more and purer iron and coal, equal deposits of copper, lead, zinc, and salt, besides corundum and gold in its mines; it enjoys what is probably the finest climate on this continent; it is permeated by the most fertile valleys, and bears upon its hill and mountain sides the heaviest growth and greatest variety of hard-wood timber." And yet "homespun fabrics still constitute the common wear" of the large population which inhabits it. Mr. Atkinson expects great things from the Cincinnati Southern and the projected Norfolk railroads in bringing the products of the Blue-Grass limestone region to tide-water.

—The Arkansas Legislature, Historical Society, and Eclectic Society of Little Rock have combined to suppress the vulgar pronunciation of the name of the State, viz., Arkan'sas (final *s* sounded), and to constrain all cultivated persons, and especially all dictionary and school-book makers, to observe the State's preference for the original and orthodox pronunciation, as first adopted by Congress. The General Assembly, however, appears to have had somewhat confused ideas on the subject of phonetics, for in the joint resolution approved by Governor Churchill it holds the "only true pronunciation" to be "that received by the French word representing the sound" (meaning by this the way in which a Frenchman would pronounce the name as now written), which it says will be reached by giving the *a* in each syllable the Italian sound. That this will not produce *Arkansaw'* or *Ar'kansaw'*, which, we are told on p. 7 of the pamphlet combining the three testimonies, has always been the pronunciation of nine-tenths of the population of the State, need hardly be argued at length. No Frenchman would give the same sound to the accented and unaccented *a*, and the Italian method would result in *Arkahnsah'*—compare *Chicah'go* and *Chicaw'go*. The source of the innovation appears to be rather Northern than Southern, and traceable to recent cultured immigration, and Mr. John R. Eakin fancies, in a somewhat involved sentence, that "it came from the ridicule which it was once the habit to throw upon the manners and customs of the people, which extended to their pronunciation 'Arkans*aw*,' because associated with 'Arkans*aw* Traveller,' and was taken for granted to be a corruption of something more elegant." He does not allude, however, to the "Arkansas toothpick," which the polite authors of the Bon Gaultier ballads more than twenty years ago celebrated in a metre requiring the vulgar pronunciation (see Bartlett, *sub voce*):

> "Straightway leaped the valiant Slingsby
> Into armor of Seville,
> With a strong Arkansas toothpick
> Screwed in every joint of steel."

We hasten to add our complete sympathy with the patriotic aim of the protestants against Arkan'sas, and to express the hope that their example will lead the State of Illinois and the cities of Chicago, St. Louis, Louisville, and New Orleans to fix the standard pronunciation for their names, one of which is pronounced in four different ways.

—Mr. W. W. Newell has attempted a metrical version of the "Œdipus Tyrannus" (Cambridge: C. W. Sever), in order "to convey to readers un-

acquainted with any language"—a queer class of readers—"a like impression to that which the original produces on readers familiar with that tongue." If we enquire what contribution this translation makes to the solution of the problem of form, we find that the interpreter has nothing to give us for the bulk of the poem except the consecrated decasyllabic. The decasyllabic is too short. Campbell, Mr. Newell's rival, finds it too short; sometimes he takes three English verses to two of the Greek; sometimes he indulges in the weak ending, which is very bad here; sometimes he is betrayed into the dodecasyllabic. Granted that the Greek trimeter has never been naturalized in English; that it is prone to sprawl; that it is apt to split into the two halves of the ordinary Alexandrine; and that the English heroic may be the better of two bad alternatives, still Mr. Newell's verses are bad at best. They have no spring; they have nothing of the "sinuous movement," as he might say, of modern idyllic verse, seldom even the ring of the older period. You have to read them with a fixed determination to get the worth of your ten syllables out of the line, and the cumulation of harsh monosyllables is a horror. So much for the form of the dialogue. The imitation, or "suggestion," as the translator calls it, of the original choral measures matches the handling of the dialogue. Time fails us to study how far the effect of the whole has been preserved, even at the expense of the parts. We have only room for a few specimens of the detailed work. All Sophocles is in the very first line. That is as good a test as any. Racine imitates it in what Patin calls a delicious verse of the "Esther"—"De l'antique Jacob jeune postérité." Let French ears decide as to the melody. The language is grave and noble. Modern translators try to do more—they try to give the image in τροφή, "nurture." Sophocles delights in that sphere. So Plumptre has "youngest brood of Cadmus famed of old"; Campbell writes: "Children, young care of Cadmus' ancient fold"; but Mr. Newell changes the figure: "Children, new branches of old Cadmus' root"—which becomes absurd in the third line, in which these branches are represented as "armed with boughs." Then in the first few lines we have such trivial phrases as "attend on your complaint" and "city home," such repulsive combinations as "unborn decayeth fruit of woman," such literalisms as "with a happy bird" (augury), and such syntax as can find no parallel in Greek or in English. In coping with Sophocles Mr. Newell has failed where it is no disgrace to fail, and his essay might have been passed over at any other time in silence, but his "angular English," "angular" but not "crystalline," makes a heavy jar on ears accustomed to the "fluid and melodious Greek," and waiting for it.

—The centre of population—*i.e.*, the centre of gravity of the people of the country—is a point to which much interest attaches, not only as being the hub about which the United States may be said to rotate, but also because its decennial change of position in distance and direction illustrates, in the tersest manner possible, the *net resultant* of all movements of population during the decade. Census Bulletin No. 145, recently published, gives the position of the centre in 1880, with a brief discussion of the method of computation and a tabulated history of the movement of the centre at the end of each decade since 1790, the date of the first census. Accompanying the bulletin are two maps: one showing the details of the position of the centre in 1880, the other showing its positions at the close of each decade. The position of the centre in 1880 was lat. 39° 04′ 08″ N., long. 84° 39′ 40″ W., which is 2.6 miles south and 8.9 miles west of the old observatory at Cincinnati, Ohio, or about eight miles south-by-west from the heart of that city. This places it in Kentucky, one mile from the south bank of the Ohio river, and 1½ miles southeast of the village of Taylorsville. The following table shows its position and movement since the date of the first census:

Date.	N. Latitude.	W. Longitude.	Approximate Location.	Movement during decade.
1790	39° 16′ 5″	76° 11′ 2″	23 miles east of Baltimore.	..
1800	39 16 1	76 56 5	18 miles west of Baltimore	41
1810	39 11 5	77 37 2	40 miles nor'west-by-west of Washington.	36
1820	39 05 7	78 33 0	16 miles north of Woodstock	50
1830	38 57 9	79 16 9	19 miles west-south-west of Moorefield	39
1840	39 02 0	80 18 0	16 miles south of Clarksburg	55
1850	38 59 0	81 19 0	23 miles southeast of Parkersburg	55
1860	39 00 4	82 48 8	20 miles south of Chillicothe	81
1870	39 12 0	83 35 7	48 miles east-by-north of Cincinnati	42
1880	39 04 1	84 39 7	8 miles west-by-south of Cincinnati	58

One of the most striking facts shown by this table is the westward movement of the population. The total oscillation in latitude during the past 90 years amounts to only 18.6 minutes, or about 22 miles, while the change in latitude from its position in 1790 to the present time is but 12.4 minutes, or less than 16 miles. In this period of 90 years the total movement westward amounts to 457 miles. The ratio between the total southward and westward movements is 1 to 29. The greatest movement westward was during the decade which witnessed the settlement of the Mississippi Valley and the rush to California, that between 1850 and 1860. The next greatest is the decade just passed. During this period the centre has moved decidedly southward, nearly counterbalancing the movement northward during the ten years preceding. There being apparently no movement of population to account for either of these changes, they are to be explained only by the imperfection of the census of 1870 in the Southern States.

—Gainsborough, Constable, and Wilkie are the subjects of the latest issues of "The Great Artist" series (Scribner & Welford). Mr. Brock-Arnold, in one volume, deals with the first two, and tells the story of their lives with sufficient fulness, embracing the opportunity to express a great many thoughts of his own suggested by his theme. These are neither apposite to the purpose of the book nor particularly edifying, as we have had occasion to observe of other volumes of this ill-edited series. The first chapter is devoted to "The British School of Landscape Painters," and is of the ordinary character which everybody expects in English writing upon art, except in the cases of a few writers who are apparently too constantly employed in more important work to devote any of their time to labors of this kind. Mr. Brock-Arnold's manner of vindicating the art of his country from the Continental reproach of "insularity" is by such statements as that the English landscape painters "have won such deathless fame as did the Cinquecento painters in other branches," that several of their number are "worthy to be ranked with the most gifted geniuses of Italy, Holland, and Flanders," and that "as a body" they have "distanced all others in the excellence to which they have brought this branch of the art." In confirmation of these, and apparently without perception that it is a different statement, he quotes from Rouquet's 'L'État des Arts en Angleterre': "Il y a peu de maîtres dans ce talent [landscape painting] qui ayent été beaucoup supérieurs aux peintres de paysage qui jouissent aujourd'hui en Angleterre de la première réputation." Mr. Brock-Arnold even adds that this is as true to-day as it was in 1775, which still further illustrates his looseness. The life of Wilkie is well told by Mr. John W. Mollett, who is an "officier de l'instruction publique" in France. The abundant material to be found in Cunningham, Haydon, and others he has used with discrimination, and his critical observations are almost altogether confined to extracts from works already published. Many of these are contemporary judgments, and have for this reason much freshness. The book, taken as a whole, is entertaining as well as instructive. Mr. Mollett had no more that was new to say about Wilkie than Mr. Brock-Arnold had in the case of Constable and Gainsborough, but for his recognition of the fact he is, as an author of one of the "Great Artist" volumes, entitled to credit. The illustrations of both books are abundant, and for the most part wretchedly executed.

—It must gratify the subscribers to the Society for Photographing Relics of Old London to find in the twelve plates of the seventh year's issue so much picturesqueness together with so much historic interest. Evidently the store of material has not begun to be exhausted. The variety, too, is remarkable, considering that no less than four of the nine subjects are Southwark inns. These as buildings are all posterior to the great fire of 1666, but are of a much earlier establishment, the famous White Hart, for instance, with its outer and inner yards, dating back to the year 1400, and having been the temporary headquarters of Jack Cade as well as the scene of the engagement of Sam Weller by Mr. Pickwick. "Since the destruction of the 'Oxford Arms' [Nos. 1–6 of this series] and one or two galleried inns elsewhere, the Southwark inns are," we are told, "with the exception of the 'Old Bell,' in Holborn, the only inns of the old type left in London." The others now represented are the King's Head, peculiarly quaint in the roofing of its sheds and the patterns of its gallery rail-panels, its uncouth crane, etc.; the George Inn, and the Queen's Head. Three more Southwark views are of Old Houses (1) in Borough High Street, (2) in Bermondsey Street, the latter extremely curious in construction—"the frame of massive timber, else mere shells of lath and plaster," but wonderfully durable without regard to perpendicularity; and of St. Mary Overy's Dock, a waterside nook which appeals at once to the eye and to the imagination—a "perfect picture." All these plates will be prized by owners of Mr. Walford's 'Old London' (vol. vi.), whose cuts of the inns, it must be confessed, bear a very remote likeness to these authentic sun-records. Crossing the river, by London Bridge, or otherwise, two photographs are given of buildings wholly or partially demolished within the past year, viz., Sion College, London Wall, a foundation of the year 1332, though the great fire left little of the original building; and Oxford Market, not very old, but which once furnished Burke a steak and had Dr. Johnson for a neighbor. As we mentioned last week, the Society (or its devoted Secretary, Mr. Alfred Marks) has compiled and printed a descriptive text for the entire series up to date, and will doubtless continue it. We suggest that with the tenth issue, if no sooner, a map of London be furnished on a page the size of the mounts, as large in scale as the limited area thus far commemorated will permit, and designating by figures the sites of the buildings embraced in the several plates. Americans at least would be laid under obligation by such a help.

—After the lapse of four years Professor Villari has published the second volume of his 'Niccolò Machiavelli e i suoi Tempi' (Florence, 1881). It was the author's intention to complete his work with the present volume, but

the large number of documents in the appendix swelled it to such a size that a third, promised shortly, will be necessary. In the one before us the life of the Florentine secretary is carried from 1506 to 1513, a period short in time but fraught with interest to Machiavelli and the commonwealth, for it beheld the fall of both—a permanent humiliation in his case. The present volume is chiefly interesting for the *excursus* in the first chapter (the ninth of Book i.) on the Age of Julius II., and for the first five chapters of Book ii., which, after a survey of the political writers of the Middle Ages, contain an exhaustive examination of 'The Prince' and the 'Discourses,' in which Villari gives not only his own opinions, but passes in review those of other critics from Machiavelli's time to our own—a critical and bibliographical résumé that cannot fail to be of great value to students. The appendix contains a large number of letters, public and private, addressed to Machiavelli; a discussion of the question whether he was acquainted with Greek, which is answered in the negative; and the autograph annotations made by the ex-queen Christine of Sweden on the margin of a French translation of 'The Prince.' The passages underscored by her are reprinted with the comments, which are interesting for the sentiments they contain and the very Swedish French in which they are expressed. Professor Villari is to be congratulated on having brought so near its end an historical work worthy to stand by the side of his 'Life of Savonarola,' and which, if offering none of the dramatic scenes of that work, has a deeper political and, we had almost said, moral significance.

—The two most interesting cuneiform inscriptions as yet published were discovered by Mr. Hormuzd Rassan in his recent researches in Assyria on behalf of the British Museum. A translation from the first, from a clay cylinder about nine inches long, was published by Sir Henry C. Rawlinson in the Journal of the Royal Asiatic Society for January, 1880. It contained the genealogy of Cyrus the Great (agreeing with Herodotus in the name of his paternal grandfather, Cyrus) and his expressions of gratitude to the god Merodach (not Ahuramazda, be it observed) for leading the Persian army into Babylon. The text and translation of the second inscription, from a mutilated tablet of unbaked clay about four inches square, were published a few months after the first by Mr. Theophilus Pinches in the transactions of the Society of Biblical Archæology, vii. 1. This contains portions of the annals of the last Babylonian king, Nabonidus, making known the very day of the month (16th of Tammuz, June, probably 539 B.C.) on which Cyrus's army, under the command of Gobryas (Gubaru), entered Babylon. In a recent pamphlet of 200 pages Dr. Victor Floigl, of Berlin ('Cyrus und Herodot nach den neugefundenen Keilinschriften,' Leipzig, 1881), aims by brilliant combinations to draw forth all that can be learned from the new facts. He is a zealous harmonizer and strives to reconcile the monuments, Herodotus, the canon of Ptolemy, and others, or at least to account for their conflicting statements. In this he is often successful, well sustaining the authority of Herodotus. His discussion of the exact numbers which Herodotus gives for the duration of particular dynasties is especially valuable. Cyrus's overthrow of Astyages (Istavegu) and the Median power should now, according to the second inscription, be put at 550 B.C. Then, as Herodotus gives 156 years as the duration of the Median empire, the revolt from Assyria is thrown not into 713 B.C., when Sargon was at the height of his glory, but 705 B.C., the year of Sargon's death. This, not the death of Assurbanipal, 80 years later, Herodotus considers the end of the Assyrian empire; and as that empire was said to have endured a *nerus*, 600 years, Herodotus subtracts 80 and thus reaches his 520 years of Assyrian rule. Further, to the Heraclid dynasty Herodotus assigns 505 years. These lead from 687 (Floigl's corrected date for the fall of Candaules) to 1192 B.C.—which seems to give us Herodotus's date for the destruction of Troy, though it does not prove the reality of the Trojan war. The author confirms this date from the writers who date the fall of Troy 1208 B.C., by reducing to sun-years the old Greek years before the Olympiad epoch. The work contains many uncertainties stated with confidence and an occasional obvious error, but also much that is new and valuable on its immediate subject, besides interesting excursuses on Assyrian chronology and the canon of Ptolemy.

—The fifth issue of Charles Friederici's admirable compilation, the 'Bibliotheca Orientalis' (London: Trübner & Co., 1881), has just been received. It is, in these days of ponderous bibliographies, a work of the utmost use and convenience. It gives "a complete list of books, papers, serials, and essays published in 1880 in England and the colonies [*quarum pars parva sumus!*], Germany, and France on the history, languages, religions, antiquities, and literature of the East." As a rule, full and descriptive titles are given, and—an important thing—the publishers' prices. The list comprises 1,007 numbers. Under *Indian Antiquary* (No. 24) we find the titles of all the articles in that journal from January to November, 1880—nearly fifty entries. Even such articles as those in the annual supplements to Meyer's *Conversations-Lexicon* are not left out, and accordingly we find under the name of Eb. Schrader a reference to a valuable paper on the progress of Assyriology. The general classification and arrangement are excellent, and it is manifest that the whole work has been done conscientiously and with good judgment. The book has an adequate index. The four back numbers of the series, containing republications of the years 1876–9, can still be had, and at the reduced price of seven shillings, instead of ten.

—Professor Karl Elze, well known as a Shaksperean scholar, has just published a new edition of his work on Byron (Berlin: Oppenheim, 1881). The first edition appeared in 1870, and was translated into English in 1872 (London: John Murray). The translation was superior to the original, in giving much additional matter. In his present, second edition, Elze has not recast the entire work, which would have been the better way, but has reprinted the first edition intact. From p. 430 to p. 483, however, he gives a chapter of *Nachträge und Abschlüsse;* from p. 483 to p. 493, some running notes (chiefly corrections) to the body of the text; and, p. 493–499, an interesting sketch of Byron, by the Countess Albrizzi, in Italian. It is with this new matter, from p. 430 on, that we are here concerned. Justice to the author's conscientious industry moves us to state that he has kept himself fully abreast with everything that relates to his subject. Not only has he utilized the recently published Memoirs of Hodgson and other books, but he has suffered nothing of importance in English periodical literature to escape. For instance, the letters from Lady Byron to Mrs. Leigh, published in the *Academy*, July 19, 1879, giving the *coup de grâce* to Mrs. Stowe's charges, will be found discussed p. 458. We have gone over the ground carefully, and can assure our readers that they may rely implicitly upon the author's statements of fact. But one or two points seem questionable. Thus, when Mrs. Webb, wife of the present owner of Newstead, is charged, p. 442, with making it her duty to destroy certain relics of the *gottlosen Dichter*, we doubt the assertion, and fear that Elze and the Countess d'Haussonville have been mystified by Southwell chatter. Far more serious is Elze's neglect to take note of Professor Jebb's estimate of Byron, in his 'Lectures on Modern Greece.' The Scotchman's estimate of our poet is juster and more in accordance with political principles than the German's. In fact, we venture to doubt Elze's ability to deal successfully with Byron's versatility of character and talent. His views are often narrow and conventional. He is unable to open his eyes to the patent fact that Byron was the European poet of his day, by eminence. The moment Elze quits his patient investigation into facts and dates, and tries to soar into the region of higher criticism, we feel that he is off his sphere. Contrast, on this point, any one of Elze's generalizations with Matthew Arnold's trenchant utterances in the March number of *Macmillan*. The difference is palpable; it is the difference between mere scholarship and critical insight.

A SOLDIER OF THE OLD SCHOOL.—I.*

IT was right that Lord Clyde's biography should be written, not merely on account of the genuine character of his military achievements, but because he was the last distinguished representative of a military school that has passed away—the school of Sir John Moore. It fell to the lot of the Duke of Wellington to raise the military glory of Great Britain to its highest point, but the army which he led with such signal skill and success was the creation of Sir John Moore. When Great Britain entered upon her long struggle with the French Revolution she had neither an army nor any military organization. A certain number of regiments, of course, she had, but so completely was all that belongs to the practice of war neglected that there was no fixed system of drill in existence; and if two regiments were required to manœuvre together, their commanding officers met beforehand to arrange what they would do and the words of command they would use. A drill-book was first compiled for the British army by General Dundas. This, though an immense step in advance, contained a system so complicated and intricate that neither men nor officers could master it; and a standing camp was formed at Shorncliffe, under the command of Sir John Moore, for the express purpose of introducing organization and discipline into the British army. He reduced the drill-book of General Dundas to comparative simplicity and intelligibility, and remodelled the British army on the basis of the regimental system. The object of this system was to make of each regiment a living unit, by making officers and men thoroughly acquainted with each other; and how great was its success is well illustrated in the following incident from the life of Lord Clyde. In the year 1857, a short time before his proceeding to India as commander-in-chief, Sir Colin Campbell was engaged upon inspection duty.

"While," he says, "I was inspecting the dépôt at Chichester, I noticed that an old man, evidently an old soldier, though in plain clothes, was constantly on the ground, and apparently watching my movements. At the end of the inspection, as I was leaving the barrack-yard, he came towards me, drew himself up, made the military salute, and, with much respect, said: 'Sir Colin, may I speak to you? Look at me, sir; do you recollect me?' I looked at him and replied, 'Yes, I do.' 'What is my name?' I told him. 'Yes, sir; and where did you last see me?' 'In the breach of St. Sebastian, badly wounded, by my side.' 'Right, sir.' 'I can tell you something

* 'The Life of Colin Campbell, Lord Clyde. By Lieut.-General Shadwell, C.B.' 2 vols. London: Blackwood & Sons. 1881.

more. You were No.— in the front rank of my company.' 'Right, sir.' I was putting my hand into my pocket to make the old man a present, when he stepped forward, laid his hand on my wrist, and said: 'No, sir; that is not what I want; but you will be going to Shorncliffe to inspect the depot there. I have a son in the Inniskillings quartered at that station, and if you will call him out and say that you know his father—that is what I would wish.'"

This feeling of close comradeship with every man under their command which, as is seen in the above anecdote, forty years of service in all parts of the world had failed to obliterate, was a special characteristic of the British officers who fought in the Napoleonic wars—the brothers Napier, Lord Gough, and others; and what a power it must have been in a day of battle can easily be imagined. Under the conditions of modern warfare the regiment is no longer regarded, as formerly, as the very soul of the British army, but it will be a calamity for that army if, with the inevitable decay of the regimental system, the feeling of *camaraderie* between officers and men should also disappear.

Lord Clyde entered the army at the early age of sixteen, and was under fire for the first time at the battle of Vimeira. He served with the Ninth Regiment through the campaign, which terminated with the battle of Coruña, and he used to relate that "for some time before reaching Coruña he had to march with bare feet, the soles of his boots being completely worn away. He had no means of replacing them, and when he got on board ship he was unable to remove them, as, from constant wear and his inability to take them off, the leather had adhered so closely to the flesh of the legs that he was obliged to steep them in water as hot as he could bear, and have the leather cut away in strips—a painful operation, as in the process pieces of the skin were brought away with it." In 1811 he was present at the brilliant victory of Barrosa, where his gallant bearing won the applause of General Graham. Under the same commander he fought in the battle of Vittoria, and led the forlorn hope in the first unsuccessful assault upon the breach of St. Sebastian. In this desperate enterprise he received two severe wounds. He was yet in hospital with his wounds unhealed when he heard that his regiment was likely to encounter the French on the banks of the Bidassoa. He and another wounded comrade determined to escape from the hospital and rejoin the regiment, so as to participate in the expected battle. "By dint of crawling and an occasional lift from commissariat and other vehicles" they succeeded in reaching the Fifth Division, and were present at the forcing of the passage of the Bidassoa. The loss of the Ninth (Campbell's regiment) was heavy, and Colin Campbell, who commanded the light and leading company, was again badly wounded. It is to be regretted that his biographer has given but a meagre account of this early part of Lord Clyde's career. They were days which Lord Clyde liked to recall in his conversation, and it would have been interesting to have had his impressions of the great soldiers under whom or against whom he then served. The omission is all the stranger because it could not have been occasioned by lack of knowledge. Lieut.-General Shadwell served for many years in the same regiment as Lord Clyde; he was on his staff in the Punjab campaign of 1848–49, and also in the Crimea, and must, therefore, have frequently heard the general speak of the men and the scenes of his early days.

Although employed in a number of highly important duties, and recognized as one of the most efficient officers in the army, it was not Colin Campbell's hap to be again present upon a battle-field until the year 1848. He was then a brigadier commanding the garrison at Lahore. The first war with the Sikhs—the campaign on the Sutlej, as it is called in India—had been ended by the victory of Sobraon, and the experiment was being tried of governing the Punjab under the titular sovereignty of Runjeet Sing's infant son, Dhuleep Sing, but actually by a commission of English officers, of which Sir Henry Lawrence was the chief. This experiment was brought to a close by the outbreak of an insurrection in the city of Moultan. The populace murdered two British officers, and then Moulraj, the Sikh governor of the place, placing himself at the head of the movement, threw off his allegiance to the recently established order of things. A British force was moved down to capture Moultan, but being unprovided with siege guns, and numerically weak, it failed in the attempt. The siege had to be raised, and then the insurrection spread rapidly over the whole of the Punjab. The survivors of the old Khalsa army, which had so nearly overthrown the British empire in India in the terrible fight of Ferozeshuhur, thronged once more to their standards, and before long thirty or forty thousand of the best and hardiest soldiers in India had mustered under the command of the Sikh chief, Shir Sing. It was plain that the struggle for the supremacy in India was, as yet, only half finished. Lord Dalhousie was at that time Governor-General of India, and Lord Gough Commander-in-chief of the Forces. The latter was an old Peninsular officer, and greatly beloved by his soldiers for the frankness and sincerity of his character, and his splendid courage in the field. He had had great experience of war, and was by no means devoid of the capacity to plan a campaign or arrange the tactics of a battle, but he would not or could not stick to his plans. He no sooner saw his enemy than the fighting impulses of a hot-blooded Irishman got the better of both his reason and his judgment; plans were forgotten or discarded, and what should have been an operation arranged with scientific foresight degenerated into a confused medley where all depended upon sheer hard fighting. It was this which so nearly caused the British to lose the battle of Ferozeshuhur; it was this which on the field of Chillianwallah did actually inflict on them a bloody defeat.

This memorable battle was fought on the 13th of January, 1849. It was past midday when the British troops approached the position of the Khalsa army. The Sikhs were strongly posted, with their flanks well protected, and their front covered by thick jungle, which made it impossible to ascertain either the strength of their artillery or the numbers of their other forces. Lord Gough prudently resolved to make no attack that day, or until the ground had been thoroughly reconnoitred. Orders to this effect had been given, and the quartermaster-general was engaged in marking out the encampments for the different brigades and divisions, when a few straggling shot from one of the Sikh batteries fell in the vicinity of the chief and his staff. The hot blood of the old soldier was instantly aflame; he could not brook such insolence; the orders for pitching the camp were countermanded, and before another hour had passed a fierce struggle was raging along the whole front of the Sikh position. The consequences are not difficult to divine. Thrust into the thick belt of jungle, which rendered all concerted movements impossible and broke up the advancing lines into disorganized crowds, ignorant of the ground they had to pass over or the strength of the enemy they were required to face, the British regiments reached the Sikh position only to be mowed down by round-shot, grape, and musketry, for the most part from an invisible foe. On the extreme right of the British army the cavalry brigade first got in front of the artillery, which had been directed to cover their advance, and then, seized with an unaccountable panic, suddenly turned about and galloped in horrible confusion over the guns, over their hospitals filled with wounded and dying men, and away to the rear of the field. They were pursued by a few Sikh cavalry, who, following close behind them, got well in among the British guns before they could be fired, and sabred officers and men in the midst of their own artillery. In the centre of the British attack the disasters were even more overwhelming, and it might almost be said that only on the left, where Campbell commanded, was the attack upon the Sikh position conducted with judgment or any degree of success.

Campbell's division consisted of two brigades, under the command of Brigadiers Pennycuick and Hoygan, but from the nature of the ground it had to traverse before reaching the enemy's position his personal supervision was limited to the latter brigade. Brigadier Pennycuick hurled his brigade blindly against the Sikhs, and it was all but annihilated. The brigadier himself was killed; the Twenty-fourth Queen's Regiment was cut to pieces, losing 13 officers and 203 men killed, and 10 officers and 266 rank and file wounded. The native regiments which supported the English infantry suffered hardly less severely than the ill-fated Twenty-fourth. Meanwhile, however, Campbell, at the head of Hoygan's brigade, had advanced against the enemy. He captured four guns immediately in his front, then, wheeling to the right, he took in flank the position from which Brigadier Pennycuick had just been repulsed with such terrific loss. Thus, he says,

"We proceeded rolling up the enemy's line, continuing along the line of their position until we had taken thirteen guns, all of them at the point of the bayonet by the Sixty-first. . . . During our progress we were frequently threatened by the enemy's cavalry, who had followed us, retaking the guns we had been obliged to leave behind us, our force not having admitted of our leaving a detachment for their protection." "I had," he says in another letter, "many miraculous escapes, for which I am duly thankful. The handle of my watch was broken by a ball. I had a pocket-pistol in my right waistcoat pocket which was broken in pieces by a ball, and my horse was wounded in the mouth. I got a sword-cut from an artilleryman of the enemy in charging some of their guns; but here I am, thank God! safe and sound, and quite well."

This murderous battle lasted but two hours and a half, but in that brief space the British troops lost six guns, and 89 officers and 2,357 fighting men were either killed or wounded. A little more than a month later the defeat of Chillianwallah was retrieved by the decisive victory of Goojerat, which destroyed the brave Khalsa army, and a few days after the battle they laid down their arms. Sir Colin Campbell, who had taken a distinguished part in this battle, thus describes the final surrender:

"They were without food and also without ammunition—not above five or six rounds per gun. The high-priest, or Gooroo, who took the chair on the right of the general (Sir Walter Gilbert), after laying down his arms, said to him in a loud and firm voice: 'The injustice of the English drove me to take up arms. They confiscated my property in the Jullundhur Doab, amounting to five lakhs annually. Poverty, starvation, and want of ammunition have obliged me to surrender. These wants have brought me here. But for these wants we should again have tried the fortune of war. I do not regret what I have done, and I should do the same to-morrow if it were in my power.' There was nothing cringing in the manner of these men in laying down their arms. They acknowledged themselves to have been beaten,

and that they gave in because they were starving. They were without money, food, or ammunition. There was nothing offensive in their manner in saying these things. Each man, as he laid down his arms, received a rupee to enable him to return to his home. . . . The greater number of the old men especially, when laying down their arms, made a deep reverence or salaam as they placed their swords on the ground, with the observation, 'Runjeet Sing is dead, or has died to-day.' This was said by all of them with deep feeling. They are undoubtedly a fine and brave people."

In less than ten years from that time this "fine and brave people" won back the Indian Empire for the very men who had conquered them at Goojerat. Great Britain has not treated them with the generosity which their courage and fidelity deserved.

NEW YORK ELECTION FRAUDS.*

LORD CHIEF-JUSTICE COCKBURN, in his charge in the Tichborne case, began by declaring that in his opinion it was the duty of a judge, not merely to review the facts brought out upon the trial of a cause, but to dwell upon the conclusions deducible from them, however much this might be to the prejudice of either side. "If the facts make one side kick the beam," said he, "it is the fault of the facts, not of the judge"; and he straightway proceeded to charge the jury against the "Claimant," as he so well knew how, pressing as close to the limits of judicial prerogative as he could go without affording ground for a reversal. In the same spirit, presumably, Mr. John I. Davenport speaks, when he says in his preface:

"It has been my effort to write without partisan bias, desiring my work to be rather a history than a campaign document. The facts only have been stated. If they seem to bear more heavily against one political party than the other, it is solely because there could be no other result and the truth be written."

The result of this laudable spirit of impartiality is a history of election frauds in this city during the period from 1859 to 1870, or, more properly speaking, a "History of Democratic Frauds." For, according to Mr. Davenport, no Republican official in this State has ever been guilty of fraud except as the result of a bargain with Democrats. Mr. Davenport professes to have spent nearly ten years of his time and several thousand dollars of his money in his examination of this subject. His book is full of interesting statistics and valuable information, compiled with much skill, and tending to show that the great election frauds of the period treated were wholly the work of one political party.

As a question of opinion based upon evidence, we believe that an impartial examination into the history of State and municipal politics during these years will lead to the conclusion that the political methods of *both* parties were simply honeycombed with corruption. The rise and growth of the evil date farther back than is commonly supposed. The election of 1844 was the first at which it was alleged that fraudulent voting affected the issue of a Presidential campaign. The sanguine and enthusiastic Whigs who in that year nominated Henry Clay by acclamation, after adopting in a single resolution the shortest platform that a political party has ever put forth upon national issues, went into the fight confident of victory. In their wrath and surprise at defeat they bitterly accused their opponents of fraud, and asserted, with some show of reason, that for the first time in the history of American politics New York State had been carried by illegal votes. This, however, was not the first time that extensive frauds had been practised at our polls. It was notorious that for the eight or ten years preceding that exciting campaign the votes of aliens, owing to the loose system of inspection then in vogue, were frequently employed, in numbers increasing with each successive election, and that the science of "repeating," although then in its infancy, was already beginning to make rapid strides towards the marvellous development it afterwards attained. As far back as 1838 the election frauds of the preceding year were made the subject of legislative enquiry, and the Judiciary Committee of the Assembly reported that they were "constantly practised at our elections, to the disgrace of the State, and to the manifest wrong of the country." But it was not until 1859 that a remedy was applied in the passage of the first New York Registry Law. The attempt to check the evil brought to light the extent of it, and naturally led to the elaboration of schemes to avoid the operation of the act. At the national election of 1860 an examination of the registry lists showed that hundreds of names had been entered, either of persons who could not be found at the residences given, or who were not legal voters. As this was mainly in Democratic wards the Republicans prepared to challenge the parties at the polls, and the declaration of this intention led to a counter-threat by their opponents. The Democratic majority of the Board of Aldermen, with a view to checkmate the proposed challenging, passed a resolution authorizing the Sheriff, Mr. John Kelly, to appoint "such special deputies" as he might require "to defend the rights and privileges of the electors of this city." Fortunately for the city's peace, however, the throng of roughs who sought employment on the morning of election day, as "defenders of the electors' rights," were not engaged, the sheriff's counsel advising him that he could not lawfully act under the authority which the resolution of the Common Council purported to convey, and the election passed off with much less turbulence than was feared, the new registry law proving clearly the necessity of its application by the opposition it evoked.

During the war the form of fraud most common, viz., the attempt to impose upon the inspectors the votes of aliens, was met by the capital device of stationing at the polls officers provided with exemption lists. Those who, having secured exemption from draft and enlistment as aliens or non-residents, afterwards attempted to vote, were quickly arrested and held subject to the orders of the Secretary of War. "This scrutiny," says Mr. Davenport (p. 45), "cut both ways, the War Department having directed the addition to the enrolment lists of the names of all persons who, having claimed exemption upon the ground of non-citizenship, should be found thereafter to have registered, or who should attempt to vote."

The year 1866 was marked by what had now come to be the biennial conflict between the Democratic aldermen and the Republican police officials. Mayor Hall requested the magistrates to hold court upon election day so as to be in readiness to commit persons who might be arrested for "systematic and successive challenging," the exercise of a duty which Mr. Hall impudently denounced as illegal. This declaration was met by an order from Kennedy, the Republican Superintendent of Police, directing his subordinates to submit to his office for inspection before service any warrant which the police magistrates should issue for the arrest of the challengers. The citizens were thus forced into the position of being the passive spectators of one of those disgraceful conflicts of municipal authority with which they have since become, unhappily, too familiar.

As the result of the election of 1868, to use the words of Mr. Tilden, "the Ring was completely organized and matured"—Hoffman was in the governor's seat, Hall was mayor of the city, Tweed and Sweeny were respectively comptroller and chamberlain, whilst on the bench sat Barnard, Cardozo, and McCunn. The first two of these judges devoted whole days, from ten in the morning till nearly midnight, to the wholesale issue of naturalization certificates. Thousands of applications were made under assumed names, supported by professional witnesses who undertook to vouch for hundreds of applicants in a single day. Up to this time the work of naturalization had been confined to the Common Pleas and Superior Courts, but, as was admitted by the clerk of the former upon his examination before a Congressional committee, "it was not done rapidly enough to suit," and so the droves of petitioners were hurried into the Supreme Court, where Barnard or Cardozo manufactured voters and issued certificates, sometimes at the rate of eight or nine hundred a day, and often, in direct violation of the law, when neither applicants nor witnesses were present. Ten of these professional witnesses, according to statistics taken from the court records by Mr. Davenport, vouched for 8,464 applicants, one man answering for over a thousand within three days. In order to encourage aliens to permit the use of their names the fees were paid for them, and certificates were issued by the thousand to applicants who were not required to pay to the clerk of the court the statutory charges. The Ring managers were, of course, too provident to trust them with the money for their fees, and so adopted the ingenious device of issuing "orders" upon the clerk, which were presented by the alien at the time of his application, and a certificate would cost him nothing, on his presenting one of these "red tickets," of which some 40,000 were issued by Tammany Hall. In the minority report the Democratic members of the Congressional investigating committee endeavored to explain this scheme by the assertion that it was the custom of the "naturalization committees" of both parties to pay the fees of aliens whose papers were thus procured by "orders" of this sort, which became in the hands of the clerk a charge upon the "hall" or the "committee," and that the Republicans used white tickets for the purpose. A careful review of the testimony taken shows that the practice was confined to Tammany Hall.

In his prolonged examination of the files of the courts where this wholesale naturalization was carried on Mr. Davenport found that large quantities of papers had been received and filed which those engaged in the business of forging had not even taken the trouble to complete. And yet they form part of our court records to-day. So reckless were some of the forgers in their work that they entered upon some of the papers the names, as witnesses, of well-known public men. So that to the applications of the O'Rourkes, O'Briens, and Schwabs may be found appended the affidavits of "John T. Hoffman" or "William H. Vanderbilt," whilst upon some of the papers, prepared evidently by some perjurer of a humorous turn, the oath is subscribed "August Belmont, his X mark." By way of giving some idea of the number of false certificates issued, Mr. Davenport asserts that he can produce two of these professional witnesses who will prove that they disposed by sale or otherwise of ten thousand certificates each (p. 142).

The honest challengers of both parties found their efforts paralyzed by

*'The Election Frauds of New York City and their Prevention. By John I. Davenport.' In two vols. Vol. i. New York: The American News Company. 1881.

the action of the judges before whom the challenged party would be brought. In one case when the accused admitted his crime Judge McCunn declared the admission proved that the prisoner was either drunk or crazy, adding: "Take him before Justice Dowling and have him discharged!" Ignorant emigrants were, of course, frequently induced to apply for naturalization and attempt to vote, sometimes within a week of their stepping ashore at Castle Garden, and often were so carelessly "coached" that instances like the following were common enough (p. 95):

"*Inspector.* What name?"
"*Would-be Voter.* Michael Murray, sorr."
"*Inspector.* Michael Murray? No such name—there's a Michael Murphy."
"*Would-be Voter.* Hould on, gintlemin, hould on! (Pulling a paper from his pocket and reading from it.) Sure an' it *is* Michael Murphy an' *not* Michael Murray!"

As a matter of fact, the corruption of the polls during these years was pretty equally divided between the two parties. It is true that the cunning hand and crafty brain were supplied by a member of the party numerically in control in this city; but among the Republican legislators the "boss" had only too many coadjutors who stood ready to become his willing tools in making up his working majority. Tweed testified, four years ago, before the Special Committee of the New York Board of Aldermen (and his evidence, if denied, has never been controverted), that throughout this period of the Ring's power certain Republican Senators "were paid to control the Republican *caucus*, so that we should be sure of having the vote not only of those who were paid for it, but of some who were not"; and it is of record that the Tweed Charter was voted for by every Republican Senator save one. In the lower House "there was an organization, formed of men of both parties, Republicans and Democrats, called the Black Horse Cavalry, composed of twenty or thirty persons, who would all be controlled by one man, and vote as he directed." With the party representatives from both sides coalescing in this way, it is idle to talk about the election frauds of that period as though they were the work of one party. The truth is plain that during the years of which Mr. Davenport writes, and more especially at the elections of 1868 and 1870, the results were amicably prearranged by a corrupt "deal" between the so-called party "leaders."

We shall await with much interest the method of solving the problem of dealing with election frauds which Mr. Davenport promises to offer in his second volume when he comes to treat of "The Remedy." His acknowledged skill in detecting, and ingenuity in defeating, naturalization frauds will entitle his suggestions to a respectful hearing, even though his strong partisan bias stamps him as one of those Republicans who, like the Thirty that controlled the Athenian "ring" after the close of the Peloponnesian war, are convinced that "no good man is outside of their party, and no bad man within it."

Life and Letters of John Howard Raymond. Edited by his eldest Daughter. (New York: Fords, Howard & Hulbert. 1881.)—It is only natural that to Dr. Raymond's daughter the personal and domestic aspects of his life should be more interesting than those of a public and professional character. The result is a biography that will be differently esteemed by different readers. Those attracted to the book by Dr. Raymond's reputation as a teacher, and especially as a pioneer in the attempt to secure for women the advantages of an education similar to that enjoyed by men, will find nearly or quite five hundred of the upwards of seven hundred pages of the book wearisome, to say the least. Dr. Raymond's correspondence, each letter a volume in itself, is devoid of charm as it is (in spite of the most laborious attempts) of humor. Among the letters of his courtship confided to his children, the first was a disquisition, which covered twelve pages of foolscap, on the question, "Why did Eve sin?" Another, even more extensive, discussed the question of the rationality of brutes. His biographer does not obtrude herself, but on the other hand she does not always give the requisite definiteness to her piece-work. Thus, we are left to cipher out the year of Dr. Raymond's birth, and the day of his death is not mentioned. Neither is the maiden name of his wife, which only transpires in a letter presumably written to her. The letters with which the biography opens, those of birthday reminiscence, written at different periods of Dr. Raymond's life, would have been more appropriate in their chronological order.

Born March 7, 1814, it was his good fortune to be expelled from Columbia College when he had nearly completed his course of undergraduate studies. This personal experience must have been invaluable to him in later years when dealing with youthful insubordination. His purpose of studying law was given up in favor of the ministry after a period of some religious excitement, and his theological studies were duly prosecuted at the Baptist Theological Seminary in Hamilton, New York. He acquired a sudden reputation by the success of his revival preaching in Brunswick, New Jersey, but nevertheless allowed himself to be attracted to a professorship in the Seminary in which he had recently been a student. There is a suggestion of monastic severity in the discipline of this institution: "A half-past four rising bell and five-o'clock chapel exercise, followed by the prayers that are held unitedly in every room in the building by the respective room-mates, still leave an hour for private devotions and study before breakfast." A homely sign of the difference between the East River of those times and our own is the fact that the scene of Mr. Raymond's baptism was "the pretty wooded point which at that time jutted out where the Wall Street ferry-house now stands." Dr. Raymond's daughter does not give the date of his return to Hamilton as professor, nor does she indicate the nature of his duties. The date must have been 1837 or '38, and the duties were apparently confined, after the first, to the teaching of "mental and moral philosophy." In 1850 the seminary was removed to Rochester, and here Professor Raymond continued his teaching, living a much fuller and less isolated life than at Hamilton. Rochester was then a centre of anti-slavery agitation, in which he took an earnest part.

If there was anything specially characteristic in Professor Raymond's teaching up to 1855 the memoirs here presented do not attest the fact. He was too earnest and sincere to perform his duties at any time in a perfunctory manner; but his talent for leadership and organization first had an opportunity to display itself at the head of the Brooklyn Polytechnic Institute, which a few "gentlemen of property and standing" had called into sudden and multitudinous existence in the year just named. Five hundred boys appeared at once, requiring to be organized and classified. The task called for a world of tact and patience. Dr. Raymond possessed these qualities in an eminent degree. The Institute under his charge acquired almost immediately a character for thorough and successful training. Several of Dr. Raymond's assistants considered physical punishment an indispensable means of discipline; he himself did not, and the quiet manner in which he managed to put off the decision until experience had settled it in his favor, was a very good example of the shrewdness of his manner in dealing with a difficult problem. Vassar College was an experiment on a much wider scale. Its object was to secure for young women who desired it a collegiate education. The story of Dr. Raymond's difficulties and embarrassments during the thirteen years of his presidency over the young and struggling institution, told for the most part in his own annual reports, is full of interest. It might with advantage have been made much fuller, but enough is given to enable us to apprehend clearly the nature of the problem and the skill which he brought to its solution: He must not embarrass himself with any difficulty that was not essential to the principal object in hand. Questions of co-education and university methods must be resolutely put aside. Co-education might be best, and the university elective method might be best, but Dr. Raymond's object was simply to give women an opportunity to procure a liberal education. If the college system of a regular curriculum was outgrown for young men, young women, he contended, had hardly grown up to it, and needed for a time "the bracing and support of its more narrow forms." On the other hand, he opposed with all his might every temptation to lower the college to the level of the Female Seminary and Young Ladies' Boarding-School. It would have been easy at any time to make the college a grand pecuniary success by doing this, but this was the one thing that Dr. Raymond would not do. He was obliged to wait three years before he could organize a collegiate course of study, and a preparatory department was always a necessity; yet as late as 1876 he noticed with alarm that the preparatory department was encroaching on the collegiate. The tendency in this direction had been checked at the time of his death, and we trust it will not reappear. Considering the materials with which he had to work, the means at his disposal, and the obstacles and temptations that he had to overcome, Dr. Raymond's success at Vassar was indeed remarkable; but if the testimonies of his scholars here recorded, and many others which we ourselves have heard, are not entirely vain, the least part of it lay in organization.

Judas Maccabæus and the Jewish War of Independence. By Claude Reignier Conder, R.E. (New York: G. P. Putnam's Sons. 12mo, pp. 218.)—The author is a great admirer of Judas Maccabæus, considered not only as a champion of liberty and faith, but also as a warrior and strategist, and he has written his life with a good deal of spirit. Not satisfied with the scanty information obtained from the books of Maccabees and from Josephus, he has exerted himself, not without ability and knowledge, "to render the story more vivid by aid of description of the scenes in which it was laid, and of the contemporary social and religious life of the Jews." The accounts of the scenes made memorable by the Maccabean struggle are due in great part to the advantages which the author enjoyed during the survey of Palestine, when he visited "more than once each of the battle-fields of Judas"; but his Talmudic information, as he himself acknowledges, rests on a very slender basis—the Mishnah in Surenhusius's translation. The most meritorious portions of the book are thus naturally those in which the writer's original knowledge and personal observation are brought into play, and the least good those in which his scanty knowledge of post-Biblical Jewish antiquities could not fail to betray him into error or superficiality. His style is animated and often

vigorous, and his descriptive pieces abundant and attractive. The following may serve as a specimen :

"The appearance of the country, when thoroughly cultivated, must have been one of unusual fertility and prosperity, though not of romantic beauty. The rugged hills of Hebron were, indeed, clothed with the thick copsewood of Hareth ; Carmel was then, as now, covered with bushes, and the lower hills of Galilee, with the plain of Sharon, were beautified by thick oak-woods surrounding the bright shallow streams which still run over the rocky beds of the valleys. On the other hand, bare and waterless deserts stretched along the east of the watershed ; the ghastly Jeshimon, or 'solitude,' reached to the crags which bound the Dead Sea on the west ; the Wilderness of Beth-Aven was stony and barren then as now ; and the open plains of Beersheba grew only grass and flowers, serving in spring as rich pasturage for the nomadic tribes. The Jordan valley was also uncultivated, and the swamps of the river afforded cover to outlaws and fugitives ; for the palm cultivation, which was first commenced by Herod the Great, had not yet been attempted, and the great capabilities of the Jericho soil were unknown. . . . Throughout the district of the Shephelah, or low hills, the yellow corn crowned the flat summits, and covered the red soil of the valleys. On the higher hills, the long apple-green vineyards spread terrace above terrace, as they still do in the fastnesses of Hermon. The dark, soft foliage of the great olive-groves in the broader valleys contrasted with the sparse, straggling leaves of the fig-trees which flourished on the higher ground."

Strategic localities are described with particular care, but in the application of his topographical knowledge to the warfare of his hero our author goes too far. The narratives on which he relies are neither ample nor accurate enough to found minute strategic and tactical speculations upon. Judas Maccabæus may have been a military genius, and there are enough evidences, perhaps, to justify the belief that his military intuition equalled his valor, but these evidences are too vague to warrant more than suppositions of a general character. The precise localities where the fighting took place, the respective numbers of the combatants, the dispositions of the troops, are all almost unknown—in a strict historical sense. What, for instance, can be predicated with certainty of a long offensive campaign, remarkable for "the rapidity of the marches, the fearlessness of the attacks, and the sudden overthrow of the cities"—one of them assaulted for a whole day—from which Judas returns without having lost a man, "as the historian affirms"? Nor is it otherwise, in spite of some tactical analogies, appropriate to say, "If the battle of Emmaus may be compared with Austerlitz, the battle of Ashdod may, with equal propriety, be likened to Waterloo."

The book abounds in comparisons, some of them much more felicitous than the preceding, and apt to cast light upon the conditions and ideas of the country and period treated of. Occasional remarks of this kind will prove instructive or suggestive even to learned readers. The stationary character of the East, however, does not justify the author's belief that, in Palestine, things in the time of the Asmoneans must have been in a great many respects like things in the time of Joshua or in our own. There is a great deal of unsoundness in a comparison like the following, considering the legendary data on which it is based, and the many really historical facts which speak against it :

"The Canaanite towns, which Joshua in a single day reduced to a heap of ruins, cannot have been extensive or very firmly built. The city which Joab would have drawn with cords into the river ; the house supported on two pillars which Samson pulled down ; the cottage-roof torn up to give room for the paralytic man's bed to be lowered—these various episodes suggest that the architecture of ancient Palestine was not far different from that of the modern Syrians."

The conquerors of well-known times, such as Sennacherib, Nebuchadnezzar, or Alexander of Macedon, did not reduce in a day or pull down with cords such Canaanite towns as Jerusalem, Tyre, or Gaza. Nor ought the writer to forget that, even according to the legend of Judges, the roof of the house which the Jewish Hercules pulled down bore "about three thousand men and women who looked on while Samson made sport."

Besides the biography proper the book before us contains an introduction ("From Ezra to Simon"), a chronological table of events, and chapters on the national life of the Jews, on their national religion, on the surviving brothers of Judas, and on the results of independence ; and, in an appendix, the genealogy of the Asmonean family. The chapters on the national life and religion contain many interesting sketches, but also much irrelevant talk, anachronistic or obscure, about Karaites, Mehistanites, Mizraimites, Cabbalists, etc., and, what is worse, a number of grave blunders. As regards the latter, it will suffice to quote the statement concerning the Jewish fasts, which runs thus, and is a perfect tissue of errors :

"Six fasts were also yearly observed, including the great Day of Atonement. The first occurred in the beginning of July, in memory of five national calamities ; the second fast, in the end of the same month, was on account of the destruction of Solomon's Temple ; the third was the great Day of Atonement, in the end of October ; the fourth, lasting three days, commemorated the taking of Jerusalem by Nebuchadnezzar, in December ; the last was the fast of Esther, preceding Purim."

The reader will perceive at once that one of the "six" is wanting ; we miss the fast of Gedaliah, the third. And thus the Day of Atonement is not "the third," but the fourth, and so on. Nor was the Day of Atonement observed "in the end of October," but generally in September. Nor does any such statement as "in the beginning," "in the end," in reference to the months of the solar Christian year agree with the lunar calendar of the Jews, their intercalary months notwithstanding. Nor did the fast, here falsely called the fourth, last "three days"—like all others it lasted only one. Nor did it commemorate "in December" the taking of Jerusalem by Nebuchadnezzar, for Nebuchadnezzar took Jerusalem in summer. The statement of the Jewish festivals (p. 33) is not much more correct. The chronological table is also very imperfect. We are very sorry to have to point out such mistakes in a book which we cannot refrain from recommending as both agreeable and instructive.

Ten Years' Experience in Works of Intermittent Downward Filtration, separately and in combination with Surface Irrigation. With notes on the practice and results of Sewage Farming. By J. Bailey Denton, M. Inst. C.E. (London and New York: E. & F. N. Spon.)—The Rivers Pollution Commissioners of England, publishing the results of the laboratory experiments of Dr. Frankland in 1870, stated their deductions from his experiments in these words: "An acre of suitably constituted soil, well and deeply drained, with its surface levelled and divided into four equal plots, each of which in succession shall receive the sewage of six hours, would cleanse the sewage of 3,300 persons." They explain that "such a filter was not a mere mechanical contrivance—it was a machine for oxidizing and thus altogether transforming, as well as for merely separating the filth of sewerage water." In 1871 Mr. J. Bailey Denton, C.E., was entrusted with the preparation of plans for the temporary purification of the sewage of Merthyr Tydfil, a manufacturing town in Wales, having a population of about 50,000. The sewage of about one-half of these was to be treated. Mr. Denton determined to adopt Dr. Frankland's suggestion, and to that end prepared twenty acres of free soil for the purpose. The area was divided into four parts of five acres each, and was thoroughly underdrained (and thus aerated) at a depth of about seven feet, so that each plot of five acres contained about 50,000 cubic yards of filtering material. The land was laid out in narrow ridges with deep furrows, carrots and other vegetables being planted on the ridges and the sewage flowing through the furrows. The effect on the growth of vegetation was most remarkable, and the effluent water was made much more pure than the Rivers Pollution Prevention Act required. The sewage was discharged alternately on the different plots, settling rapidly away in the ground, leaving its impurities attached to the interior surfaces of the soil, and flowing off as clear water. During the intervals between the applications the active oxidation of the retained matters restored the soil to its original purity, so that year after year it continued to perform its work with no abatement of effect, and demonstrated the entire practicability of the system. Had this demonstration been waited for before the purchase of several hundred acres for surface irrigation at a distance, and before the construction of a costly outfall sewer, much money would have been saved to the ratepayers, and the result would have been entirely satisfactory.

No radical improvement in sewage-engineering has ever been adopted without arousing the animosity and sharp criticism of the profession. The various reports concerning the filter-beds at Merthyr Tydfil have been conflicting and confusing. The statement of the case in Mr. Denton's pamphlet seems eminently fair, and it leads to the conclusion that entire reliance is to be placed on the statement of Mr. Dyke, the medical officer of the district, in a letter to Mr. Denton of September 9, 1880, to the effect that the filtration areas are constantly used, and that—

"On more than one occasion during the last three years the twenty acres prepared by you have had to take the whole of the sewage of 40,000 people for two or three or more weeks together. [The necessity for this was caused by breakages of the outfall sewer which conveyed the sewage to the surface-irrigation farm.] On each of these occasions the areas did their work thoroughly. . . . The feeling in Merthyr is that the filtration areas at Troedyrhiew were an engineering success. They did the work designed for them perfectly. The process you devised is the right one, and I earnestly hope the authorities of towns will adopt it."

The same system has been applied at Kendal, Abingdon, Forfar, Great Malvern, Halstead, Barnsley, Hitchin, Oakham, Earlston, and Radford; also at public institutions and country seats—in all cases with eminent success and apparently with great economy. Indeed, the returns from the cultivation of the land treated have been much more promising than those from surface sewage irrigation. It is found that the severest frost has no preventive effect ; and the only requirement seems to be a reasonable porosity of soil, heavy clays and peats being less well suited to the work than other soils, and the best of all being fertile loams on porous sub-soil. The principle on which the operation is based—intermittent downward filtration—is the same that has been successfully adopted here for the disposal of the sewage of Lenox, of the Woman's Prison at South Framingham, and in connection with

numerous private houses. In these cases the distribution has been through porous drains laid below the surface of the soil; but the principle of intermittent supply and drainage and aeration by deep-laid tiles is the same. Mr. Denton's pamphlet will be welcomed by all who are interested in its subject as much the most complete and conclusive exposition of its principles and practice that has been made.

Pictures from Ireland. By Terence McGrath. Leisure-Hour Series. (New York: Henry Holt & Co. 1881.)—This book depicts different phases of the present Irish agitation, using fictitious names and places for characteristic persons and localities concerned in it. The author is a writer of evident literary ability and of apparent trustworthiness, in so far as his positive statements and the conclusions to be directly drawn from them are concerned. If his name is not a *nom de plume*, however, it is a little difficult to account for the unsympathetic quality of his pictures of the Celtic character, except by supposing him to be uncommonly alert in checking any of the bias of patriotism he may possess. Upon this presumption his success is certainly complete. But, though the reader will have to supply for himself whatever amiable and admirable qualities there may exist among the Irish peasantry, and may make the reflection that on the author's own showing reactionary measures seem out of the question, there is almost nothing in the book that is not worth reading. A few chapter-titles will give an idea of its contents: "The Tenant's Friend," "A Parish Priest," "An Agitator," "A Home-Ruler," "The Voters of the Future," "A Gentleman Farmer," "An Absentee's Agent," "An Orangeman," and so on. Each of these types is very picturesquely described, and the description has enough verisimilitude to be convincing. The whole taken together makes a picture of the present time (or recent—1879 is the year explicitly referred to) that is varied and telling. As an example of the literary effectiveness with which it is written the following sentences may be taken from the first-mentioned chapter:

"If you tell Mr. Casey he is a blood-sucker, he will not call you out, but if human ingenuity can compass a mischief to you he will do it. And yet no term in the English language could more clearly describe him. . . . Mr. Casey is a small, squat figure, with a broad, fat face, on which a beard has never grown, and a clammy hand, the most hearty grasp of which is feeble. . . . If you met him on a prairie he would look as if he had just run against you round a corner. It is many years since Mr. Casey began life in Kilnamuck; and from the time when he pleaded infancy in defence of a process for the price of a watch that had been sold to him on credit, his master predicted that he would make his mark."

This raciness and point are sustained throughout the volume, whose limits fit its material with perfectly normal exactness, so that there is no book-making about it, as there easily might have been. Nor does Mr. McGrath draw out the moral of any of his sketches, which, for that matter, are significant enough without tags. One deduction to be drawn from what he says about Mr. Casey and others like him is that the Irish are manageable enough by people who understand them. In this book they are managed only by those who cheat and rob them, to be sure, but the author would probably not formally maintain that the only way to humor their whimsies is by humbugging them more or less seriously.

MATRIMONY.

A Novel. By W. E. Norris. 16mo (Leisure-Hour Series), $1.

The New York *Evening Post* says: "*It is a far worthier thing than any mere story. As it stands it is choice literature, and it is just so much superior to the merely dramatic stories that do duty as novels as choice literature is superior to acting melodrama. . . . The reader who cares for literature as literature would not willingly spare a paragraph, because every paragraph has a charm that is independent of its relation, or want of relation, to the plot of the story.*"

The *Saturday Review* says: "*A fine book. . . . We cannot but think that Thackeray's best work has never been approached so nearly as by the author of 'Matrimony.'*"

HENRY HOLT & CO., New York.

Kuhn's Zeitschrift.

Vol. 1–5, 7–20, and one volume of indices. Boards, $75.

Boetlingk und Roth, Sanskritisches Wörterbuch.

Seven volumes (complete), half morocco, $60.

NEW YORK, THURSDAY, MAY 26, 1881.

The Week.

WHEN Messrs. Conkling and Platt resigned there was apparently no doubt in their followers' minds, and perhaps none in theirs, that they would be triumphantly re-elected. In a few days, however, it became plain that the opposition to this would be formidable if not fatal, and their friends then gave out that both of them were tired of public life and did not seek re-election. There was something touching in the view taken of the matter by some of Mr. Conkling's henchmen, as showing how impossible it is for them to conceive that the great man at whose frown they have so often trembled in "politics" may not be an equally great man everywhere else. We have heard of one of them anticipating a great fall in stocks when the news of the resignation reached Wall Street. When it seemed likely that the chief might not be or would not wish to be re-elected, they made pathetic little efforts to throw dignity around his retirement by telling of the wonderful things he would do in private life. One of their stories was that he had been invited to enter a law-firm in this city with a "guaranteed income of $50,000" a year. Of course tales of this kind are not legitimate subjects of criticism, but we will suggest to the henchmen that this particular tale would be made much more effective by naming the law-firm. Any name will do.

There was a conference of Mr. Conkling and his leading adherents in this city on Sunday, at which he relieved their anxiety by putting himself unreservedly "into the hands of his friends," or, in other words, saying that, instead of accepting that wonderful "law-partnership," he would be a candidate for re-election. Mr. Platt made a similar announcement, thus upsetting the story that the angry stockholders of his express company insisted on his coming back to the duties of the presidency. Mr. Conkling has incontinently gone to Albany to "take command of his forces," or, in other words, to intrigue for votes in the Senate and Assembly. At this writing it is reported that enough Administration Republicans have signed a pledge not to go into a nominating caucus to make an election at this session of the Legislature impossible. But the Conklingites answer that if this happens the Governor will call an extra session, and will continue to call one till they do their duty, and if the party loses the election in consequence this fall the "Half-Breeds" will, as the cause of it, be politically damned. It is, however, useless to attempt to follow in detail the current of rumor and counter-rumor which flows through the daily press from the mêlée at Albany. The main facts are that Conkling and Platt are engaged in the ridiculous business of lobbying for an office they have just resigned, and that their opponents are suffering from want of cohesion and leadership, and that the final result is still uncertain. If re-elected it is certain that Mr. Conkling will go back shorn of most of his influence, and Mr. Platt will go back still more insignificant than when he came away. The only new feature the Conklingites have thus far introduced into the contest is the doctrine that Conkling is the champion of the "Anti-Monopoly movement," while Blaine is the agent of the "soulless corporations." This is not a bad idea.

"Organs" are queer things. The Albany *Express* is the great Stalwart organ, and does the State printing, and believes "the Machine" to be a semi-divine institution. On Monday, however, it astonished the Stalwarts by a leaded paragraph expressing the deepest sorrow at Mr. Conkling's putting himself up for re-election, alleging that he was "belittling" himself and exposing himself to "humiliation" in so doing, and that he "had better keep out of it." During the day, however, the editor got sorry, said he wrote this passage late at night under the influence of deep "emotion," and on Tuesday he declared that he was for Conkling and Platt first and last, and "heartily approved and endorsed their course," and appealed to the Legislature to support them. In other spheres of human activity such a sudden change as this would destroy a man's influence, but in "politics" and "journalism" the last paragraph is just as valuable and influential as if the first had never been written.

In response to a serenade at Albany, the other night, Judge Robertson enumerated the reasons for mutual congratulation. These were: the abolition of the "unit rule" at the party conventions; the defeat of the third-term project; the establishment of the principle of district representation at Chicago; and the reaffirmance, at Washington, of the President's constitutional right "to nominate to the Senate, and to have such nomination considered by the Senate." He saw in these achievements the dawning of a better day in politics, when there should be independence of thought and action without dread of instant political decapitation. Now, there is no illusion about these signs, which really mark so many stages in the decline of the Boss; but the Judge overlooked the discouraging symptom of the event he was celebrating, which was that his appointment was made on Boss principles and (so far as appears) on no other, and again, to all appearance, by a Maine Boss instead of a New York Boss. Moreover, such independence of thought and action as has already flourished at the Custom-house under the present régime is now trembling in its boots because of the manner of his appointment; and not one of his future subordinates is at this moment free from the dread of capricious decapitation, no matter how slavish his thought or action may be. There would have been some cause for rejoicing if the new Collector had capped the climax of his felicitations by announcing a little programme with but two articles, namely, the abolition of assessments at the Custom-house, and the retention of the existing system of competitive examinations.

Vice-President Arthur's open and active conspiring with Conkling and Platt for their return to the Senate greatly heightens the indecency of the present situation. He is another illustration of the folly of "magnanimity" in politics like ours, having been foisted upon the Chicago Convention by ex-Governor Dennison, of Ohio, the head of the late Sherman delegation. This act, as devoid of delicacy as of principle, finds its proper reward in General Arthur's endorsement of the contemptuous and insulting contents of the letter of resignation, and of the resignation itself as a means of giving the President a slap in the face—for this, from Mr. Garfield's point of view, is all that Conkling's re-election would mean. Since Calhoun's breach with Jackson in 1831 there has been nothing to compare with Mr. Arthur's behavior, and that at least was dignified by personal jealousy and ambition, while Mr. Arthur's opposition to President Garfield is purely vicarious. Under our Constitution, the Vice-President, so closely identified with the Administration in the canvass and in the election, afterwards becomes reasonably independent in his own sphere, and Calhoun did not feel called upon to resign until it suited his convenience to represent his State once more in the body over which he presided; but the rupture was immediately followed by the reorganization of the Cabinet, which contained several of his partisans. It would be too much to hope that the defeat of his political creator will cause General Arthur to follow him into retirement, and on the other hand there is no reason to fear that Mr. Garfield will ask the resignation of the Postmaster-General. We wish we could add that the present scandal will probably be a solemn warning to party conventions to bestow as much thought and prayer on their choice for the second as for the first place on their ticket. But the country's experience of promoted Vice-Presidents ought long ago to have induced this, and yet has completely failed to do so.

Mr. William E. Chandler's nomination for the Solicitor-Generalship has, we are glad to say, been rejected. This retains Mr. Phillips, a very competent man, whom there was not the slightest excuse for superseding, in his place, and probably retains Mr. MacVeagh in the Cabi-

net. No more discreditable change has ever been attempted in the public service by any Boss of them all. It is stoutly maintained now that Mr. Chandler is a lawyer, and has conducted several important cases. But we believe his law business was always of a quasi-political kind, and there was so little of it compared to his lobbying business that it is not wonderful that a good many people who thought themselves very familiar with his career did not know he was a lawyer at all. The mere fact that there should have been a dispute as to whether he was or was not a lawyer is a good illustration of the character of the nomination for such an office as the Solicitor-Generalship. We hope the President has now got through with these nondescript nominations, and that he will give us either civil-service reform or the old-fashioned "slaughter," "tomahawk," and "war-club" system—that is to say, either conduct the Government in the character of a sensible business man in a civilized community, or in that of a Mandingo chief treating his court beauties to a butchery of prisoners after a victory.

Two appointments among those confirmed by the Senate before adjournment (and it acted favorably upon all the President's nominations except Chandler's) deserve special mention. One was that of Mr. Bruce, the colored ex-Senator from Mississippi, to be Register of the Treasury; and the other that of Dr. George B. Loring, of Massachusetts, to be Commissioner of Agriculture, in place of General Le Duc. The vote on Mr. Bruce showed that he had won the entire respect of his colleagues from both sections, and that his fitness for the position may be presumed. Dr. Loring's capacity is, if not notorious, independent of the Senate's approval. We trust that in his hands the department will quietly establish its claim to higher public estimation, which it will best do by sustaining and strengthening its scientific corps. For example, the present entomologist is a most indefatigable investigator, whose two years' service, it is hardly extravagant to say, shows more solid results than can be gathered from the entire previous history of the department. His volume on cotton insects is, for one year's work, a marvel of industry and originality. No one is more competent than Dr. Loring to exhibit the practical, paying value of researches like these, which are nevertheless purely scientific, and the more he can fortify the department with such men and such evidences of their worth to the agricultural class, the more he will elevate it in the eyes of Congressmen, upon whom its future dignity and usefulness depend. Dr. Loring, by the way, has had no predecessor of anything like his intellectual accomplishments, as should in due time appear in his reports.

Pending the investigation which ex-Senator Dorsey demanded at the hands of Mr. James the New York *Times* is pursuing its revelations of the Star-route frauds, and, so far as the public is concerned, performing a service very similar to that desired. In its issue of the 19th inst. it gives details of the way in which the Dorsey combination managed several contracts that ought to satisfy a not unreasonable curiosity. The contract for Route No. 39,104, for example, was awarded to Miner, Dorsey's former partner, at $1,748; he sublet it, of course, immediately to one Pool, with whom he bargained to have the work done on the original schedule for $1,200, and under the expected increase of service to seven trips a week for $7,560. This ensured Miner a respectable profit, since the *pro rata* for the increased service would be $12,236. The service was increased and expedited as expected. Miner got rid of Pool, whose contract was terminated because he failed to do the work properly, and sublet the job elsewhere at a profit to himself of something like $6,000. A singular point in this case is that, whereas, by the usual method of calculating increased pay for increased service and reduced time his increase would have, according to his estimates of horses and men, reached $20,976, he announced to the department that he would accept $7,866—a circumstance which shows the flagrant character of the ordinary computation in such cases. For Route No. 38,113, in Colorado, John W. Dorsey got the contract, and finally ex-Senator Dorsey the sub-contract. The particulars as to moneys are substantially the same as above, but it appears that here the service was frequently not performed at all, and that, though Dorsey should have been declared a "failing contractor," he never was, and, so far as the records show, is now drawing pay from the route in question. This was originally $1,700 a year, and was raised to $31,981.

The Mayor announces that he will do the best he can to have the city cleaned under the provisions of the new conference bill, which will probably become a law. At the same time he points out the defects of the measure, which it is clear has been accepted by the Citizens' party in the Legislature simply because of the impossibility of getting a better bill through, and because a continuance of the present state of affairs would be intolerable. The bill provides for the appointment by the Mayor of a "Commissioner of Street-Cleaning," subject to confirmation by any two members of the Board of Health. His term is fixed at six years, and removal requires concurrent action of the Mayor and Health Board. As Mr. Grace says, the provision of the Citizens' bill placing the power of removal and appointment exclusively in the hands of the mayor was "the vital principle of the whole measure." At present it happens that one of the Health Commissioners is President of the Police Board, and the man of all who blocked the Citizens' bill; a second belongs to the State government and is only *ex-officio* a member of the Commission, and a third is an officer whose term has expired. It is as absurd to endow these gentlemen, who have and can have nothing in the world to do with cleaning the streets, with the power of appointment and removal, continues the Mayor, "as if the Governor were obliged to submit his nominations for State officers to the harbor-masters, port-wardens, or the State Board of Health." The probable working of the measure in the event of a necessity for removing the Street Commissioner is clearly enough described by Mr. Grace, as well as other defects of the bill which he thinks "sufficient to cause a failure of the new system," and to "deter men of recognized public merit from risking their reputation in dealing with this subject." It is very evident, all things considered, that the conference bill is a *pis-aller*, but little better, though superficially fairer-looking, than the Carpenter bill for which it is substituted.

Of the $196,000,000 6 per cent. bonds on which the option to extend at 3½ per cent. expired on the 20th instant all were extended except $16,000,000, and these will be paid in cash on and after July 1, as they are presented. It is likely that these $16,000,000 were scattered about in the hands of persons who did not know that the bonds are to be paid off if not extended, as no other reason can be conceived for refusing to accept so advantageous an offer. During the week the applications for the extension of 5 per cent. registered bonds ran up to $250,000,000, the limit to which extensions of this class of bonds will be permitted by the Treasury; the remaining $75,000,000 of registered 5's the Treasury reserves for absolute payment out of surplus revenues. The only other 5 per cent. bonds outstanding are $120,000,000 of coupon issues. The holders of these have until July 1 to elect whether they will take cash for them or extend at 3½ per cent.; although applications for extension of these are not expected to be large until the latter part of June, yet about $15,000,000 have already applied for the continuance at the reduced rate. Altogether the refunding scheme of the present Administration has literally worked like a charm. The new 3½ per cent. bonds, which represent the extended 6's, have advanced in the market to 104 to 104¼, and the coupon 5 per cents, now the only bonds for which 3½'s can be obtained, continue to be sought here and in the foreign markets.

It is likely that as the result of refunding the 5 and 6 per cent. bonds fully $100,000,000 of the cash in the Treasury will be paid out this year; the calculation being that $75,000,000 will come out for registered 5's, $16,000,000 for 6 per cents, and perhaps $15,000,000 for coupon 5's. The volume of lawful money in the country was never so large as now, the figures showing an increase of $46,000,000 since January, and over $300,000,000 since July 1, 1879; and the gain has been more in gold than in any other item. The outlook for the loan market has, therefore, been such as to encourage speculation, and this during the week has been buoyant at the Stock Exchange. Immigration continues to be enormous, and the arrivals at this port during this month bid fair to ex-

ceed the total of some years in the last decade. The railroads are generally rather more than maintaining the enormous business of last year; some of them show important gains. The general trade of the country is good, and thus far the crops look well. In London, money is also very abundant, and speculation is raging there with a strong preference for American railway stocks. The foreign demand for these during the week was sufficient to lower the rates for sterling bills a cent a pound-sterling during the week, and to leave them about midway between the gold-importing and the gold-exporting point.

The Irish Land Bill was read a second time on Thursday last, after the defeat of a condemnatory resolution offered by Lord Elcho by a vote of 352 to 176, which is a larger majority than the Government expected. They only counted on 100, and Mr. Parnell, who left the House without voting and took eighteen followers with him, was expected to take twenty-seven or thirty. Parnell's tactics are based on the theory that he and his friends must not assume any responsibility for the bill as it stands, and he has written a passionate appeal to Archbishop Croke, of Cashel, who is the only high dignitary of the Catholic Church who stands by the Land League, urging him to support him in taking this position.

The bill now goes into the Committee of the Whole. Every member can speak as often as he pleases, and there are, it is said, about one thousand amendments ready to be offered, and it will be impossible to apply the new "urgency" rules to cut off debate without endangering the bill. Mr. Gladstone's prospects for the summer cannot, therefore, be called cheerful. The only speech of marked importance in the debate on the second reading was that of Mr. Shaw Lefevre, who has long been an authority on the land question. He made a most telling point by showing, from the report of the Bessborough Commission, that even if the testimony of the tenants be altogether excluded, that of the landlords and land-agents alone supplies ample proof of the existence of the insecurity of tenure which the bill is intended to remedy. A remarkable addition to the literature of the subject has been made, too, in a memorial of the ministers of the General Assembly of the Irish Presbyterian Church of Ireland, who live mainly in the North. They say they are attached to the British Crown and connection, but declare that their parishioners, the farmers of Ulster, are pervaded by a "deep, widespread, and growing discontent" with the Irish land-tenure; that "the ancient custom called the Ulster tenant-right has been from time to time curtailed, and is now rarely seen in its entirety"; that rents, even on the estates of good landlords, are excessive, and absorb the tenant's improvements; that a good land system would put an end to outrages and make coercive legislation unnecessary, but that, while highly approving of the spirit and general principles of the bill now pending, some of its provisions would work great mischief.

The proofs that the Coercion Bill is a failure multiply every week, and already supply ample justification for the *Pall Mall Gazette's* contention that it is useless to pass such bills, if the state of public opinion is such that you cannot follow them up by any use of force you may deem necessary. About sixty persons have been arrested under it, but public opinion will not permit of their imprisonment being made in any sense rigorous, and accordingly the penalty has no terrors in it. In the meantime the attempts to eject tenants for non-payment of rent, which many landlords are making, are producing the effect one might naturally expect, when one considers that the bill is intended to prevent such ejectments, and that the Ministry tried to prevent them by a special bill last year. Resistance to the bailiffs and to all concerned in executing the process, and outrages on them, are reported in great numbers from various parts of the country. In the county Limerick matters have come, to use Mr. Gladstone's phrase, "within a measurable distance of civil war." The mob seized and fortified an old castle, from which the large military escort which had accompanied the bailiff to the scene of action were unable to dislodge them without artillery, and to prevent the arrival of artillery the bridges were broken down in their rear. Of course the Government recoils from bloodshed, and, after a futile attempt to starve out the insurgents, the troops were withdrawn, leaving the impression that they had been foiled, and intensifying the excitement. Cromwell would have made short work of such a situation, but then Cromwell's methods are no longer available, and unless they are available, threatening a whole community with an armed force is useless. Mr. Gladstone cannot, as Carlyle says, present "the truth" to the Irish the way Cromwell presented it, and they are now revelling in "falsehood" and in contempt of the "veracities."

The situation has been aggravated by Lord Salisbury's first indiscretion since he became leader of the Conservatives, and we may be sure plenty more are to follow. It was so glaring that the Conservative organs have already condemned it in strong terms. In discussing the relations of the House of Lords to the Commons he maintained that, while it might be improper for the Lords to hold out against the popular will clearly expressed through the Commons, there were occasions when the Commons did not express the will of their constituencies, and that on such occasions the Lords would be justified in resisting, and he intimated that the attempt to pass the Land Bill was one of these occasions. This, of course, is taken to mean that he will probably advise the Lords to throw it out, or modify it into nothingness, which would lead to a very exciting if not dangerous struggle, if the Ministry had to dissolve Parliament. It intensifies the lamentations of the moderate Tories over Lord Beaconsfield's death, as he, it is maintained, would have cajoled the stiff-necked peers into passing the bill, and would have furnished them with a neat assortment of reasons for doing so.

On Thursday Gambetta succeeded in procuring the adoption by the French Chamber of the *scrutin de liste*, but in order to do it he had to take the floor himself and make one of his impassioned speeches, which no French audience seems able to resist, although the opposition in the Assembly, as the vote shows, was strong. The resolution to take up the bill was only carried, in spite of Gambetta's eloquence, by 243 to 235, but the subsequent majority on the final passage was large, a stampede taking place among its opponents as soon as it was plainly inevitable. It probably seals the fate of a great many small local notables, who will have little chance of finding a place on a general departmental ticket, and this doubtless accounts in a considerable degree for the size of the minority against it. For the reasons we gave last week the adoption of the general ticket will introduce a discipline into the Republican party not hitherto witnessed, and give the managers in Paris a control of the majority such as they have never had. It undoubtedly means that after the coming election Gambetta will not refuse to form a Ministry. He will probably be returned by several departments, and be thus designated as the proper leader of the party in the Chamber. The situation then created will be a very difficult one for M. Grévy, and, in fact, for any one occupying the Presidency. It will probably lead to a more thorough discussion of the office than it has ever received.

It is difficult to say what course the present Emperor is pursuing in Russia. The reported determination to establish some kind of small representative body has as yet produced no result. It has been reported with equal particularity that a change in the position of the ministers had been determined on by the conversion of the heads of departments into a homogeneous or "solid" cabinet, deliberating and resolving in common, instead of the present system, by which each minister is responsible simply to the Emperor. General Melikoff was elected president of it, but he resigned soon after and was succeeded by General Ignatieff, and the exact state of affairs seems to be as uncertain as ever. The Nihilists, however, appear to take it for granted that the reactionary policy is to be persisted in, and have distributed in Easter eggs copies of another proclamation, warning the Emperor that they mean to pursue him with the old weapons, and will not be satisfied with anything short of the admission of popular representatives to a share in the Government.

POPULAR LESSONS OF THE CONKLING ROW.

THERE is now no doubt that even if Messrs. Conkling and Platt be re-elected they will be re-elected with difficulty, and only as the result of considerable exertion on their own part and on that of their immediate followers. Their re-election will consequently not be in any proper sense a vindication. A vindication, under such circumstances, in order to be effective has to come spontaneously. If it has to be procured by vigorous lobbying it cannot have much, if any, moral weight. Therefore it is safe to say that the victory in the late contest over Mr. Robertson rests with the Administration. The President has got the better of the New York Senator, and has his own man in the Custom-house, and has had no difficulty in getting the Senate (after Mr. Conkling's withdrawal) to recognize the completeness of his discretion in the matter of nominations. Now, in our view the whole affair has been from beginning to end unnecessary. There was no need whatever of a change in the New York Custom-house. There was no complaint against the present Collector. He is not a follower or dependent of Mr. Conkling's, and if the Administration wished to testify its hostility to Mr. Conkling's ascendency in State politics it could not have chosen so effective a mode of doing so as to strengthen and extend the system by which entrance to the public service and promotion while in it are obtained in the Custom-house and Post-office in this city. There can be no better mode of overthrowing the State Boss. It is just as much so as appointing his enemy Mr. Robertson to the Collectorship, and it would have the additional merit of preventing the growth of another Boss. It would satisfy the whole political class who follow and admire Conkling that the system which gave him his power was at an end, and they would all begin to turn their attention to something else than speculation as to the best means of ingratiating themselves with the Boss who they think is going to succeed Conkling.

But this is not all. In resorting to that mode of overthrowing the Boss the President would have kept intact his own reputation for consistency and sincerity. He would have had not only Conkling's enemies and rivals at his back, but he would have had that large, influential, and, indeed, we may say dominating, body of the voters who dislike the ways of political managers and the use of official patronage for party purposes without well knowing how to get rid of it. This class would have hailed any such action on the President's part with immense relief, because it would have seemed not only a justification of their own repugnance to the spoils system, but a suggestion from an authoritative source of the proper remedy. Their satisfaction, too, would have grown stronger every year, and General Garfield would have had, before the close of his term, the confidence and support of that portion of the American people which, in the long run, supplies every party organization with its blood, bone, and sinew, however silent it may be at conventions. As matters stand, he gets only half-hearted support, even from those who most dislike Conkling and his ways. In approving what has been done they are compelled to acknowledge that in doing it General Garfield has diminished their respect for his character, because they are not ready to admit that any man fitted to fill the office of President of the United States can deliberately repudiate professions made up to the very hour of his entering on office, without the existence of some serious defect in his moral constitution. People ordinarily put up with such defects because they live in a world made up in the main of defective people, but they do not forgive a high officer who parades them, and makes them conspicuous in great public acts. His versatile friend Mr. Blaine may assure him that this is all twaddle, and that his tergiversation in this matter will be forgotten very soon, but we venture to challenge a return to the subject in May, 1885, when the public mind on General Garfield's Administration will have been made up, and when he, returning to private life, will be craving the deliberate commendation of the class which he is now setting at naught.

Moreover, we cannot help thinking that it was very bad policy, after he had given up all pretence of being a civil-service reformer, not to follow the advice of his other friend, the Cincinnati *Commercial*, and use the patronage as a "war-club." There is really no middle ground between the use of the public offices simply for the proper conduct of the public business, and the use of them for the "slaughter" of political enemies. The giving a portion of the New York offices to Conkling, as has been done, and giving the rest to his enemies is a mixture from which it is hardly possible for any good to come. "War" on all Conkling's adherents—absurd as it is as a mode of carrying on a civilized government—would, at least, have the effect of breaking his Machine up completely, and, as we have said, causing his followers to abandon him and take up with some one else. But when they find the Administration giving marshalships, and district-attorneyships, and collectorships to persons whose sole claim to office is drawn from their being "Conkling men," it helps to keep his Machine together, and prevents his followers from dispersing or despairing. It may be magnanimous, or affecting, or magnificent, or what one pleases, but it is not "war." So that here again the President fails to rally to him those who believe in the use of the offices for "slaughter." It is very difficult to say what set or faction of the party the President's policy is giving complete satisfaction to or winning him adherents from. If he does not mean to administer the Government on business principles, the wisest course to pursue is undoubtedly to use it as a "tomahawk" and "scalping-knife," to dismiss from the public service everybody who is Conkling's friend and everybody who refuses to "work" against him, and to have it well understood that nobody who stands in either of these categories has any chance of any place of trust or profit.

What the ultimate effect of the present mélange of "war" and conciliation upon "politics" will be it is hard to say, and we make no pretence of foreseeing. But two results which are likely to be very useful to the cause of good government have already flowed from President Garfield's experiment. One is a complete demonstration of the impossibility of restoring "harmony" by means of offices among persons who have quarrelled about offices. It is now plain to be seen that no two factions of any party can be satisfied by any division of "the spoils" among them. It is plain that under the spoils system only one local leader can be allowed to distribute patronage, and that no leader who bases his authority on "spoils" can ever have "spoils" enough. His followers must always be much more numerous than all the offices in the State, and even if the whole patronage of the Government is placed at his disposal he must leave hundreds unprovided for. To expect him under these circumstances to divide good-humoredly with his enemies is absurd on its face. Mr. Conkling's position, therefore, as a spoilsman addressing persons who believe in the spoils system, is perfectly reasonable. No patronage does him any good as long as his foes get the Custom-house, because the spectacle of the Custom-house in their hands fatally weakens his authority over his followers—that authority being based wholly on the belief that he has or will have the disposal of all the Federal offices.

The other good result of the experiment is the illustration it has afforded the public of the irresistible tendency of the spoils system to run into extremes, and of the impossibility of keeping it within any limits of decency or practicability. We have at the head of the Government at this moment the best equipped public man, as far as intellect and acquirements are concerned, who has held the place for more than half a century. It was natural to expect that his accession to office would be the signal for a revival in his party of interest in the dozens of questions relating to the great moral and material interests of the country which are awaiting legislative treatment either immediately or in the near future. But so great is the momentum which the spoils system has acquired with all classes of politicians, whether from Massachusetts or Texas, that when he convened the Senate for the transaction of executive business he could not get it to do any business. It at once engaged in a "deadlock" over two small offices in its own gift, and remained in this ridiculous attitude before the civilized world for two whole months. He found further that when he undertook to exercise his constitutional right of appointing a Collector at this port without consulting the Senators of the State before making the nomination, these Senators no longer confined themselves to withholding their "consent" and opposing it in the Senate. They treated the failure to obtain their consent beforehand as, in a certain sense, a revolutionary act, which obliged them to quit their seats and lay the whole matter before their constituents in a solemn appeal. Nor was this all. Hitherto ex-Presidents have either retired quietly into private life or have refrained with somewhat ostentatious delicacy from criticising their

successors or asking favors from them. But the momentum of the spoils system has broken down this customary reserve. General Grant, on hearing in Mexico that the offices were not distributed to his liking, wrote General Garfield a very angry private letter, besides one to Senator Jones for publication, in which he complained bitterly that his own dependents had not been provided for, and especially one gentleman who needed an income while he was writing his (General Grant's) life. It is to be observed, too, and we trust has been observed widely, that in all the discussions about offices during the last six months there has not been, either in any utterance of the President, or in the debates in the Senate, or in the Conkling-Platt letter, or in General Grant's letter, the smallest allusion to the object for which the offices of a civilized state exist—the conduct of the public business. No appointment, promotion, or change has been commented on with reference to its effect on the service of the taxpayers. The offices have been constantly talked of as the property of certain individuals, or as existing in the main for their gratification. We venture to say that there is not to be found in the English political records of the eighteenth century during the days of Walpole or of Grafton a franker avowal of this doctrine than is to be found in General Grant's letter to Senator Jones. He asks for General Badeau's appointment very much in the spirit in which Lord Weymouth asked the Duke of Grafton for the lord-lieutenancy of Ireland and the Secretaryship of State for the Northern Department. And he is not greatly to blame; he came into politics a simple soldier, and the view he takes of the uses of the civil offices is simply what he learnt from the statesmen by whom he was surrounded during his two terms. It is the duty of every taxpayer to ask himself soberly, How much further can the spoils system go? What will be its next stage?

FRENCH EXPANSION IN AFRICA.

THE French Chamber of Deputies have ratified the Tunisian treaty which the cavalry extracted from the Bey, by a vote of 453 to 1. This one vote was probably cast by M. Clémenceau, who was the only person who spoke against it, and who two years ago was supposed to be the coming Radical who was to oust M. Gambetta by outdoing him in Radicalism. Since then M. Clémenceau has been consigned to comparative obscurity; first, by the success of the Gambetta campaign against the religious orders, and then by the immense financial success of the kind of republic Gambetta likes. There never was a more remarkable mistake made about the feeling of a community which was abundantly open to observation, than that made by nearly the whole foreign press about the probable effect on the fortunes of the Republic of the enforcement of the decrees against the unauthorized religious orders. Even the English Radicals who were friendliest to the Republic and most hostile to the "clericals," were satisfied that this time Gambetta's followers were making a great blunder, which would alienate the peasantry and develop a strong reactionary feeling. As it turned out, not only did the expulsion of the orders, although attended with many scandalous scenes, excite no popular sympathy for them, but it received at the election of the Councils-General, which followed soon after, the emphatic approval of the country districts. This test, which was as severe a one as could be applied, furnished sufficient proof that Gambetta had nothing to fear as regarded his position towards the Church. The Republic has been abundantly fortified on the financial side by the condition of the revenue, which has been amazing the world by a series of surpluses of increasing magnitude, in spite of the loss of nearly half the wine crop. This left the Republic weak on only one side, that of its foreign policy. It has enjoyed thus far the extraordinary advantage on that side of the presence and activity in the political arena of the generation which fought in the war, and felt the heavy hand of the invader in their homes, and suffered in their pockets through his exactions. The profound love of peace which this left behind was perhaps not new in French annals. It was felt just as fully after 1815, but this time it is accompanied by no bitterness towards the Government. The Republic is not, as the Restoration was, imposed on the country by foreign conquerors. It, in fact, gets all the benefit of the reaction wrought by the war against the policy of adventure by which the Empire had sought to prop itself up. But then the war left the French humiliated, and humiliated in their tenderest point, and no Government in France is perfectly safe which allows humiliation to become a permanent mental condition. A new generation, too, is coming forward, which does not vividly remember the war. Gambetta's dark allusions, in his speeches on several occasions during the past few years, to the necessity, at some time not named, of some restoration of the national self-esteem by some process which he never described, which the Germans have been so ready to take up as veiled threats, were probably simply intimations that he knew how the nation felt, and that he felt with it, and that the Republic would, in good time, find a balm for the wounded national pride.

On the side of Germany there was plainly little to expect. Every Frenchman who knows anything of the conditions of an armed struggle with Germany, knows that "revenge" is hopeless either for the generation now on the stage or for that which is coming. The eastern frontier bristles with fortresses such as the world has never seen, and behind them lies an army as large as that which invaded France, as well organized, and which in the next conflict would probably be as well led, because it would be led by younger men. Nothing was more remarkable about the German success in 1870 than the fact that it was achieved by old generals. It is safe to believe that the young officers whom Moltke has bred—for Moltke is not simply a great strategist, but the head of a military school—will be men of as great skill and daring as those who directed the operations of the last war. In the next conflict, too, Austria would undoubtedly stand behind Germany, if need be, as a reserve, instead of, as in 1870, as an ill-wishing spectator. In fact, as far as human foresight can go, the future which France has so long cherished is closed to her on the Rhine. Expansion towards the east has become impossible. Germany has at last recovered from the Thirty Years' War, and has probably irrevocably made the French frontier coincident with the line of the French tongue. If the French passion for cutting a considerable figure in the world outside their own territory is to be gratified, it must be gratified elsewhere than on the Continent of Europe, and it seems now most likely that the seizure of Tunis—for that is really what the chastisement of the Kroumirs amounts to—means that Gambetta is satisfied that Africa is the proper theatre hereafter for it. That portion of the nation which has any historical memory, and which in France has probably more political influence than in most others, has never become reconciled to the loss of America and of India, and the gravity of the loss is brought home to them every day by the enormous spread of the German and English language and influence. The Germans have built up a great empire, and will, it is thought, be very likely to extend it in the near future by the annexation of Holland, and it may be of Switzerland. They have planted enterprising mercantile colonies all over the globe. The English have taken possession of the continent of North America, of the islands of the Pacific, and of the southern end of Africa. Both German and English have already ousted French from the position of supremacy which it held among the languages of the civilized world from the middle of the seventeenth century down to our own time. The Slavs, too, have risen from their slumber, and bid fair to found a homogeneous community which will stretch from the gates of Vienna and the Baltic Sea to the Caspian. All through the Levant the Greeks and Italians are contending for industrial and commercial supremacy with a vigor which neither race has displayed for more than three hundred years. This spectacle of foreign growth and diffusion and activity is something to which no amount of internal prosperity can reconcile Frenchmen, and Gambetta, though of Italian origin, seems to possess in a high degree that capacity for knowing how Frenchmen feel which was one of the most marvellous gifts of that other great Italian, the first Napoleon.

The annexation of Tunis, which will certainly come before long, seems the best mode by which the Republic can gratify the country in its foreign relations. Algeria is at last proving a success, so great a success that its chief defect seems to be that it does not cover more of the coast. With Tunis it will cover nearly all that is necessary to make French supremacy incontestable. In possession of both, France will have the northern half of the African continent for her oyster, if she chooses to set herself to open it, in which she can find work for her soldiers, engineers, colonists, and speculators during the next half-cen-

tury. It is not improbable that she will within the next ten years connect the fertile belt along the coast, through the string of oases which run through the desert down to Timbuctoo, with the vast cultivable and inhabited region which lies behind the Gold Coast. The success of the Suez Canal, which was essentially a French enterprise, has kindled the imagination of French capitalists to a degree which has not hitherto been seen since the Revolution, and the task of "developing Africa" is now preached and depicted, even in sober French economical journals, as a task worthy of French enterprise, in language with which the world has hitherto only been familiar in the columns of American newspapers puffing the bonds of "transcontinental railroads." To make African annexation, however, thoroughly popular in France, it is not enough that it promises great commercial profits and a large field for colonization. There must be a little work for soldiers to do, so as to keep alive the national pride in the army as a great institution, and, above all, there must be opposition or expressed disapproval on the part of some foreign power. In the case of Tunis both these little stimulants are supplied. The young soldiers of the new army have, and will have, an opportunity of showing that the martial qualities of the French character have not declined. The remonstrances of England and Italy supply the sensation of getting something that other people would like to have, which, though it is doubtless a survival of barbarism, is still to a very large degree one of the great rewards of successful effort in the social as well as in the political arena.

FOREST FIRES.

AS is not unusual at this season of the year, destructive forest fires are reported in various portions of the New England and the North Atlantic States. Forest fires are not confined to these States, but prevail at different seasons of the year, either as the result of accident or design, wherever, with few exceptions, on this continent there are forests to burn. The value of the property thus destroyed in the United States every year is not even approximately known, and few persons probably have ever fairly considered the immense loss the community experiences from this curse. The great Wisconsin fire of 1872, which swept along the shores of Green Bay for more than thirty miles, destroyed merchantable pine which, were it standing to-day, would be worth probably more than twenty-five millions of dollars. A few years earlier a great fire raged for three months in the magnificent forests which clothe the coast range of southern Oregon, the most beautiful coniferous forest of the continent. The value of the property destroyed in this fire cannot be estimated. The volumes of smoke which rolled up from it obscured the light of the sun, and for weeks day and night could not be distinguished; labor was abandoned, and the vessels which ply along the coast were forced to stand far out to sea. Pine and fir were destroyed in immense quantities, and twelve thousand million feet of "Port Orford cedar" (the valuable wood of a peculiar cypress of that region) were, it is said, consumed. Great fires sweep every year through the fir forests of Puget Sound, forests which have not anywhere their equal in productive capacity. They are common along the Cascade Mountains of Oregon and the California Sierras. The scanty and stunted forests which nestle on the upper slopes of the mountain ranges of the Great Basin and of Arizona, and which, once destroyed, can never be replaced, are every year the prey to extensive fires. Great tracts of the pine forests of the northern Rocky Mountain region, extending east to the Yellowstone, and along the intervening mountain ranges to the Black Hills of Dakota, are already consumed. On a clear day in summer the smoke of countless forest fires may be seen from any of the high peaks of Colorado. The pine belt of the Southern Atlantic and the Gulf coasts is entirely burned over every year in order that the pasturage which these open forests free of undergrowth afford may be improved. Forest fires are happily of rarer occurrence in the Southern Alleghany region and on the Cumberland plateau, and this is probably true of the lower Mississippi Valley, where the prevalence of non-resinous trees and a more equally distributed rainfall check the spread of fire.

This waste of valuable material is not, however, the greatest loss caused by forest fires, and yet it is believed that more of our trees are destroyed every year by this cause than by all others combined. The greatest injury these fires inflict is this: The burning of the surface soil so changes its character that the original species do not often reappear after a forest has been burned, until its lost fertility has been restored by the slow growth and decay of generations of less valuable plants. When a northern pine forest is destroyed by fire it is succeeded first by stunted brambles, then dwarf huckleberries appear, and these in turn are succeeded by poplars and bird-cherries, or perhaps by scrub oaks; and many years must elapse before the soil is in a condition again to produce pines. As is well known, the pine belt of our Southern coast is largely composed of a species of peculiar value, the long-leaved pine. When from any cause a portion of the ground occupied by this tree has escaped the general yearly burning this species comes up again; but where the ground has been burned over during a number of years, and then protected from fire, another species appears whose chief value is found in its ability to thrive on, and possibly restore to fertility, poor and exhausted soil. Fortunately the fir of the northwest coast, thanks to a soil of great fertility and an excessive rainfall, still reproduces itself after fire; and here we shall be forced to look for a partial lumber supply when the southern pine shall have given place to its less valuable congener, and the white-pine forests, which a few years ago stretched in an almost unbroken line along our northern boundary from the Atlantic to beyond the Mississippi, have been replaced by poplar brakes and berry patches. This prospective damage caused by forest fires has not been generally considered in treating this subject, and the impossibility of rightly estimating its extent and nature presents a serious difficulty to the proper understanding of this important economic question. Then to the account of forest fires, too, in addition to present destruction of material and of priceless plant-food, must be charged, in part at least, the presence, along the western edge of the Atlantic forests, of those great green bays which we call prairies, and which, whatever their origin, certainly owe much of their extension and continuance to the yearly burnings by which our nomadic predecessors sought to improve their hunting grounds.

Conditions peculiarly favorable to the spread of forest fires on this continent are easily recognized. West of the 100th meridian the rain of the year falls in the winter months, and the long hot summers so parch the soil that a fire once started among the resinous trees of which the forests in that part of the country are composed has full sway. In the East, although the rainfall is more evenly distributed, there are almost every year several months of summer drought, and too often a shorter period of scanty rainfall in the early spring, during which fires are common and most destructive. All the forest regions of the country, east and west, are thinly settled, and by a people whose indifference to the value of forests comes to them by inheritance from the time when the destruction of the trees which hindered the cultivation of the soil was the gravest agricultural problem their ancestors had to encounter. As has been seen, forest fires are in some parts of the country intentionally set by stock-men to improve pasturage. They are often set by hunters, either accidentally or intentionally, to facilitate the pursuit of game; very often they owe their origin to the carelessness of the mining prospectors who every year swarm over the forest-clad mountains of the West. The Indians set many fires, and generally, it is believed, intentionally, either to improve their hunting or to avenge themselves on white settlers. Ten years ago more than a hundred and fifty square miles of pine forest in the Middle Park of Colorado were burned by the Utes as a war measure of their last memorable struggle. Loggers carelessly set many fires in the woods; and much property is destroyed by fires first started in the routine of rude agricultural operations getting beyond control and reaching the forest. Many fires are set every year intentionally by wood-choppers, who thus seek to secure immediate employment in cutting up the partially burned trees, or by charcoal-burners anxious to secure material at a price reduced by excessive supply. Locomotives set every year thousands of forest fires, and it is desirable, and probably perfectly practicable, to compel all railroads to adopt some method for preventing the escape of sparks by which the damage is done.

Almost every State has sought to check forest fires by imposing fines or imprisonment on persons convicted of starting them. Such laws, however, cannot be enforced in a community indifferent and ignorant of what such fires mean. Forest fires will continue and probably increase for some time to come, in spite of the warnings of a few specialists who study the wants of the future as well as of the present development of the country. In time the remedy for this evil will be found, but it will be found too late. When our forests shall have largely disappeared (we are speaking of forests of economic value in distinction from land overgrown with comparatively worthless species), and the prices of all that the forests yield shall have immensely increased, then, after it is too late, the person who sets a forest fire accidentally or wilfully must expect to be regarded and treated very much as a horse-thief is now on the frontier. When that time shall have arrived it will be easy to prevent forest fires by legislation. At present it is useless to do more than call attention to the fact that such fires cost the country every year millions, perhaps hundreds of millions, of its stored-up wealth, and that if we are to save any part of our forests it can only be done through aroused public sentiment in their favor and not by laws which are neither respected nor obeyed.

THE HARVARD "ŒDIPUS."

THE PERFORMANCE.

IN the ten days that have elapsed since the first performance of the "Œdipus Tyrannus" at Harvard the daily newspapers have been so full of the Greek play that the more sober weekly chronicler finds little new to record.

The whole history of Greek tragic art has been passed in review with an erudition that often lacked nothing except orthography, and the universal reporter has mastered the whole vocabulary of costume from the buskin of Æschylus down to the sandal of the Harvard solo-singer. In these circumstances all preliminary characteristic may be dispensed with, and the reader of the *Nation* may be ushered without further delay into the Sanders Theatre.

On the Saturday preceding the first performance there had been a full-dress rehearsal, which gave the actors, managers, and friends of the Harvard play the confidence so essential to success. The performance was, indeed, a triumph, and that triumph was as typically Greek as anything else, for it was the result of the most elaborate attention to details. No point had been neglected. Even the translation of the American "horse-cars" into Attic had been the subject of many grave conferences, and if there were a few prickles in the laurel crown, a few misprints in the programme, it is un-Greek to be too happy. There was no hitch in the arrangements, no jar in the mechanism, which worked as steadily and infallibly as the tragic springs of the drama itself. One might have thought that even the audience had rehearsed, so perfect was it in all its parts, so quietly did the spectators slip into their seats, so close their attention, so just their applause, so fit the manner of their withdrawal, as if under the spell of religious art. It was not merely an audience of undergraduates and their friends. Scholars and authors from all parts of the country were present, and, of the predetermined critics of the Harvard "Œdipus"—chiefly the men whose work in life had been the technical study of the language of the play—not a few were listening and looking intently. Such men, as a rule, are unforgiving, mainly, as many think, because they are after all mere schoolmasters, who wield a pen as they might wield a ferule—if they dared to do so in these humanitarian days. But something should be granted to an unfortunate guild; unfortunate in many things, yet fortunate in this—that in the sphere of art to which the "Œdipus" belongs the infinitely little is the infinitely great. It is easy enough to get up the story of "Œdipus," the characteristics of Sophocles, the philosophy of the drama, but there are points in which even pedants have their rights, though dramatic critics might refuse to hear what they should have to say of Booth and Irving, of Salvini and Sarah Bernhardt.

The Sanders Theatre is admirably adapted to an academic performance of the scope of the Harvard "Œdipus." It is large enough to admit of brilliant effects, of varied groupings. It is small enough to give each spectator the delightful consciousness of being a privileged personage, so that even a stranger can assume the genius of the place, and feel what it must be to have a covenant right to the Harvard beatitudes. The ample stage had been reduced to the narrow ledge which is all that the antique play requires for its action. Two temple-fronts in all the glory of polychromatic art rested on a heavy wall, pierced by three openings—to modern eyes a case-mate rather than a palace. There was no elaborate attempt to reproduce all the details of the Attic stage, and in this, as in much else, the managers showed a wise moderation. On the antique stage itself so much was mere indication that a little indication more or less did not here disturb the effect. The orchestra allowed scanty space for elaborate evolutions, and from what I had seen of the marchings and countermarchings of other reproductions of Greek plays, I did not regret the limitation unreservedly.

After a brief overture, or rather prelude, in which even an unmusical listener might have recognized some prophecy of the action, the suppliants entered and the attendants with visible effort opened the heavy paper doors and the protagonist appeared. Mr. Riddle has made the piece a success. He is a professional actor, a professional teacher of elocution, and is not to be classed with the young amateurs who studied under his guidance, and so I shall not hesitate to write with a frankness which would otherwise be a little out of place. The play was not Greek because the language was Greek, and so Greek freedom of speech, Greek παῤῥησία, must also be tempered to suit the modern mind. My first thought on seeing Mr. Riddle was, This is a youthful *Œdipus*, and I began to compute. At once we miss the mask and the cothurnus. It would never have occurred to an Athenian spectator to ask the age of *Œdipus*, or the age of *Jocasta*, and yet, I venture to say, some such problem was vividly present to the minds of many of the Harvard audience. I remembered that *Œdipus* himself calls his sons men, and this would bring the hero to the full maturity of life. Many years had passed since the death of *Laius*. The king cannot be a boy, and Mr. Riddle looked much younger than his part, younger even than his years. The illusion of heroic size was also lacking. There is a traditional ideal of *Œdipus* that cannot be slighted, for the lines of the figure are given by the poet himself. He is like his father *Laius*, and we demand for him a tall form and a growth of close, curling hair that bites into the skull with the vigor of strong animal life. Modern heroes, outside of muscular novels, do not need these advantages. For them they are but accessories; to the antique they are indispensable. The duty of the modern actor is to make us forget this, and, remembering Garrick, the lights of Mr. Riddle's profession might laugh at the sweet simplicity of a mere physical requirement. Momentum makes up for weight, and it must be granted that as Mr. Riddle warmed to his work he overcame in a measure the disadvantages of short stature, slight figure, and un-Greek face, and finally carried the audience with him by sheer force. But the first impression was unfavorable. There was a languor in his manner, a loose-jointedness, which did not sort with the virile character of the hero. This is not the prince reared in the house of *Polybus*, the man who slew *Laius* and his suite—all of them, as he fancied—the hero that faced the peril of the Sphinx's riddle and did not lose his wit in the encounter with death. I am rather reminded, I hardly know why, of *Richard II.* At any rate, Mr. Riddle's *Œdipus* is nearer *Richard II.* than it is to the antique *Œdipus;* but luckily we did not need the antique *Œdipus*.

Every old town in Germany has its "tokens," every author his secrets. The task which a great London editor used to set his beginners was the description of a dead-wall. The touchstone, the despair of the translator of Sophocles is the rapid interchange of the dialogue. The severest test of the actor of Sophocles is the rendering of such passages as the altercation between *Œdipus* and *Teiresias*, the quarrel between *Œdipus* and *Creon*. Sophocles, the most subtle in his artistic finish, handles a sharper rasp than any other tragic poet. Nothing can save the scenes to which I have alluded from vulgarity—or rather from what the Greeks call τὸ φορτικόν—except a tide of great passion in a great nature. This is a recurrent trouble. The pungent tartness of *Electra* is almost shrewishness; *Philoctetes* is almost a grumbling valetudinarian; and it requires a more subtle art than Mr. Riddle's to keep the mere wrangle of the upstart out of the rôle of *Œdipus*. *Œdipus* must be a prince from the crown of his bruised head to the sole of his pierced foot, and this Mr. Riddle was at no time from his languishing entrance to his half-fainting exit. To cite examples of false conception would take up too much space, besides opening questions of varying interpretation. One or two instances among many must suffice. *Jocasta*, whose part, like that of all Sophocles' heroines, demands the intensest study, has a truly feminine access of impiety, like so many of her modern sisters, who are habitually devotional and yet contradict any religious authority at a moment's notice, only to yield again when it suits them. With a thoroughly womanlike "neither here nor there," *Jocasta* scouts all prophecy; she would not waste a glance on such matters henceforth. *Œdipus* has heard her bit of blasphemy with the outward ear, and indeed has caught the drift of her speech, but it has made no impression on his mind; he has taken no comfort, and his καλῶς νομίζεις is a mere piece of marital politeness, a "doubtless you are right"; and it is a capital error to make him reply in the tone of one who has pondered her speech carefully, with the air of an Addisonian Œdipus, as who should say:

"It must be so. My wife, thou reasonest well."

Again, when the Harvard *Jocasta* kneels at the feet of *Œdipus* and entreats him to seek no further, closing her appeal with those heart-sickening words ἅλις νοσοῦντ' ἐγώ, the Harvard *Œdipus* lays his hand in consolation on his queen, and the bitter "Be of good courage" is construed as a balm.

But I turn with pleasure to more grateful themes. Mr. Riddle's declamation as declamation was often admirable, and in the celebrated passage in which the hero describes the death of *Laius* the audience was conquered, and from that point held captive to the end, so that the faults of detail were lost sight of in the total effect. His voice is carefully trained, as might be supposed, and his pronunciation beautiful. A college-bred man, I believe, Mr. Riddle is not a professed Grecian, and this study of Greek pronunciation, as accepted to-day by advanced scholars, must have been made under most excellent guidance. The Anglo-Saxon mouth finds the short Italian *a* a difficult sound. There were lapses in the final letters at times, and some of the diphthongs were too labored, but it must have been a rare pleasure to many in the audience to hear Greek so well rendered. This alone would have redeemed everything—to the schoolmaster element.

So much turned on Mr. Riddle's performance of *Œdipus* that I have dwelt longest on his part—too long, perhaps, to leave myself room to explain why the play was a success apart from Mr. Riddle, or to give the meed of praise due to the other actors. *Teiresias* was well done. Indeed, the effectiveness of young men in the representation of old parts is noteworthy, and is clearly traceable to the necessity which they feel of getting out of themselves. So the Corinthian messenger, and especially the servant of *Laius*, came fully up to the requirements of the piece. The second messenger would seem to an outsider to have had distinctly in view an imitation of Mr. Riddle's achievement in the narrative of the death of *Laius*. The contrast, both in manner and pronunciation, was only too much to the advantage of the model. *Creon's* part is ungrateful. A chapter might be written on the character of *Creon* and the handling of it in the Attic drama. For my own part, I cannot understand why some critics find it difficult to mediate between the *Creon* of the "Œdipus Tyrannus," on the one hand, and the *Creon* of the "Œdipus Coloneus" and the "Antigone," on the other. *Creon* is a narrow, conventional nature throughout. His nobility in the "Œdipus Tyrannus" is the nobility of a formalist. One imagines that he must have studied some Theban Theognis or other mythic

moralist. The tragedy in his subsequent history is the conflict of the church-warden nature with the larger things of fate. It is a tragedy which leaves its hero without respect. The Harvard rendering of *Creon* was designedly commonplace. Remains *Jocasta*. I have purposely reserved that part to the end. *Jocasta* was clearly next to the protagonist in the favor of the audience, and the applause which followed her final words was the most enthusiastic and spontaneous of the evening. The actor was marvellously feminine in appearance, and imagination fails me when I try to represent to myself how he could have acquired all that suppleness and "lissomeness." The most audacious metaphor of the play suggests a large frame, a *Magna Mater*, a figure to which might have been forgiven the deep voice that issued from the slender form of our *Jocasta*. At first the girlishness of *Jocasta*'s appearance shocked me; but if the way of a man with a maid is wonderful, the ways of a wife with a husband, say, eighteen years her junior, are too hard for most of us. Sophocles, as is well known, was learned in love beyond the common range, and if we knew more of his own life, we might understand *Jocasta* better. Imperious, coaxing, defiant, tremulous, gracious, *Jocasta* has all the resources of queenly, wifely, womanly experience; and when I said to some of my friends that our *Jocasta* was too much a girl for that, a number of modern Antigones and Andromaches rejoined that wives who were older than their lords were always younger than their lords. And such oracles are infallible. *Jocasta* is no more within my province than is the music.

And yet I earnestly desire to say something about the music from the Hellenist point of view. The composer's choice lay between a severe melody with little instrumentation and a more modern treatment which should be in consonance with the necessary change of conditions. For my part I had resigned myself to an utter extinction of the original rhythms, as they are understood by scholars nowadays; and as these rhythms seem to most of us to have a definite symbolism, it was with a sigh that I renounced all hope of recognizing the familiar movements with which I had so long associated the voice of prayer, the wail of anguish, the whirl of doubt, plangent musing, tremulous joy. But all these reflexes and prophecies of the development of the action came out with full distinctness in Mr. Paine's music, and only gave in larger lines and brighter colors the effects which the unaided voice of the teacher could never have so much as sketched. As I have said, there was no choral evolution, and the evident weariness of the heroic fifteen was the only drawback to the interest of the audience. The voice of the coryphæus, so musical in song, was thin and mechanical in speech, and the action of the stage did not transmit itself through the persons of the chorus to the audience, according to the theory. But the music gave the unity which it so often destroys.

It was my good fortune last summer to witness the performance of the "Agamemnon" of Æschylus in the hall of Balliol College, and it is natural that on this occasion my thoughts should go back to that scene, of which I endeavored at the time to give some slight account to the readers of the *Nation*. A comparison of the two performances is evidently unfair. The "Agamemnon" and the "Œdipus" belong to different stages of art. The articulation of the "Œdipus" is complete in itself. The "Agamemnon" is one of a trilogy, and the choral masses demand a different disposition. It would have been impossible to handle them as Mr. Paine handles the choruses of the "Œdipus" without wearying the audience and dulling the edge of the action. Parts of them were sung, parts declaimed, now in unison, now by single *choreutai*, and a certain dramatic effect was thus attained, and a far closer unity of actors and chorus than was possible in the Harvard rendering of the "Œdipus." The antique character was more seriously compromised, but the vitality was more tense. Nor would it be fair to compare the external conditions. The Oxford men had made no long and elaborate preparation. The stage appliances were simple in the extreme. Not half as many shillings were spent at Oxford as dollars at Harvard. A superb young undergraduate was busy stencilling a part of the palace roof of the Atreidæ a couple of hours before the performance began. The costumes were not elaborate; there was no "book of the opera," no distinct effort to be scholarly or archæological; and yet it was a marked success—a success that repeated itself at Harrow, at Eton, in London. It is a beautiful thing to remember with all its youthful dash and zest. Carefully planned, thoroughly studied, wrought out with minute attention to such details as fell within the limits, our Harvard "Œdipus" was by far the more finished piece of work, and the memory of it a more brilliant picture. The Old World and the New seem to have changed parts, but we must not forget that had there been no Oxford "Agamemnon" there would have been no Harvard "Œdipus." It is to be counted among the happinesses of a lover of Greek to have witnessed both. B. L. G.

THE MUSIC.

Signal as was the artistic success of the performance in every respect, the most original and striking feature of it all was the noble music. It is the feature which will no doubt be interesting to future generations as one of the landmarks in the history of musical art. In this great work Mr. Paine has most completely attained the end of making the music enhance the emotions naturally awakened in the development of the tragedy, until, in spite of all the anachronisms of detail, in spite of all the mythical unreality of the whole situation to the modern mind, the awful grandeur of the old Greek conception is impressed upon us as intensely as it could have been felt by the devoutest believer in Apollo and in the Eumenides. The acting, by itself, great as were its merits, could hardly have achieved this. Nor could the music have achieved such a result had it been conceived in a spirit of narrow antiquarianism. To reproduce the forms of ancient Greek music was no part of Mr. Paine's purpose. We do not really know what the old Greek music was, but even if we did it may be safely assumed that any imitation of it would produce but a very slight emotional effect upon the modern mind. So far from seeking to copy the antique, the true method of dealing with the problem is to apply the highest resources of modern musical expression to the illustration of the ancient dramatic idea; and this is what Mr. Paine has done. Of all his works this is perhaps the most distinctly modern in treatment, unless it be his second symphony.

The music is written for male chorus with orchestra. The acting chorus, of fifteen voices, stands about the *thymele* before the stage, while the supplementary chorus, of sixty voices, sits arranged in a semi-circle with the orchestra of thirty-five players. For the purely musical effect both chorus and orchestra might well be much larger. With an orchestra of fifty the effect of the strings would, of course, be enhanced, but the limited space in the theatre would hardly allow of this.

Among the themes of the six choruses the most striking contrast is between the second theme of the second chorus and the theme of the sixth chorus. The former, *adagio* in G major, sings the trust of the people in *Œdipus*, and is worked up in one of the most exquisite cantabile passages that ever gladdened the heart of man. The latter, *moderato* in C minor, follows the terrible cry with which *Œdipus* rushes from the scene on discovering the horrible situation into which resistless fate has led him, and all the shuddering horror of the moment is expressed in this theme, in the syncopated accompaniment, and in the wonderful movement of the basses, in which the relentless obstinacy of fate itself seems to be well typified. These two strongly-contrasted themes, worked up with various elaboration, form the chief burden of the overture, which thus epitomizes the fundamental conception of the tragedy.

While the second and sixth choruses thus represent the opposite extremes of feeling between which the development of the drama is carried on, the first and fourth give noble expression to the feelings of religious awe with which the harrowing themes of the Greek tragedy were approached by the ancients. The Greek tragic drama originated in a religious service, and in the great days of Æschylus and Sophocles it had by no means lost the evident marks of its origin. These sublime "plays"—which some modern fools, I observe, are swift to stigmatize as "immoral"—were witnessed by the Athenian spectators not, indeed, with such feelings as those with which devout worshippers take part in a church-service, but, no doubt, with feelings as earnest and solemn as those with which we listen to a grand oratorio. This mood is especially apparent in Mr. Paine's fourth chorus, which, for elevation of religious sentiment, is on a level with the great choruses in "St. Peter." Historically, too, such a chorus is no doubt essentially true, giving voice to the really religious element in paganism far more profoundly than Mendelssohn's "O be gracious, ye immortals," though that chorus is true enough when considered, so to speak, with its context.

In marked contrast with these devotional and supplicating strains comes the third chorus, which breaks in upon the quarrel between *Œdipus* and *Creon*. Here the alternation of dialogue and chorus, sustained by rich and varied orchestration, is extremely lively and dramatic. In the fifth chorus comes one of the brightest moments by which the horror of the tragedy is relieved, when the people, mistaking the import of the revelations just made—which only *Jocasta* comprehends—jump to the conclusion that *Œdipus* is of celestial origin. The beautiful melody here, given to a tenor voice, accompanied by the rest of the chorus, was finely rendered by Mr. George L. Osgood.

But dry description of this sort can convey to the reader but a scanty idea of the manifold excellence of the musical treatment of this interesting subject. The music is, from its intrinsic beauty, well fitted to be produced in concerts, apart from the full text of the great drama, which it has invested with a fresh interest for all to whom modern music is the highest and noblest of all the modes of expression that the human mind has learned to employ. To reproduce the drama, as it has been done now at Harvard, will always be a difficult task. To perform the music, from season to season, is a comparatively easy matter; and the hearing of these choruses will go far toward extending the popular reputation of Mr. Paine. J. F.

THE TORY LEADERSHIP.

LONDON, May 6.

THE lamentations around Lord Beaconsfield's bier had not died away before people began to dispute about the great inheritance which he has left—the leadership of the Conservative party, carrying with it the reversion

of the Premiership whenever fortune shall snatch power out of the grasp of the Liberals. With us in England the headship of one of the two great political parties usually passes unquestioned from one man to some other whose previous office has clearly designated him as the rightful successor. Lord Derby took it because he was, after the split between Peel and the bulk of the Tory party, indisputably the best speaker and most conspicuous figure in the Tory ranks. Mr. Disraeli took it because he had led the party in the House of Commons for many years, and was, therefore, the obviously right person for the Queen to make Prime Minister when Lord Derby's ill-health compelled him to retire. Mr. Gladstone's succession to Lord Russell was equally simple and natural. But now it is far from clear who ought to take Lord Beaconsfield's post; nor does any regularly-settled mode, like that of your national conventions, exist for deciding between the candidates. The Liberals were in a similar difficulty six years ago when Mr. Gladstone resigned the leadership, and they then held a meeting of Liberal members of the House of Commons and chose Lord Hartington. But this was a less serious difficulty, for Lord Granville was to some extent recognized as leader of the whole party, so that the selection had reference to the House of Commons only, while in the present case the Conservatives have got to choose a supreme chief to direct their entire policy in both Houses and the country.

The candidates whose claims are actively discussed are four in number. The first in rank is the Duke of Richmond. He is a dull, solid man, of what we call in England the farmer type; slow in his ideas, averse to novelties, with little power of expression or of consecutive argument, yet with some of the qualities useful in any kind of practical life—the qualities of composure, industry, a liking for business, a willingness to hear reason, a character for honesty and good faith. If he would never devise a brilliant stroke of strategy, neither would he be likely to get his party into a mess by any outrageous blunder. His policy would give fair play to those natural forces which always make for Conservatism, but would not add to them by any schemes that could be called original or constructive. In fact, to put it shortly, he would be a negative sort of leader, who, though he could not do much good to his party, would probably do it no harm. The weak point about him is that he would enjoy very little of that kind of authority among his colleagues which flows from intellectual strength, and that he is not known at all in the country generally. His name could not be made a rallying cry at Tory meetings. His somewhat tame and ordinary countenance would excite no interest when hung in a gilt frame on the walls of a Conservative club-room. In these respects the contrast between him and Lord Beaconsfield, who, whatever else may be said of him, was certainly a most striking individuality, would be so marked that it is not wonderful the Conservatives should hesitate before placing so commonplace a man at the helm of their ship.

Equal in rank to the Duke of Richmond, but singularly unlike him in character, is the Marquis of Salisbury, whom the more extreme and noisy section of the Tory party are putting forward. Three years ago he would have been generally accepted as the rightful heir to the vacant throne. He had a successful career in the House of Commons. He is a great noble, with vast wealth and influence. He has been all his life a very active politician, known to everybody in the country, and versed in all the minor arts of party warfare. No member of the Upper House has done so much stumping or does it with so much keenness and force. He is an incisive speaker, effective by the sarcastic bitterness with which he puts his points, and animated by a double measure of genuine party spirit. He is possessed by all the orthodox Tory beliefs and aversions—hatred of the Dissenters, fear of the Radicals, contempt for a peace policy, a sincere attachment to the hereditary aristocracy and the landed interest. His personal probity stands high, and those who know him best declare that the acridity which marks his speeches is quite absent from his private conversation. And there is a sort of dash and *abandon* about his tactics which used to fascinate people, and make them think him a man of eminent courage and decision. But he has two faults—fatal faults—the one discernible through all his career, the other first revealed by his conduct as foreign minister. He is not wise, and he is not straightforward. Hardly any leading man has committed so many blunders of judgment, said so many needlessly intemperate things, given so little evidence of possessing that cool foresight which is so necessary in the head of a great party. His vigor is not really the persistent vigor of a statesman; it is the irresponsible vehemence of a literary man, who gets carried away by his desire to produce a temporary effect. The defect in candor, one does not wish to say in truthfulness, is a still graver one. He has repeatedly used language which misled, and was clearly intended to mislead, his adversaries, and through them the public. Much must be forgiven to a minister who is pressed by inconvenient questions. But it is above all things necessary that confidence in the declarations of responsible ministers should be maintained; and he is thought, even among his own allies, to have crossed the line which separates the mere parrying of a disagreeable querist from the giving currency to statements which conceal the facts and deceive the country. This imputation has seriously affected his position, weakening the confidence which would otherwise have been felt in him. It goes even further than his want of the higher kind of political wisdom to make the sager heads among the Conservatives shy of accepting him. They feel that as they are likely to have for some time to come to stand on the defensive—indeed, to conduct a retreat in the face of the enemy—they need a cool and cautious chief, who will select his ground carefully before he gives battle, and whose own reputation must be such as to command the confidence of the whole country in his good faith as well as his patriotism. But Lord Salisbury would be apt to lay himself open to attacks on his personal conduct which would, unfortunately, affect the party also.

Next in dignity and position, but far superior in intelligence, comes Lord Cairns. He is a lawyer from the North of Ireland, a middle-class man, who has pushed himself to the front by abilities of the highest legal order; a singularly clear and powerful, albeit somewhat dry, speaker, with a capacity unrivalled among his former compeers at the bar for stating a case with the utmost cogency of argument. In the House of Commons he was a very effective debater, and all his subsequent performances in the House of Lords, both while he filled the great place of Lord Chancellor and while he sat in Opposition, have still further raised his oratorical reputation. Nor does that reputation rest merely on intellectual gifts. He is a man of great strength and decision of character, knowing exactly what he believes and means to do, able to form a prompt resolution and carry it out with vigor. His presence is imposing, his manner dignified, his private character irreproachable. He is indeed a trifle too conspicuously, though no doubt quite sincerely, religious; opens his house for prayer-meetings, and occasionally in the country holds forth from the pulpit or the reading-desk. Himself self-reliant, he would inspire confidence in his followers. If report speaks truly, he was the only one of the late Conservative Ministry on whom Lord Beaconsfield was accustomed to lean, and whose advice he sought at critical moments. Since the days of Lord Lyndhurst no lawyer has appeared so well qualified for political strife, or has obtained so conspicuous a success in it. Still, after all, he is a lawyer and a middle-class man. The Conservative country gentlemen cannot forget a fact of which the style of his oratory so constantly reminds them. It took them many years to overcome their repugnance to Mr. Disraeli; and Mr. Disraeli had a power of acquiring influence over persons which Lord Cairns, whose nature and manners are cold and ungenial, does not possess. Few equally eminent men seem to have made so few personal friends. They feel that somehow he is not one of them; that he is, after all, only a consummate advocate, who will hold their brief and loyally do his best for his clients, but who doesn't care about the party traditions and share the party prejudices in their own sense. Herein they probably do him some injustice, for he is in many respects a genuine Conservative, being by birth an Irish Orangeman, with most of the passions and many of the narrow views of that faction. But it cannot be denied that he, like the Duke of Richmond, wants weight in the country. His public appearances have of late years been confined to the House of Lords, a cold though stately theatre, and one which the nation little regards. No popular interest surrounds him, and it is doubtful whether his gifts, great and admirable as they are, could awaken it.

There remains Sir Stafford Northcote, who has led the Tory party in the House of Commons since Lord Beaconsfield quitted that chamber. His abilities are inferior to those of Lord Cairns, but superior to those of the two other rivals. He is an able and versatile man, with a great capacity for business, quick in mastering a subject, lucid in explaining, with a remarkable power of easy and fluent though certainly unimpressive speech. Without ever rising to a great height, he never sinks below a respectable level. With an admirable temper and manners which make him generally popular he combines a good deal of tactical craft, but a craft which is always quite within the rules of the game, never unworthy of an honorable man. He is, in spite of a mild and gentle exterior, a dangerous person to be opposed to, for he is very watchful and very quick. The complaint which his party make against him is that he wants energy and pugnacity, that he is too reasonable, too conciliatory—perhaps, indeed, too little of a genuine Tory. He was once, in the beginning of his political career, Mr. Gladstone's private secretary, and he seems to have retained traces of the Peelite influence in his enlarged views of all commercial and financial questions, his disposition to look out for fair compromises, his superiority to class prejudices. Thus his trumpet is thought to give on many questions an uncertain sound. The noisy men of the party do not care to rally to him; do not feel as if his voice roused their courage or inspired them with hopes of victory. His type of Conservatism, in short, is not the type to which Lord Beaconsfield had accustomed its followers, and seems pale and colorless beside the brilliant pictures which they had learnt to admire.

The question between these four is not yet settled, and perhaps may not be for some little time to come. It is understood that the leadership in the Upper House will in the meantime return to the Duke of Richmond, who held it a while before Lord Beaconsfield mounted thither, while that of the Commons, of course, continues with Sir Stafford Northcote, the general headship of the party remaining in abeyance. Meanwhile, the Liberals enjoy the hesitation of their adversaries, and amuse themselves by tendering advice. Its

burden commonly is, "Whatever you do, don't choose Lord Salisbury." But this counsel only perplexes those it is addressed to; for while some say, "*Fas est et ab hoste doceri*," others insist that the Liberal dislike to Lord Salisbury is the most substantial testimony to his merits. The Liberal papers reply by protesting that, so far as their own interests are concerned, they desire nothing so much as to see Lord Salisbury chosen, because he would be sure to upset the Conservative coach, but that they care more for the good of the country than for party interests. Meanwhile, there is a real call for a vigorous and commanding mind to give the Conservatives a consistent policy on the Irish Land Bill, which has now been debated for a fortnight. Everybody, now that Lord Beaconsfield has departed, extols his sagacity, and declares that he would have known how to play the game so as at once to checkmate the Government, and yet not rouse popular feeling against the House of Lords. Whoever is now selected to succeed him will have to bear for some time a disagreeable comparison with him, for the greatest difficulty in leading a party in a parliamentary country is to make your authority acknowledged and obeyed; and none of the four aspirants can for years to come approach Lord Beaconsfield in this respect. The contrast between him and them sets his peculiar gifts in the strongest light, and goes some way to justify the extravagant eulogies which his memory has been receiving. These eulogies, and the manifestations of the feeling of the Court, have provoked a certain reaction among the opposite party—a reaction which finds expression in the opposition threatened to the vote for giving him a monument at the public expense in Westminster Abbey. Those who hold that a public monument implies public approval of his career as a whole, naturally urge that it is absurd for a party which a year ago was condemning his personal behavior as well as his policy in fierce terms, now, merely because he is gone from among us, to turn round and appear to forgive everything. The more general view, however, seems to be that Westminster Abbey is to be regarded merely as a place where famous men who have played a great part, be it a good part or a bad one, in the history of the country are to be commemorated in stone. Otherwise, it is argued, you will make every death of an eminent statesman the occasion for an unseemly party wrangle. And as this vote is moved by Mr. Gladstone, than whom no one thought worse of Lord Beaconsfield's public conduct, posterity can hardly misinterpret it. The matter will doubtless have been settled before these lines can reach you. Y.

MME. DE MAINTENON AND MARSHAL VILLARS.

PARIS, April 28, 1881.

THE correspondence of Madame de Maintenon and of Marshal Villars is still inedited; we know only that the famous Marshal was among the most assiduous correspondents of the person who may be said to be as a letter-writer almost a rival of Madame de Sévigné. Nothing, of course, will be found in the correspondence of Madame de Maintenon which can equal the charm, the wit, the *naturel* of the marquise. The letters of Madame de Maintenon belong to history more than to literature proper; but they are written in the most admirable French, in that sober, firm, and now inimitable French of the *grand siècle*. The first collection of her letters was published by La Beaumelle in two very small volumes, which bear the title, 'Lettres de Madame de Maintenon, à Nancy, chez Dailleau, 1752.' These two volumes are now found only with difficulty. La Beaumelle published afterwards a new collection of letters under his name—'Lettres de Madame de Maintenon, publiées par La Beaumelle, Glasgow (Paris), 1756'; seven volumes. The same La Beaumelle had published a year before, in 1755, at Amsterdam, fifteen volumes of 'Mémoires pour servir à l'histoire de Madame de Maintenon et à celle du siècle passé.'

It is very much to be regretted that in his second publication La Beaumelle very often made interpolations and changes; the true Madame de Maintenon is more apparent in the two little volumes which I have mentioned first. It is hardly possible that La Beaumelle could have found this, for instance, which is in a letter addressed by Madame de Maintenon to her niece, Madame de Caylus (who published most interesting memoirs):

"My dear niece, believe in my tenderness and my experience; I have tasted everything, and I see that we must return to the sentiment of Solomon—'All is vexation of spirit.' I can speak out to nobody; but if I am silent even with you on the nature of my pains, I can tell you with truth that there are no such pains in the world. I am often in despair; the King does not see it, and when he is gone my only pleasure is to remain alone and to weep between four curtains. I am not unaware of what is said of me by those who do not love me; they impute to me all that happens, as if I were mistress of events; they treat my devout habits as hypocrisy, they ridicule the severity of my morals and accuse me of not having always been so severe. It is hard to live with other people than those of your century; it is the misfortune of those who live too long" (1709).

Among those great enemies of Madame de Maintenon, to whom she alludes here, was Saint-Simon; and his hatred of her extended to all her friends; Villars was among them, and Saint-Simon is unsparing of him. Happy circumstances have placed the correspondence of Madame de Maintenon and of Marshal Villars in the hands of a person who can make the best use of it, the Marquis de Vogüé, a member of the French Institute, who was for a few years ambassador of France at Constantinople and in Vienna, under the government of Marshal MacMahon. M. de Vogüé has given us already a glimpse of the great treasure which is in his hands. The correspondence which he possesses begins only in 1703; there is nothing left, unfortunately, of the letters which were exchanged before that time, when Villars was learning the art of war under Condé, Turenne, and Luxembourg, and when Madame de Maintenon was still Madame Scarron. Villars had been introduced to Madame Scarron by his father, whom Madame de Sévigné calls the "Bel Orondate." He had known her from his earliest youth, and it is perhaps natural that many years afterwards, when he wished to ask something from Louis XIV. which he did not like to ask directly, or when he wished to give him some information of a delicate nature, he wrote to Madame de Maintenon, whom he knew to be a safe person, of good judgment, and of consummate tact.

In the year 1703 Villars was discontented; he was greatly disgusted with the ally of France, the Elector of Bavaria, who opposed his plans. Villars intended to strike directly at Vienna, by the valley of the Danube (an idea which Napoleon afterwards put in execution); he thought that his great and then recent victory of Hochstedt gave him a right to impose his plans; but they were not adopted at Versailles, and Villars asked for permission to leave the army and to take some rest in France. He had hardly returned when the King gave him the difficult and painful task of pacifying the Cévennes. To do him justice, he used mercy as well as force, and he was successful where many others had failed. "The King," writes Villars to Madame de Maintenon, "did me the honor of saying, when he honored me with his last orders, that if I gained him two battles on the frontiers I could not render him a greater service than if I ended this revolt, from which his enemies expect great consequences. It is now ended, and the happiness of having ended it comes after the taking of Kell (*sic*), after the forcing of the Black Mountains, and a battle well gained in the heart of the Empire." Villars, you see, was not a little vain, and nobody understood better than himself the value of his services.

Villars gives an interesting account of the state of Languedoc at the time. In the letter which announces the end of his operations he says to Madame de Maintenon: "You know the rigor which was exercised here. The cruellest tortures, the hardest punishments employed two years ago were only irritating the evil. I know from M. de Basville himself [M. de Basville is the famous intendant who was the most active instrument in the persecution of the Protestants] that those who were led to death marched to their fate singing the praises of the Lord with such zeal and devotion that it was necessary to surround them with a number of drummers in order that their speeches should not make more impression than the example of their death. In the small engagements those who fell into the hands of the soldiers, and who were left at their mercy, thanked those who gave them death, and none was ever found to ask for mercy. Such a mania had taken possession of this revolted people. I have believed, with the wisest, that gentle means were more proper than violence to bring back such men; still I have kept my troops in perpetual motion in order to press warmly those who kept arms in their hands, extending mercy to those who implored the clemency of his Majesty." This system ended in an interview between Villars and the chief of the Camisards, Cavalier. "This chief offered to submit with all his troops, and promised the same in the name of the other chiefs, who regarded him as the first. It was so done, and Cavalier kept his word; he brought with him to Calvisson, which he had chosen for the purpose, eight hundred men, and went himself to speak to the other chiefs, who followed his example."

Villars enters into very minute details, and defends himself against those who accused him of too much leniency. He says that he considered it the best policy to manifest the greatest confidence in Cavalier. What effect could such letters have on the granddaughter of D'Aubigné? Was there nothing left in her of the old Huguenot spirit? We cannot answer these questions. Madame de Maintenon was a most devout Catholic, her letters express the most sincere admiration for a well-ordered, well-disciplined Church; she does not admit any revolt of conscience. She had adopted the ideal of her time, the ideal of Bossuet, of Bourdaloue, of Massillon. She was deeply religious, but she did not understand religion with freedom of conscience. This very word "freedom of conscience" alarms and frightens the seventeenth century. "I hope," says Villars, "the rebels will well recognize a truth which I have often affirmed to them—that the King will never admit the slightest liberty of conscience." This is said quite naturally, as a thing which goes of itself. France was very far in 1709 from Henri IV.; a century had passed since the son of Jeanne d'Albret had been murdered, and after a century nothing was left of his work. The war of the Cévennes was only an incident in the military career of Villars; on the field of his victories in Germany France

met with a disastrous defeat. Villars was very indignant, and Madame de Maintenon urged the King to send him back to the German frontier. He came to court, saw the King, and left at once for the army; he re-established the affairs of France, and made three campaigns in 1705, 1706, 1707. He wrote to Madame de Maintenon short letters after each important affair, as regularly as if she had been the minister of war. It is in this curious style, for instance, that Villars announces to Madame de Maintenon that he has taken the lines of Wissembourg: "Madame, I will never take the liberty of writing to you except when I have the honor of announcing to you a bit of agreeable news. This last is not very bloody, at least for the troops of the King, since we have only had a dragoon wounded. As for the enemy, they were taken by surprise; they thought only of flying, and we killed a good number, quite at our ease."

In 1707 Villars made a very brilliant campaign across the Rhine, and led his army as far as Würtemberg. He would have gone further than this province if the military events in Flanders and in Italy had not obliged him to retrace his steps in the direction of France and to defend the line of the Rhine. In 1708 he was sent to Italy. He could not do much there; he was very anxious to be sent to Flanders, and he developed his plans to Madame de Maintenon in long letters, which are a curious mixture of disinterestedness and egoism, of military precision and of gasconade. He understood his own character very well; he believed in his luck. In the postscript of one letter he says: "Allow me to tell you, madame, that it is sometimes useful to have your cards held by somebody who plays with luck, and especially when the confidence which fortune gives does not exclude an extreme precaution." It is very amusing to read the letters in which he gives Madame de Maintenon—that is to say, Louis XIV.—all the reasons why the conduct of the campaign should be left to him in the North: "I am perhaps the only general in Europe whose luck in war has not yet suffered any alteration." The answers of Madame de Maintenon are very diplomatic; they are very clever; they show that she followed all the operations of the war in the minutest details. She speaks of "our armies" in a most natural way: "The Duke of Burgundy is much to be pitied for beginning with something which is so difficult . . . nothing short of a miracle can save Lille. This great affair, sir, absorbs all our attention . . . but if it were not for you our inquietude would not be only for Flanders." She is flattering, encouraging; she has a noble and truly commanding style.

On the 15th of March, 1709, Villars was appointed to the command of the army of the North, and three days afterwards he was at Cambrai. Our affairs in Flanders were in a deplorable state. He set to work with his rare energy. "You alone, sir, console us. You make us perceive that we shall have an army; this army will be conducted by you, and this is perhaps the point to which God has wished to conduct us, to show us what revolutions he can make when it pleases him" (letter of Madame de Maintenon, April 8, 1709). Negotiations were going on while a new campaign was preparing. France was almost ruined. Villars developed in these trying circumstances a wonderful energy. Prince Eugène was saying loudly at the Hague that he would soon invade France; Madame de Maintenon, who informed Villars of it, added: "My hope is in God and in you." The coalition offered to France such terms that she could not accept them: the restitution of Alsace, the abdication of Philip V. Villars saved the honor of France at Denain; this victory allowed France to obtain the treaty of Rastadt, which was negotiated by Villars. During the two years which elapsed before the signature of this treaty the correspondence of Villars and of Madame de Maintenon was incessant, and, when it is published, it will be found to be greatly to the credit of the person to whom the great King had given his unbounded confidence.

ITALIAN INDUSTRIAL EXPOSITION.

MILAN, May 6, 1881.

WHILE the foreign press represents Italy as exclusively occupied with the question of Tunis, here we have their Majesties, the Prime Minister, the Minister of Agriculture, and hundreds of thousands of men of all classes, especially workingmen, congregated in Milan for the opening of the first truly national exhibition of art and industry that has been held in the United Kingdom since it had existence. The result has astonished Italians themselves, and the comparatively few foreigners who have thought it worth their while to visit the "moral capital of Italy" at this juncture confess that they can hardly believe their eyes. For myself I own to experiencing the first pleasant sensation, the first hope for the future of Italy, since the proclamation of "one Italy with Rome for the capital" was proclaimed after the defeat of the French Empire at Sedan. Living in Rome you know about as much of real Italy as living in Washington you know about the United States. A short sojourn in the manufacturing and agricultural districts, especially of northern Italy, convinces you how artificial, how superficial is the Roman view of Italian life. At the present moment "all Lombardy" is intent on silkworm rearing, and the considerable space allotted to, and the admirable exposition of all that concerns, this most important branch of Italian industry form one of the most attractive features of the great exhibition. Again, the increased tax on importation of cattle just voted by the French Chambers is a serious drawback to cattle-breeders in Italy; hence the bill presented to Parliament for the abolition of the export tax is for them of vital importance, even as the proposed abolition of the tax on salt, which weighs so heavily on the poor (salt being the only condiment to their wretched *polenta*), and also on the landed proprietors, who are obliged to economize this necessary ingredient in their manures because even the waters of the ocean are a Government monopoly! On these subjects you will hear the most animated discussions, but anent Tunis never a word. Yet Lombardy was the classic soil of revolution. No city has for courage and daredeviltry surpassed Milan in the "five days" when the unarmed populace expelled Radetzky from their midst. Ten years of passive resistance followed, then came deliverance. Again, till Venice, Naples, Sicily, Rome were free, Lombardy sent the flower of her sons either to the regular army or to the volunteers; and for this very reason they now decline to "play at revolution," feeling sure that Italy will never go to war to wrest the unredeemed provinces of the Tyrol and Trieste from Austria, and that no party or cabinet can mean seriously to despatch the *Duilio* or embark their riflemen for Tunis. The masses of workingmen of all classes deplore the time wasted by a "crisis," the bad feeling raised between France and Italy; and accuse the "politicians" of appropriating the time and resources of the nation for their personal ambition and private ends.

This much was embodied in the address of the workingmen who sent delegates to the general meeting on the eve of the Exposition, and that address fairly represents the feeling of the people. To-day, at any rate, the Expositions absorb all the interest left after attending to daily affairs. There are really five: the Industrial, the Artistic, the Horticultural, the Agricultural, the Musical. The first and third are those which most surprise people who knew the Italy of twenty years ago. Then almost all objects of common use, from a needle to a fine saw, from a side-saddle to a comfortable chair, had to be brought from abroad. An elastic band, much more a gutta-percha tube or sheet or bed for invalids or wounded, was unknown. Now the manufactory of Pirelli & Casassa can vie with the best factories of England or America. It was founded in 1872, and at first produced only the smallest objects; now it employs two hundred workmen, and has three steam-engines of one hundred and forty horse-power. It now supplies the navy, the paper manufactures, the hospitals with all the articles required; and a gutta-percha factory is well at work in the Exposition, producing, under the eyes of the spectators, tubes, balls, purses, elastic bands which would make an American smile, but which surprise Italians with the fact that they can be made "at home." No one will be much surprised to know that Genoa sends the finest velvets, Como the most perfect silks; but natives and foreigners stand astounded before the woollen cloth and cotton stuffs from the factories of Schio, Biella, and other parts of Italy. The woollen factory at Schio deserves special notice because the company, headed by Senator Rossi, work on the "division-of-profits" system. The colony, for it is nothing else, is a model colony, with its "cradle" (*crèche*), where the working mothers can bring their children at dawn and retake them at sunset; healthy nurses feeding them if the mother's work is too distant. Then there is the infant school, all the four classes of the common schools, the technical classes, a school at Vicenza for such scholars as show special aptitude, while for the rank and file there is the workshop ready with its "fair day's wages for a fair day's work." The workingmen's houses are airy, healthy, and the men become householders by paying yearly instalments. And this is a *paying*, not a benevolent, institution. Here the capitalists receive interest for the money employed, and the men feel themselves human beings and not slaves. Cotton stuffs cut also a good figure. There are at present six hundred and forty-seven factories, employing fifty-three thousand hands. The cultivation of cotton has been tried in Italy with only partial success as yet, though it is asserted that both climate and soil are adapted for it.

The gallery devoted to engines and machines, to railway carriages of new invention, is really remarkable. I was specially attracted by an ambulance train which, in time of peace, by removing the furniture can be transformed into an ordinary passenger train. The first carriage contains the sleeping compartment for the surgeons and doctors, a capital library, and a pharmacy, equipped with every necessary—medicines, surgical instruments and appliances. You pass from one car to another as in America. In the second is the kitchen, fitted up with boiler, oven, stove, etc. Then comes the sleepin -car for the wounded, capable of receiving eighteen patients, and giving them each a long, wide, airy berth. The litters being movable, the sufferer only has to be slung up and down to his perch; each berth has a window. There is a bed and all the necessaries for the attendants. In the adjoining car the wounded who do not need a reclining position can be received in double the number. Finally, there is the wardrobe and magazine—in short, a model ambulance train. This was invented in Italy and built entirely in Vicenza. The agricultural machines and implements are many and ingenious, and here

again it must be remembered that Italy twenty years ago had no other implements than those taken by Noah into the ark. Now you have a collection of threshing, reaping, sowing machines, the latter most ingenious and economical, for by moving a screw you can sow a larger or smaller quantity of grain according to the fertility of the soil, just as you can sow broadcast or in rows at will. Hoeing, raking, and weeding machines are all there, while the machines for threshing Indian corn are pronounced perfect.

But the chief attraction of the industrial exhibition is the department devoted to *bachicultura*. Before the advent of the silkworm disease Lombardy and a great part of Venice possessed forests of mulberry-trees. Besides the immense rearing establishments, every peasant's wife kept her three or four ounces; the poorest day-laborer an ounce. Then the women who had no house-room went out as silk-worm nurses, getting their food and thirty francs for the season. Two million ounces of seed were hatched in Italy; one million in Lombardy alone. Taking the average in those days of fifty kilos of cocoons per ounce of eggs, you had one hundred millions of cocoons which were all spun, woven, and prepared for the loom in Italy. The *atrofia* or *pebrina* appeared, and the entire crop was swept away, just as was the potato in Ireland. Some said that the disease was in the eggs, others in the mulberry. The former idea prevailed, and seed was imported from Japan and from China. Still this, though healthy the first year, does not stand reproduction, and the expense of importation is enormous. Moreover, you can never secure the perfect seed, as the Japanese keep that for themselves. Hence the one aim of the Government and of the silkworm-rearers has been to restore the native race to its pristine splendor, and to acclimatize the foreign breeds so that they can be reproduced at home. The Lombards now flatter themselves that this has been accomplished, and in the first "gallery of work" the processes of hatching, feeding, sleeping, cocoon-making, transformation of the chrysalis, marriage, egg-laying, and death are all performed in their various stages before the naked eye. The *bachicultori* attribute the greatest importance to the selection of the butterflies, male and female; these are put into small gauze bags, and only the eggs laid during the first two hours are kept for next year's crop. They have to be kept at a certain temperature during the summer, winter, and spring months, and are repeatedly examined with the microscope invented for the purpose, in order to see that no malady has supervened. Endless are the new inventions for suffocating the worms in the cocoons for the purpose of spinning off the silk; no less than eight different furnaces are on show. Then come the different methods of winding off the silk from the cocoons after they come out of the furnace, some by hand, some by steam; others for throwing, winding, twisting the golden hanks, for combing off any fluff that remains, so that the snow-white or golden hanks are flawless and bright when purchased by the manufacturers.

The difficulty of securing and rearing healthy seed is, it is believed, overcome; but another grave question faces the silkworm-rearers, and that is the diminished price of the *bozzoli*. In the olden days Italian cocoons fetched five, six, seven, and even eight francs per kilo. Now that Japan and China have flooded Europe with their raw material, it is rare to get more than three francs for foreign, four for native cocoons; and this scarcely pays the cost of production, if you calculate the expensive plantations of mulberry-trees, the price of the seed (this year nineteen and twenty francs per cartoon or ounce), the labor, and the cost of frames and (if, as this year, the season is capricious) of firewood. The problem now to be solved is a reduction of expenditure. Every silkworm-rearer, large or small, must be able to save his seed from one year to another, or else large establishments must be able to produce it at a very small cost. The mulberries must be grown in larger quantities and on some less costly system. Some method of economizing the leaves and hand labor must be found, and then Italy may once more regain her pre-eminence in this department. The gallery devoted almost entirely to silk, with its marvellously beautiful, hard, heavy, spotless cocoons, actually spun by the worms before your eyes, shows that the great difficulties are over, and that the secondary ones will yet be overcome.

It will take a month to visit fairly the Expositions, but such time spent will be well repaid by the satisfaction to be derived from the palpable, visible fact that Italy, after achieving her political independence, has set herself so resolutely to achieve her emancipation from foreign industry, and to prove that in natural productions and native manufactures she intends to be second to none and unrivalled in more than one department. Each of the departments of the Ministries of War, of the Navy, and of the Interior have separate *kioskos*, which are exceedingly interesting. The ceramic and glass departments each require a separate article. The tramway-carriage and omnibus department surprises foreigners. The Pompeian Hall, where the costumes of all the provinces of Italy are gathered, with the different cooking-utensils, head-ornaments, and implements of labor, is a precious boon to artists. I have only given a most cursory glance at the art exhibit, but with a few rare exceptions, such as six *chefs d'œuvre* from the brush of Induno, I should say that it was vastly inferior to that of Turin. But Italy can afford to rest on her oars for a while in artistic matters, sure to win the race when it be her mind so to do. M.

Correspondence.

CHOOSING THE PRESIDENT BY LOT.

To the Editor of The Nation:

Sir: I do not often omit any portion of the *Nation*, but I find that I have done so with a letter of "Spectator," in the issue of March 31, in which he says that he "once heard a distinguished statesman seriously advocate, in private conversation, the choosing of the President by lot from the Senate." "Spectator" may be interested to know that the proposition was not only advocated in private conversation, but formally brought before the Senate as a proposed amendment to the Constitution, by Senator Hillhouse, of Connecticut, in April, 1808. His amendment provided (1) for reducing the term of representatives to one year, (2) for reducing the term of senators to three years, and (3) for the choice of a President by lot from the Senate, to serve one year. His arguments in favor of his amendment, which "Spectator" will find in 3 Benton's Debates of Congress, pp. 607–611, are full and quite strong, and are summed up (in part) as follows:

"1. *It will make the Senate more respectable.*

"2. It is prompt and certain.

"3. It will avoid the evils of a disputed election, now [and ever since] unprovided for in the Constitution.

"4. It will exclude intrigue and cabal.

"5. It gives talent and modest merit an equal chance.

"6. It is economical.

"7. It gives to the people a President of the United States, and not the chief of a party.

"8. It removes temptation to use power otherwise than for public good."

Senator Hillhouse's amendment was never acted upon. Perhaps some of his arguments in its favor might still be applicable. J.

Norwalk, Conn., May 13, 1881.

A LITERARY OUTRAGE.

To the Editor of The Nation:

Sir: For excellent but most uninteresting reasons I was away from my post until the so-called "Beaconsfield article" was in type, done for *Quiz* by a well-meaning friend to whose ears Mr. Davin's name had not made music, but who rescued the little pamphlet from the purgatory of a second-hand book-shop, and, thinking it timely, sent it in. *I* discovered it was made up from the pamphlet by its author only in time to give him the responsibility of it, which I purposely did for two reasons: the first being that he might have any real or imaginary honor that should accrue from its compilation (for a compilation, and from Beaconsfield, Isaac D'Israeli, a Hebrew paper, and two journalistic "facts," it certainly is), and, the second, that he might shoulder the responsibility of an article that simply *was* a compilation. Had it not been for an accident at the last moment, to which any journal is liable, I should have drawn my editorial pen through it and marked the matter "dead."

If the person feeling himself outraged accuses me of careless editing I may only bow my head to save it from instant decapitation; but when he accuses me through *Quiz* of wronging him in any way, or talks of "a sale" which the pamphlet has in the States, he is saying what is the reverse of anything like a semblance of the truth. And I am sure if you choose to put your editorial microscope upon the matter it will show you, as it has others among your honored confrères, a desire for gratuitous advertising.

Yours respectfully, Ed. "Quiz."

Philadelphia, May 18, 1881.

BAR EXAMINATIONS.

To the Editor of The Nation:

Sir: I wish to call your attention to an article on "Admission to the Bar" in the last number of the *American Law Review*. It is a subject in which the members of the Bar in every State must feel the keenest interest; and I hope the influence of the *Nation* will be given to sow throughout the land the suggestions so clearly expressed in this article.

The ideal method of bar examinations is to have them the same for the whole country, as in England. But as we cannot expect that, at least for a long time, it will be a great step in advance if each State would have a single board of examiners.

In course of time these examiners might consult with each other in regard to the acquirements necessary for admission to the bar of each State, and in this way gradually equalize them.

It may not be beyond every possibility of the future that these boards should some time combine so far, at least, as to agree upon the examination papers, and thus make them the same for every State.

The great advantage of a method of pleading common to the courts of all

the States would become more apparent; and the benefit to all classes of the community of a higher standard in the legal profession would be practically unlimited.—Respectfully, D. B. HOAR.

BOSTON, May 16, 1881.

Notes.

A. C. ARMSTRONG & SON will have ready for delivery by the end of this month vol. ii. of the American Catalogue—the subject portion—which will doubtless, as they predict, be consulted even more frequently than vol. i. The value of the completed work cannot easily be exaggerated.——Robert Clarke & Co. have in preparation 'The Northwest in 1634, with a Sketch of the Life of John Nicolet, the Discoverer,' by C. W. Butterfield; 'Spanish Americans,' by F. Hassaurek; and 'Miami Woods,' a volume of poems by Wm. D. Gallagher.——'The Philosophy of Carlyle,' by Edwin D. Mead, is in the press of Houghton, Mifflin & Co.——A new and enlarged edition of Miss Amy Fay's 'Music Study in Germany' is promised by Jansen, McClurg & Co.——Ginn & Heath have issued a partial catalogue of their proposed college series of Greek authors, already announced by us as to be edited by Professors John Williams White, of Harvard, and Lewis R. Packard, of Yale. Some of the co-laborers are Professors T. D. Seymour, F. D. Allen, M. W. Humphreys, W. W. Goodwin, I. T. Beckwith, Isaac Flagg, M. L. D'Ooge, C. D. Morris, Irving J. Manatt, W. G. Frost, etc., etc. There will be two editions, one with notes on the same page with the text, and one of simple text. Three years will be consumed in completing the issue.——The Smithsonian Institution has just published the 'Memorial of Joseph Henry' ordered by Congress. It consists of the funeral proceedings, the exercises at the Capitol, the action of societies, etc., concluding with the act of Congress authorizing a bronze statue of Henry by W. W. Story.——The Concord Summer School of Philosophy will open for its third term on Monday, July 11, and continue for five weeks, with eleven lectures weekly, at the Hillside Chapel, near the Orchard House. All students should be registered on or before July 1 at the office of the Secretary, F. B. Sanborn, in Concord. Mr. Alcott delivers the opening address (as well as the valedictory), and Mr. Stedman will read a poem. Professor Harris, Dr. Jones, President Porter, Mr. J. Elliot Cabot, Dr. Hedge, Dr. Bartol, Mrs. Howe, Miss Peabody, Mrs. Cheney, are among the lecturers announced.——A well-considered memorial tribute to the late Professor J. Lewis Diman, prepared for the Massachusetts Historical Society by Edward J. Young, will appear in the Proceedings of that Society. Professor Diman's Lowell Institute lectures on 'The Theistic Argument as affected by Recent Discoveries' will soon be published, under the editorship of Professor George P. Fisher, by Houghton, Mifflin & Co.——Mr. Charles M. Kurtz's illustrated 'American Academy Notes' (Cassell & Co.) has passed from a first edition of 5,000 copies to a second, without the introduction, however, of any new matter.——Our enquiry last week as to the fate of the New York Coffee-House Company (limited) brings us by way of response a bill of fare, presumably of current date, which shows that the Company have two rooms open, one at 520 Grand Street, another at 515 Greenwich Street. We hope this is only a beginning.——Ollendorff of Paris announces a volume of 'Esquisses Américaines,' freely translated from Mark Twain by M. Émile Blémond; and in Mme. Th. Bentzon's second series of 'Contes de tous les pays,' only recently published, the American contribution is a condensation of Mr. Bret Harte's "Gabriel Conroy." On the other side of the Rhine the latest American contributions to the Tauchnitz series are Mr. Aldrich's 'Stillwater Tragedy' and Mr. James's 'Washington Square.' Mark Twain's new book has already been included in the series.——Mr. Edmund W. Gosse has done a good thing, and has done it very well, in editing a selection of 'English Odes' (London: C. Kegan Paul & Co.; New York: Scribner & Welford), and the publishers have sent it forth in fitting attire—tough paper, uncut edges, gilt top, rubricated title-page, a woodcut vignette printed on India-paper as a frontispiece, and a binding of pure white vellum. Mr. Gosse prefixes a brief introduction defining the principle on which he has made his selection. He has confined himself strictly within the limits of his title, and the forty-seven odes collected in these two hundred and fifty pages, and ranging from Spenser to Swinburne, are all the handiwork of English writers, no American work being admitted.——"Collection Spemann" is a handy library of useful and entertaining literature undertaken by the well-known Stuttgart publisher. Its merit, apart from the selections, consists in its charming form and typography and binding of blue cloth, and in its extremely low price of one mark a volume. The first volume embraces two tales, 'Phosphorus Hollunder' and 'Zu Füssen des Monarchen,' by Louise von François, and in the long list to be fulfilled hereafter we find represented Cervantes, Anson (Voyage round the World), Gogol, Le Sage, Cooper, Irving, Götz von Berlichingen, Mme. de Sévigné, Manzoni, Von der Trenck, Kleist, Scott, St.-Simon, Stilling, Rousseau, Franklin, H. Walpole, Poe, Bulwer, and many others. B. Westermann & Co. are the American agents.

—The absence of a catalogue and a marked superficial resemblance led to the mistake, in our notice of the Decorative Art Society's present exhibition, a fortnight ago, of some imitations of Mrs. Holmes's landscape embroideries for inferior works by her own hand. But one of those on exhibition is hers, the rest being "merely copies," we are informed by the Society.

—Eight hundred thousand copies of the revised version of the New Testament were ordered in advance of the New York and Philadelphia publishers, and since its appearance last Friday the unusual spectacle has been witnessed of the Scriptures hawked about the streets and in the cars and for sale at every news-stand in a variety of forms. The *Tribune* is moved to conjecture that "possibly we are on the eve of a great revival of Christianity," and the other papers, though less "thoughtful," have made a "sensation" of the event, and exhibited it in all its aspects and with extreme copiousness. The Chicago *Times*, we believe, had most of it telegraphed from here, and the *Tribune*, of the same city, published it entire in an extra on Sunday. Sunday, too, it was the universal pulpit-topic; and the utterances of the various preachers show almost a unanimity of favorable reception. The Committee of American Revisers were considerably more radical in their suggested changes than their English coadjutors, being even opposed to the retention of the "S." in the titles of the Gospels, for example, and the community in general, or at least the ecclesiastical portion of it, appears to have shared their views, and to find little or nothing to regret in any details of the revision. Dr. Roswell D. Hitchcock expresses the most qualified praise we have noticed in saying to an "interviewer" that the work was "not in every respect what the scholarship of the country might expect," though he adds that it was "the best the Committee could do, all things considered." However, he appears to have no especial attachment to the authorized version, and has "no objection to any number of revised translations, provided that purity and perfection are the only points aimed at," since (according to the reporter) he "does not believe that the inspiration of the Scriptures is carried into the languages into which they may have been translated, but is confined to those in which they were written originally." The Baptists should perhaps be excepted from the consensus of applause, as they find Pædobaptist prejudices respected in the revision. In England, where the sales have been much larger, its reception, or at least its press reception, has been quite different. The *Times* expresses dissatisfaction, and the *Standard*, in an article whose tone at all events is admirable, says: "Whatever scholars may think of the labors of the revisers, the impression produced upon the public mind is one of disappointment." This proceeds from a feeling which, so far as we have remarked, has as yet scarcely found an echo in any public utterance on this side of the water, though it is to be expected that sooner or later it will. As the *Standard* expresses it, the revisers have, even in places where no change in sense or substance was requisite, "nevertheless thought themselves justified in mending the English and improving the grammar of passages which have struck deep root in the hearts and memories of the English people." One effect of the revision may be referred to here, namely, the calling of public attention to the manuscript documents on which all versions rest. It is probable that the popular notion of the revision has been that it contemplated merely a revised translation, whereas it is now explained to be in equal part a revision of the original text in the light of the science of Biblical criticism as well. Some congregations doubtless learned from their preachers last Sunday for the first time that there were 150,000 different Greek readings, 1,760 different MSS., and that the oldest of the latter dates only from the fourth century. The changes, we believe, affect no doctrinal tenets, though the Rev. Edward Everett Hale, we notice, is pleased that "Trinitarians" will no longer be able to quote to him certain verses long known to be spurious.

—Mr. Dorman B. Eaton addresses himself in the *North American Review* for June to the refutation of Judge Tourgee's recent utterance therein on the civil service, with the result of proving the needlessness of the task, and with equal success in the June *Lippincott's* to quieting the fears of an aristocracy of officeholders should the reform go into effect, some time ago expressed in that magazine. In both articles, which cover substantially the same ground, he makes a clear statement of the aim and significance of the reform, and this, considering the misconceptions prevalent even yet, cannot be done too often, apparently. As to the objection that the reform, the return to the old system, will create a special and obnoxious official class, Mr. Eaton points out that this is just what we have now, and that the system of appointments is at the farthest possible remove from a popular system, being wholly in the hands of bosses and henchmen. As to the President's notion about short fixed terms, he shows that, in the first place, it would mean nothing as a check upon removals—witness the case of Collector Merritt—and, in the second, that "every political speculator, all the managers of caucusses and rings, every demagogue and desperate adventurer in politics, will welcome the shortest term he can get, for under it he can see more frequent and better chances of offices and spoils." Under a quadrennial term, moreover, at least one place in the Treasury Department at Washington would have to be filled every day

in the year, at the New York Post-office nearly three hundred novices would take the places of trained men each year, and four hundred changes occur annually in the Custom-house. The truth is that the just prescriptions of the reform are very simple, and any effort to substitute others for them can only proceed from unworthy motives and result in speedy discomfiture when candidly examined. There is, however, a certain plausibility about the "fixed tenure and short terms" notion, in the complete pricking of which Mr. Eaton has performed a grateful public service. The other papers of note in *Lippincott's* are an entertaining study of Southwestern life, entitled "Among the Cow Boys"; Dr. Oswald's third contribution upon "Zoölogical Curiosities," and a good article by Rowland Connor on the shady side of "Moral Reformers." The stories are of flimsy texture, though a brief Russian tale is rather lively, and the serial, "Craque O'Doom," reaches a climax of absurd sense and taste, if not the climax of the plot.

—A distinct endeavor to recur to the literary flavor which gave the *Atlantic* its character in popular estimation long ago is observable in the June number. Mr. John Burroughs in "A Taste of Maine Birch," Miss Edith Thomas in "A Spring Opening," and Mrs. Helen Hunt Jackson in "Bergen Days" contribute agreeably to this. Mr. Charles Egbert Craddock essays the same thing in a sketch of Alleghanian incident and character, entitled "Over on the T'other Mounting," but without success. The danger of the attempt is considerable, and well enough understood (outside of the more impassioned literary circles, we suppose) to consist in the dismalness of the failure which awaits you if you don't succeed. The reader of this effort will not escape a sense of irritation that his persistence is so ill rewarded with either substance or color. Miss Thomas's fragment, on the other hand, is very charming and —her name is new to us, at least—witnesses the unusual circumstance of a real addition to the number of magazine essayists. "A Spring Opening" has a strong infusion of Thoreau, having not only the intrinsic characteristic of intimacy with nature, but the external marks of decorating discourse about her; but aside from the fact that any sympathetic reflection of Thoreau is agreeable, the echo here is clearly natural, and to the traits which she shares Miss Thomas adds a peculiar poetic ardor of her own, which concentrates her attention on the natural phenomena with which she is occupied, in an endeavor to express from them their essences, instead of seeing analogies and suggestions of import in them. Altogether we shall ourselves undertake to read all she may write in a similar vein. "The Indoor Pauper: A Study" is really a study, attentively pursued, by Octave Thanet of a matter, each fresh exposure of which seems calculated to make the blood of philanthropism boil, but interest in which is "lightly laid again" in a community that understands so little the meaning of the word "administration," and entrusts its inspection to amateur benevolence. The author fortifies her revelations with copious references to official and other reports, though she is betrayed occasionally into a loose statement; *e.g.*, "When a New Hampshire poor-house burns down no one seems to know where the keys to the cells are"; this happened once only, so far as the article shows. The generally excellent execution of a task involving the labor evidently performed here ought not to be passed over. "Who Lost Waterloo?" is a question examined with care and discussed with much explicitness by Mr. John C. Ropes, who concludes that Grouchy is largely chargeable with the disaster, and lied about it freely. Mr. Richard Grant White expresses a very poor opinion of "French Tragedy," which he thinks formal and cold, and wholly inferior to Shakspere in divers important respects, and maintains that France is the only civilized country which has no national drama. Carlyle's 'Reminiscences' are the subject of a short note, as good as it is brief; the other good review is an equally brief one on Palustre's 'La Renaissance en France.' The serials are continued, and in this instalment of "The Portrait of a Lady" Mr. James is at his best. The "Contributors' Club," by the way, has a good paragraph upon his work in general.

—There are three literary articles in the *International Review* for June, of which the réchauffé of gossip about Lady Mary Wortley Montagu and the critical disquisition upon George Eliot may be skipped. Mr. Matthews's paper on the younger Dumas discusses *seriatim* the dramas of that clever writer with considerable reprehension for their moral delinquencies, but as much without prejudice as without predilection. No critical consideration seems to escape the scrutiny of his detailed examination, but if he had made all this for himself and presented the result, his readers would have had a portrait of Dumas instead of a chronological study of his works. The latter, whatever its conclusions, of necessity implies, it strikes us, an exaggeration of Dumas's importance, whereas he is certainly, as Mr. Matthews shows, picturesque though difficult material for literary sketching of a light order. In "An Experiment in College Government" Mr. John M. Gregory describes the peculiarities of a students' régime at the Illinois State University, where four hundred youth manage themselves according to a constitution which provides various popular forms of government machinery. The penalties are fines, and the President of the College has the power of veto and may remove or suspend from college at his pleasure. Thus the students' organization is a substitute for the Continental universities' plan of letting the civil authorities govern the students and the ordinary American plan of Faculty supervision. The writer says the experiment has been a success, but we fancy Illinois is a more favorable field for its demonstration than the East would be. The fun of this kind of thing would naturally be best appreciated in communities whose educated classes have not yet become a prey to an unpatriotic disgust for "politics"; among the Illinois boys, Mr. Gregory says: "The contests are sometimes warm and exciting, and call out as much electioneering skill and energy as the elections in larger bodies," and doubtless the experience thus gained will be valuable to them in the practical work of Illinois life. "The Pioneers of the Sierra Madre" are genially described by Mr. A. A. Hayes, and it does not appear that they are very different from what other writers upon the same subject have led us to believe. "A Forgotten Astronomer" is Professor Holden's title for a review of Professor Olmsted's 'Life and Letters of Ebenezer Porter Mason.' A Russian article on the Czar's assassination referred to and a paper on "The Zulu Kafirs," by Élie Reclus, the most valuable contribution of the number, complete the table of contents.

—Census Bulletin No. 127, by Robert P. Porter, contains a statement of the valuation of property, of county indebtedness and of taxation for State and county purposes, for the State of California. The total assessed valuation of real estate is $466,273,585; of personal property, including in this every thing excepting real estate, $118,304,451. The total per capita valuation is $676 05, which is very high in comparison with other States. The total bonded indebtedness is $5,621,212; floating indebtedness, $1,992,932; making a total indebtedness per capita of $8 80. The State tax for school support is $1,362,665; for other than school purposes, $1,853,112. The county tax for school support is $572,553; for other purposes, $3,486,918. The rate of State tax for school support is 2.33 mills on the dollar; for other purposes, 3.17 mills. The average rate of county tax for school support is a little less than one mill on a dollar, while for other purposes it is nearly six mills; making a total taxation of about one and one-fourth per cent., exclusive of that for municipal purposes in the cities.

—Bulletin No. 141 contains a brief abstract of the statistics of the daily press of the country. In the expression "daily press" are included the semi-weekly, tri-weekly, weekly, and Sunday papers published in connection with dailies. The table gives only the numbers of such periodicals, with their circulation and average subscription rates, by totals of States. Without quoting the full tables, which are very extensive, the following statistics relating to the whole United States are abstracted:

Dailies.

Total	962
Morning	436
Evening	546

Papers connected with dailies.

Weekly	682
Semi-weekly	44
Tri-weekly	39
Sunday	138
Dailies established during census year, included in above,	114
" suspended " " " " "	80

Papers published in foreign languages.

German dailies	81
Weeklies, etc., connected therewith	111
Dailies in other foreign languages	9

Average subscription price.

Dailies	$7 33
Weeklies	1 82

Average circulation.

Dailies	2,800
Weeklies connected with dailies	3,509
Semi-weeklies " "	2,332
Tri-weeklies " "	965
Sunday papers " "	8,476
German dailies	2,870
Weeklies, etc., connected with German dailies	4,686

Aggregate circulation.

Dailies	3,581,187
Weeklies connected with dailies	3,121,890
Semi-weeklies " "	156,344
Tri-weeklies " "	39,890
Sunday papers " "	724,671
German dailies	321,204
Weeklies, etc., connected with German dailies	487,798

The total number of dailies includes both those established and suspended during the census year.

—In the total number of newspapers, as well as aggregate daily circulation, New York State, of course, leads, having 115 dailies, with a total daily cir-

culation of 990,620, while the average subscription price is $7 20. Pennsylvania is second on the list, with 98 dailies, having an aggregate daily circulation of 597,417. Illinois is third, with 73 dailies; then Ohio and California, with 54 each; then Missouri, with 42; Indiana, with 40; Massachusetts, with 35; while three States, Iowa, Michigan, and Texas, have 30 or more. Going to the other end of the list, Florida and West Virginia have but 3 each; and Delaware, Mississippi, South Carolina, and Vermont have but 5 each. There are ten States, besides the District of Columbia and the Territories, which have less than 10 dailies each. The average subscription price of dailies being $7 33, and the circulation being 3,581,187, the people of the United States pay annually the sum of $26,250,100 71 for daily papers. It is to be regretted that statistics showing the distribution, by States, of the newspaper circulation have not been collected. It would probably, however, have been well-nigh impossible to obtain full statistics of this kind.

—Almost on the eve of preparation for observing the coming transit of Venus (the 6th of December of next year) the first portion of the American observations of the last transit, December 8–9, 1874, is published by the American Commission. We learn from the editor's preface that, in the issue of these observations, the scheme presented by the Astronomer Royal of England to the Royal Astronomical Society, in March, 1875, has been adhered to so far as seemed necessary and practicable; but we confess to no small degree of astonishment that, at so late a day, the Commission should have thought it wise to follow the appended dictum of the *Astronomische Gesellschaft*—"Publikationen von Einzelresultaten für die Sonnenparallaxe aus den Beobachtungen des Venusdurchgangs von 1874 sind als die Interessen der Wissenschaft beeinträchtigend thunlich zu vermeiden"—a sentiment well enough in its way, perhaps, at the time it was proposed, but now open to very serious objection, and to which we believe no nation having any separate result in shape for publication has paid the slightest regard. The entire amount of Congressional appropriation for this transit of Venus appears to have been something like $160,000. It will be remembered that the stations originally selected for occupation by the American parties were three in the northern hemisphere—Siberia, Japan, and China; and five in the southern—Crozet Islands, Kerguelen's Land, Tasmania, New Zealand, and Chatham. The wisdom of this selection will be apparent from the fact that, should the northern observations fail completely, the long line of the southern stations would still suffice for a good determination of the sun's parallax. In fact, there were three groups of stations, the combination of observations at any two of which would furnish a reliable parallax. As is well known, the Crozet party failed to effect a landing, and were afterwards stationed as an additional party in Tasmania.

—The points pertaining to the instrumental equipment of the parties, their organization and preliminary practice, are too generally known to need allusion here. The greatest interest and importance will attach to the third chapter of the present volume, entitled the "Discussion of the Photographic Operations," wherein is described an essentially new instrument, the photo-heliograph; the method of its use is detailed, and a neat general investigation of the mathematical formulæ for the reduction of the photographs is given. Herein also are presented, mostly in tabular form, the reduction-elements of all the photographs of the late transit, more than two hundred in number; but, in accordance with the resolutions adopted by the Commission, no value of the solar parallax is worked out from them, although they appear to be in convenient shape for such a result. We may mention here that Mr. Todd, of Washington, has recently published (though we are not aware that his paper has yet appeared in detail) a value of the sun's parallax which he has obtained from these photographs equal to 8″.88—a result which will possess a good deal of interest at this time, and which is sufficiently large to suit well the fancy of a few investigators whose researches have led them to believe that the sun is much nearer than it really is. Most astronomers, however, will regard this result in confirmation of the opinion, rapidly gaining ground of late, that a trustworthy value of this important astronomical constant is not obtainable from transits of Venus at all. Chapter iv. and Appendix ii. deal with the optical observations of the transit. The Commission has left these in much the same condition as the photographs, and some importance would attach to a derivation of an independent value of the parallax from these observations alone, though it has come to light that observations of this sort, once thought so definite and trustworthy, give rise to a solar parallax of most obliging elasticity—in truth, any investigator may reasonably get from them any value he likes. Were we not aware of the delay which customarily attends the completion of enterprises of such magnitude, we should express the hope that the remaining parts (ii., iii. and iv.) might be issued at an early date, that thus the entire American work might be rendered serviceable to investigators, who ought to have these results before a value of the solar parallax can be definitively worked out which will serve the purposes of astronomers of all nations for a half-century or more to come.

LODGE'S SHORT HISTORY OF THE ENGLISH COLONIES IN AMERICA.*

THE distinctive and original feature of Mr. Lodge's work is a very special treatment of the social, economic, political, and religious status of the individual American colonies in and about the year 1765, the year of the Stamp Act Congress in New York and of the opening struggle for Federal independence. The other parts of the volume, relating to early colonial and later Revolutionary events, are historical sketches, rapid summaries based upon existing literature, and making no pretence to original research, although they contain much that will interest the general reader. The chapters concerning the condition of the American people at the dawn of their Federal life are the fruit of independent study, and constitute a most valuable contribution to American history. Although most of the materials employed in the construction of what may be called the monograph portion of this work already exist in printed form, yet much of this historical matter is now so rare or inaccessible that it has almost the flavor of rediscovered sources, like Bradford's long-lost manuscript, the 'History of Plymouth Plantation.'

In the arrangement of the contents of his volume Mr. Lodge has interwoven the two kinds of work, the introductory and the monographic portions, for the sake of greater continuity and completeness in the treatment of individual colonies. With the exception of the New England group he has devoted two chapters, one introductory and one special, to each colony—for example, "Virginia from 1606 to 1765" and "Virginia in 1765." The New England colonies are treated separately in introductory chapters—for example, "Massachusetts from 1620 to 1765," and then collectively, in a special chapter, entitled "New England in 1765." Beginning with Virginia, Maryland, the Carolinas, and Georgia (a somewhat unusual mode of procedure for a New England writer), Mr. Lodge returns from the far South, by way of Delaware, Pennsylvania, New Jersey, and New York, to the sacred soil of Massachusetts, and treats of New England last. He finishes up his work as he proceeds, and presents a complete history of each colonial establishment from its foundation down to the time of the Stamp Act, without compelling the reader's attention to wander up and down the Atlantic seaboard in chronological journeys, suited only to accidental dates or to the convenience of annalists. At the close of the volume three supplementary chapters are given concerning the causes and results of the American Revolution, thus concluding in a concise and rapid sketch the account of the English colonies in America.

Such a work is especially valuable to the student of American constitutional history, in the wide sense of that term, for this Union did not originate in the written Constitution, nor yet in the Articles of Confederation, nor in the Declaration of Independence. The germs of the American federal republic lie far back in colonial history. Before the middle of the seventeenth century, says Lodge (p. 15), "the first step toward federation was taken in the passage of an act ratifying and regulating commerce" between Virginia and Maryland. Not long after, in 1651, through the influence of Cromwell, was passed the Navigation Act, "as a war measure, by the Long Parliament, the first of the famous series which led ultimately to the revolt of the colonies" (p. 17). But, in spite of the restrictive policy of Cromwell in requiring American products to be brought to English ports alone, the commercial spirit of the American colonies was fostered by his protection, and they were brought closer together in a common relation to England and to one another. Treaties for the common defence against the Indians were made between the various New England colonies and between New England and New York. The federal spirit widened continually. "In 1684 Virginia sent delegates to Albany to meet the agents of Massachusetts and the Governor of New York, in order to discuss the Indian troubles. Thus another uncertain step was taken on the road to confederation. Every step of this nature, no matter how trifling, acquires importance in marking the slow stages by which the principle of union rose by external pressure from the jarring interests of separate colonies" (p. 24). In the year 1740 the American colonies joined with the mother country in an expedition against Carthagena, fruitless, indeed, but "one more step in the development of union" (p. 28). This forward movement was hastened by the French and Indian wars, which, closed by the treaty of Paris, in 1763, left the English colonies in virtual possession of a vast tract of common territory lying back of their seaboard settlements. The common cause of colonial defence first united all the colonies in a kind of commonwealth, and in the territorial conquests acquired from the French by the blood and treasure of all lay a material basis for permanent union. "With the close of the French war the whole current of American history changes. Not only did that struggle bring the colonies together in a common cause, but it destroyed the power of France in America. Fear of France no longer bound the colonies to the parent state. Their loyalty in the future depended on the policy of England alone" (p. 36). The colonies were learning their own strength.

* 'A Short History of the English Colonies in America. By Henry Cabot Lodge.' New York: Harper & Brothers. 1881. 560 pp. octavo.

The Virginians had seen that English troops were not invincible. The failure of Braddock's expedition had convinced the planters and backwoodsmen of the superiority of militiamen and of native commanders like Washington. English military protection did not protect. The American colonies could defend themselves. The next question naturally was, Should America pay for inefficient protection of any sort, whether military or commercial? Taxes for the maintenance of English standing armies, parliamentary acts for the enforcement of England's commercial policy, these things brought on the American Revolution. "Virginia was the first to sound the alarm against the Stamp Act in the famous resolutions of May, 1765, introduced by Henry and advocated by him in the now celebrated speech comparing George III. to Cæsar and Charles I." (p. 40).

It is rather remarkable, in the light of recent events, that the first awakening of an independent spirit in the Old Dominion should have been occasioned by an early desire on the part of the Virginians to readjust their debts, a desire which the mother country very properly attempted to curb. In 1755 the Virginia Assembly passed an act of readjustment, providing for the payment in money of all debts due in tobacco, reckoning tobacco at twopence a pound; but the weed rose to the price of sixpence a pound, and thus people were able to pay their tobacco-debts at a reduction of about sixty-six per cent. So well pleased with this arrangement were the majority of voters, who belonged to the debtor class, that in 1758 they tried it again, and with equal success. The clergy of the country, who had fixed salaries payable in tobacco, were among the principal sufferers by this readjusting process. They appealed to the King in council, and were supported in their claims both by him and by the court of Hanover County in a test case. The plaintiff, the Rev. James Maury, was ordered to go before a jury, who should determine damages. Before this jury, in the interest of the parish, appeared young Patrick Henry, who defended the readjusters, not upon legal but upon political grounds, and appealed so powerfully to the independent spirit of the Virginia jury that they awarded merely nominal damages. "The parson's cause," says Lodge (p. 39), "deserves lasting remembrance, because Henry gave utterance to the latent feeling of the community. He owed much of his greatness to being the first in Virginia, and the second in America, to express in words what every one was thinking more or less indistinctly. Henry's whole speech resolves itself into one proposition—the colony of Virginia must manage her own affairs in her own way, and she cannot brook outside interference."

The self-governing instincts of the Virginians and of all English colonists in America had been quickened into conscious activity by the gradual development of habits of political representation. In Virginia, for example, was summoned, in the year 1619, the House of Burgesses, "the first representative body in America." There were at that time eleven boroughs, each sending two burgesses. This system of representation was not unlike that first instituted in Plymouth colony, which, in 1638, ordered "That every Towne shall make choyce of two of their ffreemen and the Towne of Plymouth of foure to be Committees or deputies to joyne wth the Bench to enact lawes and ordinances" (Plym. Col. Rec., Laws, p. 31). In the year 1639 deputies from seven towns met at Plymouth; but twenty years before, eleven Virginia boroughs or plantations sent their delegates to Jamestown. It is interesting to note in passing that the New England towns were originally called "plantations," and that the name survives to this day in the State of Maine. Mr. Blaine reported to the chairman of the Republican National Committee, after the late Presidential election, that there were "a few distant plantations" whose returns came in somewhat late. It is also interesting that the early laws of the Plymouth plantations and of the Virginia boroughs related to much the same matters—for example, agrarian concerns, the management of cattle and swine, police regulations, the support of the ministry, etc. As early as 1624 the Virginia House of Burgesses had laid the foundations of constitutional government in America. By an act of that year the Governor was not "to lay any taxes or impositions upon the colony, their lands, or other way than by the authority of the General Assembly, to be levied and employed as said Assembly shall appoint." Burgesses were to be free from arrest during the discharge of their duty as representatives of the people. In the time of the Commonwealth (1653) the Assembly had secured the right of electing their own Speaker, and a half-century later they had in their hands the election of the Treasurer. "There were, in the year 1760, one hundred and ten burgesses, two from each county, and one from Jamestown, Williamsburg, Norfolk, and the college respectively. They received one hundred and twenty pounds of tobacco, or about twelve shillings a day, and were elected by the freeholders, who were alone entitled to vote. No act could become law without the assent of both Houses and of the Governor, besides the ratification of the King in council. Such was the government of Virginia; English and practical, but very far from being symmetrical or theoretically perfect" (p. 48). And such, as regards constitutional principles and habits of representation, was the government of every English colony in America. What particularly impresses the student of colonial institutions is the fact that they were copied so closely after English models. Burgesses and delegates were the Commons of America. The Governor and his Council (which in Virginia became the Upper House) represented the Crown and its allied interests.

Perhaps the clearest evidence that the American colonies were guided by English precedents may be seen in the county system, which was early established throughout all the colonies. The Plymouth plantations, with "the chiefe government tyed to the towne of Plymouth" (Plym. Col. Rec., i. 16), were originally but the reproduction of an English county, with Plymouth as the shire town and with the Plymouth constable acting as high sheriff for the whole government. As the plantations spread, it became necessary to subdivide into three counties, Plymouth, Barnstable, and Bristol, which was done in 1685. The county system of Virginia, as Dr. William Palmer has so well shown in his admirable introduction to the Calendar of Virginia State Papers, was the most exact reflection of the old shire system of England. Probably no English colony in America approached nearer to the mother country in its types of local self-government, in county and parish, than did old Virginia. Mr. Lodge has done a valuable bit of work in describing the system of county courts and county judges as they used to be in that section of country.

"In the year 1765 there were inferior courts, known as county courts, sitting once a month at the county town, and the general court, composed of the Governor and council, which sat twice a year at Jamestown as a court of oyer and terminer, and to hear appeals. Quarter-sessions were also held at county towns by members of the quorum, and by those of the general court on the circuit. The county courts were composed of the gentlemen of the county, appointed as judges by the Governor. They were eight in number, and, as finally arranged, superseded the private courts held by individual planters in the early part of the seventeenth century. Four judges sufficed to constitute a quorum, and the bench of the county court was thus filled by country gentlemen or planters, able and judicious persons, in the language of the statute, but wholly innocent of any legal training. With the natural aptitude of their race, however, they administered substantial justice between man and man, and were respected and obeyed by their neighbors as the best, wisest, and wealthiest men among them."

From such rude beginnings of justice, dispensed originally by Virginia planters acting as justices of the peace upon their own plantations, like the English country gentlemen upon their estates or throughout the towns and parishes belonging to their jurisdiction, developed a body of aristocratic justiciaries in every Virginia county, more like their English prototypes than any county judges this country has ever seen. By their sovereign appointment and by their social position, placed high above all popular influences and mercenary considerations, it may be doubted whether even the Supreme Court of the United States has maintained a loftier standard of judicial honor and a more untarnished name. Although in early times pettifogging lawyers were not held in high repute by the country gentry of Virginia, who preferred to settle legal disputes in a clean-handed way, and who, in 1646, actually prohibited attorneys' fees, yet in colonial times a class of professional lawyers had developed in the Old Dominion who deserved to rank with any in the land. "It was at this period that such men as Patrick Henry, Jefferson, George Mason, and Wythe studied law, and were admitted to the bar, which found its crowning glory in John Marshall, the greatest name of all those which have adorned the legal profession in America" (p. 53).

For the student of American local institutions one of the most suggestive portions of Mr. Lodge's work is his reference to the old parish system of Virginia. In the eulogies that have been expended upon the towns and town-meetings of New England it seems rarely to have occurred to New England orators and historians that both the South and the North have, to a great extent, a common inheritance in the matter of local institutions, that Southern parishes and New England towns were derived from the same English stock. According to the authority of Canon Stubbs, the English parish was only the Saxon town or *tun* in ecclesiastical form. The boundaries of a parish, or the district assigned to a church or priest, often corresponded to those of a town, and, in many cases, the civil unit of organization was lost sight of entirely. But the vestry meetings of an English parish, which, says Stubbs, were "primarily meetings of the township for church purposes," kept alive the old Saxon self-governing spirit and transmitted it to the towns of New England. In these vestry meetings, which, like early New England town-meetings, were held in church, many secular officers were chosen by the parish—for example, overseers of the poor, surveyors of highways, assessors, etc. Although there are the clearest indications of an historical connection between the parish system of old England and the towns and parishes of New England, yet, in all probability, the nearest approximation to the English system will be found in the parishes of Virginia and of the other Southern States that were settled by people belonging to the church establishment of the mother country.

"At the close of the French war," says Lodge (p. 38), "there were in Virginia sixty or seventy parishes of the Established Church, and these were governed by vestries, which were very important and active bodies. They represented all the local and municipal government there was in Virginia, and had attained, moreover, a commanding position in Church affairs. At

an early day secular functions were assigned to them by the Burgesses. They were to make returns of births, marriages, and deaths; present for crimes under the statutes against vice; command the sheriff to hold the election for Burgesses, and assist the county courts in building workhouses. To the vestry belonged the duty of 'processioning the land' [like the perambulation of boundaries by the New England selectmen] once in four years, and upon them devolved the care of roads and ferries. Thus far they corresponded to the English vestries and the New England town-meeting; and, as might be imagined, became in time of revolution a nucleus of opposition. . . . At the time of the Revolution the vestries, consisting of twelve of the parish, were chosen by the heads of families, and were in the hands of the ruling class. Washington, Henry, the Randolphs, and the Lees fairly represent the kind of men who sat at these local boards, and thus controlled the sources of political power."

The history of the local institutions of the South is yet to be written. It is a good field of investigation for the rising generation of students in that section of the country. There are county and parish records preserved in Richmond and elsewhere that will throw fresh light upon this subject, which assumes an ever-increasing interest as constitutional history works downwards to the protoplasm of state-life.

A SOLDIER OF THE OLD SCHOOL.—II.*

COLONEL CAMPBELL became Sir Colin Campbell for his services during the Punjab campaign. He regarded his military career as finished, and two years after the close of the campaign he resigned his Indian command and returned to England with the intention of immediately retiring from the service.

"They have," he writes to his friend Colonel Hope Grant, "made me a K.C.B. I may confess to you I would much rather have got a year's batta, because the latter would enable me to leave this country a year sooner, and to join some friends of my early days whom I love very much, and in whose society I would like to spend the period which may yet remain to me to live between the camp and the grave. The day I leave this country will terminate my military career."

The old soldier little thought that the most crowded and eventful part of that military career lay just ahead of him. When he arrived at Cawnpore seven years afterward, to take command of the force assembling for the relief of Lucknow, he met there his old friend Hope Grant. "You little expected," said the latter, "when I last heard from you, that you would be appointed commander-in-chief in India." "I should," replied Sir Colin, "as soon have thought to be made Archbishop of Canterbury." Sir Colin returned to England just when the nation had made up its mind to sacrifice forty thousand soldiers and about seventy millions of money in defence of that beneficent potentate, the Sultan of Turkey. Sir Colin being offered a command in the war thought no more of retiring from the army, at least for the present. He was placed in command of the Highland brigade, and commanded it at the battle of the Alma. In a letter to one of his friends he gives a clear and interesting account of his share in that battle:

"The account of the passage of the Alma and action fought on the left bank, on which the Russian army was very strongly posted and intrenched, will have reached you before this can arrive in England. The First Division formed the extreme left of our army, and was in immediate support of the Light Division. My brigade was on the left of the Guards. The Alma itself is not of any width, and is fordable in most parts; but the bottom through which it flows is covered with vineyards and garden enclosures, all of which were under the fire of the enemy's batteries. Their guns were of large calibre, and quite overpowered the fire of our nine-pounders. When the Light Division was ordered to advance we (the First Division) followed in close support. In a gigantic gorge, immediately in front of the Light Division, the enemy had made a large circular redoubt, protected on each side by artillery on the heights above and on either side, covered on its flanks and its front by a direct as well as an enfilading fire. This artillery was supported by numerous and large masses of troops near their guns, and also by other large masses in rear on the inward slopes of the heights on which they were posted. These heights extended far to the enemy's right, with an open valley, without bush or tree to afford cover or protection from their fire down the slope to the bank of the river, on which we had to form, and to advance to the attack after crossing. The vineyards and garden enclosures in the narrow valley through which the river runs completely broke the formation of the troops. They passed through in a disorderly manner, necessarily; but the left bank being high, I was enabled to collect my right regiment (the Forty-second) in a goodly number under its cover. . . . On gaining the summit I observed a large portion of the Light Division advancing to attack the redoubt, which was a good deal to the right of my right regiment. . . . I hastened the formation of my own right regiment, for the other two were still struggling through the difficult bottom from which I had emerged. . . . The Forty-second continued its advance, followed, as I had previously ordered, by the other two regiments (Ninety-third and Seventy-ninth) in echelon, forming in that order as they gained in succession the summit on the left bank of the Alma. On gaining the heights we found the enemy, who had retreated from the redoubt, attempting to form upon two large masses of troops that were advancing over the plateau to meet the attack of the Forty-second. The men were too much blown to think of charging, so they opened fire while advancing in line, at which they had been practised, and drove, with cheers and a terrible loss, both masses, and the fugitives from the redoubt, in confusion before them. Before reaching the inner crest of these heights another heavy mass of troops came forward against the Forty-second, and these were disposed of in the same way as the two first we encountered. I halted the regiment on the inner crest of the heights we had gained, as I have described, when two large bodies came down from the right of the enemy's position direct on the left flank of the Forty-second. Just at this moment the Ninety-third showed itself coming over the table of the heights and attacked these bodies, who did not yield readily. The Ninety-third, whom I had great difficulty in restraining from following the enemy, had only time to inflict great loss, when two bodies of fresh infantry, with some cavalry, came boldly forward against the left flank of the Ninety-third; when, thinking (as in the case of the flank attack on the Forty-second), of the dispositions I should make to meet it, the Seventy-ninth made its appearance over the hill, and went at these troops with cheers, causing them great loss, and sending them down the hillside in great confusion. . . . Lord Raglan came up afterwards and sent for me. When I approached him I observed his eyes to fill and his lips and countenance to quiver. He gave me a cordial shake of the hand, but he could not speak. The men cheered very much. I told them I was going to ask the commander-in-chief a great favor—that he would permit me to have the honor of wearing the Highland bonnet during the rest of the campaign, which pleased them very much; and so ended my part in the fight of the 20th instant."

When the siege of Sebastopol was established, to Sir Colin Campbell, in co-operation with the French Marshal Vinoy, was entrusted the duty of protecting the rear of the allied armies at Balaclava. Sir Colin Campbell was an accomplished French linguist, and a friendship sprang up between him and Vinoy which continued unimpaired till the death of Sir Colin. The command at Balaclava involved incessant labor and watchfulness, but was not so harassing, or exposed to such constant danger, as the duty in the trenches. Towards the close of the siege the Highland brigade was marched to the front, and Sir Colin Campbell accompanied it. It acted as a reserve when the British delivered their unsuccessful assault on the Great Redan. Sir Colin condemns this operation as insane.

"The column," he writes, "was to be preceded by forty ladders, and the work to be entered by escalade. . . . Was it to be supposed that such a work, defended by Russian soldiers, could be carried by forty men presenting themselves on the ramparts from forty ladders, even allowing that we had succeeded in bringing the whole party to the scarp of the work and placing them against it—a most impossible event under the fire of artillery and musketry to which our troops would be exposed?"

He bears generous and ample testimony to the bravery with which Sebastopol was defended, and the skill and humanity with which its final evacuation was effected:

"These same Russians, it must be acknowledged, made a noble defence; and surely never was an operation in retreat from a difficult position so wonderfully well managed. . . . I cannot conceive anything more perfect or more complete in every detail than the mode and manner in which they accomplished the retreat and withdrawal from Sebastopol, and transport of their troops across the harbor. I found the Great Redan abandoned at one A.M. I dared not occupy it, from the numbers of explosions taking place all around, before daylight; but while the enemy fired every magazine along the line of their defences, they did not touch their magazines in the Great Redan—an act of great humanity, for the whole of our wounded who remained in the ditch and our trenches would have been destroyed. Indeed, some of our wounded were carefully dressed and placed in safety, before the Russians left the Redan, from the fire of our own shells, which were directed against the interior of the work after the attack had failed."

On the close of the Crimean War Sir Colin Campbell reverted to his determination to leave the service, but still another stirring episode had to be passed through before his career as a soldier terminated. The Indian mutiny broke out in 1857, and he was offered the chief command. He had just before refused the command of the China expedition, on the ground of advancing age and failing health; but he felt that it would be dishonorable to hold back when the nation was inviting his assistance in the midst of such a catastrophe as the Sepoy revolt. The day after the offer was made to him he was on his way to Calcutta. The best part of Lieut.-Gen. Shadwell's two volumes are taken up with an account of Lord Clyde's Indian campaigns, and here it is that he has most grievously misunderstood the duties of a biographer. Of these campaigns we have read enough, and more than enough, in the thousand and one narratives which have been published concerning them in the form of despatches, histories, memoirs, personal narratives, etc. What we now desire to know is something regarding Lord Clyde himself. This most legitimate desire his biographer studiously ignores, and merely adds one more history to those already in print on the same subject. This history is prolix and wearisome to the last degree; it is without novelty of any kind, being no more than a compilation from Kaye's history and other easily accessible works.

The fact is that biography is a species of literature which ought never to be entrusted to an inexperienced writer, and, least of all, to an inexperienced writer who is also a military man. Lieut.-Gen. Shadwell was an inti-

* 'The Life of Colin Campbell, Lord Clyde. By Lieut.-General Shadwell, C.B.' 2 vols. London: Blackwood & Sons. 1881.

mate friend, through life, of Lord Clyde, but beyond the assurance in the preface that this was so there is absolutely nothing in the book which would cause a reader to surmise it. He tells us nothing about his hero which any one might not have learned from books. To say that we get no clearer knowledge of Lord Clyde from General Shadwell's biography than from many a book already in print is to understate the case; we get very much less. The following passages, taken at random from Mr. Russell's 'Diary in India,' reveal the man to us more vividly than the whole of General Shadwell's bulky biography:

"I could not but be struck with the admirable *personnel* of our officers as they stood chatting in groups to-day. Sir Colin, spite of a slight stoop, is every inch a soldier in look and bearing—spare, muscular, well-poised on small, well-made feet, to which some utilitarian boot-maker has done scant justice and given plenty of leather; one arm held straight down by the side, with clenched fist, the other used with easy gesture; his figure shows little trace of fifty years of the hardest and most varied service beyond that which a vigorous age must carry with it; the face is marked, indeed, with many a seam across the brow, but the mouth, surmounted by a trimmed, short moustache, is clean-cut and firm, showing a perfect set of teeth as he speaks; the jaw, smooth and broad, is full of decision; the eye, of the most piercing intelligence, full of light and shrewdness."

"It was late when we broke up. . . . The tents shone like cones of snow in the light; no sentry challenged as I approached the main street; not a voice could be heard; but on looking towards the end I saw one solitary figure pacing up and down in solitary thought. As I got nearer I recognized the well-known and peculiar light, soldierly step and figure of Sir Colin, who was, perhaps, pursuing the same train of thought that Shakspere attributes to Henry before the day of St. Crispin. We had a long and interesting conversation. He laid the greatest stress on the all-importance of handling soldiers judiciously when they are taken under fire for the first time. 'It may take years to make infantry which has once received a severe check feel confidence in itself again; indeed it will never be done, perhaps, except by most careful handling. It is still longer before cavalry once beaten recover the dash and enterprise which constitute so much of their merit.' I understood him to allude to the conduct of some of the regiments under Windham at Cawnpoor, which had been engaged in two unsuccessful assaults against the Redan. The variety of illustration, the keenness and excellence of reasoning, which distinguish Sir Colin's remarks on military matters, render his conversation very instructive and delightful. So eager is he when engaged in a demonstration that he cares not for time or place. So, to-night, he took me into his tent to show me some papers, late as it was; but he could not find them, and I bowed myself to bed.'

Lord Clyde was not a soldier of original genius, but he was, as Sir Charles Napier designated him, "war-bred"; he may have learned much from books, but all that he had so learned had been tested in the school of experience; and the management of troops under fire was an art which he knew, as a skilled artisan may be said to know the craft at which he has been working all his life.

Epochs of Modern History. Frederic the Great and the Seven Years' War. By F. W. Longman, Balliol College, Oxford. (New York: Charles Scribner's Sons. 1881.)—There is perhaps no period of history better worth studying from a purely intellectual point of view than the Seven Years' War and the career of Frederic the Great. The events are compact and stand in no close connection—except so far as such connection must necessarily exist in historical events—with either those that went before or those that followed. The hero of the war is one of the great men of history, equally great as a statesman and as a general; so that, whether it is the building-up of Prussia from a petty kingdom to a great power or the masterly application of the rules of military science, the student is all the time dealing with the work of a master mind. Frederic the Great may rank with Richelieu and Cavour as a statesman, with Alexander and Napoleon as a general. Moreover—and this is, in our point of view, another advantage—the interest is a dry and purely intellectual one. The reader is not called upon to sympathize. There is no cause at stake, only the dynastic interests of kings. The religious controversy which kindled the fiercest wars in the century before had died away; the revolutionary movement which has inspired most of the wars of the present century had not begun. The Protestant reader may feel a languid satisfaction in the protection afforded to Protestants in Silesia; German patriots hail the beginnings of a German nation; we Americans cannot help rejoicing over victories in Saxony and Bohemia which helped Wolfe in his conquest of Canada; but these are only dull and distant echoes of the profound and personal feeling with which one reads of William the Silent, Cromwell, or Napoleon. We do not like Frederic; we do not dislike him especially; for this very reason he is all the better fitted to be an object of study.

Mr. Longman's history of this interesting period is excellent in all respects, although the closing years of Frederic's life are rather more compressed than desirable. This is very excusable, considering the great extent and variety of the events that had to be comprised in the work. It should be remembered, further, that these closing years really belong to another series of events, and that Frederic's career may be said to have closed with the Treaty of Hubertsburg. Indeed, one is surprised at the fulness and comprehensiveness with which events so distant from one another and each of such magnitude—as the conquests of Clive and of Wolfe, the campaigns of Frederic, and the party changes in England—are narrated. Of all these we have accounts which, if brief, are very satisfactory. The two vital moments in Frederic's career, those which have stamped his memory with reprobation, are the seizure of Silesia and the partition of Poland. The remarks upon both of these are excellent, and we think just; still, in questions of such importance, we should have been glad of somewhat greater fulness. Perhaps it was not necessary with regard to Poland, as to which the judgment of history is positive. With the Silesian war it is different. This has been almost as unanimously condemned, and yet it is certain that Frederic himself regarded his claims as valid, and that many modern historians justify him. Mr. Longman says that they were "certainly valid in themselves; their weak point was the length of time they had lain dormant" (p. 46). He gives very good reasons for this opinion, but we wish he could have found space to discuss the question more at length. There are good maps and plans of battles, and an index.

Principles of Contract at Law and in Equity. By Frederick Pollock, LL.D. First American from the second English edition, with notes by Gustavus H. Wald, of the Cincinnati Bar. (Cincinnati: Robert Clarke & Co. 1881.)—This is, strictly speaking, a book for professional use, and a valuable one; but the rather broad philosophical treatment of the subject gives it a freshness and originality which will make it merit a more general reading than books of technical law usually get. The effort to bring together the doctrines of the common law and those of courts of equity relating to the subject of contracts implied a departure from beaten tracks and a discussion of fundamental principles of rights and of obligations. The breaking-down of the barrier between the courts of law and of chancery which is practically accomplished both in England and in this country, produced a conscious want of such a treatise on the law of contracts as should blend into one system the remedies of both tribunals, and exhibit them, not as merely concurrent or correlated, but as the consistent forms of development of the same principles of justice. Pollock's 'Principles of Contract' has already been recognized in England and in this country as an able effort to supply the need referred to. He has made good use of the codification known as the Indian Contract Act, to supply and suggest terse definitions and distinctions, and has, as he modestly says, referred occasionally to Roman, American, and Continental law in elucidation of his theme. These things have given the volume a character of its own, and will make it welcome to the library shelves of many a student of the philosophy of law outside the regular members of the profession. Its position as a working lawyer's text-book is, meanwhile, solidly established.

The American edition has been annotated in a most conscientious and intelligent manner by a careful collation of the more recent decisions in both England and America, and is especially full in its references to cases reported in the United States.

Flags. Some Account of their History and Uses. By A. Macgeorge. (London: Blackie & Son; New York: Scribner & Welford. 1881.)—In writing on the flag it seems to be difficult to avoid the temptation to digress into the endless scenes and events with which it has been associated. Mr. Macgeorge, however, keeps his subject skilfully in hand without trying to exhaust it. This elegant little volume, agreeable in size, admirable in type, and beautiful in illustration, gives a brief summary of military emblems from the earliest references in authentic history to the establishment of the present flags of the principal nations of Christendom. The account of our own national flag is concise and, in the main, correct. It is, however, wrong in stating that the stars in the union are always arranged in parallel rows. This is true of our Navy flags, but in the Army they are generally set in one large star. It is also mistaken in saying that the flag of Liberia is the same as ours, with the exception of having but one star in the union. In fact, the Liberian flag has only eleven stripes, while ours has thirteen.

Most attention is naturally paid to the British flag, of which the sketch given shows much general knowledge as well as technical learning—*e.g.*, in the curious and entertaining information as to the proper use of flags in warfare, international etiquette, false colors, manifestations of surrender, and kindred points. The author maintains, with much heraldic learning, that the flag of Great Britain is not conformed to the minute of the king in council by which it was established, and that Garter King-of-Arms, when referred to, could not deny this, but that he very properly declined the responsibility of advising a change. The error consists in the width of the white border or fimbriation of the St. George's cross. A similar mistake is indicated in the omission of St. Andrew's cross entirely from the penny coin. A discussion of the propriety of the precedence of the arms of England on the royal standard introduces as an argument the familiar verses:

"The lion and the unicorn
Were fighting for the crown;
The lion beat the unicorn
All round the town."

Mr. Macgeorge does not consider this conclusive. The version is inconsistent alike with patriotism and with historical accuracy:

"It is certainly not the correct one. The true version, familiar to every boy in Scotland, is more impartial and it has more fun in it. It runs thus:

'The lion and the unicorn
Fighting for the crown,
Up came a little dog
And knocked them both down,'

the 'little dog' being the small lion which stands defiantly on the crown and constitutes the royal crest at the top of the achievement."

It is, however, painfully evident that, no matter how clearly Mr. Macgeorge may show England the error of her ways in respect to her union and her coin, we may be sure she will continue to see the right but still the wrong pursue.

Adam Smith. By J. A. Farrer. (New York: G. P. Putnam's Sons. 1881.)—This work forms the first of a series on English Philosophers, the primary object of which, as defined in the editor's preface, is to place before the reader an exposition of the treatment by each philosopher of the problems with which he dealt. Each volume of the series is to be issued "as a complete and integral work, entirely independent of the rest, except in form and general method of treatment." At the same time, "it is hoped that the series, when complete, will supply a comprehensive history of English philosophy." This hope seems to us unreasonable, however valuable the separate volumes may prove as aids to students of philosophy. The execution of the present work, unfortunately, falls far short of realizing the promise of its conception. The reader whose attention is limited to one part only of Adam Smith's doctrines is in danger of losing sight of the comprehensive character of his system, and of ignoring the broad deductive element which underlies every branch of it, and the history of which affords a clue to many apparent anomalies. Thus, the 'Theory of Moral Sentiments,' with which the present volume is exclusively occupied, represents Adam Smith's conclusions in one department only of philosophy; but the same principles on which his ethical doctrines are founded also determined his views on the social, jural, and political problems to which his speculations extended.

In an historical introduction we should like to be shown something more than the points of agreement or disagreement between Adam Smith and his immediate predecessors. Adam Smith, who, as Mr. Farrer indicates, was considerably influenced by his intercourse with French philosophers, presents in his philosophical writings a striking example of the conflict between two diametrically opposite methods of philosophical investigation. Mr. Farrer's delineation of these conflicting tendencies is unsatisfactory, and we must object to his unqualified statement that Adam Smith's theory "represents the reaction" against the *à-priori* method of the intuitionalist school. His emancipation from *à-priori* prejudices was very partial, and the independence of his conclusions is often conspicuously vitiated by his endeavor to find in the results of his patient and accurate observation traces of nature's design, so as to accommodate his conclusions to the ideals in his own mind. A passage in Dugald Stewart's biography of Adam Smith affords a striking illustration of the powerful influence exercised in the last century by the historical fiction of a "law of nature." Stewart says: "In most cases it is of more importance to ascertain the progress that is most simple than the progress that is most agreeable to fact; for, paradoxical as the proposition may appear, it is certainly true that the real progress is not always the most natural."

Mr. Farrer announces that "criticism will be suggested rather than indulged in," and to fulfil this design a short epitome is given of the criticisms advanced by Brown, Stewart, and Jouffroy. There cannot be much advantage in quoting objections which are conceived so nearly from Adam Smith's own general standpoint that they are capable of refutation from his theory. What the student of philosophy now needs is to be shown the kind of criticism that is rendered possible by the wider scope of modern investigation. Throughout the book there is a conspicuous absence of independent suggestions from the author, and it might more properly be styled an abridgment than an exposition. This, we think, will diminish its value to mature students of philosophy. It can be but a questionable guide in the hands of teachers or to younger students, from the author's deficiency of analytical power and a certain narrowness in his view of Adam Smith's philosophy. The only class of readers to whom, therefore, it is likely to recommend itself are those who are not averse to instruction provided they can obtain it in not too voluminous a form. It may attract to the perusal of portions of Adam Smith's philosophy readers whose literary appetite is unequal to an attack on the original works.

Gedichte von Hermann Kletke. Dritte, reich vermehrte mit dem Bildniss des Dichters versehene Gesammtausgabe. (Berlin: Carl Habel. 1881. 16mo, xx.–468 pp.)—If no books but those of the first order of literary merit were ever permitted to be printed a second time, the uncritical public would be happy in the possession of a certain standard of excellence whenever it happened to see the words "Second Edition" on a title-page. As things now are in this respect, the critic himself is often at a loss to divine what occult forces contribute to prolong the life of poor books through one edition after another. But even the poorest book which is issued afresh at intervals long or short must minister to the needs of some circle of readers. This is the only explanation which occurs to us of the reappearance of Hermann Kletke's 'Gedichte.' We venture to say that very few of our readers, even those familiar with German literature, know much of Kletke as a poet, or perhaps know who he is. We volunteer the information that he was born in 1813 in Breslau, Silesia, the seat of the famous *Saengerschule* in the seventeenth century. He got his university education in his native city, and afterwards migrated to Berlin, that Mecca of German talent and genius. In this, as well as in his present occupation, Kletke's name is connected with that of an illustrious predecessor. A hundred and thirty years ago Gotthold Ephraim Lessing, then two-and-twenty, went to Berlin and immediately made himself famous by the vigor and originality of the literary criticisms which he wrote for the *Voss'sche Zeitung*, of which Hermann Kletke is now the editor. Perhaps the familiar appellation by which this venerable journal is now known among the witty Berlin people, "Tante Voss," is somewhat indicative of the literary character of its present management.

Kletke's reputation was earned principally as a writer of juvenile books, one of which ('Ein Mährchenbuch') has gone through a good many editions. The present volume of lyrical poems, ballads, and romances presents the familiar themes of love, friendship, youth, nature, and life. The changes are rung upon them in the customary style. Judging them by any ideal criterion, we should have to say that very often the rhythmic movement of the verses has a very decided limp, a lack of melodious perfection. The sentiment, too, is often superficial. Depth, penetration, and force of thought are rarely to be found. Tolerably free from these defects are a few pieces among the *Gedenktafeln*—"Memorial Tablets"—to the great men of the past and the present. The genuine admiration which Kletke bestows on poets like Uhland, Rückert, Lenau, Platen—men of a genius greater than his own—is certainly creditable to him. So it must be said that his treatment of love is refined and spiritual. No young heart will ever be poisoned by his poems. The healthy tone in which he deals with the grave questions of life is likewise commendable. Had the author been wise enough to discriminate severely in favor of his best work, the collection would have lost much in bulk, but the satisfaction to the reader and the credit to the author would have been greater.

BOOKS OF THE WEEK.

NEW LEISURE-HOUR BOOKS.

A Matter-of-Fact Girl.

By Theo. Gift, author of 'Pretty Miss Bellew.' 16mo, $1.

MATRIMONY.

A Novel. By W. E. Norris. 16mo, $1.

HENRY HOLT & CO., New York.

A REVISED EDITION OF THE

NEW TESTAMENT

Is in press. It may, therefore, be appropriate to look back 1,600 years to the time of a former revision by the Council of Nice, A.D. 325, and enquire:

After the writings now contained in the New Testament were selected from the Gospels in existence in the fourth century, what became of the rejected books? In answer,

The Publishers are glad to be able to say that they now offer the

APOCRYPHAL BOOKS OF THE NEW TESTAMENT,

Being the Gospels and Epistles rejected by the Council of Nice. Illustrated with 32 engravings from old missals. 1 vol. 8vo, cloth, $1 50. Mailed free.

GEBBIE & CO.,

No. 619 Sansom Street, Philadelphia.

Kuhn's Zeitschrift.

Vol. 1-5, 7-20, and one volume of indices. Boards, $75.

Boetlingk und Roth, Sanskritisches Wörterbuch.

Seven volumes (complete), half morocco, $60.

WILLARD SMALL,

14 Bromfield Street, Boston, Mass.

RECENT IMPORTANT PUBLICATIONS.

THE OLD TESTAMENT IN THE Jewish Church: Twelve Lectures on Biblical Criticism, with Notes. By W. Robertson Smith, M.A., recently Professor of Hebrew and Exegesis of the Old Testament, Free Church College, Aberdeen. 1 vol. 12mo, cloth, $1 75.

Professor Smith, it will be remembered, was teacher of Hebrew and lecturer on Hebrew literature at Aberdeen, where he was deposed by the Scotch ecclesiastical authorities for alleged heresies. This action was only needed to make the professor exceedingly popular with the laity, influential members of which induced him to deliver at Edinburgh and Glasgow the course of lectures on the present state of Biblical criticism, which are now put in book-form to reach a still larger circle of hearers.

THE FATHERS OF THE THIRD Century. By the Rev. George A. Jackson. Second volume of the "Early Christian Literature Primers," edited by Prof. George Park Fisher, D.D. 18mo, cloth, 60 cents.

The "Early Christian Literature Primers" are to consist of *four* volumes: 'The Apostolic Fathers, and the Apologists of the Second Century'; 'The Fathers of the Third Century'; 'The Post-Nicene Greek Fathers'; 'The Post-Nicene Latin Fathers.' First and second volumes are now ready.

GENERAL PHYSIOLOGY OF Muscles and Nerves. By Dr. I. Rosenthal, Professor of Physiology in the University of Erlangen. With seventy-five woodcuts. International Scientific Series. 12mo, cloth, price $1 50.

"The attempt at a connected account of the general physiology of muscles and nerves is, as far as I know, the first of its kind. The general data for the branch of science has been gained only within the past thirty years."—*Extract from Preface.*

POPULAR LECTURES ON SCIEN- tific Subjects. By H. Helmholtz, Professor of Physics in the University of Berlin. Second Series. 12mo, cloth, price $1 50.

CONTENTS: I. Gustav Magnus. In Memoriam.—II. On the Origin and Significance of Geometrical Axioms.—III. On the Relation of Optics to Painting: Form, Shade, Color, Harmony of Color.—IV. On the Origin of the Planetary System.—V. On Thought in Medicine.—VI. On Academic Freedom in German Universities.

The favor with which the first series of Professor Helmholtz's lectures were received justifies, if a justification is needed, the publication of the present volume.

THE LAND OF GILEAD. With Excursions in the Lebanon. By Laurence Oliphant. With illustrations and maps. Crown 8vo, cloth, price $2.

"His journeys took him quite off the beaten tracks of tourists and archæological explorers; he got an 'inside view,' so to call it, of native life and manners; he saw something of the wandering Bedouins; and we know of no recent book on Palestine which is really so instructive, from which the reader can derive so large a fund of entertainment."—*Eclectic Magazine.*

ANIMAL LIFE, as Affected by the Natural Conditions of Existence. By Karl Semper, Professor of the University of Wurzburg. With maps and one hundred woodcuts. International Scientific Series. 12mo, cloth, price $2.

"It appears to me that of all the properties of the animal organism, Variability is that which may first and most easily be traced by exact investigation to its efficient causes; and as it is beyond a doubt the subject around which, at the present moment, the strife of opinions is most violent, it is that which will be most likely to repay the trouble of closer research. I have endeavored to facilitate this task, so far as in me lies."—*From the Preface.*

ELEMENTS OF ASTRONOMY. Being No. 18 in the series of "Text-Books of Science, adapted for the Use of Artisans and Students in Public and Science Schools. By R. S. Ball, Professor of Astronomy in the University of Dublin. 16mo, cloth, with illustrations, price $2 25.

ANECDOTAL HISTORY OF THE British Parliament. From the Earliest Periods to the Present Time. With Notices of Eminent Parliamentary Men and Examples of their Oratory. Compiled by G. H. Jennings. 1 vol. crown 8vo, 546 pages, cloth, $2 50.

"As pleasant a companion for the leisure hours of a studious and thoughtful man as anything in book-shape since Selden."—*London Telegraph.*

"It would be sheer affectation to deny the fascination exercised by the 'Anecdotal History of Parliament."—*Saturday Review.*

THE ATOMIC THEORY. By Ad. Wurtz, Member of the French Institute. Translated by E. Cleminshaw, M.A., Assistant Master at Sherborne School. International Scientific Series. 12mo, cloth, $1 50.

GREAT VIOLINISTS AND PIAN- ists. By George T. Ferris. Appletons' New Handy-Volume Series. 18mo, paper, 40 cents; cloth, 60 cents.

'Great Violinists and Pianists' is the fifth volume of Mr. Ferris's Music Series, now consisting of 'The Great German Composers,' 'The Great Italian and French Composers,' 'Great Singers, First Series,' 'Great Singers, Second Series,' and 'Great Violinists and Pianists.' Price for the complete set, in cloth, $3; in paper, $1 50.

SIGHT: An Exposition of the Principles of Monocular and Binocular Vision. By Joseph Le Conte, LL.D., author of 'Elements of Geology,' etc. International Scientific Series. With illustrations. 12mo, cloth, price $1 50.

"In writing this treatise I have tried to make a book that would be intelligible and interesting to the thoughtful general reader, and at the same time profitable to even the most advanced specialist in this department."—*From Preface.*

DESCRIPTIVE SOCIOLOGY; or, Groups of Sociological Facts. Classified and arranged by Herbert Spencer. No. 7, Division II., Part II. B. HEBREWS AND PHŒNICIANS. Large folio, price $4. (To subscribers for the whole work, $3 50 per Part.)

THE POWER OF MOVEMENT IN Plants. By Charles Darwin, LL.D., F.R.S., assisted by Francis Darwin. With illustrations. 12mo, 592 pages, cloth, price $2.

"Mr. Darwin's latest study of plant-life shows no abatement of his power of work or his habits of fresh and original observation. We have learned to expect from him at intervals, never much prolonged, the results of special research in some by-path or other subordinated to the main course of the biological system associated with his name; and it has been an unfailing source of interest to see the central ideas of the evolution and the continuity of life developed in detail through a series of special treatises, each well-nigh exhaustive of the materials available for its subject."—*Saturday Review.*

A HISTORY OF GREECE. From the Earliest Times to the Present. By T. T. Timayenis. With maps and illustrations. 2 vols. 12mo, cloth, price $3 50.

"While I cheerfully acknowledge my obligations to Gibbon and Grote—the most eminent of modern historians—a careful study of the Greek writers has led me to differ from them on many important matters. The peculiar feature of the present work, therefore, is that it is founded on Hellenic sources. I have not hesitated to follow the Father of History in portraying the heroism and the sacrifices of the Hellenes in their first war for independence, nor, in delineating the character of that epoch, to form my judgment largely from the records he has left us."—*Extract from Preface.*

APPLETONS' HOME BOOKS. A Series of New Hand-Volumes, at low price, devoted to all subjects pertaining to Home and the Household. Now ready: BUILDING A HOME. Illustrated. HOW TO FURNISH A HOME. Illustrated. THE HOME GARDEN. Illustrated. *Other volumes to follow.* Cloth, flexible, with illuminated design. 12mo, price 60 cents each.

LOUKIS LARAS: Reminiscences of a Chiote Merchant during the Greek War of Independence. From the Modern Greek of D. Bikelas. Appletons' New Handy-Volume Series. Paper, 30 cents.

This fascinating narrative has met with great success abroad, translations having appeared in French, German, Italian, and Spanish, as well as in English. It is a simple story of the adventures and vicissitudes of a Chiote merchant and his family during the Greek War for Independence, written in a singularly felicitous style, and affording a striking picture of the suffering of the Greeks in that desperate struggle.

THE ART OF SCHOOL MANAGE- ment. A Text-book for Normal Schools and Normal Institutes, and a Reference-book for Teachers, School-officers, and Parents. By J. Baldwin, President of the State Normal School, Kirksville, Missouri. 12mo, cloth, price $1 50.

SCOTCH SERMONS, 1880. 12mo, cloth, $1 25.

"The *Christian Union* gives these bold and reverent and spiritual preachers cordial welcome as builders together with God; welcome for the sincerity of their quest, the general clearness of their thought, the unwonted frankness of their utterance, the catholicity of their sympathies, and the unexceptionable reverence and humility of their spirit. . . . We especially advise all ministers and thoughtful religious teachers to study it; conservatives with such patience as they can command, because, whatever may be thought of the soundness or unsoundness of its teachings, it is unquestionably one of the ablest of all the recent representative utterances of a phase of modern thought of which no religious teacher has a right to remain in ignorance."—*The Christian Union.*

For sale by all booksellers, or any volume sent by mail, post-paid, to any address in the United States on receipt of the price.

D. APPLETON & CO., Publishers, 1, 3, and 5 Bond St., New York.

G. P. PUTNAM'S SONS,

27 and 29 W. Twenty-third Street, New York,

Have recently published:

LITERARY ART: A Conversation between a Painter, Poet, and Philosopher. By John Albee. 16mo, cloth extra, $1.

This conversation, which attempts to present its subject from the three standpoints of pictorial and plastic art, poetry, and philosophy, was read at the last session of the Concord School of Philosophy, and attracted attention by the freshness of its style, its loftiness of thought and charm of illustration.

"A readable and sensible book."—*N. Y. Herald.*

"A book for scholars. . . . Full of sound criticism and valuable suggestions."—*N. Y. Nation.*

"A rare and admirable volume, . . . the work of a fresh and original mind. . . . The style is exquisite, recalling Landor and Hawthorne."—*Washington Capital.*

Nearly ready:

AMERICAN NERVOUSNESS; its Causes and Consequences. By George M. Beard, M.D. 16mo, about $1 25.

Contains the results of the author's researches on the longevity of brain-workers, the relation of age to work, the philosophy of modern nervous diseases, etc.

CONTENTS.—Nature and Definition of Nervousness—Signs of American Nervousness—Causes of American Nervousness—Longevity of Brain-Workers—Relation of Age to Work—Physical Future of the American People.

A ROMANCE OF THE NINE- teenth Century. By W. H. Mallock, author of 'Is Life Worth Living?' etc. Square 16mo, in the "Trans-Atlantic Series," about $1.

☞ New Catalogue of Spring Publications, including List of the issues of the Civil-Service Reform Association, the Social Science Association, the Society for Political Education, and the Free-Trade Club, sent on application.

A New No-Name.

MANUELA PAREDES. The 8th Volume in the No-Name (second) Series. Price $1.

"There is almost everything in this novel to make it perfect—plan, scene, character, incident, feeling, motive, style; and we do not hesitate to say that to us it is by far the finest in the procession thus far. . . . The book is a masterly one in every respect, and not to be missed by any one who enjoys fiction of the highest class," says the *Literary World.*

RANDOM RAMBLES. By Louise Chandler Moulton. Square 16mo, red edges, price $1 25.

A novel and picturesque volume, descriptive of foreign travel. Mrs. Moulton has been a frequent visitor abroad during the last few years, and in this book gives pen-and-ink sketches of the specially interesting phases of foreign life; a chapter on the London season, another on visiting Parliament, Parisian sketches, a chapter on the Roman carnival, another on living in Rome, and others on subjects of equal interest.

Sold by all booksellers. Mailed, post-paid, by the publishers,

No. 306 Chestnut Street, Philadelphia, Pa.

The Nation.

NEW YORK, THURSDAY, JUNE 2, 1881.

The Week.

THE week at Albany has been given over to the Senatorial contest, which has, of course, wholly superseded legislation. The Conkling cause has steadily waned from the first, despite the efforts of the ex-Senator himself, Vice-President Arthur, the Speaker of the Assembly, and other Stalwarts. Mr. Blaine came on from Washington to New York and gave the ex-Senators' friends a gleam of hope, but he speedily went back, and, in the face of the Buffalo Collectorship and other Conkling appointments, there was a certain faintheartedness in the talk about Administration interference and the opposition of the monopolists to Mr. Conkling's return. The "Half-Breeds" soon gained recruits enough to prevent the ex-Senators from getting a caucus nomination, and Monday night held a gathering of their own which outnumbered an informal caucus called by Speaker Sharpe in the proportion of fifty-seven to thirty-five. This latter was a great blunder. It was irregularly called, all efforts to get a call regularly issued having failed, and was thus handicapped at the outset by the excuse it gave the wavering for absenting themselves. The proceedings were rather farcical, and when the roll-call showed that a majority of the Republican members of the Legislature was not present, adjournment was the only course open to the participants. The Democrats held a caucus at the same time and nominated State-Senator Jacobs and ex-United States Senator Kernan for the vacancies. Thursday Mr. Woodin read a set speech in the Senate against Conkling, and was answered by Mr. Strahan for the other side. The correspondents remark a striking change in Mr. Conkling's demeanor in the direction of affability, but this may be mere rumor. It is certain, however, that his presence on the scene of action has disappointed the expectations of those who believed, with "a gentleman whose representative position would be recognized at once if" the *Herald* correspondent "should give his name," that "if Mr. Conkling were to come here and just walk through the corridors of the Delavan and down Broadway and up State Street to the Capitol, the effect would be electrical." On the first ballot, Tuesday morning, Conkling and Platt got but 9 and 8 votes respectively in the Senate, and 26 and 21 in the Assembly. The "Half-Breeds" scattered their votes among a score of candidates.

The performance is altogether the most singular one in American political history, because the chief actors in it are politicians of long experience and great repute for shrewdness, and nevertheless have blundered in their own art to a degree which no "theorists" or "visionaries" could have equalled. The general result is, however, so gratifying that there will be but little thought bestowed on the *modus in quo*. With Conkling restored to private life or that enormous law practice, and Platt—who has now been degraded in newspaper nomenclature from "Tom" to simple "Tommy"—gone back to his express business and Quarantine Commissionership, with two or three penitentiaries "yawning" for Brady and Dorsey, with the eyes of the country opened to the character and capacity of the Vice-President, and to the real nature of General Grant's influence as an amateur politician, and all the Machinists of the State sick, sore, and sorry, Monday morning last might fairly be called a glorious one for America by a reformer who was disposed to gush. Mr. Conkling will not be left without compensations. One of the great solaces of his political life has been the practice of cutting the acquaintance of his colleagues and brother politicians. This will remain to him. He is not on "speaking terms," it is said, with either the President or the Cabinet, or with fifteen Senators. Hereafter he will not have to speak to any Senator at all, and will have a new sensation in quarrelling with those remarkable law partners and "holding his nose" when his clients come in. He has few mental resources outside of "politics," it is true, and has no real interest in public questions apart from the distribution of offices, but he is said to know a great deal of poetry by heart and to be fond of reciting it. This simple and beautiful distraction will still be open to him, and we have no doubt Silas B. Dutcher, "Tim" Cregan, "Barney" Biglin, "Jake" Hess, and other choice spirits will be glad to listen to it and be improved by hearing it.

One of the oddest features in the proceedings was the assumption by Mr. Conkling, or by his friends for him, when they found that his position was weak in his quarrel with the President, of the rôle of an "Anti-Monopolist," or champion of the people against the railroad kings. This was a great mistake, as it called forth numerous accounts of the extent to which he had himself played the part of counsel for the monopolists before the law-courts, of the utter indifference with which he has always treated the railroad question in Congress, of his failure to support Mr. Thurman's Pacific Railroad Bill, of his connection with the moiety extortioners in the Dodge case in this city, and so on. His appearances as counsel before the Supreme Court in Washington and the Court of Appeals at Albany have been, it is no secret at the bar, largely due to the belief of attorneys that a prominent Senator is likely to impress the imagination of the judges in some way not open to the ordinary lawyer. Of course, if any such influence is exerted it is a corrupt influence. Considering the relations in which Senators stand towards the Supreme Court in the matter of filling vacancies on the bench, there is, to say the least, considerable want of delicacy in their holding a brief before it. But, then, if you talked of delicacy of this kind to a member of "the Grant Crowd," either he would be unable to understand you or would take you for an impertinent humorist. The Crowd, however, it must be admitted, were considerably disconcerted during the week by a telegram from the General himself in Mexico, expressing his desire that Conkling and Platt might be elected. When he sent it he was evidently not aware of the effect of his letter to Senator Jones, as none of them probably had the courage to tell him. They did, however, call in the aid of the clergy, and got a letter of strong recommendation to the Legislature from the Rev. Dr. Bridgman, and obtained a rousing prayer in the Conkling interest from the Assembly chaplain, who, however, evidently takes a too hopeful view of the susceptibility of "the boys" to spiritual influences during a heated Senatorial canvass.

Commander Gorringe has felt it necessary to inform the Mayor that he would not accept the office of Commissioner of Street-Cleaning if nominated to it, because he has always held that the undivided responsibility and authority of the Commissioner were necessary to the proper discharge of the duties of the office. He finds, however, that the bill just passed divides this responsibility and authority between five different departments of the city government, giving the least share of all to the Street-Cleaning Department. Commander Gorringe is probably under the impression that it was by some sort of oversight or miscalculation that this result was reached; whereas it is exactly what the authors of the bill intended. They meant that there should be a fair divide of the patronage of the place among as many influential persons as possible. Moreover, the Commander evidently thinks the cleaning of the streets ought to have been the sole object of the bill; but in this his judgment is obscured by his naval education. On board ship, it is true, the care and navigation of the vessel are, in time of peace, the one object of the officers and crew, but that is because there is on board ship an office for everybody. On shore it is very different. There are not nearly enough offices to go round, and they have to be distributed so as to keep the discontent down to the lowest possible point, even if the streets are a little dirty. If there were not enough offices on board ship for the ship's company, the apple-pie order for which men-of-war are famed could not be kept up, as the officers would have to spend most of their time talking to the office-seekers, keeping them in good humor, and promising to get them put into vacancies, and not to look when they were stealing the stores or sleeping on watch.

The Virginia Readjuster Convention meets to-day and will do something to simplify the very much "mixed" condition of the "politics" of the State. A fusion of the Readjusters with the Republicans seems

necessary to the defeat of the Funder Democrats, but the action of Mahone in the Senate has cut both ways, and has apparently alienated a good many of the 31,000 who voted for the Mahone Electoral ticket last year. It is true that there is this year no national election to make a fusion impossible, and both Republicans and Readjusters desire the repeal of the capitation tax, the prerequisite to voting, which is likely to be a main issue of the campaign. But it is not to be forgotten that among Mahone's supporters there must be many whose antipathy to the Bourbons is less than their dislike of being called Republicans—a name associated among the whites of the State with the still lively memory of carpet-bag rule. On the other hand, the Republicans are themselves coy. Their "bosses," of course, have no desire of sharing Federal patronage with Readjusters or any one else, except upon compulsion; and in spite of the sacrifices Mahone has made, it does not seem likely that they will be thus compelled. The President and Mr. Blaine are both reported to be opposed to any fusion with a repudiating party, and even the efforts of "Bob" Ingersoll are said to have been invoked in vain by Mahone. This is as near the propriety of absolute non-interference in the matter as the Administration permits itself to come, perhaps. The most significant result of Mahone's "setting his face towards the morning" is the substantial disappearance of the debt-question; and it should be brought to Senator Hoar's notice that the Bourbons have pretty much fallen away from the severe rectitude of their debt-paying policy, and allege as an excuse that "the Northern people" see no especial value in it. This is very "thin," but so is everything in which Mahone has been concerned since he came out from among the tombs.

However much anxiety Gen. Mahone may feel in the present situation, the greatest sufferers are of course those worthy Senators who took him to their bosoms for the sake of a divided South. By what possible miscalculation they assumed that the Administration, on the one hand, and the Republican party in Virginia, on the other, would fall in with their plan of regulating the politics of that State, must now be a painful mystery to them, and it will go hard with them in their summer retreats to vindicate the ways of Providence to man. They will ask themselves, If Mahone was a good-enough Republican to organize the Senate with, why is he not fit to lead the party in Virginia, and to be trusted with the Federal patronage there? Have we not vouched for his eminently proper views as to a free ballot and a fair count, and cannot Republicans and Readjusters unite on that issue to the exclusion of all others? The truth is, of course, that it was not Mahone who changed his skin in the late coalition, but the Massachusetts moralists who invented so many irrelevant excuses for the selection of Riddleberger, and who by pledging their votes for him won the dishonest victory which gave them the organization of the Senate Committees. Instead of wondering that Gen. Mahone does not wear an altered look to the people of his own State, they ought rather to be surprised that they themselves, with their Readjuster veneer, are recognized by their constituents. From the side of poetic justice there is much to be said in justification of the hope that by means of a deadlock at Albany, or a coalition by which one Democrat will be returned to the Senate, the Republicans may be exempted next December from any obligation to conceal their opinion of repudiators, no matter to what section these belong.

Judge Parker, of the western district of Arkansas, has confirmed the action of the Interior Department last winter in forcibly keeping out of the Indian Territory the organized squatting expedition headed by Payne. He shows that the coveted district, known as Oklahoma, was acquired by the United States through the Seminole treaty of 1866, and was designed to furnish a refuge for the late slaves of the several tribes, in case they were molested in their freedom, as well as a settlement for other Indians. Thus set apart, it was withdrawn from the operation of the general laws relating to the occupancy of the public lands, while at the same time it continued to be a portion of the Indian Territory, and hence under full governmental control, which has been unaffected by the grant of a railroad charter through the Territory. This opinion disposes of several classes of "raiders"—the needy and dissatisfied white farmers who had had a trying experience in Western Kansas of drought and grasshoppers; the reckless spirits who naturally attach themselves to such an adventure; and the colored immigrants of the "exodus." These last are now told that they have no more legal title to enter the Territory than the whites, and less than their brethren, the freedmen of the Indians, who must themselves, however, obtain permission of the Government before their right of settlement and preemption becomes perfect.

Early in the week the applications of holders of registered 5 per cent. bonds to have them extended at 3½ per cent. exceeded $250,000,000, which was the limit fixed by the Treasury for extension. The Secretary, however, decided to include in the extensions bonds which were mailed on the day that the $250,000,000 limit was reached, and it is understood that these will amount to perhaps $5,000,000. This would leave $70,000,000 to be paid in cash by the Treasury. Of the $120,000,000 coupon 5's it is said that about $20,000,000 have been extended, the exact figures not having been published. There is little doubt that a large majority of these bonds—probably nine-tenths—will apply for the extension before July 1. Without assuming anything as to the future, the present situation respecting refunding may be said to be as follows: Since the middle of March the interest on $180,000,000 of 6 per cent. bonds has been reduced to 3½ per cent., and $16,000,000 have been notified for payment in full July 1. The interest on $250,000,000 to $255,000,000 5 per cent. registered bonds has been reduced to 3½ per cent., and the remaining $70,000,000 to $75,000,000 will be paid, principal and interest, in cash. The $120,000,000 coupon 5's are all that remain, and such of these as are not extended at 3½ per cent. by July 1 will be redeemed in cash. It is not at all likely that the Treasury will be obliged to sell any 4 per cent. bonds; and as these bear now the highest rate of interest of any which run as long, they have been freely bought during the week up to 118⅝ here and 121½ in London, the highest prices ever paid for them. Money continues very easy for borrowers here and in London, and the spirit of speculation is still rampant, although at the Stock Exchange here there has been something of a reaction in the last few days. Securities of all descriptions are again going to Europe in large quantities and the rates for sterling exchange have been reduced three times during the week.

The seasonable dulness in the book trade has been singularly relieved by the enormous demand for the revised version of the New Testament, which, like the Tischendorf version published by Tauchnitz, has at last found a place in a popular library of biography and fiction. We mentioned last week the journalistic rivalry at the West in printing parts or the whole of the new version as special telegraphic despatches. It now appears that the only paper that deserved to be credited with this journalistic "beat" was the Chicago *Tribune*, which had the entire book, preface included, sent over the wires; and that what the *Tribune* calls "the Wells Street concern," which professed to have had the four gospels "wired," was guilty of a "last and most brazen attempt to deceive the public." The *Tribune* prints a number of parallel extracts, to show that its esteemed contemporary really palmed off on its readers the old King James version of 1611; and its theory is that "the fraudulent newspaper set up the whole four gospels" from that version, and then "attempted to get the *corrections* made by the revisers by telegraph," but "broke down long before the job was completed," and decided to face the matter out. This is certainly a flagrant piece of "journalism," and the refusal of the electricity to be a partner to it ought not to have escaped comment. Electricity, as the New York *Tribune* pointed out at the time, did refuse to work on the attempt of Tilden's friends to buy the South Carolina vote in 1876. The Chicago *Tribune*, however, is more impressed with the professional side of the imposture, and wishes the public to take notice where the only Simon-pure enterprise is to be found. But the people, in going to the bottom of the matter, would probably ask the *Tribune's* views on the journalistic code of padding telegrams either with mere verbiage, or with whole columns of preliminary and decorative discourse which, though headed "by telegraph," was really transmitted by mail, and has been in type for days before the event reported. We are far from laying this at the *Tribune's* door, but it probably knows of such doings in more respectable quarters than Wells Street.

Professor Robertson Smith's case has come up on appeal before the General Assembly of the Free Church of Scotland, and they have condemned him by a small majority to removal from his professorship in the Divinity School at Aberdeen, but leave him in possession of his salary to prevent his appealing to the secular courts. The salary, however, he has indignantly refused to retain. The affair is creating great excitement in Scotland, partly owing to the zeal with which the orthodox have pursued him, and partly owing to the extraordinary ability he has been displaying as a critic of the Hebrew Scriptures. His main offence was found in an article in the 'Encyclopædia Britannica,' but it has been aggravated by the publication of 'Twelve Lectures on Biblical Criticism,' in which he takes many startling views of the Old Testament, and supports them with great learning and acumen. The most startling of these is the view that the Pentateuch is not the oldest portion of the Scriptures by any means, and that during the whole period from the Judges to Ezekiel the Israelitish people knew nothing about the Mosaic law and did not obey its precepts.

The British Government has been unable to complete the negotiations for a renewal of the commercial treaty with France in time to remove all fear that the new French tariff may take effect before the treaty is ready. The treaty expires on the 8th of November, and the new one has to be ratified by the two French Chambers, which do not meet until the 1st of November, and are by no means likely to be ready to discuss a commercial treaty within a week; so that even if all went well there might be an interval during which the business relations of the two countries would be seriously damaged. The French Government has been protesting all along that it did not mean to raise the duties on English products, but the English have had no difficulty in showing that if the substitution of specific for *ad valorem* duties proposed in the new tariff were carried out, it would operate, even under the existing treaty, to increase the duties on English goods from 25 to 90 per cent., and the manufacturers are persuaded that whatever the French may say they do undoubtedly mean to have the duties on English goods raised. The late bad harvests and the failure of the wine crop have strengthened the protectionists in France. The wine interest was their principal opponent, and the wine interest has greatly declined. In fact, France has become a heavy importer of wines, and cares less about the English market for this particular product, while the cotton and woollen men are as hostile as ever to English competition. In England, on the other hand, the prospect of having to meet a French hostile tariff has revived once more the demand for "retaliation" on the part of those who figured two or three years ago as preachers of "reciprocity" in free-trade. The United States is the country they would most like to retaliate on, as it is the one from which the agricultural interest is suffering so severely, but to retaliate on it would be to raise the price of food and of raw material, which is simply out of the question. France, however, offers a more tempting subject, as the imports from her are mainly luxuries, such as wine and silk, and the exports to her from England are only ten per cent. of the total. It seems as if there were really some fear entertained among the free-traders in England that if the treaty be not concluded soon the retaliationist cry may become too strong to be resisted.

There could hardly be a better illustration than this cry and the recent reciprocity cry have afforded of the extent to which popular views on economical principles in every country depend on the condition of business for the time being. If there ever was a principle the soundness of which seems proved by experience, it is the free-trade principle in England. The prosperity of the country under it has been very great. The revenue rose from £55,000,000 sterling in 1846 to £72,000,000 in 1872. The rental of land returned for the income-tax rose from £33,000,000 in 1846 to £64,000,000 in 1869. There were 21,000,000 spindles at work in the cotton factories in 1850; there were 34,000,000 in 1871. The importations, which amounted in 1856 to £6 per caput of the population, amounted in 1871 to £10 per caput, and the exportations of English products, which amounted to £4 per caput in 1856, rose to £7 per caput in 1871, and the population, which was 27½ millions in 1851, was 32 millions in 1871. The number of paupers relieved either in workhouses or out of doors was no greater, in spite of the increase of population in 1872, than in 1852, though the expense had increased, owing to increased liberality of administration. One would suppose that these figures would constitute an argument which would be proof against any failure of crops or commercial crises. The effects of the depression which spread over the world after the American panic of 1873 were no sooner felt in England, however, than the protectionists began to raise their voices after a quarter of a century of silence. They said that free-trade was all very well if it was universal, but that one-sided free-trade was ruinous, and they pointed triumphantly to the condition of industry during the years 1874–5–6 as proof that it was wrong to persist in the policy which had brought about the prosperity of the previous twenty-five years. They did not, it is true, attack free-trade in the abstract; they simply said that it must be reciprocal in order to be profitable, and that a nation which has a low tariff when all its neighbors have high tariffs must surely come to grief.

The Irish Land Bill has got into Committee, but makes very slow progress. Mr. Gladstone has made a second and very impressive speech on it in the House, addressed mainly to the Opposition, and, while admitting that the bill had defects which might be remedied in committee, warning them solemnly as to the consequences of successful obstruction, or the folly of supposing that, even if the Liberals were beaten and driven from office on this question, the Tories would, if they came into power, be able to avoid bringing in a similar one, after the Irish tenantry had been maddened by twelve months' more of hope deferred. Sir Stafford Northcote replied, declaring that they were not going to oppose the bill *in toto*; that they were willing to concede to the tenant any improvements he himself had made, and to consent to the establishment of some external authority for the settlement of rents.

Lord Salisbury has also spoken on it again, denying that he had said that the Lords would throw it out. What he meant was that they would agree to give the tenant the value of his improvements, but they would not give him what he had not earned or paid for and belonged to some one else, and he insisted with much solemnity that the sanctity of the rights of property is just as important to the poor man as to the rich. It is difficult to make out from the telegraphic summary what he objected to here—probably the interest in the farm which the bill gives all tenants in possession at the time of its passage, even where they have not made improvements, and which may be best described by the phrase "good-will." The Tories are evidently afraid Lord Salisbury will get them into trouble.

The turbulence in Ireland is in the meantime kept alive by the continued evictions or attempts at eviction in which a portion of the landlords are indulging themselves, and the danger of bloody collisions between the people and the troops increases every week. The soldiers and police are losing their temper under the worry and fatigue of escort duty in a hostile country among an implacable population. It is difficult to see how any but strictly legal relations between the landlords and the tenantry can survive this crisis. The Coercion Act has proved so complete a failure that there is now talk of suppressing the Land League itself, as the great promoter of strife, which will be another step in the wrong direction. Nothing will restore quiet, apparently, but the refusal of the aid of legal process to enforce landlord claims which will not be enforceable after the bill has passed, and this is plainly not practicable, thanks to the House of Lords. It is asking too much of human nature to ask the peasantry to submit now to claims from which the passage of the bill would three months hence protect them.

The Eastern Question somehow does not get settled. Prince Alexander of Bulgaria has suspended the constitution, which was one of the most elaborate instruments of its kind in existence, and announces that if the Bulgarians do not convene a national convention and furnish him with a better-working machine he will abdicate. The English Ministers assert that they regret this, and do not know what it means. It is conjectured that the Bulgarians were going too fast for Germano-Austro-Russian susceptibilities, and that the whole Government was an offence to the Czar, who is afraid to give anything of the kind to his own subjects, and therefore the Prince has been put up to declaring it a failure.

THE MEANING OF MR. CONKLING'S "MISTAKE."

THE struggle at Albany which has been occupying the attention of the country for the last fortnight would be very paltry and insignificant if Mr. Conkling were simply a wrongheaded man who was trying to recover the Senatorship which he had recklessly thrown away in a fit of bad temper. He is really, however, far more than this. He is the product of a system which he is performing the great public service of working out to its logical results in a peculiarly conspicuous way. One of his most prominent friends, the leading Republican paper of the western part of the State, the Buffalo *Commercial Advertiser*, has come out with a defence of him which is based on the admission that he has made a "mistake," but treats the mistake as an isolated act, which it is preposterous to punish by exclusion from public life in the case of a man who can balance it by so many years of meritorious service, and who has been distinguished by entire freedom from corruption and venality. But the "mistake" is clearly not an isolated act. It is an act strictly growing out of and in the line of his previous career. In other words, it is a mistake only because he did not foresee the manner in which the public would receive it, and not because it did not flow logically and naturally from the principles which have governed all his previous political course. The argument that his blunder, if blunder it be, is to be forgiven because he has not taken bribes or been mixed up with jobs, may be fairly dismissed with little consideration. It is drawn from a lower view of public life than any portion of the American people which is worth arguing with is ready to accept. There are no pessimists among us as yet, so far as our knowledge goes, who are so dismally inclined as to admit that personal honesty in an American legislator has the quality of supererogation, so that it may be used as a set-off against other serious defects or delinquencies. We are still, happily, in the stage when purity is for the public man a duty of the highest obligation, and can no more be pleaded as a justification of gross misconduct or incompetency than courage in a soldier can be pleaded in defence of habitual disobedience to orders.

It must be remembered that it is not proposed to inflict any penalty, properly so called, on Mr. Conkling. No one proposes to fine, or imprison, or stigmatize him in any way. What his opponents at Albany demand is simply that he shall not be again placed in an office which he deliberately resigned a fortnight ago. They say: "If your resignation meant that you were tired of your place, we take you at your word and relieve you of it. If it meant that you wished us to indicate by a new election whether we approve or not of your conduct in your controversy with the President about the New York Collectorship, we answer that we do not by electing another man. You see you yourself chose the mode in which we should pronounce judgment. You might have obtained the opinion of the Legislature by the simple and ordinary expedient of having your friends move a vote of confidence in you on this one point. If this vote had been carried you would have got what you say you seek—the support of your own State. If it had not been carried, you could have bowed to the decision and have withdrawn your opposition to Mr. Robertson's confirmation with a perfectly good grace. In either case the two Senatorships of the State would not have been left vacant. We owe you no grudge and do not propose to inflict any censure upon you beyond what necessarily flows from the manner of dealing with your application for re-employment which you have yourself imposed upon us." This is impregnable ground.

Whether Mr. Conkling's public career has been meritorious or not is a question which there is little use in discussing without the aid of a common standard of excellence. There is a considerable number of intelligent and well-informed persons in the State—one meets with some of them every day—who think him a man of a very high order of ability and possessing great powers of mind. That he is a man of ability there is no denying. No one could obtain the influence he has obtained in this State, and retain it as long as he has retained it, who was not a man of ability. That he has certain great mental qualities, such as strength of will and the habit of command, is proved by the number of his humble and devoted followers. But then the question whether he is an able man in any sense is not raised by the canvass at Albany. The sole question there is whether he has the kind of ability required by a Senator from a leading commercial State. This ability, like all other ability, has to be displayed; it is not something which it is allowable to infer without some practical demonstration of its existence. We know that a man is a great general, not by his looks or by his talk, but by his conduct of difficult military operations. We know that a man is a great scholar, not by the amount of time he devotes to study, but by the books or articles he writes or the lectures he delivers. We know that a man is a great orator, not by his love of eloquence, but by his speeches. We know that a man is a great administrator, not by his commendation of good administration, but by his actual administration of some great enterprise or organization. So also we know that a man is a great statesman by the legislation he prepares or assists in preparing, and by his skill in presenting it and procuring its passage, or by his conduct of difficult negotiations. Now, tried by this last-named test, Mr. Conkling has, as has been pointed out a hundred times, nothing to show to prove his possession of real *senatorial* capacity. He has neither originated nor shaped any important piece of legislation in the last fifteen eventful years. He has paid no public attention to the peculiar commercial and financial interests of his State. The one thing he has been pre-eminently identified with ever since he appeared in the Senate is what is known as "the spoils system"—that is, the distribution of the offices under Congressional supervision for the promotion of party objects. Indeed, it may be said to have reached its present strength and proportions under his hand. General Grant put the whole Federal "machine" into his care, and to Mr. Conkling it may be said to owe whatever perfection it now possesses. Having had charge of it during the eight years of General Grant's Administration, when, the war being over, politicians had time to examine the instrument of party aggrandizement which it had left in their hands, it was not surprising that he should gradually have come to regard the management of it as the whole art of government. He did so regard it when Mr. Hayes came into power, and he treated Mr. Hayes's attempt to make a change as a revolutionary act. Nothing short of this view would, of course, warrant a Senator in refusing for four years to hold any intercourse with the first officer of the Government, with whom he had necessary official relations, and with whom he could not under ordinary circumstances refuse to hold intercourse without doing injury to the public service. He apparently got the sanction of the State Legislature for this view, too, by being re-elected without opposition, while he was treating the President as a public and private enemy. After this it is not surprising that he should have come to the conclusion that four years' more of meddling with his use of the patronage, by a new President, would be intolerable, and that his State would so regard it, and would stamp it with condemnation in the most emphatic manner within its reach. He put within its reach what he considered the most emphatic manner by resigning. Probably no one was ever more astonished than he at finding that his view of the Senatorial connection with the Federal patronage was no longer shared, and that another four years of abstinence from intercourse with the President was not considered desirable by his constituents.

Now, this mistake of his as to the way in which his resignation would be received is the most interesting and illustrative incident of the whole transaction. If there was any one thing in the whole range of human interest on which Mr. Conkling's opinion would have been supposed valuable, if not unerring, six months ago, it was the effect which would be produced on the body of men "inside politics"—that is, the men who make and get nominations to the Legislature, and other public offices, by any particular act of his, or indeed of anybody's. He had not for many years found the least difficulty in shaping their opinions or divining them on every important question. From 1867 to 1878 he had only to send a telegram to Albany in order to cause the Republican majority to do or refrain from doing anything he chose to mention. Evidently his judgment has now failed him. His friends admit that he has made a prodigious "mistake," that he has entirely gone astray in a matter on which he had not only all the materials for forming a correct conclusion, but the strongest possible motive for forming a careful conclusion. Now, what does this mean? It means simply that the conditions under which he built up his political reputation have changed without his being aware of it. He grew into "great proportions," as General Grant says, as a dispenser of patron-

age. He got at public opinion not through the ordinary channels, through which the rest of the world gets at it, but through the reports and responses of his agents or henchmen. He found that as long as he held patronage, these reports or responses were correct; that conventions and caucuses, which composed the world he lived in, thought as he did, and verified all his predictions. If he said a State election ought not to be won, it was not won; if he said a certain man ought to be nominated, he was nominated, or that a certain man should not get a certain place, he did not get it. He became as sceptical about the existence of forces outside the Machine as a great military commander is apt to become about the amount of strength a government draws from popular approval. He had the same contempt for those who opposed him on moral grounds, or disapproved of his system in speech or writing, as the elder Napoleon used to have for "avocats," as he called all orators and journalists. He not unnaturally, too, under the additional stimulus of high self-esteem, gradually confounded the influence derived from his control of offices with the influence derived from his personal weight. He came to the conclusion before General Grant left office that he would be a ruler of men if there were no such things as custom-houses and post-offices in the world. Four years ago, however, he lost his patronage. The effects of this were not at first apparent, because his followers continued to believe that he might any day regain it. The waning of this hope, and its effect in diminishing his influence, were shown in the failure of his attempt to secure the delegation from this State for Grant. This effect would have been still more marked if the Hayes Administration had not committed the folly of helping him to elect his leading henchman Governor of the State, and if the "magnanimity" of his opponents at Chicago had not given him the Vice-Presidency for another. The finishing stroke was given to his power by the revelation which the Robertson nomination afforded that he was not to have the control of the patronage for another four years. A man of real craft and self-knowledge would have tried to conceal from his followers the gravity of this blow. He would have taken, or have affected to take, it lightly, or even have appeared to acquiesce in it, and claim it as his doing and as an illustration of the shrewdness of his policy. It was by strokes of this sort that Disraeli, who was probably the greatest master of the political art as Mr. Conkling understands it and tries to practise it, preserved his influence over his followers amidst all defeat and disaster. Mr. Conkling, however, acknowledged at once that he was not going to be of any account with the Garfield Administration, or, in other words, was to have no means of rewarding his adherents for four years more, and he acknowledged it as conspicuously as possible by proclaiming that Robertson's nomination was a blow which crushed him to such a degree that to enable him to bear it he would have to leave the Senate and get his constituents to pat him on the back and re-elect him. Such was his estimate of himself personally, however, that he felt sure this confession of his continued want of influence with the President would make no difference, and that there would be as much magic in his words and in his presence without offices as with them, and that his talents and appearance and eloquence would count for as much. The result shows that on this, to him, vital point his opinion was of no value at all; that he did not know the real sources of his strength, and had misunderstood his hold even on the class of men who go to the Legislature, to say nothing of the public outside politics; in other words, that he is a man of no real political judgment, and that his conceit and bad temper, to which the possession of power gave an air of imperiousness, are, when stripped of "the spoils," simply the conceit and bad temper of the ordinary cantankerous man of other walks of life.

THE GERMAN CHANCELLOR AND THE DIET.

PRINCE BISMARCK has just failed in an attempt to introduce biennial sessions and biennial budgets—in other words, to check the flow of forensic eloquence and render less frequent the hateful seasons in which by law the Imperial Diet now meets for debate, enquiry, and criticism. The measure was rejected, it appears, by a large majority, which is not surprising. Timid and docile as is the Reichstag on most occasions, and above all since the revival of protection and other socialistic schemes has given the Chancellor a tolerably firm majority on the Right of the House, it is not quite ready to accept an invitation to commit *felo de se*, even when given by a man whose invitations are disagreeably like commands. Nor is it difficult to believe the further statement made by the telegraph, that the Prince is very much vexed over his defeat. The Prince, like our own excellent Mr. Conkling, is always angry when he cannot have his own way, and shows his anger, too, by acts scarcely less childish and ridiculous. By a mental process not unlike the processes of the Conkling mind, he magnifies every petty whim of his own into a determined aspiration of "the people," every new scheme which takes possession of his fancy into a vital and imperative affair of state, until he comes to regard opposition as political treason, and failure as a national disaster. We cannot, however, flatter our late Senator by pushing the comparison beyond this merely superficial resemblance. If Bismarck shows a ludicrously passionate interest in his measures, they are at least great measures of far-reaching public importance, not petty questions of a postmaster here and there; while the infallibility that he seems almost to claim for himself is, if not justified, at least excused by transcendent achievements in the very highest spheres of statesmanship. But his arrogance, and, what is worse, the evident sincerity of his arrogance, are none the less a defect which seriously impairs his usefulness. There is no place in a genuine parliamentary government for a statesman destitute of that elasticity of temper which, without excluding convictions and their defence, takes account, nevertheless, of the ebb and flow of public opinion, and gracefully yields when defeat is assured.

Nobody understands this truth better than the Prince himself, though the statement may seem paradoxical. It is not that he is ignorant of the conditions of representative government. He has a singularly clear insight into the workings of different political systems; and of the English system especially, in which parliamentary institutions with ministerial responsibility are found in their greatest vigor and purity, he has an appreciation as correct, probably, as any man on the Continent. He simply will not accept such a system for himself and consent to its introduction into Germany. And for this policy he has an abundance of reasons, some sound, some unsound; some based on the actual institutions of the country, some on the political habitudes of the people, some on their assumed wants and dispositions; some reached by careful and correct observation, and some by rash speculative deductions. Thus, he has often said that his own inflexibility is matched by the inflexibility and impracticability of parties; that the Liberals are mere doctrinaires, who claim the benefits while declining the sacrifices of parliamentary government. In this there is unquestionably a large measure of truth, although its precise force as an objection cannot be determined without first learning what is cause and what effect. More doubtful is the proposition that parliamentary government is unsuited to the spirit of the German people. The spirit or genius of a people is a convenient instrument of conservatives who wish to resist popular reforms, although it has not infrequently been used also for the other side. We are far from denying its efficacy, and even farther from attempting to decide whether Prince Bismarck's resort to it is justifiable. In his sixty-seventh year the Chancellor may be presumed to know something of the characteristics of the people to whom he belongs; and one is safe only in saying that if parliamentary government is a good thing in itself, the true policy is not for ever to exclude the Germans from it, but by prudent trials to educate them to it. These two objections are, however, in any event, objections of substance, which as judgments are easily influenced by subjective prejudices. But in the purely formal proposition that the institutions of the Empire do not permit a parliamentary system, at least like that of England, the Prince is on unassailable ground. Whether those institutions were wise at the time of their adoption is a question which admits of more than one answer. Whether others were possible, and whether these may now be modified, are problems of a speculative rather than a practical interest, as will be conceded by every person at all familiar with German politics. But that they render parliamentary government difficult is, unfortunately, only too clear. A system in which the legislative body can practically originate nothing; in which the Federal Council is neither a senate nor a cabinet; in which there is but one responsible minister, and the executive has no veto; in which, by a strange anomaly, the party of state rights is hostile, and the party of centralization favorable, to the author-

ity of the people—such a system seems almost calculated to make representative government ridiculous and impossible. Without serious constitutional changes the dream of the Liberals can never be realized.

If Prince Bismarck rested here he would be above reproach, for to recognize facts is one of the first conditions of practical statesmanship; but, unfortunately, all of his recent measures have been designed, not to correct the evil, but to render it more permanent. The introduction of a protective tariff was, viewed from its fiscal side, such a measure, since, by substituting fixed indirect revenues for annual assessments made by the Diet upon the States, it cut off from this body one of its most important attributes. The acceptance of the so-called "Franckenstein proviso," which authorized the redistribution of the surplus revenue among the States, without the aid or authority of Parliament, only added insult to injury. And now comes the project of biennial sessions and quadrennial elections, which has, indeed, been for the present defeated, but which will certainly be revived, and in the end, doubtless, carried.

The scheme is no new one with the Chancellor, and the arguments for it have, for the Germans, an antique flavor. He has alleged the extravagance of holding annual when biennial sessions would serve the public interests equally well; though the argument, if worth anything, may also be used in behalf of triennial, or of septennial, or of decennial sessions—nay, even of the entire abolition of parliaments. It is further urged that the country has become weary of the stream of legislation which has flowed since the war, and that the people are indifferent to their so-called rights, as expressed in the loud declamation of parliamentary adventurers—a view which is confirmed by many novel and instructive symptoms. Finally, the Prince advances the reason, most personal to himself—though as an argument *ad hominem* addressed to the Reichstag it cannot be considered well chosen—that the incessant criticism to which he is subjected in the Diet is trying to his nerves, and impedes the execution of his official duties. He has grave responsibilities. He meets resistance at the royal palace and in the Federal Council. His constitution is undermined, and his health is precarious. In view of these difficulties, he has often complained, it is too much to ask him to meet every winter a parliament of impracticable doctrinaires, to answer all the malevolent criticisms of irresponsible deputies, to discuss his policy with cobblers from Leipsic and crude barristers from all parts of the Empire. A longer interval between the sessions would give him more time for serious work, the time spent in the Diet being regarded by him as an interruption of his work. Hence the ill-judged scheme for biennial parliaments. It cannot be unjust to the Prince to assume that the practical arguments for the change really counted for little; that the bill was inspired by a deep and strong hatred for parliamentary institutions as such, and that the term of two years for the legislative intervals would soon have given place to a still longer term, the first change being only the entering wedge in the process of destroying the authority of the popular representation. It was doubtless from a conviction of this sort that the Liberals opposed the biennial bill, and not because they believed that particular measure to be of itself fatal to the liberties of the country.

The undiminished vigor with which Bismarck returns again and again to these assaults upon the parliamentary principle must cause not a little amazement to people outside of Germany who read only the bulletins of his defeats. But there are many significant details of these actions, many important compensations of gain and loss, which the formal reports do not describe. Does he in every attack win a little ground? Does he generally kill or disable more of the enemy's forces than he loses of his own? Is he on the whole making such progress as will assure him ultimately the capture of the rival works, and the complete triumph of his cause? We are forced to answer these questions in the affirmative. There may, indeed, be a sudden revolution, a revolt of the long-tried patience of the Germans, and Bismarck himself may be swept away in the violence of the torrent; but up to this time a comparison of the several checks which he has suffered would probably show that he has, on the whole, made very substantial conquests. He has lessened the absolute strength of the National-Liberal party, and, what is scarcely less important, he has completed its division into two factions, one of which is unconditionally devoted to him. He has effected a partial reconciliation with the Ultramontanes. He has a reactionist ministry after his own heart. The Emperor grows daily more impatient of parliamentary control. The majorities by which even the Chancellor's most aggressive and most audacious schemes are defeated are gradually decreasing; some of those schemes the Liberals are barely able to modify. And the country seems to have lost its enthusiasm for the sonorous formulæ with the enunciation of which, ten years ago, the new constitutional era was ushered in; to have acquired a perverted view of the conflict between Crown and Parliament; to be content to abandon the constant vigilance, the tireless activity which free institutions exact of a people, and to give itself blindly up to the guidance of a great leader administering a paternal government. In a recent number our correspondent enumerated some of the leading features of the Chancellor's wild socialistic policy. The first of these—protection—has already been enacted into a law, and its effects are beginning to be felt. The others have been or soon will be presented to the Diet. Now, although the co-operation of Parliament is required in every one of these measures, and to most of them will doubtless be accorded as it was to the protective tariff, it suits their author to represent the deputies as systematically hostile to them and to their general tendency; so that the very classes which are flattered and favored by this suspicious patronage are led to regard the Chancellor as a public benefactor and the Reichstag as an obstructive evil. This treatment of an indispensable ally by Bismarck seems disingenuous, but it may be explained by the habit of his mind. He is not satisfied with a hesitating, tardy, yet final, obedience; nothing but prompt and silent submission will satisfy him. Discussion of his measures is in his eyes, as above said, a species of opposition; and he is perfectly sincere when he tells the peasants and artisans that the Diet is hostile to him, and indifferent to their welfare, although it may only perform its constitutional duty of considering measures before ratifying them.

In this way the Prince is building up in the country a sentiment unfriendly not to this or that Diet but to parliamentary institutions as such, and favorable, though not perhaps avowedly and consciously so, to the most dangerous form of Cæsarism. The pregnant term which helps them along this course is "Manchester." *Das Manchesterthum* designates for the German workingman a principle of government, or a school of political philosophers, hostile to state aid and friendly to free private competition. Incidentally, too, it means local self-government and the sovereignty of parliament. It is, therefore, not difficult for Bismarck to unite the different elements of the Manchester creed in such a hateful compound that the proletariat, greedy for state encouragement through protection, insurance relief, public workshops, and the like, are forced to reject it as a whole, and to treat the most servile parliament as an original and necessary enemy. For the present this class is doing the Prince's work; but history ought to teach him that he is playing with a fire which may some day become uncontrollable and sweep even him away with all the institutions so laboriously constructed. This possibility seems to us the deepest shadow on the surface of German politics and society.

THE SELF-MADE AMERICAN OF CULTURE.

WE have had self-made men of many varieties hitherto in America, and at last we have conquered paradox definitively and have our self-made man of culture. The class has grown up within a very few years, and indeed hardly dates its decisive origin a decade back; but so distinct are its traits and so great its recruiting power that every one must have observed the peculiarities of some member of it, in whatsoever social places his lines have been cast. It is, like various other types which are beginning to attract attention since the old "stage" species and those of the earlier period of our history have disappeared, a metropolitan product. Probably nothing in a world of change and chance possesses within itself the secret of permanence and successful resistance to innovation more perfectly than what are called rural types. Even with us this is sensibly true. In spite of much migration westward, and in spite of the fears alarmists have been known to entertain of the prospect that New England would some day in the near future become a Celtic and Catholic colony, no one can penetrate a half-score of miles into the neighborhood of any city therein without remarking the scrupulous integrity with which the entire moral hereditament is handed down from father to son. But along with this inevitable rural conservatism there has grown up, notably since the civil war, a many-sided metropolitan life; and, whereas the recognized American types, "the Brother Jonathan" and other, have either

disappeared or entrenched themselves in the earth-works of "country living and country thinking," there are, in various stages of development—many of them doubtless yet embryonic but others of a distinctly-marked *Tendenz*—a multiplicity of urban varieties which have not yet been exploited, but among which our familiar literature, at last giving signs of promise, will probably find its best material. For nothing bears more interesting testimony to the ingrained raciness of American character than they do. Even in metropolitan life, where if anywhere a nation which, to use Mr. Disraeli's phrase, "borrows its religion, its laws, and its literature," would especially exhibit its imitativeness, there is apparent an absolute American individuality; and, indeed, perhaps this is just where American character is especially exhibited. And every year what we may call the provinces, instead of contributing to metropolitan life as heretofore, are more and more feeling the refluent effects of urban modes and manners; and in this matter of self-made culture, for example, the cities, towns, and villages throughout the country are already forming, as Carlyle said of the outlying circles in Coleridge's drawing-room, "secondary humming groups of their own." One gets the oddest sort of echoes from them from time to time.

An ingrained American raciness is, at all events, to be observed in the class here concerned. It is in effect an outgrowth of the universal American desire, one may even say passion, for self-improvement—its impulse, a variant of the universal solicitude for "getting on in the world," very likely. The old avenues to advancement becoming overcrowded, and "the upper stories" of Webster as difficult of access as ever, if not less roomy, the almost formal withdrawal from the sphere of activities has naturally an attraction for increasing numbers. In older countries the ranks of the leisure class are constantly recruited in this way, as we all know, but with us a passive subsidence into anything like inaction is extremely rare. The dilettante who has failed in life has, in general, at least made an effort, and the self-made men of culture are in no way more remarkable than in the amount of enthusiastic effort that marks them. Their entire attitude towards the Philistine world is that of discontent rather than of discouragement. A high purpose sustains them, their eyes are fixed upon their ideal, and to the attainment of it they bring the same conscientious devotion which characterizes the tradesman or professional man in his business; or perhaps a better analogy still would be the conscientiousness of a sincere camp-meeting convert bent on "carrying religion into his daily life." The latter is notoriously a bore to the heedless and carnal-minded man of the world, and the same earnestness accompanied by the same lack of the sense of measure and proportion arouses the contempt of the Philistine for the self-made man of culture. He returns the feeling with interest, it is to be said. "Philistinism" is a word frequently in his mouth, and is his only shibboleth; and he employs it to characterize not those who have no "care for the things of the mind," but those who have no sympathy for dilettanti. For dilettanti he has himself a regard that is almost grotesque, considering his own lack of relationship with them. They would doubtless ill requite his regard, and have a painful sense of his rawness, the crudity of his critical apprehension, and the zeal of his conduct and demeanor in general. It is, indeed, the crudity of his critical perception, joined to an invincible native rectitude, that prevents him from scenting any peril from dilettantism, with which, moreover, his acquaintance is extremely slight, and focusses his reprehension upon the pitfalls of Philistinism, which, on the other hand, yawn around him, and from which in his inward parts he cherishes the illusion that he has been saved so as by fire. He feels more or less acutely the human spirit's craving for something beyond "business and bethels," or, at all events, strenuously covets a share in the craving; and he endeavors to conform to a larger and more inspiriting regimen. Being extremely impressionable, and withal extremely conscious of the fact, his thorough-paced straightforwardness dictates a careful ordering of his life, so that it may be subjected only to the sweeter and more kindly influences, human and material. One identifies an interior inhabited by a family of this class as soon as he sets foot within it. Just at present he is more than likely to hear some such confession of faith as the following set forth with much earnestness and simplicity in the course of an evening spent therein. Such externals as the hardness of the American *coup d'œil*, the bad architecture of our monumental edifices, the blank uniformity of our resident quarter, the absence of color (contrast the gay and bright array of rugs hanging from the windows of an Italian street), such corresponding internal blankness in American life as that involved in perpetual money-getting, "politics," aimless idling, and reading the reports of all these procedures in the daily newspapers, are dwelt upon with feeling. The beneficence of a simpler and more rational life is held up to view. "We can do little," perhaps, is the conclusion, "but at least we can all do something." A very little fancy would transport one to the scene of the "Friday evening meeting," the tone of modest earnestness and subdued enthusiasm is so strikingly similar. The walls are hung with "things" that have been "picked up" in the varied pursuit of a simple life, the furniture is arranged with some perception of other than utilitarian needs, and all the surroundings are regarded as having an unobtrusive missionary effect, just as a few years ago in the same interior, possibly, "The Silent Comforter" and illuminated Scriptural texts were regarded.

In what other country in the world could all this exist untinctured with the alloy of affectation? For, notwithstanding the acute self-consciousness of the devotees, an absolute sincerity is equally characteristic of them. Moreover it is an intelligent, though at bottom it will have to be admitted to be an untrained, sincerity. The simplicity so much sought for is successfully attained—by mere force of logical effort, perhaps; or, perhaps, considering its flavor, it originally lay near at hand and really needed only an opportunity for development. Where else in the world can one hear precisely the same note struck which is struck with such a clean stroke in the following sentence from Dr. Holland's department of *Scribner's Monthly*: "In these days of confusion of doctrine and lessening of faith many are turning for something stable and indisputable, not to science but to art"? Besides which the remark relates a sociological fact. "Art" does, indeed, absorb the attention of the many who are thus seeking new objects for emotional interest, but not in the narrow sense in which a Philistine would understand the word. It is not appreciation of landscapes and statues merely that is meant, we feel sure the self-made man of culture would explain, "but art as a penetrating force, influencing all the details of our life and attuning them to a spiritual harmony." Thus, one finds not only in the studios but even in Broad Street, in lawyers' offices, and in banking-houses, members of this new class who are dissatisfied with humdrum, and swing clear of the conventional by all sorts of devices; at worst it is possible to have a hobby, and one may take to anything, from the study of lace to Egyptology, if he be careful not to get enthralled beyond the point of elasticity. But an American analogue to the British "nincompoop," the chronicling of whose idiosyncrasies has renewed the humorous youth of the London *Punch*, it would be impossible to find in all the ranks of this class. And it is a little singular that the sincerity which characterizes it, and which we have boldly called intelligent, is closely allied with the simplicity which we know mainly as an English quality. The only class in America, one may affirm, which in any noticeable degree shares the ingenuousness characteristic of every Englishman except the "cad" and the "nincompoop," and in the Englishman is wholly consistent with the most highly-organized intelligence, is this class and its affluents. The caricature in *Punch* which represented a group of *soi-disant* critics exclaiming before a landscape their delight with its "er—" may be remembered, and furnishes an apt illustration here. The self-made man of culture is not a rhetorician; his resources of expression are uncomfortably slender; his emotion, vague and exhilarating, and filling his breast with a kind of diffused stimulus, is out of all proportion to his power of statement. As every one must have observed, he ekes out his inadequacy of expression, of which he has an almost painful consciousness, with meaningless formulæ, such as "don't you know" with the falling inflection, and inarticulate ejaculations such as the circumflex "er." This last monosyllable plays an important part in his efforts at close characterization. But the point to be noticed is that, in contradistinction to the affectation satirized by *Punch*, behind *his* "er" there is a world of sincere though somewhat tumultuous susceptibility. To him it does mean something. In his class it is surprising to find few, if any, parrots by conscious predetermination, but Du Maurier might search it for such in vain. On the contrary, "er" is often substituted for the phrase which comes to the lips but is rejected on account of its conventionality or some other unsatisfactory quality, and even to take it as the sign of a meagre vocabulary is an error. Any one may test the sincerity which underlies this by the simple device of demanding a repetition of any descriptive or characterizing phrase which the self-made man of culture happens to have attempted. However happy it may chance to have been, his chronic dissatisfaction may be implicitly trusted to vary it. It is a slight thing, but his own.

The remedy for whatever deficiencies may appear in such a character is, of course, training. But its lack of training is scarcely more apparent, and certainly less remarkable, than the respectable showing it contrives to make without any. The utmost that can be done to atone for this lack by the cultivation of the susceptibility is accomplished; and it must be admitted that the results are often little short of astonishing, when the small share which the intellect, properly so-called, has in the matter is considered. Of reading—what is really meant by reading, that is to say—the self-made man of culture does so little that he may be said to do none at all. He reads reviews, and a good specimen of the type seems to have some secret talisman that indicates to him what judgments to echo. His sensory faculties are curiously alert. He may never have made a first-rate literary acquaintance at first-hand, but by some mysterious conjuring he acquires familiarity with the consensus of competent criticism upon such. He is as firmly convinced as Professor Seeley that Macaulay is shallow; he shares M. Scherer's contempt for the French apotheosis of Byron, and he feels as sure of the provinciality of Addison's thought as Mr. Matthew Arnold, whom now and then he does read, and applies in a way which would probably make that advocate of culture feel that he had much to answer for. He makes errors occasionally; who among all the emotional devotees of "the things of the mind" escapes that penalty?

We are not quite sure that he would instantly seize upon the blunder of a recent novelist's reference to "Darwin's 'Origin of the Human Species.'" And though, as Dr. Holland intimates, science offers little that can satisfy his wants, now and then he betrays a superficiality of view even where art and the humanities in general are concerned. It is probable that, whomsoever he has read or been obliged to pass over, he has read more or less of Emerson, and first found in his preaching about "the duty of making the most of one's self, of living by one's own personal light, and carrying out one's own disposition," as Mr. Henry James, Jr., puts it, "what he had been looking for," as the phrase is—just as the clerk class in England is said to owe its "spiritual awakening" to Carlyle.

All this implies, of course, a deep interest in and concern for what is essentially elementary. It is a trait more or less common to the English race, to be sure, and perhaps there could be no better illustration of it than that afforded by a recent anecdote which describes the two foremost writers of this race then living, Carlyle and Tennyson, discussing for hours the abstract right of William the Conqueror to cut off the legs of a large number of Cambridgeshire gentlemen. Discussions which thus go to the root of things, and are even less capable of solution, are the stimulating substance of the soberer discourse of the class in question. To such they bring an inexhaustible freshness of enthusiasm that the jaded sensorium can only envy. But in dialectics they are possibly still less expert than in rhetoric, and in the application of the fundamental ideas which interest them the Philistine frequently has them at a disadvantage. Especially is this the case when the matter in hand concerns the application of elementary formulæ to topics of current politics, foreign or domestic, towards which their attitude is noticeably embarrassed—compelled to interest by an Anglo-Saxon heritage, and yet impatient of the subject's subtleties, so little have these to do with the pursuit of a simple life. Constantly on their guard against priggishness, which is the main mark of the intelligence of their sincerity, they set down actual politics as "vulgar" with reluctance, and sigh without illusions for the participation in them of the best people. The "scramble for office" awakens a sincere disgust, and restricts their own activities to "voting for the best man," careless of party. But for reasons evident enough, perhaps, they find the best men invariably in the Republican party. Yet the elementariness of "the things of the mind" which appeal to them is such that if an expert dialectician should set forth the philosophical basis of a popular party as opposed to consolidated capital, ask whether the real danger of the country lay in demagogy or in "vested interests," and especially if he should quote Emerson as looking with complacence upon "the predominance of the Democratic party in the politics of the Union," and affirming that "the lodging the power in the people has the effect of holding things closer to common sense," they would be disagreeably perplexed. Elementary propositions make as bad masters as they do good playthings. Similarly in other departments of "the things of the mind," a novel of George Eliot, the acting of Salvini, perhaps a rereading of "Lear," prove to them what America was to Columbus—something they had long been looking for but had theretofore not found. One who has been abroad—and by hook or crook most of them compass that laudable enterprise in the spirit of the intellectual discoverer—has an accumulation of sensations that makes any communication of them hopeless, and necessitates any number of "ers." Certainly no people are more teachable and less cockneyish, and "suggestions" from the humblest sources are noted upon their mental tablets with radiant eagerness by the ever-active passion for self-improvement, for culture already too long delayed. With his belief in translations, and his confidence that there is "a career at home" not only "for more genius than we have, but for more than there is in the world," Mr. Emerson would doubtless assign them an important place in the "work before us to be done." One recalls, however, Lowell's lines,

> "Nay, I think
> Merely to bask and ripen is sometimes
> The student's wiser business,"

and wonders if they will ever get time for such ripening, and how they will contrive to render the autumn of life a season of "mellow fruitfulness." "All fables have their morals," said Thoreau, "but the innocent enjoy the story." We have called the self-made man of culture ingenuous, and, indeed, in one sense that is an extenuated epithet to employ—in one sense his guilelessness may be said to be almost of a *bravura* description; but such "innocence" as Thoreau refers to will probably have to be left to the disinterested observer, who also may be trusted to draw the moral.

TALLEYRAND AT VIENNA.

PARIS, May 13, 1881.

THE 'Inedited Correspondence of Prince Talleyrand and King Louis XVIII. during the Congress of Vienna' has just come to light. It is published by M. Pallain from the original manuscripts, preserved in the archives of the Foreign Office in Paris. Talleyrand left at his death, in 1838, memoirs which could not be published for a long time; they cannot be published even now, and, as we are deprived of this precious source of information, we must attribute all the more value to the collection which belongs to our Foreign Office. M. Thiers was allowed to consult this collection when he prepared his 'History of the Empire'; it has also been consulted by M. de Vieil-Castel, the author of an excellent 'History of the Restoration.' M. Pallain was, perhaps, not very well prepared for the present publication. He was, in 1870, the secretary of M. Ernest Picard, one of the members of the Government of National Defence; he has since occupied a post in our Ministry of Finance. He occasionally commits mistakes which show that he is not very familiar with the history of the French Restoration. He repeats, for instance, after many others, the statement that on the very eve of the revolution of 1830 the Government of Charles X. had made a treaty with Russia in virtue of which Russia would have become mistress of Constantinople, and France of the frontier of the Rhine. This is one of those historical errors which make their way in the world because they happen to satisfy some political passion or to strike the popular imagination. The truth is, that M. de Polignac made some very extraordinary propositions to Russia at the time when Diebitsch was making war in the Balkans and had suffered some reverses; but the fortunes of the Russian armies were afterwards retrieved, Russia made peace with Turkey, and the propositions of M. de Polignac remained in the limbo in which so many diplomatic schemes are lost.

The volume before us does not relate, however, to the period of 1830; it is the collection of the letters sent by Talleyrand to the King of France during the famous Congress of Vienna. It was a curious characteristic of Talleyrand that wherever he was he played the first rôle. In the first days of the French Revolution he was, as Bishop of Autun, chosen to celebrate the great fête of the "Federation," when liberty had not yet been divorced from religion. We find him afterwards near the First Consul and the Emperor Napoleon, distributing thrones and crowns, the real arbiter of Europe with the great warrior who gained the battles and gave him the care of extracting from victory all that victory contained. When France fell under the repeated blows of the Coalition, Talleyrand was sent to Vienna, and he appeared there at once less as the representative of a conquered nation than as the representative of a triumphant principle. France was vanquished, but legitimacy was victorious. Talleyrand did not invent the principle of legitimacy, he invented the word; and this word gave him a sort of prestige in the eyes of all those European potentates who had been, one after another, threatened and humbled by the French Revolution.

The principle of legitimacy was the only defence of France in 1814. She could not oppose to the conquering kings and emperors the principles of '89, the rights of man, the sovereignty of the people; the principle of legitimacy, invoked by Talleyrand in favor of the Bourbons, became the only possible limitation of the rights of conquest, the only moral arm left in the hands of France. Talleyrand was a sceptic, but he spoke of the principle of legitimacy with a gravity, a dignity, an apparent faith which produced a great effect on all the statesmen assembled in Vienna; it seemed as if without such a principle every throne would be soon again in danger, and as if it had become the sheet-anchor of Europe, and the only safeguard of civilization in the great conflict of passions aroused by the French Revolution. If the historian compares the events of 1870 and the events of 1814, the Treaty of Frankfort and the Treaty of Vienna, he will see at once that Talleyrand played his part with more ability than M. Thiers and M. Jules Favre. He found the means of interesting the European governments themselves in the preservation of old France; he gave up the spoils of revolutionary and imperial France, he preserved the France of old, the France of the Bourbons.

Can it be wondered at that Louis XVIII., who was not an imbecile, gave his confidence to Talleyrand, even though he had sinned in so many ways—though he had abandoned the Church, though he had served the usurper? Louis XVIII. understood perfectly that he could trust Talleyrand; as a negotiator, Talleyrand had a sort of professional honesty. He was a Frenchman: he could betray everybody, he could not betray his own country. He understood better than anybody the various forces of Europe; he knew all the sovereigns and all their ministers; he had a sort of aristocratic *hauteur*, which placed him above vulgar ambition; his studied indifference covered the instincts of a gentleman. He was, in short, the best negotiator, even if he was not the best royalist.

Talleyrand went to Vienna with a complete programme. He had clear views; he never lost himself in vague and undefined conceptions. He saw no good alliances for France except England and Austria; he was not willing to serve the ambition of Prussia or of Russia. In his instructions, which were written by himself, he says: "In Italy we must not allow Austria to dominate, nor in Germany, Prussia. The constitution of Prussia's monarchy compels her to be ambitious. . . . The Allies have engaged to replace her in the state in which she was before the war—that is, with ten millions of subjects. If we allow this she will soon have twenty, and all Germany will be in her power." Saxony was occupied by Prussia, and Prussia meant to keep it; but Talleyrand spoke warmly for the King of

Saxony, and his cause could not be in better hands. Prince Hardenberg was defeated by him. Instead of Saxony, Prussia was obliged to accept the Rhenish provinces, separated from Prussia proper by Hanover, by Hesse, by the Duchy of Brunswick, the Duchy of Nassau. The treaty of January 3, 1815, embodies the views and the work of Talleyrand. Unfortunately, the return from Elba of Napoleon I. changed the sentiments of Europe; the "Hundred Days" prepared what was called the Holy Alliance, which was the work chiefly of Alexander of Russia. Talleyrand was in favor of a true parliamentary government, of free institutions not only for France but for all Europe. The Holy Alliance inaugurated a system of reaction, and, after having for a time been the chief adviser of Louis XVIII., Talleyrand soon felt that he was no longer in harmony with the sentiments of the new Government. Louis XVIII. was too enlightened not to appreciate his views, but the passions which surrounded him, the sentiments of his family and of almost all the monarchical party, soon separated him from Talleyrand. The negotiator of 1814 remained proudly in a semi-disgrace till the Revolution of 1830 justified his fears and his prophecies.

The style of Talleyrand has a singular clearness, a sort of transparency. The Prince evidently had no literary preoccupation; and if he ever said that "la parole a été donnée à l'homme pour déguiser sa pensée," he had no other object, with a pen in his hand, than to express his thoughts. He writes on the greatest events with a curious sort of simplicity; he probably spoke as he wrote. "If the Emperor speaks to me about the affairs of Poland and Saxony, I will be mild, conciliating, but positive; speaking only of principles, and not swerving from them." Alluding to Metternich, he says: "Unfortunately, the man who is at the head of affairs in Austria, and who pretends to rule the affairs of Europe, considers as the most certain mark of the superiority of genius a levity which he carries on the one side to ridicule, and on the other to a point where, in the minister of a great state and in circumstances like these, it becomes a calamity."

Talleyrand tries, in the great conflict at Vienna, to appear neither impetuous nor indolent: his natural dignity serves him well. Let us hear him, for example, addressing the Emperor Alexander. After a long conversation on France, the latter alluded to Saxony and Poland; he wished Prussia to keep Saxony and intended himself to keep Poland.

"'Now,' said Alexander, 'let us speak of our affairs; we must soon terminate them.'

"'It depends on your Majesty. They will be soon and happily ended if your Majesty brings to their settlement as much nobility and greatness of mind as in the affairs of France.'

"'We must, however, all find our convenience suited.'

"'And also our rights.'

"'I will preserve what I occupy.'

"'Your Majesty will only preserve what legitimately belongs to him.'

"'The convenience of Europe is right.'

"'This language, sire, is not yours; it is foreign to you, and your heart disavows it.'

"'No; I repeat it, the convenience of Europe makes the right.'

"I then turned towards the wall near which I was; I leaned my head on it, and, striking the wall, I said, 'Europe! poor Europe!' Turning again towards the Emperor, 'Will it be said,' I exclaimed, 'that you have destroyed it?'

"He answered: 'Rather war than renunciation of what I occupy.'

"I let my arms drop, and, in the attitude of a man who is sorry but decided, and who seems to say, 'The fault will be yours,' I remained silent.

"The Emperor waited a little while, and repeated: 'Yes, war, rather war.' Then, putting his arms up and agitating them as I had never seen him do, he screamed rather than said: 'This is the hour of the play; I must go; I have promised the Emperor; I am expected'; and he went away.

"Then, when the door was open, he came back, seized my body with his two arms and pressed it, and said, with a voice which was not his natural voice: 'Adieu, adieu; we will see each other again.'"

Talleyrand remarks that in this long interview the Emperor never pronounced the word Saxony or Poland; Saxony was "those who have betrayed the cause of Europe." The extract I have given is a good specimen of Talleyrand's manner, of his extraordinary attention to details. He writes thus not to give himself the amusement of describing a dramatic scene; it is because he feels that everything is important, and he means to convey a true impression. He was an observer, a moralist, and these qualities give an almost philosophical interest to the curious volume of despatches which he wrote in 1814. Despatches such as these cannot be analyzed; they must be read in the text, in their long and sometimes tortuous development.

Correspondence.

LIMITED FEMALE SUFFRAGE.

To the Editor of The Nation:

Sir: As a constant reader of your columns I have learned to value highly many of your comments on the various popular suggestions you consent to publish in them. Will you allow me, therefore, to invite your comment on the following question, itself suggested by the latest vote in the State Assembly on the Woman Suffrage Bill?

I ask: Would not the effect of a *limited* female suffrage be not only different from but directly opposite to that of a universal female suffrage? I am among those who believe that the latter must be necessarily accompanied by all the existing evils of universal suffrage, without a correlative share of existing compensations. Certainly the educational value of the vote can only be acquired by those who already possess a certain degree of education, and those who do not possess this could hardly be expected to contribute any desirable influence towards the direction of social forces. It follows that neither the welfare of society, nor that of ignorant and helpless women, could be shown to demand the extension of the suffrage to the latter. But it will be conceded that there exist several classes of women who do not come under this category—who are either educated or intelligent, or pecuniarily independent, or all the three. Now, even if it be supposed that the political capacity of these classes of women is so embryonic that from them would come no important initiative, it is evident that their votes, even if all marshalled to the order of some personal and directing influence, would be at the service of the educated classes of society. They would thus constitute a considerable make-weight against the mass of illiterate votes which at present offers so serious an embarrassment in the working of republican institutions.

But I think it would hardly be maintained that the entire votes of the women of leisure, or of those engaged in the more intellectual avocations—as the profession of teaching, for instance—would always be marshalled to order. At all events, women protected from pecuniary necessities, either by inherited fortune or by the care of fathers or husbands, could hardly fail to be free from the pecuniary temptations which, admittedly, sophisticate the judgment and demoralize the action of thousands of men. Why should not the latent energies of these women be set free to aid officially in discharging some of the heavy duties of our complex society, the work of which is constantly getting muddled for want of sufficiently disinterested workmen? Even should motives of vanity and *amour propre* take the place, with these protected women, of the greed and unblushing selfishness so rife among those who now make the laws for them, society would gain by the balancing of different motives. I may be permitted to say that, personally, the aspect of the suffrage which has always interested me, has been the opportunity it affords to energetic and competent persons to participate in the noble responsibilities of public affairs, to the extent to which the arrangement of their private affairs renders this possible. The view that suffrage should be claimed by women in order to facilitate their scramble for government spoils, and which bases a special claim to patronage for women on the greater difficulty experienced by the latter in sustaining independent exertions, has always seemed to me both inconsistent and dangerous.

The political uninventiveness of mankind has often been commented upon. Is it not again illustrated by this apparent inability to conceive any middle course between universal female suffrage and the present system, which officially excludes all women from participation in public affairs? I submit that such universal exclusion is detrimental to public affairs, and to at least many of the women who would be included under the following limitations:

1. Women engaged in professional work. This class would at present consist mainly of teachers, with at present a relatively very small percentage of physicians.
2. Women who, by independent exertion in other pursuits, earned $1,000 a year and upwards.
3. Women holding office under Government.
4. Women paying taxes on independent property.
5. The wives of men of an annual income of $5,000 and upwards.
6. The wives of professional men, even if their income be less than this.
7. Adult unmarried women who, though not possessed of independent property, are supported by their fathers without necessity for exertion on their own part.

Such limitations could only be considered arbitrary by those who claim the suffrage as a natural, inborn right. On the theory that it is a gift of society, conferred with the intention of accomplishing some specific purposes of utility to society, each of the above clauses may be clearly justified. It is useful to society that all persons above a certain minimum of intelligence and energy should be called upon to contribute a certain quota of these towards the discussion of public affairs, and not be allowed to concentrate them entirely on personal ends. Correlatively, the same persons, by their actual participation in a certain grade of public work, have established a right to a voice in the social arrangements which, mediately or immediately, affect the welfare of all. These considerations apply to the first, second, and third of the above classes. In regard to the remaining classes, no direct proof of capacity exists, or is perhaps attainable; but it is evident that in all these classes there is almost a certainty of an education considerably superior to that

of thousands of existing voters; there is a large individual presumption at the present time of native, and even of some trained intelligence; and, finally, there is for all a relative freedom from the pressure of pecuniary temptation, and for many an arduous leisure seeking employment—two of the conditions which are supposed to render the vote of the "upper classes" peculiarly valuable. Complex classifications for the right of suffrage may invoke abundant precedent in their favor, and I am not aware of any case where they have proved so disastrous as has the sudden gift of suffrage to unprepared and comparatively powerless masses—*e.g.*, to the French peasantry in 1848 or the South Carolina negroes after the war. To limit the right of suffrage to taxpaying women is a plan that commends itself to many by its simplicity, but on this very account it is inadequate. It would exclude many women really competent, and would include many of mental calibre too limited really to manage the property of which they had nominal control. To claim for such women, therefore, a "representation" in the disbursement of the taxes assessed on their property is certainly, from one point of view, illogical. It is other considerations which really come into play in such cases—considerations of expediency, desiring to balance the overwhelming mass of illiterate and needy voters; considerations of education, of the possible development of latent forces in the wealthy incompetents themselves.

I am, sir, respectfully,

MARY PUTNAM JACOBI.

NEW YORK, May 26, 1881.

[Even if we conceded all that Dr. Jacobi claims as to the value of educated female suffrage, we should be compelled to consider her scheme useless because impracticable. The same reasons which forbid the establishment of a property or educational qualification for male voters forbid it for female voters. The power of extending the suffrage in any direction beyond its present limits lies with men who, whatever they may think about the source of the right to vote, are unalterably opposed to any discrimination in the bestowal of the legal privilege on account of income, knowledge, or social position. "The poor man" would passionately and successfully resist any attempt to give female teachers, doctors, annuitants, or the wives and daughters of the well-to-do, votes which were denied to factory-girls, seamstresses, maid-servants, and laborers' wives, or other women of his own class. There is, in our opinion, not the smallest chance of ever getting such a proposal entertained seriously by any legislature or constitutional convention in the United States. In other words, we think Dr. Jacobi's questions purely speculative. The only progress in the direction of the larger participation of educated women and women of leisure in the work of government, which seems to us at all attainable in the near future, is the employment of them in greater numbers in certain branches of administration—such, for instance, as the management of the public schools and the public charities. Here, we think, the enlargement of their field of activity is feasible, and worth working for. They are already employed in large numbers at Washington in the executive departments of the Government, but this is by no means an unmixed good under the present system of appointments. In fact, there is so much evil in it that we are constantly surprised that it has not converted the women who discuss publicly the position and prospects of their sex, into vigorous advocates of civil-service reform. The present mode of distributing patronage in the service of the United States, which requires every clerk to have a male "backer" or "influence" in the person of a member of Congress, in order to get or keep a place, when it comes to be applied to poor young women, at their wits' ends for a livelihood, is probably as shameful a system as was ever maintained by a civilized government. The subject is a delicate one to touch, but everybody who is familiar with public life at Washington knows well that it needs touching, and with a vigorous hand, and we commend it to the attention of those who are interested in the "woman question."—ED. NATION.]

THE DECLINE OF CULTURE.

TO THE EDITOR OF THE NATION:

SIR: The very able article by "B. L. G." in the present number (829) of the *Nation* on "Œdipus Tyrannus at Harvard," while cheering us with the fact of the advancement of classical studies in America during the last thirty or thirty-five years, again suggests that wider and somewhat serious question (beginning to be agitated) concerning the progress of culture.

Allow me to point out some of the very strong indications now everywhere apparent, at least in the West, of the actual decline of culture. The fact that the number of those persons who may fairly be called well-informed, well-read, etc., is fast decreasing, is shown most conclusively by the state of the book-market and by the reports of the public libraries. Upon the impulse of the above-mentioned article I made to-day the following inquiries at the principal bookstores in this city. First, as regards the better or higher class of magazines. These have actually disappeared from the market. You cannot buy at any of our book or news-dealers' either the *Westminster Review* or the *London Quarterly*, the *Edinburgh Review* or *Blackwood's Magazine*. I was informed that there is no sale for any of these magazines; that some ten and fifteen years ago they were still kept for sale, and that to-day there are only a few readers left, who are all regular subscribers. Next I enquired as to books on subjects which would be most likely to interest the intelligent citizen of a great republic, and would probably be kept for sale in a great centre of trade like St. Louis. On the subject of political economy I found in the largest of our bookstores one copy of Mill's treatise, which was, however, as I was told, kept more for a sample than anything else, since hardly a copy or two per year were sold. There was no other book on this important subject kept on hand. Next I enquired as to books on the science of finance, and found that nothing whatever is to be had, except one or two ephemeral and local little books concerning the silver question, etc., nor were the dealers acquainted with any of the larger works on this subject. Next I enquired what books on statistics were kept on hand or known to the dealers; none whatever, save our Census Reports, etc. Since the whole country for several years has been agitated with financial questions one would expect that thoughtful persons would look for the best sources of information regarding these matters, that they would read what is known through the labors of economical writers; but the fact is that very rarely can any one be found who has informed himself except through the daily papers. Novels and daily papers are almost the only things read nowadays; hence the fact that the tone of society is declining, that few persons can any longer be found with whom a conversation on any subject of general interest can be enjoyed.

I am tempted to point out now what I consider the real source of this deplorable state of affairs, but will content myself to-day with calling attention to the facts above stated.

W. A. S.

ST. LOUIS, MO., May 21, 1881.

Notes.

HARPER & BROS. have in preparation 'Farm Festivals,' by Will Carleton; 'Beauty in Dress,' by Miss R. M. Oakey; and a 'Sketch of Thomas Carlyle,' by Moncure D. Conway. They have added the Revised New Testament to their Franklin Square Library.——A co-operative work, 'The Public Service of the State of New York,' edited by President Chadbourne, of Williams College, will be published, with illustrations, by J. R. Osgood & Co.——A new *Chess Monthly* has been begun by Brentano, 5 Union Square, with Mr. H. C. Allen for editor. The first number is dated May. ——The second annual report of the Executive Committee of the Archæological Institute of America describes the three-fold activity of the year—Mr. Ad. F. Bandelier's pueblo researches in New Mexico, the Assos expedition under Mr. Joseph T. Clarke, and Mr. W. J. Stillman's attempt to excavate in Crete. Only Mr. Bandelier's labors have thus far borne fruit, but Mr. Stillman has made valuable observations for future work when the political condition of the island is more favorable, and, according to his letters published in the appendix, he thinks he has discovered the Labyrinth at Gnossus. The Committee recommend a union of American colleges in founding and sustaining at Athens an American School of Classical Literature, Art, and Antiquities.——A third number of *Appalachia* recalls public attention to the admirable mountain club of which it is the organ. The annual address of the president, Mr. Charles R. Cross, is an elaborate discussion of barometric measurement of heights, and concludes with the apparent revelation of an exception to the rule that winter measurements are lower than summer, in the case of the White Mountains. The good work of the club in exploring new altitudes and making the tourist's path easy is described in papers and reports. ——Nos. 10–12 of the Bulletin of the Essex Institute, apropos of Lowell (formerly Catta) Island, near the entrance to Marblehead harbor, gives a curious chapter in the history of inoculation for the small-pox. Elbridge Gerry, Capt. John Glover, Col. Timothy Pickering, and other notable persons figure in it, but the popular violence growing out of the "Essex Hospital" is the memorable feature.——The Weymouth (Mass.) Historical Society has made a praiseworthy beginning of its publications in the reproduction of Gen. Solomon Lovell's journal kept during the Penobscot expedition against Fort George, in Castine harbor, in the summer of 1779. The journal proper occupies but a few pages, but the Recording Secretary, Mr. Gilbert Nash, furnishes a preliminary sketch of the General's life, including a full account of the

Penobscot expedition, which possesses much interest. Several Albert-type illustrations adorn the volume.——We have received from San Francisco a pamphlet entitled "The California Silk-Growers' Instructor," by Mrs. T. H. Hittell, Corresponding Secretary of the California Silk-Culture Association. ——The civil-service reform associations of Boston and Cambridge have united in issuing a periodical broadside of appropriate reading-matter, called the *Civil Service Record*. It is well calculated for editorial copying as well as for the popularization of the aims and methods of the reform. It is sent free on request, but voluntary contributions for its support are solicited, and may be sent to Mr. William Simes, Treasurer, Box 3084, Boston.——Cairo is still the theme of the current numbers (Parts 11 and 12) of Ebers's 'Egypt' (Cassell & Co.)——No. 91 of the Berlin Geographical Society's *Zeitschrift* is extremely valuable for the special maps of the new Balkan boundaries by Dr. H. Kiepert—namely, the southern, western, and northern frontiers of Eastern Rumelia, and the southeastern frontier of Servia. These are elucidated by the geographer in an accompanying paper.——Karl Hillebrand's yet unfinished 'History of France from the accession of Louis Philippe to the fall of Napoleon III.' has begun to be reissued in a second edition for the first part ('Geschichte des Julikönigthums—1830–48') by F. A. Perthes, Gotha. The compliment to this remarkable work is well merited.——As showing that our accurate German friends and masters have occasional Homeric nods, we note that Dr. Petzholdt, in the *Neuer Anzeiger für Bibliographie* for May, 1881, has printed, under the rubric of *Bibliographie*, "Baldwin Locomotive Works Catalogue: illustr. catalogue of locomotives. Phila., Lippincott, 4to, $5."——A chronological list of "Travels in the Holy Land" is now publishing from time to time in *Notes and Queries*. The latest instalment covered the years 1830–1845, during which over thirty books of Palestine travel were published.——Another volume of Müller's Sacred Books of the East (numbered vol. x., part 1) has recently appeared (London: Trübner & Co.) It contains translations of Buddhist scriptures from the Pālī: the Dhammapada, by the editor, and the Suttanipāta, a collection of moral discourses, by Professor Fausböll. The former is of little extent, and is a favorite subject of translation; it has been already once published by Müller himself; the other is said by Fausböll to be of special interest, as doubtless containing some remnants of primitive Buddhism. Müller's Introduction discusses general questions relating to the extent and chronology of Buddhist literature.—— The 'Illustrated Catalogue of the Paris Salon' for 1881 (J. W. Bouton) suffers by comparison with last year's issue in respect to the careful execution and printing of the memorandum sketches. It is, nevertheless, indispensable, and adds vastly to the edification with which we read the criticism (say) of the *Athenæum*.

—The catalogue of Mr. Henry Stevens's collections of literary matter, relating mainly to America ('Stevens's Historical Collections, Part I.'), to be sold at Sotheby's auction-rooms, London, on July 11 and four following days, recalls Dr. Dibdin's advice with regard to the proper care of libraries—namely, "to look well to their being creditably catalogued." We can say this of Mr. Stevens's catalogues—and in his long experience he must have made a score or more—that they are alike creditable to himself and to the books that have passed through his hands. The one now under notice exhibits some of his best work, and is to such a degree attractive that the bibliophilist will not wish to skip a page. The description of lot No. 1,269 will engage particular attention. It fills thirty of the large and closely-printed pages of the catalogue, and forms an elaborate treatise on Mr. Stevens's "Franklin Collection"—a collection comprising "nearly three thousand different manuscripts, a large portion of them autographic, and nearly three hundred volumes of printed books of and concerning Franklin." In this treatise Mr. Stevens traces the adventures of the "papers" from the death of Dr. Franklin in 1790 (when they passed into the possession of William Temple Franklin) down to the present time. That for a money consideration, paid by the British Government, Temple Franklin destroyed or kept back from publication some of his grandfather's most important papers, is an old and oft-repeated charge. Rumor named the very price. Dr. Sparks, when engaged upon the life of our great philosopher, made a careful investigation of the subject, and arrived at the conclusion that "the suspicion that papers were finally suppressed for any cause is without proof and highly improbable." Later historians, however, not satisfied with this conclusion, have revived the charge—a charge which Mr. Stevens's argument goes a good way towards setting at rest. Still, it is certain that many manuscripts from the pen of Franklin have never passed through the printing-press. Mr. Stevens's estimate is that 2,430 pages (taking Sparks's volumes as the standard) remain unprinted, and he leads us to understand that for about thirty years he himself has been carefully nursing the precious documents—arranging, repairing, collating, adding to them when opportunity occurred—and all this at an outlay of £1,000 beyond the original cost. How for years these unpublished manuscripts were neglected, forgotten almost, and how he eventually secured them, Mr. Stevens tells at length in the catalogue. The printed books in the "Franklin collection" number 202 titles, and manuscripts and books will be offered in one lot, notice being given that the upset price is £7,000. Other numbers in this catalogue will not be hastily passed over. The Virginia Records include eighteen autograph letters of Washington to Governor Dinwiddie, sixty-one of Dinwiddie to Washington, and several hundred other documents of historical value. The Original Records of the Colony of Georgia, in two folio volumes, are of considerable importance as showing the process of British colonization in North America. Somewhere in the libraries of the United States is the proper resting-place for these Records. In the books of voyages and travels De Bry takes up sixteen, Hulsius nine, Hakluyt three, and Schouten ten numbers of the catalogue. Autograph manuscripts of the poet Burns, American ballads, Spanish tracts, works of the Mathers, etc., are minutely described; but for a clear understanding of Mr. Stevens's collections the catalogue itself is indispensable. Three more parts are to follow at intervals of six or eight months.

—Mr. Franklin B. Hough's 'Report upon Forestry, prepared under direction of the Commissioner of Agriculture,' and issued from the Government Printing-Office, although bearing on its title-page the date of 1880, has but lately reached us. A useful and conveniently-arranged summary of the laws passed by the General Government and by various State governments with reference to forests, etc., occupies the first thirty-four pages, and here the publication might well have closed so far as the public may expect to derive any benefit from what follows. What are called "Notes upon Forestry in the Several States" occupy thirty-one pages more. These "Notes" have all appeared before in different forms, and generally several years ago. Then comes a section devoted to "Miscellaneous Statistics," which are mostly translations from various rather obscure European publications, and contain nothing of practical value to the American people. A mass of undigested statistics relating to the products of the forest, and already printed in the annual reports on commerce and navigation, occupy three hundred and thirty-five pages. A second portion of the Report is devoted to the timber resources and timber trade of Canada, and here too Mr. Hough has "padded" in his usual indiscriminate style. Such reports deservedly bring discredit on the Government, and show the utter hopelessness of obtaining any valuable results from the Department of Agriculture as long as it is run as a part of the political machine.

—A local timeliness belongs to the June *Scribner* by reason of Mr. R. W. Gilder's paper on the Farragut monument newly set up in Madison Square, and an excellent description of the battle of Mobile Bay by an eye-witness, a signal officer ("An August Morning with Farragut," by J. C. Kinney). The illustrations well suggest the substantial merits of Mr. Saint-Gaudens's masterpiece. Colonel Waring supplies the remedy for the existing sanitary condition of this city, which is in many ways revolutionary, though the execution and the cost of it could be distributed over several years. Prof. Fisher reviews the Revised New Testament, now in everybody's hands, with general approval, and with very helpful indications of the broader classes of improvements as well as of some details. Such are the changes of tenses, particularly in the strict rendering of the aorist, the restoration of the definite article, etc.; while by the judicious modernizing of the English, not less than by a more correct translation from a more correct text, "much of the work of commentators is spared." Mr. Joel Chandler Harris contributes "A Rainy Day with Uncle Remus," the first instalment, we hope, of a second volume of the 'Sayings,' for which we think it quite probable that he has sufficient material. Mr. Cable's "Madame Delphine" develops rapidly, introducing us again to that Creole atmosphere which, whether falsely or most historically imagined, is a consistent reality to this writer, with all the charm of dreamland to the reader. Mr. Howells, too, though changing his medium, remains faithful to his first love, and seeks to interest us in the fortune of a New York girl transplanted during the war to Venice, and placed in charge of an American professor and his wife—"A Fearful Responsibility." The stir made by the "Œdipus" will attract many to the article on "The Westminster Play." Dr. Holland, under "Topics of the Time," gives a generous and interesting account of the origin and growth of the magazine which has just parted company with the publishing house whose name it has hitherto borne. The notable woodcutting of the number is Mr. Cole's portrait of Lord Beaconsfield, and the figure of Joan of Arc from Bastien-Lepage's huge canvas.

—The Farragut statue by Augustus Saint-Gaudens, presented to the city by the Farragut Memorial Association formed for this purpose, was unveiled last week with much ceremony. It proves as fine a thing as the impression made by its appearance in the Paris *Salon* last year, where it was an unusual success, had guaranteed. It is of bronze, and stands nine feet high on a pedestal of the same height, at the northwest corner of Madison Square Park, fronting due west. The position is an excellent one, as it should be for the city's most important statue. The figure is admirable in portraiture, and in point of art illustrates with sensitive nicety the union of reality with the heroic. It is, that is to say, the portrait of a man easily approached, and endued with no divinity, and, on the other hand, of an admiral in whose face and bearing are ap-

parent the qualities of which actual heroism—such as that so often displayed by Farragut—is made up. Error from exaggeration of one or the other of these conceptions must have been difficult to avoid; in fact, it could only have been avoided by fixing the attention on a definite conception of the character to be represented, and dismissing all notion of attending difficulties. This—the most difficult thing of all—it seems to us the sculptor must have done. The result is the portrayal of a character of simple dignity, of firm purpose, and of perfect security of self-confidence. You feel at once the correspondence between the actions which history records of Farragut and the capacity here disclosed. The statue, further, discloses the sailor, and the American sailor. Indeed, to our mind, the thoroughly American character of the entire work is the most conspicuous, as it is the most grateful, trait it has. It would be impossible, at all events, to mistake the nationality of the subject, and (though, of course, this is less verifiable) one would scarcely go astray about that of the sculptor. It is evidently modern work, a genuine expression without classic reflections, and it is evidently not French or Italian or German—as any one may see who will contrast it with the other sculptures the city possesses. And it avoids affectation of any kind at no expense of grace or quality. On the contrary it would require a nice analysis to decide whether charm or force predominated in the work. There is certainly plenty of power—the position, with the legs apart, breasting the breeze which blows back the drapery; the alertness of the whole figure; the intentness of the look and the nervous contraction of muscles. At the same time the repose accompanying this is relieved from austerity with so much elegance of treatment that the transition from the statue of an American sailor to the pedestal decorated with Renaissance grace involves no violence. The pedestal is exceedingly beautiful. It is in the form of a high-backed, semi-circular seat, in the middle of which is an engaged pier on which stands the statue. Across this pier sweeps a suggestion in sculptured lines of a swelling billow, carried just to the verge of conventionalization with a tact of whose refinement it would be difficult to say too much. On either side is a female figure of true poetic interest in itself, modelled in the low relief in which Mr. Saint-Gaudens has no rival, the flowing lines of which carry the wavelike movement to the dolphin-arms of the seat at the ends of the arc, where again, in reticent but unmistakable imitation of the element, it "suffers a sea-change." In the credit of this charming work Mr. Stanford White, the architect, has, we believe, an important share. Thus to "bind" into a complete whole the character of a distinctively American hero who was called "Brave Old Salt" and a classic relief of allegorical figures representing "Loyalty" and "Courage," by means of a hazardous transmutation of blue-stone into marine significance, so to speak, is an accomplishment which very few artists living, probably, could successfully attempt. Here it has been done with great success. If the work has any serious shortcomings they are in directions in which no effort has been made.

—Mr. Louis C. Tiffany and several of his company of "associated artists" have recently decorated the Veterans' Room and Library of the Seventh Regiment Armory in a manner which illustrates the advantages and difficulties of associated action in monumental work of this kind. The Veterans' Room is a large apartment occupying the northwest end of the Armory, and the library adjoins it on the south. The general scheme of decoration and the stained-glass windows are Mr. Tiffany's; Mr. Colman advised as to color; Mr. Millet and Mr. Yewell composed and executed a frieze depicting the different chronological stages of the art of war; Mr. Stanford White designed the architectural detail, and Mrs. C. Wheeler the embroidered *portières* and curtains. The decoration is a development of the veteran idea embodied in iron, one may say. Iron chandeliers in scrolls and arabesques depend from massive transverse cranes, iron fillets surround the necks of two groups of pillars that support the mantel, iron nail-heads dot the massive but scanty oak furniture, iron chains are twisted about the lower halves of two large columns that help carry the ceiling, iron plates are recessed at regular and frequent intervals in the high oak wainscoting, and the railing, gratings, and staircase of the library are of the same material. This involves a light and metallic key of color, and accordingly there is an abundance of oak and of silver and yellow stencilling. The ceiling, cut up into innumerable squares by cross-beams of a light brick-red, is yellow with silvered arabesques; the walls and upper portions of the columns aforesaid are of the same quality plus a metallic lustre, the forms of stencilling resembling chain-armor; the frieze is silvery in general appearance and the fire-place is a bed of turquoise glass-tiling. The whole effect is metallic rather than rich, and suggests the glitter of tinsel quite as much as the sombreness of veteran armor, though the plates of the wainscoting and the chains wound round the columns are painted into the semblance of rust. Beneath several of the windows the walls are pierced with designs in solid glass lumps that have a color effect, but in general the glass is of the same pale character. The library has tone and sobriety owing to the simply treated mahogany of its shelving, but the ceiling is of a salmon pink varied with silver discs of various sizes, and the hangings of the gallery are leaden rather than blue or green. At night, however, the effect here acquires softness, not to say richness, and in the Veterans' Room the tinsel is keyed up to brightness if not to positive brilliance. There has evidently been no difficulty in harmonizing the work of the different artists, as one might have supposed there would be; when one person undertakes a work of this sort he sometimes experiences trouble in bringing into just relation the details executed by assistants, and *à fortiori* one would think the mere coöperation of "associated artists" liable to discord. The failure is, on the contrary, in the opposite direction. The work is a congeries of harmonious details rather than a whole, and in its lack of impressiveness, or of any quality even remotely related to monumental work, betrays the lack of a single and total conception. The conjoined ingenuity of the several artists has resulted in a refinement of fanciful symbolism instead of a true expression, and one leaves the rooms with the feeling that a great deal of talent and industry has been rather fruitlessly expended upon a work which any one of the artists employed would have made more effective.

—Under the head of "Queries and Answers" we find the following gem in the *Practical Teacher*, Chicago:

"90. How should the name of Beaconsfield's last novel be pronounced?

"The learned, precise, but in our opinion pedantic, pronounce it with the accent on the next to the last syllable, in the same manner as 'Orion,' 'Hyperion,' 'Samaria,' 'Alexandria,' which are now mainly pronounced as English words, with accent thrown back on the ante-penultimate, especially the last two. If a word is naturalized and is used as an English word it should receive the English accent, which tends toward the first syllables of a word."

The remarks, as far as "Hyperion," "Samaria," and "Alexandria" are concerned, are all fair enough; but a community which "mainly" pronounces "O'rion" is worthy to give birth to the "learned and precise" who say "Endymī'on"!

—After eighteen years of labor M. Champfleury has now published the fifth and final volume in his series of histories of caricature. His earliest articles, on ancient caricature, began to appear in the *Gazette des Beaux-Arts* in 1862, almost simultaneously with the publication in the *Art Journal* of the articles out of which the late Thomas Wright afterwards made his 'History of Caricature and of the Grotesque in Literature and Art.' After the 'Histoire de la Caricature Antique' M. Champfleury put forth a 'Histoire de la Caricature Moderne,' in which he confined himself mostly to later French caricaturists, notably Daumier (whose "Robert Macaire" is immortal), Gavarni, Philipon, and Henri Monnier, the creator of "Monsieur Prudhomme." Since the death of this last artist, M. Champfleury has enlarged the chapter devoted to his work into a monograph, 'Henry Monnier, sa vie, son œuvre' (Dentu, 1879). Between ancient and modern caricature was a great break which M. Champfleury has attempted to fill by three later volumes, first, a 'Histoire de la Caricature au Moyen Âge et sous la Renaissance,' then a 'Histoire de la Caricature sous la Révolution, l'Empire, et la Restauration,' and, finally, the volume only recently issued, the 'Histoire de la Caricature sous la Réforme et la Ligue—Louis XIII. à Louis XVI.' (Paris: Dentu; New York: J. W. Bouton). All of these books are profusely and aptly illustrated, and all, save the last, have been improved in successive editions. The insularity which French critics charge against English writers may be brought against themselves as readily. The four volumes, for instance, in which M. Champfleury considers the history of post-classical caricature are almost wholly devoted to France. Even in discussing the comic art of the Middle Ages he rarely goes beyond the borders of his own country. Looking back over his work, in the preface to the latest volume, he does not detect the meagreness of his reference to caricature in Germany, Spain, Italy, England, and America, but he does declare his omission of the Orient, and promises to describe in an epilogue the comic art of the East as soon as he has got his materials fully in shape. In no other volume of the series is the fragmentary construction of the work so obvious as in the fifth and latest volume, which practically consists of twenty-three distinct essays on different points in the history of French caricature, from Louis XIII. to Louis XVI. Four or five of these really belong to the volume devoted to the Reformation, while the last three essays, on society in the days of Voltaire and Diderot, are really the introduction to the special history of caricature during the Revolution. A remodelling of all these histories, except the earliest, into a consecutive account of French caricature and comic art, from its origin in the grotesque sculptures of the Middle Ages to the present day, is much to be desired.

—The mediæval love of allegory inherited from the earlier ecclesiastical writers invaded every department of learning, and revealed itself in its most grotesque shape in the realm of natural history. The *Bestiaires* and *Lapidaires* are well known to all students of Old-French literature, but their diffusion has not yet been clearly traced. The Gem-Books were based on the 'Liber de Gemmis' of Marbodus, Bishop of Rennes, who died in 1123, and whose sources were Pliny and Isidor. In his poem the bishop simply gave the fabulous properties of the various gems, and in a prose work ('Lapidum

pretiosorum mystica seu moralis Applicatio') he added their allegorical meaning. These two works were very popular, and became, as we have said, the sources of the mediæval *Lapidaires* of which Old-French and Provençal translations are extant. Other Romance versions had been wanting until Karl Vollmöller recently published a Spanish one of the fifteenth century under the title 'Ein Spanisches Steinbuch, mit Einleitung und Anmerkungen, zum erstenmal herausgegeben' (Heilbronn, 1880). The little work (found in but a single MS. in the British Museum) contains a description of forty-two gems, thirty-four taken from Marbodus, the remaining eight from Isidor. The gems from the former source are, with a few exceptions, followed by a *summa*, or brief account, from Isidor and in four cases from Marbodus's 'Applicatio.' The editor has not used in his notes the Old-French versions published by Beckmann (Göttingen, 1799), nor the German *Steinbuch* of Volmar (Heilbronn, 1877), but has cited another Spanish *Lapidario* of the fifteenth century which differs materially from the one before us. The chief value of the present publication is as a heretofore inedited text of a period of peculiar interest to the student of Spanish philology and literature. The translation itself is far from successful; the translator had before him a poor text of Marbodus, and his own imperfect knowledge of Latin made matters worse. In one case he read *rex Pyrrhus* as *rex purus*, translating it *el rey muy limpio*; in another, he translates (speaking of the stone called *Lyncurium*) *Electro similem Theophrastus habere colorem hunc ait* by "this resembles amber, and is the color of the stone called Theoprastrus."

MISS PRESTON'S TRANSLATION OF THE GEORGICS.*

MISS PRESTON'S skill and success in translating the modern Provençal poets have been universally acknowledged, but when she undertook a metrical translation of Virgil's 'Georgics' she imposed upon herself a much more difficult task. The 'Georgics' are, perhaps, the least translatable of any of Virgil's works, because their charm and meaning are the most subtle and local. The ancients looked at nature in a manner that is even more foreign to the modern mind than the way in which they looked at man or at the supernatural. Whereas in the modern poet Nature excites curiosity, admiration, love, etc., in the ancient she awoke feelings of childish wonder, fear, credulity, superstition, apprehension, etc. To him Nature was a vast, vague, mysterious, portentous power, which he could hardly bring himself to look upon except through his imagination or his sentiment of fear and adoration. To Virgil the swallow was Procne, with the mark of a bloody hand upon her breast (this crimson stain is much more obvious upon one of our grosbeaks, but we call it a rose); and every movement of bird or beast was full of deepest portent. The old poet speaks of the crow, the raven, the crane, and of the song-birds, not as a loving observer of them, or as the steady-eyed Shakspere does, with some close-fitting word or phrase, but as types or instruments of some unseen, mysterious, and often malevolent power. Hence the vagueness that attaches to the names of Virgil's plants, trees, and fowls. Translators are not agreed as to what tree he refers to in verse 187 of the first 'Georgic,' the abundant bloom of which shall be a sign to the husbandman of a plentiful harvest—

"Contemplator item, cum se *nux* plurima silvis."

Dryden translates it "flowering almond"; in Bohn's translation it is "almond." Miss Preston renders the line thus:

"Again; the forest search for the walnut-tree
In the time of bursting leaves and odorous bloom."

"Walnut-tree" seems to fulfil the conditions better than almond, as the latter tree, like its relative the peach, flowers before its foliage appears, and is never in a condition that would justify the poet's words of luxurious foliage and dense shade—

"luxuria foliorum exuberet umbra."

Miss Preston says she has never wittingly swerved from the sense of her author, but we note several instances in which she seems to have done so. Virgil certainly does not put the "owl" in the ground under his threshing floor, or name it among the plagues that baffle the husbandman, as he does the mouse, the mole, the toad, and other vermin (i: 181):

"saepe exiguus mus
Sub terris posuitque domos atque horrea fecit:
Aut oculis capti fodere cubilia talpæ:
Inventusque cavis bufo, et quæ plurima terræ
Monstra ferunt."

There is no place for the owl here, unless your threshing floor be above a colony of prairie dogs. Dryden adds the "hissing serpent," which is not so much amiss. It is evident, also, that our translator misinterprets Virgil when she makes him say in effect that pulse grown from seed that has been steeped in various oils and juices

"Cooks by a lesser fire."

This rendering seems preposterous. When the modern gardener soaks his black onion-seed in hot water is his object in so doing to produce an onion that will cook quickly? Virgil's husbandman soaked his seed over a slow fire, in nitre and in black lees of oil (i: 194), to prove and to quicken them. We are at a loss, also, to understand why, in translating verse 207, Miss Preston says

"or attempt the strait
Of purple-peopled Abydos."

Abydos, famous for the loves of Hero and Leander, was also famous for its oysters, and most translators have said "oyster-breeding Abydos," which Virgil's line of

"Ostriferi fauces tentantur Abydi,"

justifies. Virgil's phrase in verse 262,

"Cavat arbore lintres,"

has caused some confusion among translators, some rendering *lintres* boats, and others troughs. Miss Preston says boldly,

"And for the vineyard's day of need
Hollowed are trees for troughs."

It is more probable that the troughs, if troughs they were, were for the stock of the farm to drink and feed from rather than for use about the vineyard. In verse 361 Miss Preston makes the gull come screaming into the shore on the approach of a storm, whereas Dryden and others have called *mergus* a cormorant. But this is less objectionable than the liberty she takes in the next verse of making the cormorants leap high and dry on the shore. Dryden and other commentators say "coots," and certainly the coot, which is a shore bird, and is quick and active, would be much more likely to leap and play upon the shore than the heavy, web-footed, awkward, goose-like cormorant.

In departing from the usual course of translators in rendering the phrase "agmine magno corvorum" "a mighty army of crows," instead of "ravens," and "cornix" with its "improba voce" as "the grim raven," instead of the clamorous crow, or impudent crow, we think our author hits the mark exactly. The raven is a solitary bird, has a dismal, croaking voice, does not congregate in vast flocks, but would be very likely to stalk alone on the sands where Virgil represents her. The crow, on the other hand, is eminently gregarious and social, and large and noisy flocks of them are still thought by some persons to indicate a storm. Again, in the passage wherein Virgil describes the signs of fair weather, we think our author justified in saying it is the "rooks," and not the ravens, whose tranquil and contented voices are heard "in their leafy homes on high." But the "rooks' exultant lay," which our author reads in the 423d verse,

"et ovantes gutture corvi,"

credits the rook with vocal powers that Virgil would hardly be willing to subscribe to.

Some of Virgil's notions about grafting, as set forth in the second book of the 'Georgics,' are wide enough of the truth, as when he says the plane-tree has borne apples, and the elm, acorns; yet he does not say that the pear can be grafted upon the ash, as Miss Preston has it. By *ornus* he evidently means the European rowan-tree (Pyrus aucuparia), which is like our mountain-ash. This tree is not an ash at all, but is closely related to the pear. The latter grafted upon it thrives well. The Virgilian horse, as described in book third, is a noble beast. Miss Preston's lines,

"And his fiery bosom, soon as the hour is come
For wedlock, swells with a riotous delight,"

are masculine, but, by a curious confusion of the primitive and the derived significations of *torus*, they fail to give the purport of her author's phraseology:

"Luxuriatque toris animosum pectus":
"His proud chest swells luxuriant with brawny muscles" (Davidson).

Verse 87 in Virgil's description, wherein he further emphasizes the superabundant muscular power of his steed by reference to his double spine, *duplex spina*, is omitted entirely by our translator.

Virgil's painted, scaly-backed lizzard, which devours bees in the fourth book, Miss Preston turns into "the gaily-harnessed lizzard." Why the creature should be harnessed does not clearly appear, unless it be that he may die with harness on. But her "bee-eater" in the next verse is a more exact rendering of Virgil's "merops" than the "woodpecker" of Davidson, or

"The titmouse, and pecker's hungry brood"

of Dryden. Neither the titmouse nor the woodpecker catches bees, though the green woodpecker of Europe has been thus accused. If Virgil could be heard upon the subject we imagine he would object to our author's interpretation of his 39th and 40th verses, wherein she makes him say that the bees stop up the cracks of their dwelling

"With flowers and the pollen of flowers, and always keep,
Gathered and stored for the use of their skill,
A glue more dense than the gum the pine-trees weep
On Phrygian Ida."

It is preposterous to say the bees bring the flowers themselves to calk up

*'The Georgics of Vergil, translated into English verse. By Harriet W. Preston.' Boston: J. R. Osgood & Co. 1881.

their hives with, though both Dryden and Davidson say so; and it is equally wide of the truth to say they use pollen. Neither is it true that they keep their cement or "gluten" stored ready for use; they gather it and bring it to the hive only as it is wanted. The bees use two substances about their hives to protect themselves against the wet and the cold, and to strengthen their works, namely, wax and propolis. In the early season they use wax, in late summer and in the fall they use propolis freely, as it is only at that time that propolis can be obtained, it being secreted by the buds of certain trees, as the birch, poplar, and Balm of Gilead. Virgil knew both of these substances, and refers to the latter in verse 160 as "tough glue from the barks of trees." By "fuco et floribus" he probably refers to this fragrant or flower-like propolis. Miss Preston's translation of verse 181 is an improvement upon the original so far as truth of natural history is concerned. Virgil says the young bees return from the fields at night

"crura thymo plenæ,"
"their thighs laden with thyme."

Our author says:

"their treasures of thyme unlade."

Thyme is a mint and is very prolific in honey, but yields no pollen, and honey the bees bring in their honey-bags and not upon their thighs. It is pollen and propolis that they bring upon their thighs, and they do not, as a rule, obtain these articles from the same plants or trees. From the willow, the red maple, the blooming grain, and from other sources the bees gather pollen; from thyme, rosemary, clover, and many other flowers they gather honey. John Martyn, Professor of Botany in the University of Cambridge, who translated the 'Georgics' in 1740, commenting upon this verse, says: "The hairiness of the bees' legs serves to retain the juices which they gather from flowers"! In verse 54 our author makes Virgil's bees

"pause on the wing to sip the running stream,"

which the fact will not bear out, and which Virgil's line,

"flumina libant
Summa leves,"

will hardly justify.

Honey-bees do not drink on the wing like swallows, or like the osprey, but lick up the water very daintily about wells and springs; though Gilbert White, in his fifty-fourth letter, referring to the swallows, says they drink on the wing like Virgil's bees, giving the same interpretation to the passage Miss Preston does. Dryden has it:

"They skim the flood,"

and Davidson says:

"Lightly skim the surface of the stream";

and these expressions are nearer the truth.

Every lover of Virgil will sympathize with our author's effort to make a metrical translation of the 'Georgics' that shall not masquerade the sense or the verse, but that she has succeeded in making a melodious and beautiful poem we cannot admit. Most readers, we fancy, will still prefer the literal prose translations of Davidson, or Conington, or even that of John Martyn of the last century, which is as good as any. As a fair sample of her work we will give her translation of the passage on spring in the second 'Georgic,' which begins at the 323d verse, and append the literal prose translation of old John Martyn:

"But spring is good for the grove and the wood; the seeds
Of plants to be, the Earth all palpitant prays
In spring-time of the almighty father Sky,
Who, tarrying not from her so glad embrace,
Cometh in showers of full fertility,
And the mightiest things that be, commingled so,
Minister being unto the least that grow.
Then the bird-haunted boughs with melody ring,
And the very herds of the stall have seasons set
For love's delight. Then the warm zephyrs bring
Delicious languors unto the land, and get
Fair offspring of the fields; and everywhere
Light mists arise and succulent grasses dare
Trust the new sunshine. The vine-branches young
Fear never the surgent Auster, nor the streams
Forth of the clouds by northerly tempests flung,
But lavish their buds and leaflets."

Thus Martyn:

"The spring above all seasons is beneficial to the verdure of the groves; the spring is beneficial to the woods; in the spring the lands swell, and require the genial seeds. Then the almighty father Æther descends into the bosom of his joyful spouse with fruitful showers, and greatly mingling with her great body nourishes all her offspring. Then do the lonely thickets resound with tuneful birds, and the herds renew their love at their stated time; the teeming earth brings forth, and the fields open their bosoms to the warm zephyrs: all abound with gentle moisture; and the herbs can safely trust themselves to the new sun; nor does the vine-branch fear the rising south winds or the shower driven down from heaven by the furious north, but puts forth its buds and unfolds all its leaves."

THE AUTOBIOGRAPHY OF MARK RUTHERFORD.*

"MINE is the tale of a commonplace life, perplexed by many problems I have never solved; disturbed by many difficulties I have never surmounted; and blotted by ignoble concessions which are a constant regret." These are the terms in which Mark Rutherford describes his own career. They are justified by every detail of his life, as far as that life is laid before the reader. These 180 pages contain in one sense nothing but the commonplace facts of the commonplace existence of a dissenting minister, who passed through very ordinary trials, both moral and physical, and did not come out a conqueror. From another point of view the book is as real, as striking, and as instructive a picture of what life in England often actually has been to men of this generation as any which can be found in the pages either of biography or of fiction. To which, indeed, of these two classes 'Mark Rutherford' ought technically to be referred, admits of doubt. Of its author we know nothing, and nothing, we take it, is as yet known to the general public. Whether the autobiographer, the editor, and the author are or are not one and the same person we can judge only from internal evidence. All that we can say is, that if the book be an actual autobiography, the writer possessed, unknown to himself, a touch of realistic genius which utterly redeems him from the charge of being commonplace; whilst if, as we are inclined to suppose, the book be a work of imagination, it is certain that England possesses a writer endowed with a simplicity and terseness of style, no less than with a directness of thought, which were not exceeded by De Foe, combined with the capacity for dealing with problems and entering into sentiments hardly known to De Foe or to his contemporaries. In any case, whether 'Mark Rutherford' be biography or fiction, it is stamped in every line with the impress of unmistakable bare truth, and the simplest course both for reviewers and for readers is to accept the essential truth of the narrative, and ponder upon the experiences of what we may be sure is, in one form or another, the record of a real life.

Mark Rutherford's life, as far as it is revealed by the fragment now laid before the public, may be paralleled by that of scores of dissenting ministers. He belonged to the ordinary English middle class of well-to-do shopkeepers. He was brought up in a quiet country town in one of the Midland shires—one of those places which were easily to be found before the era of railways.

"There was absolutely no competition, and although nobody in the town who was in trade got rich, except the banker and the brewer, nearly everybody was tolerably well off, and certainly not pressed with care as their successors are now. . . . . Everybody used to take an hour for dinner between one and two, and at that time, especially on a hot July afternoon, the High Street was empty from end to end, and the profoundest peace reigned."

His father and mother were rigid Calvinistic Independents, and Rutherford passed a youth common to thousands of his countrymen. During the week-day he went to a public school, "where I learnt little or nothing that did me much good. The discipline of the school was admirable, and the head-master was penetrated with a most lofty sense of duty, but the methods of teaching were very imperfect." The two half-holidays in the week were the happiest part of his life. They were spent in fishing, bathing, swimming, or skating, and formed, one may conjecture, the best part of his real education.

"On the Sundays, however, the compensation [for these week-day joys] came. It was a season of unmixed gloom. On that day no newspaper nor any book more secular than the 'Evangelical Magazine' was tolerated. Every preparation for the Sabbath had been made on the Saturday, to avoid as much as possible any work. The meat was cooked beforehand, so that we never had a hot dinner even in the coldest weather; the only thing hot which was permitted was a boiled suet-pudding, which cooked itself while we were at chapel, and some potatoes, which were prepared after we came home."

The outward dreariness of the Sunday was nothing to its moral miseries. Sunday-school, prayer, sermons, Bible-reading, and the like filled every hour. Every word of the picture given of Mark Rutherford's Sundays should be studied again and again. The account of the sermon gives some idea of the kind of suffering which a child of religious parents had to undergo:

"The minister invariably began with the fall of man, propounded the scheme of redemption, and ended by depicting in the morning the blessedness of the saints, and in the evening the doom of the lost. There was a tradition that in the morning there should be 'experience'—that is to say, comfort for the elect—and that the evening should be appropriated to their less fortunate brethren. The evening service was the most trying to me of all these. I never could keep awake, and knew that to sleep under the Gospel was a sin. The chapel was lighted in winter by immense chandeliers with tiers of candles all round. These required perpetual snuffing, and I can see the old man going round the chandeliers in the middle of the service with a mighty pair of snuffers which opened and shut with a loud click. How I envied him because he had a semi-secular occupation which prevented that terrible drowsiness!"

Rutherford's training, with all its fearful defects, produced two beneficial results, which he with striking candor acknowledges. "The first was a rigid regard for truthfulness. My parents never would endure a lie or the least equivocation. The second was purity of life, and I look upon this as a simply incalculable gain." The good, however, no less than the bad side of his education led to the miseries of his life. After the manner of his sect he went,

* 'The Autobiography of Mark Rutherford, Dissenting Minister. Edited by his Friend, Reuben Shapcott.' London: Trübner & Co.

as one may say, "mechanically" through the process of technical conversion. Believing himself, and thought by others, to be "as good as most of the young men who professed to have a mission to regenerate mankind," he passed through a dissenting college, where he learnt nothing but barren formulas, "into the ministry." For Rutherford's experiences at college we must refer the reader to his own account. The net result was that he began without conscious dishonesty to preach to others when he had himself neither religious experience nor theological knowledge, and found himself bound to inculcate on his hearers dogmas which to him were either unmeaning or incredible. The consequences of such a false position to a man of commonplace intellect, of a sensitive conscience, of a weak will, and of a sincere heart may be easily foreseen. Rutherford passed from orthodox dissent to avowed Unitarianism, and from Unitarianism to Agnosticism. His fragmentary autobiography leaves him a bookseller's hack without definite creed, without a definite career, without adequate means for supporting life, and without the health either of body or mind which could make existence endurable. He was, in short, as painted in the published portion of his biography, simply a typical representative of hundreds of commonplace men who have made shipwreck in the intellectual conflicts of the day, and whose existence is none the less tragic because their miseries are commonplace.

Either strict reproduction of literal facts or the power of a consummate literary artist has enabled the writer of the 'Autobiography of Mark Rutherford' to force into prominence two aspects of life which are usually overlooked by those who, like Mr. Froude, for example, in the 'Nemesis of Faith,' record or paint histories of spiritual conflicts ending in failure. The first is that great and mysterious problems may occupy the minds and torment the consciences of very ordinary, every-day kind of men. In modern days, as probably in all times, it is not gigantic intellects alone which are met by difficulties hardly to be overcome by gigantic power. An honest searcher after truth may have no gift for discovering her. The only peculiarity of Rutherford's case is that he knew his own incapacity. A verse from the impressive poem which anticipates the result of the biography sums up the whole matter in four lines:

> "For I was ever commonplace;
> Of genius never had a trace.
> My thoughts the world have never fed—
> Mere echoes of the book last read."

Here lies the secret of the whole matter. The thoughts of men both better and worse than Rutherford are constantly "mere echoes of the book last read." Such men are the uncrowned and the unvenerated martyrs of an age which boasts of free enquiry and of widely diffused education. They are honest, but unless they have rare force of character they are likely to miss both the strength given by convinced disbelief, and also the strength and consolations of religious faith.

The second and even more important aspect of life which Mark Rutherford's biography forces into view is that spiritual conflicts, intellectual efforts, the painful effort to attain unto truth, do not exempt men from the ordinary or extraordinary troubles, or from the petty miseries, of every-day existence. In nothing is the truthfulness or the power of our author, whoever he may be, so manifest as in the way in which he mixes up the external pains or woes of life with Mark Rutherford's religious crises. The passage from orthodoxy to Unitarianism, for example, represents, we suspect, to most readers a mental or moral event which, though it may involve bitter regrets or sharp pangs of conscience, has about it something of intellectual dignity. What such a change may really mean one understands, perhaps for the first time, when one read's Rutherford's account of his introduction to a dreary chapel, occupied and not filled by a congregation consisting of exactly "seventeen, including two very old laborers who sat on a form right at the end near the door." It is a touch further absolutely true to life that recollections of the dreary service should remain associated in the sufferer's mind with the memory of all the disgusting details of a sordid dinner:

"I remember perfectly well what we had for dinner. There was a neck of mutton (cold), a suet-pudding, and some of the strangest-looking ale I ever saw—about the color of lemon-juice. What it really was like I do not know, as I did not drink beer. I was somewhat surprised at being asked whether I would take potatoes *or* cabbage, but thinking it was the custom of the country not to indulge in both at once, and remembering that I was on probation, I said 'cabbage' . . . My host presented me with nineteen shillings; the fee was a guinea, and from that two shillings were abated for my entertainment."

So much for the petty miseries which, in one form or another, were, so to speak, the miserable frame to the sad picture of Rutherford's existence. But it is not petty miseries alone which torment even commonplace persons. Behind Rutherford's moral perplexities, behind his poverty, lies the dark background of hypochondria, which all but led its victim to the fate of a drunkard. Add to all this difficulties arising from love affairs, which had all the perplexity without any of the charms of romance, and you have a life as full of sadness as can well be imagined, and yet a life so marred by weakness no less than by misfortune that those who can pity and even respect Mark Rutherford can well understand why he could scarcely respect himself. To say more, however, of the details of Rutherford's life is futile. No reviewer can curtail a book of not two hundred pages, each line of which is a model of lucid compression. All that he can do is to urge on his readers that they should read 'Mark Rutherford' for themselves, and to answer one question which a mere sketch of the book is certain to provoke.

What, it will be said, is the moral or the use of a work which, whatever its power, is confessedly the melancholy record of sad failure? This enquiry, which is one of general application, is worth an answer, and our reply to it is as follows: The value of truthful biography, whether real or imaginary, does not lie for the most part in what is called a moral. Mark Rutherford's experiences will not serve the end either of apologists of orthodoxy or of assailants of the received creeds of the day. Unitarians or Theists will regard it with at least as little favor as any Episcopalian clergyman or Independent minister. Its value lies in its truth itself. Few men can read the book with open eyes without learning something which it behooves them to bear in mind. It impresses, for instance, on any young man the patent fact that in the present condition of the world it is folly to undertake clerical functions without both having obtained definite convictions and having undergone the discipline of genuine experience. Good intentions and a wish to benefit mankind are a very scanty outfit for a man who undertakes to teach others the truth on the highest and most mysterious of all topics. Important problems are not always pressing problems, and to thousands of men the voice of conscience, no less than the dictates of common sense, prescribes abstinence from speculations which they have not the capacity to bring to any satisfactory result. Few thoughts are sadder than the reflection that in modern times men who, in practical life, might have been the salt of the earth, have again and again wasted their talents because, by a natural but mistaken choice of career, they have found themselves doomed for life

> "To finger idly some old Gordian knot,
> Unskilled to sever and too weak to cleave,
> And with much toil attain to half-believe."

For such, who are numbered by thousands, Mark Rutherford's autobiography has invaluable lessons.

But direct instruction of any kind does not make up the whole worth of this noteworthy book. Its chief effect, after all, will be as a confession. The vices of the confessional are well known, and need no exposure. Perhaps its gravest flaw is that it has cast undeserved discredit on that true kind of confession, or rather self-revelation, which might be and has been of infinite value to the world. If sensible and manly persons could manfully reveal to each other the genuine errors and miseries of their own lives, half the misery of the world would be removed and an infinite number of its sins would be cured.

"I have observed," writes Mark Rutherford, "that the mere knowing that other people have been tried as we have been tried is a consolation to us, and that we are relieved by the assurance that our sufferings are not special and peculiar, but common to us with many others. Death has always been a terror to me, and at times, nay generally, religion and philosophy have been altogether unavailing to mitigate the terror in any way. But it has been a comfort to me to reflect that whatever death may be, it is the inheritance of the whole human race; that I am not singled out, but shall merely have to pass through what the weakest have had to pass through before me. In the worst of maladies, worst at least to me, those which are hypochondriacal, the effect which is produced by the visit of a friend who can simply say, 'I have endured all that,' is most marked. So it is not impossible that some few whose experience has been like mine may, by my example, be freed from that sense of solitude which they find so depressing."

MIVART'S 'THE CAT.'*

THE author of this work believes that the study of the cat may "serve as an introduction to Zoölogy in general, and even to Biology itself. The problem has been to select as a type for examination and comparison an animal easily obtained and of convenient size; one belonging to man's class, and one not so different from him in structure but that comparisons between it and him (as to limbs and other larger portions of its frame) may readily suggest themselves to the student. Such an animal is the common cat." This expression of opinion has the more weight from its apparent independence of somewhat similar views which have been held by other anatomists, notably the late Professor Jeffries Wyman, as recorded by one of his former pupils in the New York *Medical Journal*, October, 1879. Following Wyman, one teacher of anatomy thinks that "Felitomy should be the stepping-stone to Anthropotomy," and another holds that "No medical student should be allowed to dissect the human cadaver until he has familiarized himself with the anatomy of the cat."

The present volume, however, "is intended for those persons who are interested in zoölogy, and especially in the zoölogy of beasts, birds, reptiles, and fishes, and not merely for those concerned in studies proper to the medi-

* 'The Cat: An Introduction to the study of Backboned Animals, especially Mammals. By St. George Mivart, Ph.D., F.R.S.' 8vo, pp. xxiii.-557; 208 figures. New York: Charles Scribner's Sons. 1881.

cal profession." After a brief but interesting and instructive "Introductory," the author treats in turn of the skeleton and muscles of the cat, its digestive and circulatory systems, its organs of respiration and secretion—including the reproductive organs—the nervous system and organs of sense, the development of the cat (which is thus disconnected from its reproduction), its psychology, the different kinds of cats, the cat's place in nature, and its pedigree and origin. Broadly speaking, the work comprises two nearly equal portions, the one embracing more or less detailed descriptions of the various parts, and the other discussing the general problems connected with the entire organism. Since the author is best known as a comparative anatomist, one naturally looks for greater perfection in the purely descriptive portion, which, so far as appears in the work itself, is based wholly upon the recent and original observations of the author or his collaborators. Yet a close examination discloses serious deficiencies in the anatomical division of the volume. It would not be fair to find fault with the space which is devoted to the different organs, for upon the whole more is allowed to the softer parts than is customary in works upon descriptive anatomy; but since a separate chapter is entitled "The Psychology of the Cat," one would expect that the brain—the organ of psychosis—might be given more than half as many pages as the skull, and more than an eighth as many separate illustrations. Both the descriptions and the figures of the bones are excellent, although one looks in vain for a representation of the rudimentary clavicle, and is surprised at the absence of reference to the fact that many cats have a ninth sternal segment. The illustrations of the muscles, though mainly accurate, are poorly executed, and whoever is familiar with the spirited attitudes of the animal in Straus-Durckheim's work will be apt to liken the general aspect of Fig. 77 to that of a sober-minded cow. The descriptions of the muscles, considering their extreme brevity—which really unfits them for the use of either the beginner or the advanced investigator—are very correct; but has the author never seen the "long head of the *coraco-brachialis*," or the "*pecto-antebrachialis*" of Straus-Durckheim? The digitations of the "*serratus magnus*" often number nine instead of ten, and (leaving out of view several cases of disputed homology to which our author does not allude) whoever examines many cats will find numerous variations and peculiarities for the existence of which the present work affords no preparation whatever. Most of the names given to muscles are well chosen, but surely the elaborate descriptions of Straus-Durckheim deserve some recognition in the way of synonymy.

The remainder of the anatomical division is far less satisfactory. The statement, on p. 183, that "the pancreas is composed of peritoneum," is doubtless due to a *lapsus calami*, and of course our author is aware that the wall of the left ventricle of the heart is thicker than that of the right, notwithstanding the reverse proportion is shown in Fig. 102. But no such concessions can be made in respect to the descriptions of the arteries of the arm (p. 210), the azygous veins (p. 217), the mediastina (p. 224), the vagus nerve (p. 275), the peritoneum (p. 190), and, in general, the brain. Within sixteen pages devoted to the brain and the cranial nerves there are distinct misstatements with regard to the olfactory ventricles in the adult (p. 358), the pituitary body (p. 264), the *septum lucidum* (p. 266), the middle commissure (p. 266), the pineal body (p. 267), the "eminences within the ventricles produced by certain sulci" (p. 267), and the apparent origins of the third, fifth, sixth, ninth, and twelfth cranial nerves. The lateral and dorsal aspects of the brain are well shown, but the figures (128, 129) of the mesal and ventral surfaces present more inaccuracies than can be enumerated here. Excepting the general outlines, and a few features which the least observant artist could not easily overlook, these two figures represent characteristics which are not feline, but more or less distinctively human. It might be rash to deny the possibility of such a combination of features as is given in Fig. 128; but it is safe to say that when such a combination is actually observed, the advocates of evolution will be provided with a "missing link" which the most ardent of them have not as yet ventured to predict. The fact is, a very large proportion of the statements which are incorrect for the cat are more or less nearly correct for man, and certain portions of the work are little else than human anatomy with a faint feline flavor. Not content, apparently, with the abundant evidence of the close structural resemblances of the cat to man, our author seems to have assumed that absolute identity must exist so long as the contrary has not been demonstrated. No one would blame Mr. Mivart for the lack of information upon special points, but when it appears that he has filled up the gaps in his knowledge of the cat with fragments of human anatomy, the reader may hesitate to accept even that which is really true, and may ask himself wherein the unspecified substitution of one kind of knowledge for another differs from the adulteration of material commodities.

Almost equally to be regretted with the feature just mentioned is the absence of all admission of possible error, or of the existence of differences between varieties and individuals, or of the desirability of farther investigation upon any of the points treated in the descriptive portion of the work. In the more general portion the affinities and possible origin of the cat are very fully and satisfactorily treated, and no undue prominence is given to the author's peculiar views respecting "Specific Genesis." As to "The Cat's place in Nature," felicitous expression is given (pp. 491, 493) to an idea that "something may be said in favor of cats being the highest of mammals, if man is considered merely in his animal capacity, in which alone he can be brought into comparison with other organisms."

The metric system is ignored. The terms employed in the designation of position and direction constitute a strange assemblage. The author is conscious, as stated on p. 258 and elsewhere, of the inappropriateness of the current anthropotomical terms, yet he cannot bring himself to abandon them altogether, and he labors under an aggravated form of the peculiarly British affection for the word *axial*. Surely it is bad enough to entangle the arms and the legs with an adjective already applied to a single vertebra and to the entire trunk-skeleton, but to use "preaxial" and "postaxial" as the equivalents of *cephalic* and *caudal* constitutes the very apotheosis of *axialism*. The bibliographical portion of the work offers some remarkable features. All the references are made by foot-notes in place of the more convenient list of works and papers which many writers now give at the close of their volumes. With a single exception these references are in the more general division of the work, and the descriptive division is bibliographically barren. Is the author willing his readers should think that our knowledge of the cat's structure is complete, that he alone has elucidated it, and that his account of it is infallible? Even if he has not seen the little works of Newton and Williams, or the brief though solid contributions of Gage on the pancreatic duct and the *ligamentum interarticulare*, can we suppose that Mr. Mivart has never consulted Straus-Durckheim's 'Anatomie du Chat'? The following is a nearly complete list of the writers quoted: Balfour, Bastian, Cobbold, Cope, De Blainville, Flower, Gervais, Gaudry, J. E. Gray, Haeckel, Lewes, Leidy, A. Milne-Edwards, Owen, Paget, Schäfer, Spencer, St.-Hilaire, St. Augustine, Van Beneden, and Wilder. A few of the above-named would naturally be quoted in any general anatomical or zoölogical work, but in the place of, or in addition to, the rest one would expect to find the elder Agassiz, Dana, Darwin (indirectly mentioned as "the author of 'The Origin of Species'"), Huxley, Marsh, and W. Kitchen Parker. Perhaps Huxley's papers on Evolution and on the Cranial and Dental Characters of the Canidæ appeared (about the first of January last) too late for consideration in the body of the work, but the foot-note to p. 439 discusses certain matters published in an American journal for December, 1880. Among all the theistic writers upon evolution only St. Augustine is mentioned. On page 6 is given an opinion of "the Père David, the well-known Lazarist missionary, and naturalist," and in the index, among the five names of authors given, the appellation of the same Catholic father is entered under both David and Père.

The unexpected discrimination just mentioned might, perhaps, be regarded as accidental but for a paragraph upon p. 520. As has been stated, Huxley's name does not occur in the book, but, in an indirect way, he is quoted, or rather misquoted. After dismissing "the notion that the origin of species is due to 'Natural Selection' as a crude and inadequate conception," the author remarks: "Its anti-theological character has been declared by a conspicuous English advocate to be 'one of its greatest merits.'" In an essay entitled "More Criticisms on Darwin" Professor Huxley did make himself unpleasantly "conspicuous" by an adverse commentary upon Mr. Mivart's statement in "The Genesis of Species" (p. 266), that "ancient and most venerable [Catholic] theological authorities distinctly assert Derivative Creation, and thus harmonize with all that modern science can possibly require; . . . the various extracts given showing clearly how far 'evolution' is from any necessary opposition to the most orthodox theology." After examining the writings of St. Augustine and Suarez, including the passages named by Mivart, Huxley comes to the conclusion that "if Suarez has rightly stated Catholic doctrine, then is evolution utter heresy. And such I believe it to be. In addition to the truth of the doctrine of evolution, indeed, one of its greatest merits in my eyes is the fact that it occupies a position of complete and irreconcilable antagonism to that vigorous and consistent enemy of the highest intellectual, moral, and social life of mankind—the Catholic Church." The terms here used by Huxley are *evolution* and the *Catholic Church*; but Mivart, in the passage quoted, makes him say *natural selection* and *theology*. Doubtless the verbal changes were made unconsciously, but this does not lessen their injustice. In the closing paragraph of his article on "The Origin of Species," in the *Westminster Review* for April, 1860 (which is reprinted in the 'Lay Sermons'), Huxley admits the possibility that Natural Selection may not explain everything, and an even more definite reference to the "subordinate action of Natural Selection" is made in the essay already mentioned, p. 51. As to the other change, Mr. Mivart has on a previous occasion made religion synonymous with theology, and orthodox theology to embrace only the doctrines of the Roman Catholic Church. But this confusion in his own mind in no way justifies him in ascribing a like want of discrimination to one whose writings are at least free from ambiguity. With all respect, therefore, for the sincerity of our author's personal convictions, and with sympathy for the ill-success of his efforts to put the "new wine of Science into the old bottles of Catholic theology," we wish he had frankly referred to the writings of the English anatomist, in so far as they bear upon

the topics of his book, rather than to have so dealt with him as to leave upon the minds of his readers, according to their familiarity with the progress of science, one or another of the following impressions: either that Mr. Mivart has never heard of Professor Huxley; or that Huxley's writings have no value for the matter in hand; or, finally, that it is not desirable that Mr. Mivart's readers should be also readers of Professor Huxley.

The index to the present volume is extensive, but far from perfect. Only five authors are included, and one of these is entered under his given name. *Purring* is not entered at all, and there is no intimation of the existence, in the text, of any comparison of the feline with the human structure. On the other hand, we meet with such entries as "Most general characters of the cat" and "Bearing of psychology on development." Typographical errors are much too frequent, and some of them are inexplicably persistent: *Gregorinida*, for Gregarinida, occurs on pp. 450 and 454, and *rythm* both on p. 226 and in the index. Some other orthographical peculiarities are apparently due to the author's laudable wish to shorten certain lengthy terms, and if "Echinoderma" and "Cœlentera" are legitimate they should prevail; but is it quite fair to the unprofessional reader to rechristen the Protozoa as Hypozoa without explanation; and is not the introduction of "Monocondyla" and "Zygencephala" rather out of keeping with the author's almost puerile insistence upon the vernacular (and etymologically incorrect) "backboned animals" in the place of the universally naturalized *vertebrates?* The type is large and clear, and most of the illustrations are excellent.

It will have been seen that most of the defects noted do not concern the general plan and idea of the work, which is at once admirable and almost unique. Even with the errors which have been pointed out, it will serve the desirable purpose of directing attention to the anatomical and zoölogical usefulness of an animal which has been too much neglected in favor of the really less eligible rabbit and dog. If the author will do that which some superficial reviewers affirm that he has done, "verify by dissection and observation each assertion that he makes"; if he will supply adequate references to the anatomical portion, and offer at least a general suggestion that students should endeavor to make individual additions to our knowledge of the cat, we shall predict for the future editions which we hope may be demanded a place in every library, laboratory, and household.

Harper's Cyclopædia of British and American Poetry. Edited by Epes Sargent. (New York: Harper & Brothers. 1881.)—The editor of this anthology died some months ago, but, as a publisher's note informs us, "every page passed under his careful supervision," and "it was the crowning work of a life devoted to literature." It is a quarto of 958 pages, and contains poems by 745 different authors, if we have counted rightly. It is thus an *omnium gatherum*, the compiler of which one is not surprised to find taking the view in his preface that "poets have multiplied during the present century as at no previous period. Never was the accomplishment of verse so general as now"; that "it is hard for the most diligent critic to keep pace with the fertility of our poets"; that "much of the best poetry of recent times has been the product of feminine genius"; and that "poetry is to be found nowhere, unless we have it within us." The arrangement is chronological. To the selections from each poet is prefixed a short biographical and critical note, those on many of the later and less distinguished being quite as complimentary as would be expected, and therefore not wholly affording due perspective to those upon the more famous. Of the latter the reference to Milton may be taken as an example: "The fame of this eminent poet seems to have been undisturbed by the lapse of time"; of the former this to Mary Clemmer: "Her style is at once facile, fluent, and brilliant. Her emotional nature is plainly that of the born poet." These brief introductions sometimes contain information that could not be obtained elsewhere in the same compass. For instance, we learn of Mrs. Helen Hunt Jackson that, "To the question, 'Is she not our best female poet?' Emerson replied, 'Why not omit the word *female?*'" The collection itself serves to remind a heedless age of many poets whom else it might forget even the names of—Elizabeth Akers Allen, James K. Lombard, Harriet McEwen Kimball, Nancy Priest Wakefield, Emily R. Page, Emma Tuttle, Henry Ames Blood, George McKnight, May Riley Smith, Marie R. Lacoste, Rosa H. Thorpe, and numerous others. It is pleasant to add that most of these are Americans, though we must admit that an anthology upon the same plan compiled by a patriotic Briton would probably incline the poetic balance in the other direction. English magazine poets as a class, however, have no reason to complain of neglect, and the pleasure of being bound up with Shakspere and Wordsworth, referred to in similar terms and awarded nearly the same space, experienced by so many authors, too modest we are sure to have expected it, will far outweigh the pain suffered by the few who have been excluded. To quote the preface again, "there have been omissions for which no better reason can be given than that they were unavoidable"; it is obvious that a work of this kind could not attempt completeness.

What might have been fairly expected, nevertheless, and what might have been accepted as a partial atonement, is accuracy in execution. But, if the ratio of errors is represented by those we have found in a rather cursory and extremely incomplete examination, inaccuracy must be added to the other defects of the work. Doubtless most of these are misprints and some are trivial, but correct typography is the more to be insisted upon here as it is the only thing to be hoped for. "*Gay* old shadows," in Whittier's "Tent on the Beach," p. 638, should read "gray"; in "The *orchard's* full," in Lowell's "She Came and Went," p. 764, the possessive should be a plural simply; and in the selection from "Sir Launfal," p. 763, "*The* heaven" should be "Then heaven," "*grasping* blindly above it for light" "groping," "*or*" "nor," "*illuminated*" "illumined," "*the*" "for," and there is a "*so*" interpolated and an "all" left out. In Keats's "Ode on a Grecian Urn" we have "*this* folk" for "its folk," p. 496; in the "Ode to a Nightingale," p. 494, "*Lethe-ward*" for "Lethe-wards"; in a passage from "Endymion," p. 491, "*on through*" for "thorough"; and in the "Eve of St. Agnes," p. 487, "*dreamed*" for "dreamt." In a lyric from "The Spanish Gipsy," p. 771, "inly" appears as "*July*," and "requiem" acquires an "s"; so does "benediction" in the "Ode on Intimations of Immortality," p. 290. A sentence which joins two stanzas of "In Memoriam," p. 686, is divided by a period at the end of the first, and in "Tears, Idle Tears," p. 688, we read "*helpless* fancy" for "hopeless." In Shelley's "Skylark," p. 426, "ne'er" becomes "*never*"; in the "Hymn to Intellectual Beauty," p. 435, "amongst" becomes "*among*," and in "The Cloud," p. 421, for "whilst" we have "*while*," for "shade" "*shades*," and for "at fits" "*by* fits." Perhaps the "minor" poets represented have fared better; and it should be remembered that no anthology is flawlessly correct.

Music-Study in Germany. From the Home Correspondence of Amy Fay. (Chicago: Jansen, McClurg & Co. 1881. Pp. 348.)—The number of pianists, male and female, who advertise as especial pupils of Liszt is countless as the stars in the milky way. It is true that there is hardly a prominent pianist who has not at some time or other taken some lessons of Liszt; but in many cases the claims advanced rest on a very slender basis. Miss Fay happens to belong to the genuine pupils of Liszt. She spent some five years at the various musical capitals of Germany, and for several months she had the benefit of regular lessons from Liszt at his house in Weimar. The volume before us, which contains some of her letters to a relative during this whole period, will prove of interest to all who like to read accounts of life in Germany, and more especially to the large class of young people who go abroad every year to study music. It reads like a novel, and although the author chiefly dwells on her musical experiences in conservatories and concert-halls, there is yet enough extraneous description of opera balls, soldiers, social affairs, etc., to do away with all sense of monotony. The fault of the book is an excess of enthusiasm. That the writer was aware of this is shown by her choosing as a motto Cherbuliez's "Pour admirer assez il faut admirer trop, et un peu d'illusion est nécessaire au bonheur." If all the superlatives were removed the book would be some ten pages shorter. Everybody seems to be a sublime artist, a wonderful genius, a heavenly musician, and to compose like an angel. But then young ladies have always been fond of superlatives and italics, especially the musical young ladies. Such enthusiasm is quite harmless when it does not obscure the critical sense, and it cannot be said that it has done so in the case of Miss Fay. On the contrary, some of her criticisms and comparisons are uncommonly clever, and reveal a talent for characterizing artistic peculiarities which many a professional critic might envy her. What, for instance, could be better than the following account of Von Bülow's playing?

"He has the most forcible style I ever heard, and phrases wonderfully. It is like looking through a stereoscope to hear him. All the points of a piece seem to start out vividly before you. . . . His expression is proud and supercilious to the last degree, and he looks all round at his audience when he is playing. . . . His face seems to say to the audience, 'You are all cats and dogs, and I don't care what you think of my playing.' . . . Many persons find fault with his playing because they say it is pure intellect, but I think he has too much passion to be called purely intellectual. Still, it is always passion controlled."

Equally good are the accounts of the performances of Rubinstein, Tausig, Madame Schumann, Joachim, and others. But the most valuable letters are those describing the author's personal experiences with Liszt. Liszt is not the greatest musical genius the world has ever seen, but he is by universal agreement the greatest of all performers, and Miss Fay's description of his appearance and manners cannot fail, therefore, to interest all lovers of music. We will quote a few scattered passages as specimens:

"Liszt is the most interesting and striking-looking man imaginable. Tall and slight, with deep-set eyes, shaggy eyebrows, and long, iron-grey hair, which he wears parted in the middle. His mouth turns up at the corners, which gives him a most crafty and Mephistophelean expression when he smiles, and his whole appearance and manner have a sort of Jesuitical elegance and ease. His hands are very narrow, with long and slender fingers that look as if they had twice as many joints as other people's. They are so flexible and supple that it makes you nervous to look at them. Anything like

the polish of his manners you never saw. . . . But the most extraordinary thing is his wonderful variety of expression and play of feature. One moment his face will look dreamy, shadowy, tragic. The next he will be insinuating, amiable, ironical, sardonic; but always the same captivating grace of manner. . . . All Weimar adores him, and people say that women still go perfectly crazy over him. When he walks out he bows to everybody just like a king. . . . Liszt is just like a monarch, and no one dares speak to him unless he addresses one first. . . . You never can ask him to play anything for you, no matter how much you're dying to hear it. If he is in the mood he will play; if not, you must content yourself with a few remarks. You cannot even offer to play yourself. You lay your notes on the table so he can see that you *want* to play, and sit down. He takes a turn up and down the room, looks at the music, and if the piece interests him he will call upon you."

While Miss Fay's letters thus contain much that is of interest to all musical folks, there are in them many valuable hints to pianists in particular. There may be a difference of opinion as to the merits of Herr Deppe's pianoforte method, but no pianist can fail to learn something from the careful analysis here made of the mode of teaching adopted by various famous teachers, including Papa Wieck, Tausig, and Kullak.

The Young Nimrods in North America. A book for boys. By Thomas W. Knox. (New York: Harper & Bros.)—Mr. Knox, in his introduction, states that the "adventures of George and Harry are quite within the range of easy probability," but a perusal of the book convinces us that it contains no more improbable statement than this. The boys whose experiences are narrated begin their exploits in the woods of Maine, where, under the care of a benevolent and accomplished doctor, they take their first lessons in woodcraft, and kill a bear and moose. Afterwards, by rapid transition, they catch blue-fish and sharks in Great South Bay, try a few weeks' sport in the Adirondacks, then speed to the West, where buffaloes and Indians are successfully encountered, and wind up the season with a short trip to California overland, and some successful whale-fishing. The doctor, whose life appears to have been passed under even more thrilling conditions, is always ready to complement the adventures of the boys with the recital of some more wonderful ones of his own, and we venture the assertion that the youth who goes steadily through Mr. Knox's book will have the North American fauna so mixed and jumbled together in his mind that he will be glad of a long respite from sporting literature.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Besant (W.) and Rice (J.), The Chaplain of the Fleet, swd.	(Harper & Bros.) $0 20

MATRIMONY.

By W. E. Norris. 16mo (Leisure-Hour Series), $1.

The New York TIMES *says:* "*The best things are apt to come with very little announcement. . . . Carries with it a fine sense of literary art. It is full of humor—not the humor of Thackeray, we should say, although that is the name that is oftenest suggested by those who have fancied the book, but a humor at once broader, more genial, and less potent. . . . There is no end of good things in this most enjoyable of novels.*"

"*It is choice literature, and it is just so much superior to the merely dramatic stories that do duty as novels as choice literature is superior to acting melodrama. . . . The reader who cares for literature as literature would not willingly spare a paragraph.*"

A Matter-of-Fact Girl.

By Theo. Gift, author of 'Pretty Miss Bellew.' 16mo (Leisure-Hour Series), $1.

"*A bright, fresh story, with few characters, but those cleverly and sharply drawn.*" — BOSTON TRANSCRIPT.

HENRY HOLT & CO., New York.

HELIOTYPE.

PERMANENT PHOTOGRAPHIC BOOK ILLUSTRATIONS.

THE HELIOTYPE PRINTING COMPANY

Are producers of illustrations by the most approved Photo-Mechanical, Photo-Lithographic, and Photo-Engraving Processes. Employed by the United States Government in illustrating Scientific and Medical reports; by Scientific, Historical, and other learned Societies; by the leading Publishers, and for illustrating Town and Family Histories, Trade Catalogues, Show-Cards, etc. Fac-similes of Medals and Coins, Ancient Manuscripts, Paintings, Drawings, Sketches, and Autograph Circulars, Views and Portraits from Nature, Medical and Scientific Objects, Antiquities, etc.

Estimates and specimens furnished on application.

THE HELIOTYPE PRINTING COMPANY,
Near Boylston Street. 211 Tremont Street, Boston.

Notice to Investors.

We offer for sale a limited amount of RICHMOND & DANVILLE RAILROAD SIX PER CENT. GOLD BONDS, due in 1915, at 10[illegible] accrued interest, with the right to advance the price from time to time without notice. These Bonds are secured by a consolidated mortgage on the Richmond & Danville Railroad and the Piedmont Railroad, and the lease of the North Carolina Railroad. We can confidently recommend these Bonds, as the annual report for the year ending September 30, 1880, showed that the Company had reduced its debt over $450,000 during the two preceding years, besides adding largely to the rolling-stock and machinery, and also purchasing 6,300 tons of steel rails. For seven months ending 30th April, 1881, the net receipts exceeded $240,000, equal to about 6 per cent. on its capital stock, after paying interest, rentals and all other fixed charges, besides paying large amounts for equipment, steel rails, and additional workshops. The receipts for carrying mails last April show an increase of over 100 per cent. over same month last year, and from freight of 39 per cent.

Previous to 1st of May 40 per cent. of the Atlanta & Charlotte freight went *via* the Carolina Central Railroad; now all its through freights go over the Richmond & Danville Railroad, which will add largely to its income. Richmond & Danville Railroad stock selling at 110.

Respectfully,

THOS. BRANCH & CO.,
Richmond, Va.

The Nation.

NEW YORK, THURSDAY, JUNE 9, 1881.

The Week.

THE balloting at Albany during the week has been nearly monotonous, the Conkling forces remaining firm and the Administration men scattering their votes as at first. The first change was the increase in the number of votes cast for Governor Cornell, who got 23 upon one ballot, and is said to have been privately admonished from headquarters to withdraw more into the shade for the present; on Tuesday, Depew suddenly gained 21 votes, giving him 42 in all. The Stalwart party make no disguise of their intention to force a speedy adjournment if possible, and the Democrats may probably be relied upon to help them. Of course it is for their interest to do so before their opponents unite upon candidates, as an adjournment after any Administration candidate should get enough votes to be equivalent to a caucus nomination could only be urged with a very bad grace. However, it is difficult to see how an adjournment to-morrow could help Conkling, and the talk of his side about the Governor's calling the Legislature together after the next election, the results of which shall have been prearranged with the Democrats, seems very wild. It is on its face a forlorn hope, and success would not mean the recovery of the party-leadership which Conkling lost with the Collectorship. The only incident to relieve the tedium of the balloting has been the presentation of a bogus petition for the ex-Senators' return by Mr. Eidman, of this city. It purported to be signed by 3,100 residents of the Eighth Senate District, but it soon appeared that the names were alphabetically transcribed by one person in one kind of ink from some list or other. In the way of petitions the "Half-Breeds" have far outstripped the Stalwarts, and it was probably felt that something would have to be done to show that "popular enthusiasm" was not all on one side.

Mr. Arthur, the Vice-President, is exciting a great deal of indignation, not only in this State but all over the country, by his performances at Albany as a touter for votes for his friend Mr. Conkling. But we must say that much of this condemnation, certainly that part of it which comes from Republicans, seems to us unreasonable. Mr. Arthur was nominated by the Republican Convention and elected by the voters with a full knowledge of his character and antecedents. It is, indeed, seldom that a candidate is in these days so well known to the general public. The New York press had made everybody familiar with the nature of his activities in this city—his management of the Custom-house, and the caucuses and the primaries, and his bargains with the Tammany Democrats, and his great skill and energy in all subterranean politics. It is true nothing was or is known about his opinions on leading questions of the day, but this may be said of a great many highly respectable politicians. He is no more to blame for concealing these, or for never forming any, than scores of other men who are rated more highly. He figured, too, very prominently in that very prominent affair, the extortion of $271,000 from the Dodge firm by the moiety men. Of this he pocketed $21,000, and has probably never regretted it or felt ashamed of it for one moment. It has never occurred to him that people would be shocked by seeing him "tout" at Albany. If he were so constituted as to expect anything of the kind, of course his whole career and objects in life would have been different. As he has been guilty of no sort of concealment about his calling, we bespeak for him the patience and consideration of all who voted for him. The moral of his performances is that we must not expect to change a man's nature by electing him to the Vice-Presidency, and must not suppose, as we often do, that electing a man to any office will be received by him as an intimation that he must change his ways. On the contrary, he naturally receives it as an intimation that we rather like his ways.

Much the same thing may be said of Platt. He was perfectly well known when elected to the Senate last year, and his recent performance and present position flow so naturally and logically from his character that they might almost have been predicted before he entered the Senate. His election marked the lowest point reached by the politics of this State under the Conkling influence. We advise any one who wants amusing reading to turn to the files of the Republican papers of this city on the morning after his election for explanations of him and of his success, and for stories of his owing his success to his having really broken with Conkling and determined "to set up for himself"—as if he had anything to set up with.

Mr. Conkling was in this city for some days last week, having left his lieutenant, the Vice-President, at Albany "in command of his forces." He came down as counsel for the Manhattan Elevated Railroad Company, to argue on their behalf in aid of the movement to get their taxes reduced. It seems rather odd that the "Monopolists" should be so eager to secure the legal services of a great Anti-Monopolist champion like Mr. Conkling. It looks like a depraved taste on the part of the railroad extortioners; but it is not odder than the alacrity with which Mr. Conkling accepts their briefs. The Manhattan Company is the greatest monopolist of them all. No railroad has ever before taken or damaged so much private property without compensation, and it has wallowed in every other form of monopolist vice, including construction companies, stock-watering, and uniform charges. It levies "through rates" on every man, woman, and child who enters its cars, even if they only travel a mile, and now sends the Anti-Monopolist champion into court to ask for a reduction of its taxes, although it is paying or trying to pay ten per cent. dividends on its much-watered stock.

Mr. Conkling's ability to play the part of an Anti-Monopolist champion in politics and a Monopolist lawyer in the courts has a counterpart in the West just now, but with the rôles reversed, in the case of Mr. James F. Wilson. This gentleman has been for many years the confidential counsel and champion of the railroads. In 1876 he appeared before a joint committee of the Iowa Legislature as the representative of the Chicago, Burlington & Quincy Railroad, to oppose the railroad tariff law and demand its repeal, and said the reason he had been selected for this duty was that he was well known to be opposed to such legislation, and he then and there delivered a discourse against legislative interference with railroad rates which the Monopolists printed and circulated far and wide as "a legal and powerful speech that every one ought to read." He returned to the subject so late as January, 1880, and delivered another address to the House Committee of Congress against the Reagan Inter-State Commerce Bill, which he denounced as "impracticable, unphilosophical, and opposed to the best interests of the country," and he held up the experience of his own State, Iowa, as a warning against the principle of the fourth section of the bill, which forbade "low rates for long hauls." He said "it had produced evil, and only evil," in Iowa. In fact, he had advocated the freedom of the companies in the management of their business as the best thing for all concerned. He seems to be now tired of being so long out of politics, so he has just been thundering at the Hennepin Canal Convention against the "Monopolists," and laid down the amazing doctrine, which goes far beyond anything heard in Iowa or Wisconsin in 1876, that when any increase in the value of a railroad takes place through increase of traffic, and corresponding improvement of the road, it properly belongs not to the stockholders who ventured their money in the enterprise, but to the people who travel on it and have invested a few fares or inconsiderable freight-charges in it. We are greatly afraid the Anti-Monopolist movement is going to produce worse cases of demagogy than even the Granger movement.

Mr. Hayes has helped to swell the tide of Mr. Conkling's misfortunes by some observations made to a reporter on Mr. Conkling's character, which show more sharpness and destructiveness than was commonly supposed to be in the ex-President's composition. His assertion that Mr. Conkling is suffering from "monomania on the subject of his own importance" is a very happy bit of diagnosis; and the news that Mr. Conkling was also mainly instrumental in getting up the Potter Committee, and that he declared that Mr. Hayes "would leave the

White House in disgrace in thirty days after the investigation began," is an interesting contribution to the history of the troubles of the late Presidential term. But it will probably surprise no one. Quarrelling, intrigue, and private abuse of his enemies have been the principal occupation of the ex-Senator's life for many years.

General Grant has reached New Orleans on his return from Mexico, and seems to grow angrier over the treatment his friend Mr. Conkling is receiving at Albany the nearer he gets to home. He says it is shameful, and thinks the newspaper abuse of the ex-Senator is instigated by the White House, but does not believe the President personally has anything to do with it. He probably thinks that Mr. Blaine sent out circulars to all the papers directing them to attack Mr. Conkling and Mr. Platt daily until further notice. Gen. Grant is evidently not fully informed about the situation, and we would suggest his not commenting on it further until he reaches New York. His railroad enterprise in New Mexico, he says, has been eminently successful, and he does not seem to entertain that dread of "Monopolists" which characterizes some of his "Crowd" in Albany.

The week was lit up for a moment in sporting circles, and in a smaller degree in all, by the winning of the Derby by an American horse, Iroquois, owned by Mr. Lorillard, of this city. The excitement would unquestionably have been very great if Iroquois had been a real American horse, of Kentucky or Vermont stock on both sides; but reflection brought out the fact that his father was an English horse, and that he went to England when a yearling, and was trained in an English stable and ridden by an English jockey. Consequently he was about as much an American thoroughbred as Heenan was the champion of the American "heavy-weights," and his victory has little of the sweetness which came from that of the yacht *America*, or from the rifle matches. Mr. Lorillard, the owner, by being an American and staying at home, loses much of whatever gratification the Derby brings to the owner of the winning horse. Were he in England he would be for a few months a more honored and envied man than the Archbishop of Canterbury or Mr. Gladstone. This is probably the strangest kind of honor the modern world has yet produced, because the recipient rarely does anything to earn it beyond spending money freely in paying trainers to try colts and fillies. At present the jockeys are pressing close behind the owners, if they have not already surpassed them, as popular favorites. Archer, who rode Iroquois, is not yet thirty, and was brought up in a stable, and yet has earned a considerable fortune. He got a year's salary of a highly-paid clergyman or professor—$5,000—for riding this one race. Some of the jockeys are said to keep their broughams, and "run down to Nice" now and then for change of air in winter.

The surplus reserve of the New York banks was reduced during the week to $9,500,000 from $14,720,000, mainly on account of transfers of money out of town in settlement of construction-company and corporate-loan accounts. Since the last bank statement was rendered another important settlement has been made, involving a little over $16,000,000, paid by the Pennsylvania Railroad Company to the committee representing the holders of the Philadelphia, Wilmington & Baltimore Railroad stock, which was recently bought by the former company. This settlement was, however, so arranged through the Bank of Commerce, where the principal parties to the transaction all keep accounts, as to cause little disturbance to the money market. Except for these large settlements there has been nothing to disturb the money market, which, moreover, promises to be very "easy" for borrowers during the summer. The New York banks evidently look for low rates for money, for they have expanded their loans beyond $340,000,000, which is by far the highest point ever reached. Unfortunately this expansion is not, good as general trade is, in response to a commercial demand for money, and accordingly it has properly drawn forth conservative criticism. Mercantile business of all kinds is good; the transportation traffic is fully up to the large volume of last year. The most conflicting reports have been current during the week as to whether the trunk-line railroads were "cutting" through-freight rates; and the week has witnessed about the usual amount of lying, for this season, respecting the condition of the crops. This has not been confined to one side or the other; each side, as in a horse-trade, apparently considering it fair to make any representations not on their face incredible. The foreign exchanges have been less active than of late, and there is a profit neither in importing nor exporting gold. At the close of the week the 412½-grain silver dollar had a bullion value of $0.8662.

The Republican papers are naturally annoyed at the failure of the Virginia Readjusters to "sink" the debt question. It has been very pleasant all along to believe that repudiation was merely the original issue made by General Mahone and his friends because it was the only one available, and that after they had used it as a stalking-horse to cover their attack upon Bourbonism they would promptly discard it. Unhappily, however General Mahone personally may feel about the matter, his party of "live young men" still preserve their disagreeable prejudice against paying their debts, and at their State Convention last week made the provisions of the famous Riddleberger repudiating bill one of the foremost planks of their platform. General Mahone and his friends must not be too severely blamed for this. Perhaps they do not fully appreciate the fact that their professions as to their real purposes and the insignificance of the debt question are implicitly trusted by other than the Massachusetts Senators. But even if they did, and were ever so anxious to deserve the good opinion so freely offered them, they would be unable to let "the original issue," the mere excuse for fighting Bourbonism, subside, simply because it is more important to them to secure the votes of the mass of their party than the sympathy of Northern Republicans. They are not far wrong in supposing they will get a good deal of the latter any way, we presume; but what would have really done them some good is the support of the Administration, and they certainly would not have thrown away their chances of getting that if they had not been obliged to do so.

The Convention was very boisterous and enthusiastic, and the correspondents were all sufficiently impressed by its animation to be convinced that the party has good prospects of success. The representation was large and a third of it negroes. Colonel Cameron, ex-Mayor of Petersburg, was nominated for Governor, after a vigorous contest with Auditor Massey, his principal opponent, during which the friends of Riddleberger endeavored to "spring" him upon the Convention, but with lamentable ill-success. For Lieutenant-Governor, John F. Lewis, who has occupied the office before as well as that of United States Senator, was chosen with very little opposition, except on Riddleberger's part. In fact, all the Convention seemed to desire of Riddleberger was his bill. Mr. Lewis was originally a farmer, entered the legislature of 1861, and, steadily opposing secession, was the only member who voted against the ordinance. He has since been a Republican, and his nomination should win votes for the ticket. Frank S. Blair, who was nominated for Attorney-General, is a simon-pure Readjuster, like Cameron. If the Republicans adjourn their convention without nominating, and it is already rumored that an effort will be made to "capture" it with this view, doubtless the Readjuster ticket will receive most, if not all, of the Republican vote. The Convention seems to have proved that Mahone is as popular with the leaders of his party since his Senatorial escapade as he was before. Whether he is with the rank and file, the election, of course, will have to disclose.

A counter demonstration to what may be called the fashionable prohibition movement in North Carolina was made in Raleigh last week. A convention representing the liquor-makers and dealers, and their friends, met and resolved to found an anti-prohibition party, and listened to a number of very indifferent speeches from white and colored orators. Great sympathy was manifested for the poor farmer, who was to be cut off from his customary tipple and at the same time compelled to make good the loss in revenue caused by destroying a taxable industry. There was unmixed contempt, too, for the "miserable drunkards" whom the bill professed to protect, and, as one speaker phrased it, "he did not propose to sacrifice a great business interest simply to save some young sot from ruin, just because his 'daddy' had not taken care of him." But the prohibitory parsons were most severely overhauled, and their religious fanaticism was appropriately rebuked by a Baptist brother, who said he

had studied the Bible for years, and that "from lid to lid there was no passage forbidding the use of ardent spirits." According to one speaker, he had witnessed the degrading spectacle of a doctor sitting in front of his own drug-store and selling liquor by the pint, "without looking at a patient's tongue or feeling his pulse." And another told of a colony of Germans who would not settle in Halifax because they could not get their lager-beer. There was a general agreement that the curse of intemperance was on the wane, that the shutting off the liquor supply was the very thing to revive it, and that the "real representatives of the cause of temperance in North Carolina" were the members of the Convention.

The evident desire to prove that the prohibitory movement was a party, or at least a crafty political, measure did not succeed very well. Political it is, no doubt, but with what ulterior object, beyond that which it wears on its face, is not clear. The bill soon to be voted on was opposed, as it was carried, by both parties, and the minority was extremely small. The Democrats, as the dominant party, doubtless are more entitled to the credit of it than the Republicans; but the line was not drawn between them. Whether in the campaign of the next two months an effort will be made to identify the Republicans with the anti-prohibitionists remains to be seen, and a curious sight it will be, when we remember the traditional "rum Democracy" of the North. One wonders if the Massachusetts Senators could resist the temptation to back up "rum Republicans" with Federal patronage in the pursuit of a divided South. At all events, we advise Mr. Thomas N. Cooper, late chairman of the North Carolina Republican State Committee, who called the Raleigh convention to order, to put in a timely application for the Senate secretaryship, Riddleberger's "claim" having undoubtedly been vacated.

Mr. Blaine and Sir Edward Thornton have settled the Fortune Bay affair by the payment of $75,000 by Great Britain as compensation for the outrages inflicted on American fishermen by the Newfoundlanders in 1878. The English press is very much dissatisfied with the result, and thinks that England always gets the worst of it in these disputes, forgetting the magnificent haul of $5,000,000 under the Fishery Award, for which Americans maintain they got little or nothing in return. An agreement has likewise been made looking to the drafting of regulations preventing fishing in the close time, by which both Americans and Newfoundlanders will be governed.

We wish some wine-dealer would come out with a frank explanation of the failure of French wines to rise in price since 1875, and of the continued fulness of the supply. In 1875 France produced 78,205,000 hectolitres of wine. The decline then set in until, in 1879, she only produced 25,806,000, and in 1880 only 29,600,000—that is, considerably less than one-half of the maximum. We know, too, that the supply of the ordinary clarets has during these years fallen far short of meeting the home demand, and that she has imported heavily from Hungary, and Italy, and even from the United States. How is it that under these circumstances the price of French wines in this country has remained perfectly steady, and that anybody can have as much Bordeaux as he wants for just or very nearly what he paid in 1875? We have no doubt that any wine-merchant possessed of the literary faculty might convert the answer to this question into a very entertaining magazine article.

A complimentary dinner was given on Friday by the Ontario Press Association to Professor Goldwin Smith, in view of his departure for England. The Toronto *Globe* had expressed so much alarm lest this honor might be taken as a sign of the growth of the annexation doctrine which it charged Mr. Smith with propagating, that special manifestations of "loyalty" were made by the speakers who preceded and followed him. Mr. Smith himself insisted on the personal and non-political character of the occasion, and referred to his fifteen years of journalistic activity as his sole title to be feasted by a press association. He thought that during that period he had observed a very marked gain in force on the part of the local press, together with "a great development of opinion, which meant liberty of thought," to guard which was the first duty of the press. He announced his intention to return to Canada as the home "where his lot was cast, where he intended to spend his life, where his duties and his interests were." The *Globe*, therefore, has but a temporary respite from its fears about the safety of the border so long as the editor of the *Bystander* continues to speak his mind monthly on topics domestic and foreign. What seems to irritate this paper especially is Mr. Smith's ability to indulge his fancy for independent journalism regardless of expense. The same outlay in yachting or on any other kind of purely personal gratification would have passed as natural and harmless; whereas a rich man's attempt to influence public opinion by not only paying the printer's bills, but furnishing the "copy," justifies the most dreadful suspicions in regard to him. As the *Globe* says: "Mr. Smith does not stick at trifles, and never hesitates to use his wealth for the furtherance of his political objects."

The English news relates almost wholly to Ireland. The contest between the Government and the Land League, or with the tenant-farmers, continues, with the advantages unquestionably on the side of the latter. Every eviction is made at immense cost of money and with the help of a strong force, and the arrests, which are growing numerous, seem in no way to damp the enthusiasm of the agitators. The police can obtain no conveyances for love or money, and the army ambulances and transport wagons have been brought into use for them, and the malcontents have introduced a novelty into warfare by letting loose a swarm of bees on the horses. A proclamation has now been issued warning the people that assemblages intended to obstruct the process of the law will be dispersed by force. But the only way to disperse a large crowd by force is to arrest it—for which, of course, there are never enough police or soldiers—or to fire on it, and the slaughter of unarmed men and women in this way would plunge the Ministry into troubles which would probably cause its downfall. A Liberal Government in England cannot administer martial law in Ireland with rigor or severity. The game of blocking up the roads, breaking down the bridges, and cutting the telegraph wires has now been begun, and it is likely to be very successful as a means of harassing the troops. In fact, the situation is one of the most puzzling with which any government has ever had to deal. It looks more and more as if the Ministry would have done well to dissolve Parliament and go to the country on the defeat of the Disturbance Bill by the Lords. The passage of some such measure stopping evictions, it now clearly appears, was absolutely necessary to the proper preparation and discussion of the permanent Land Bill. The accounts of Mr. Gladstone's health, too, become more and more alarming, and make his early removal to the House of Lords very probable. The Land Bill is making very slow progress in committee, and it is not likely to go faster as the later sections are reached.

The more that is known about the crisis in Bulgaria the more probable it seems that Prince Alexander's suspension of the constitution and dismal account of its working are simply the result of his own inexperience, and impatience, and ignorance. He is simply a young Prussian lieutenant of cavalry, and was selected for the throne because of his family connections, and to earn the good will of Germany. The constitution is too democratic to suit his tastes, and the task of making it work in spite of his tastes is beyond his power. Moreover, he has probably the secret support of Russia in trying to overturn it, the Bulgarian Parliament being just now a very inconvenient precedent for the Czar. The Prince's plan of calling a national convention is meeting with very violent opposition among the people, and it is by no means certain as yet that it will succeed. If it proves a failure he intends to abdicate, and would, it is said, like much to be back in Berlin among his old comrades.

From Russia and France there is nothing new. The whole energies of the Government in the former country are still concentrated on the task of keeping the Czar and his family from being blown up, and there are every day rumors of mines and subterranean galleries, and of arrests in connection with mines and galleries. It is probably the oddest problem of modern politics, and there is not the slightest sign that the Russian Government is mastering it. The Czar is now, except the Sultan, the only sovereign in the civilized world who is holding out for the old absolute monarchy of the last century. All the others have succumbed to the parliamentary system, and he will have to succumb, too, sooner or later.

"POLITICS" AND BRIGANDAGE.

MR. WINDOM has been interviewed by one of our esteemed contemporaries in order to obtain his views on the probable result of the contest now pending at Albany. We are glad to find that, if correctly reported, he holds that Mr. Robertson's appointment to the Collectorship of the port will not in any event cause any change in the method of appointment or promotion in the subordinate offices of the Custom-house now in operation. We hope this expresses Judge Robertson's view also. The Chamber of Commerce of this city last week passed a resolution declaring that this method was of "substantial value to the mercantile community," and is in their eyes of "great importance"; and that "the interest of all doing business with the Custom-house" "demands its continuance and extension," as it has "resulted in more prompt and intelligent attention to the business both of the Government and the merchant." In other words, the merchants of New York do not approve of the use of the public service for "war" or "slaughter," or as a "tomahawk" or "scalping-knife." They do not think that when Judge Robertson comes into control he ought to begin to "decapitate" clerks because they are some one else's friends, or because they have not worked at primaries, or because they have not paid assessments, any more than one of the partners in a banking-house ought to begin to "slaughter" and "tomahawk" the employees when he finds himself left in charge by the departure of the other members of the firm for a trip in Europe. Judge Robertson will take charge of the Custom-house not as a Mandingo chief after a victory, but as a civilized trustee placed over a great business concern, which he is bound to administer faithfully, not for the benefit of any portion of the people, but for that of all taxpayers. The money he collects is the money of the people of the United States, and not of the Republican or any other party. It comes directly or indirectly out of the pockets of *all* who contribute to the support of the Government. Therefore, whatever he does to prevent any money from reaching the Treasury, either by diverting the attention of the employees from their duties, or tempting them to fraud and corruption by party levies on their salaries, which they cannot submit to without privation, or by shaking their confidence in the security of their tenure and thus diminishing their diligence, is in the nature of a fraud on the community. It will differ from a fraud of the same kind committed by the supposed member of the banking-house during the absence of his partners in Europe simply in the fact that there is no one person who will feel it sensibly, or will be authorized by law or usage to call him to account for it.

That Judge Robertson will have the support of the President in maintaining the system now in force we can hardly doubt. The President knows what the conditions of an efficient and honest civil service are, and has expounded them more than once in speech and in writing. His disregard of his own rules and recommendations in the case of Messrs. Robertson and Chandler was, we feel sure, due to a deep and perhaps morbid sense of the importance of "harmony," and he felt that in using the offices to promote harmony he was doing a little wrong in order to do a great right. But he now sees that "harmony" cannot be restored by means of offices, and that any attempt to restore it in this way only increases discord. He sees also that "discord" is not such a very dreadful thing as it seemed at Mentor, when he was in the first emotion of joy and gratitude over his nomination and election; that any man who means to administer a great government honestly must be prepared to meet it as one of the ordinary incidents of his business, just as a sailor meets storms and fogs. He sees, too, that men like Brady and Dorsey and "dear Hubbell," though they have during the excitement of a campaign an air of saving grace about them, are nevertheless very much to be distrusted, and that their tricks and dodges, and devices, and contributions are, after all, vanity and vexation of spirit; and that the only sure reliance of a Presidential candidate is in the honesty, good sense, and high moral ambition of the American people, who like a manly man, that will not whiffle, or quibble, or evade, and is not afraid to look them in the eye.

He must see, too, that the evil which he has himself so vigorously exposed both in Congress, before the Social Science Association, and in the *Atlantic Monthly*, is growing into a national disease, like brigandage in Greece and Macedonia, and must be stamped out if the Government is to remain a civilized government. In those countries brigandage is now, we are told, carried on by joint-stock associations with assessable shares. The capital goes into arms and accoutrements, and the employment of spies, and the preparation of dens and caves. Persons can take shares without actually joining the band, and dividends are paid out of the ransoms of the victims, and assessments are levied on the stock during bad times when the receipts do not meet the operating expenses. Of course the state of public feeling which makes the existence of such associations possible, and which makes the position of a stockholder not incompatible with a lively and demonstrative piety, is a morbid state. In this country every man sees the monstrosity of such schemes for attacks on private property, but with regard to that portion of the revenue of the Government which is paid in salaries there are signs of a moral perversion almost as great among a large class. What other inference can one draw from such utterances as the following from the letter of a Republican Secretary of Committee to the coroner of Chester Co., Pa.?

"Allow me to add, when conveying to you this painful intelligence, the high appreciation I entertain for you personally and for your discharge of the duties incumbent upon you as a public officer, to express to you the deep regret which I, together with the larger portion of the committee, felt on learning that one so intelligent, so patriotic, and so loyal had lost sight of the one great leading and fundamental principle of our free institutions, viz.: To the victors belong the spoils, etc. This maxim, which is graven on the hearts of every member of the committee, we had hoped, when you received the flattering endorsement of our suffrages, was likewise engraven on your own, and would be the Polar Star in the distribution of your large and lucrative patronage.

"To deprive your friends and the party you represent of the benefits of coronial patronage alienates the former and tends to destroy the peace, good order, and dignity of the latter.

"Permit me to suggest that, when obeying the behests of the committee, you confine your removals not to the deputy at Coatesville alone, but, taking a broader and more statesmanlike view of the case, you make it include all of the opposite party in your employ, be they deputies or surgeons."

Whichever way we turn, we find all over the country that any man who is called on by the taxpayers to enter on any work of reform, whether philanthropic, political, social, or financial, finds "politics," which is our name for brigandage, barring his efforts. As soon as he leaves his own house the brigands seize him, carry him into the mountains, and hold him till he either ransoms himself or agrees to resign. They have just elected a new reform Mayor in Philadelphia, and his printed inaugural address lies before us. He declares that he finds "the police" are in "politics," and that, consequently, when "votes are to be secured the laws and ordinances are disregarded, and known and open violators of the most salutary laws go free and unpunished." Moreover, the brigands levy assessments on the police force for political purposes, and he means to stop this too. The Board of Guardians of the Poor, he hints, is in "politics," and so are the Trustees of the Gas-works, and so is the Fire Department. In every city in the Union we find the ordinary business of life carried on by the bulk of the population with fair integrity, industry, and fidelity to engagements; but as soon as we turn to the public business we find it surrounded by a large force of adventurers maintaining stoutly that to this the ordinary rules of Christian morality do not apply; that here the principle of brigandage comes in, and that "the boys" who like better to be out on the mountains and carrying a rifle than hoeing in a field or spinning in a mill, ought to have a chance at the funds. President Garfield is not only a noted civil-service reformer but a religious man, and, we believe, has officiated as a minister of his own denomination. He must feel, therefore, the liveliest interest in having the great public offices of the nation maintained in such a way as to furnish the same lessons in social morality which well-conducted private offices afford. Among these lessons are: (1) That a good education and a good character are the best equipment for an American youth's start in life; (2) that, when the youth has obtained employment, the best modes of keeping it are honesty, industry, and fidelity; (3) that his salary being paid as the equivalent of the labor, he ought, if it is more than he needs for his daily wants, to save the remainder in order to provide for sickness and misfortune, or as capital for another step in life, and ought not to give it away for any but charitable or religious purposes; and even in these cases ought

not to allow the charitable and religious collector to "assess" a certain sum on his income, that being a duty imposed on his own conscience, and not assignable.

We are quite sure these are the doctrines of the Campbellites, as they are of every other Christian denomination; and they are, of course, just as applicable to the custom-house clerk as to the banker's clerk. President Garfield knows very well that in the forum of morals there is no difference between threatening a man with the loss of his situation if he does not give you money he does not owe you, and carrying him off to a cave and threatening his life unless his friends send a ransom. The latter argues greater political disorder in the country in which it is perpetrated, but in a Christian church this distinction is of no importance.

THE NEW AND OLD VERSIONS.

THERE is no more interesting passage in Professor Green's 'History of the English People' than that in which he describes the effect of the translated Bible in transforming the gay and light-hearted England of the Renaissance, the England of Shakspere and Elizabeth, into the austere and serious-minded England of the Puritans—the England of Milton and Cromwell. But the Bible in that day had the field of popular reading all to itself. It may be said to have been the first book which ever reached the English people, and it came to them, as it were, out of the thick darkness of the Middle Ages, and with all the effect of a new deliverance of the Law from the very hand of the Almighty. It is not surprising that it should have for a whole century changed the current of the national history, and have introduced into the English world the new and marvellous force called Puritanism, which has left so deep an impress both on the character and politics of the Anglo-Saxon race. It was all the more powerful in its influence on the popular mind from its reaching it but gradually and what we in these days should consider very slowly. Books were dear, and the art of reading was comparatively rare. But, on the other hand, there were no critics or cavillers. The scholars were all divines and thorough believers, and wherever the Bible went it found no rivals. It had behind it also that reverence for the printed word which has survived among the peasantry in most European countries to our own time. It is only within the memory of the present generation that the argument that one "had seen it in a book" ceased to be conclusive among unlettered folk in England. The new Bible came into a world, too, in which signs and wonders still supplied much of the terror and comfort of life, and in which miracles did not seem very miraculous, and in which the Copernican system had not reached the masses, and in which authority still supplied the standards and tests of conduct. Everything, in fact, was favorable to the literal acceptation of the work of the translators, and to the success of that very curious practice into which the ministers soon fell, of taking verses or clauses of verses containing any sort of proposition, or even ejaculation, and making them "the text" or subject of a long discourse, in which a great variety of suggestions and principles were ingeniously extracted from them. The worship of the Book—for so it may be called—spread into other Protestant countries, and prevailed for a time among the French and Swiss and Germans of the new faith, but with very little of the fervor which marked it in England and afterwards in America. It became in the Anglo-Saxon communities not only a history of the Christian religion and a revelation of the Divine will, but the great comforter in every kind of affliction. Chance openings of it often supplied the solution of puzzling cases of conscience or guidance in perplexing circumstances of practical life. It often stopped bullets in battle even when carried unwillingly in the pockets of unregenerate soldiers. It became the first permanent family register of marriages and births and deaths. It succeeded the Latin authors as the great storehouse of quotation and illustration when plain men began to write and make speeches, as representative government rose on the ruins of feudalism. Hostility to it was during two centuries much the same mark of reaction and obscurantism that hostility to the newspaper press is in our day. It furnished the New-Englanders not exactly with a framework of government, but with principles of government which lasted almost to our own time. In fact, even from the point of view of those who deny it a supernatural origin, its success has been one of the most extraordinary phenomena of modern history. There has been no island of the sea so remote, and no forest so deep, as not to have been reached by the English Bible, for the comfort or distraction or elevation of some colonist or wanderer or outcast. King James's Company of translators performed the greatest literary feat the world has ever seen.

The reception of the new and revised edition which has just been issued is mainly important as furnishing a test of the effect of the decline of faith during the last forty years on the place of the Bible in popular estimation in the English-speaking countries. The enormous sale of it—something wonderful even in this age of enormous sales—is, at all events, the sign of an immense curiosity. There was a widespread expectation that it would put a different face on a great many articles of faith, that it would force theologians to modify a good many of their positions which the assaults of hostile criticism were every day making less tenable, or, in other words, would furnish a Bible suited to the science and morals and politics of our day, as the old one was to the science and morals and politics of its day. It is plain enough that this expectation has been measurably satisfied. As far as our observation has gone, the new translation has been either sternly rejected or received with apology and resignation by the orthodox denominations. In England the High-Church dignitaries are fighting very shy of it. The English press is denouncing it a good deal, but chiefly because it is considered injurious to a very beautiful piece of old English literature. The argument that it is destructive of tender and hallowed associations is a purely literary argument, and evidently comes from men who are more concerned about form than matter. The only rejoicing over it as a theological triumph is heard from the Unitarians, who have no difficulty in citing a long list of changes which accrue to their benefit. Then it must be confessed that the very great publicity given to the sources of the text of the New Testament and the half-dozen imperfect manuscripts, mostly of unknown origin—none dating from much less than four centuries after Christ, a period equal to that which separates us from the Wars of the Roses and the fall of Constantinople—is not calculated to strengthen the popular faith in the authenticity of the book as revelation. King James's translators had no such difficulty to contend with. The sources of their perplexity as scholars were not published far and wide, and were not examined and commented on by malevolent critics. The very frankness with which the differences of opinion that have revealed themselves between the translators of the new version are spread out on the record in marginal annotations and appendices, is likely to diminish the weight of the triumphant renderings. It is a sort of laying bare of the *arcana imperii* such as has never yet been made in religious history, and its effect can hardly but be injurious to the authority of the Scriptures. Ecclesiastical opponents, too, are indulging in the somewhat suicidal course of assailing the reputation of the revising Company on both sides of the water as scholars, and of pointing out how many as good or better critics did not share their labors and probably dissent from their conclusions. This, if true, must, of course, diminish popular reverence for King James's version also, because if great questions of faith are to be settled by verbal criticism there can be no doubt that even the mediocre scholars of our day are better equipped for such work than King James's divines were.

In fact, it is difficult to see in what way the new version strengthens the hold of Christianity on the popular mind, either in England or America. The very discussions which it is provoking are revealing differences of opinion between ministers and churches which are not edifying, and which are likely to become more and more acrimonious as the struggle between the two versions for acceptance in the various denominations goes on. Of the gain to mere literature there can be no question. If correctness of translation be of any value either to narrative, or exhortation, or exposition, or poetry, the new version is almost certainly an advance on its predecessor. As to the loss of certain familiar phrases, of which much complaint is made, it must be remembered that this is a loss which will be only felt by this generation, and that what we now lament as old and hallowed was new and strange to the ears on which it first fell. Even if the changes are as numerous as is alleged, most of them are trifling, and the whole put together will make no perceptible difference in what may be called the ring of Scriptural

phraseology. Both the Old and New Testaments are still, and will probably always remain, the most moving English ever written. Its beauty as English is, to a certain degree, lost on most of us by familiarity with it at an age when style is still an unfelt force. Probably those only can appreciate it thoroughly who take up the Bible for the first time after reaching mental maturity. So that it may be said that the less the English Bible is used as a religious text-book the stronger is its hold likely to be on the popular mind as a great literary monument. There is no chord in the human heart which it has not touched, and will not touch to all time. There are passages which "beat to battle" like a drum, and others, again, which flash kindly light over the most hopeless misery and weariness.

ENGLAND AND TUNIS.

LONDON, May 20, 1881.

THE Conservative party have made their choice of a leader, and at a meeting of peers held a few days ago it was announced to have fallen upon Lord Salisbury. Many stories are current as to the secret intrigues which have led to this result, but it is sufficient to indicate the main causes that were at work and the consequences which the selection is likely to have. The difficulties of appointing a chief for the party in both houses of Parliament and in the country were so great that it was decided to choose a leader for the House of Lords only, and leave to the logic of events or to the summons of the Crown to determine who should ultimately take the supreme authority in the whole party. Thus Sir Stafford Northcote's claims were disposed of without being rejected. Then Lord Cairns was set aside, partly from the natural jealousy which the Peers feel towards a new man who made his way as a lawyer, partly because he is a very pronounced Low-Churchman; and the High-Church section of the party, influential by its activity even more than by its numbers, refused to follow him, thinking that if he came into power as prime minister he would exercise his church patronage, and especially the right of nominating bishops, to their prejudice. This is a curious instance of the way in which our ecclesiastical questions affect politics, determining men's sympathies even when no precise issue has arisen on which a decision is required. The choice then lay between the Duke of Richmond and Lord Salisbury. The latter is unquestionably the abler man of the two—not, perhaps, the wiser, but possessed of more showy gifts, of greater energy, and much better known to the whole country. He had played a far more conspicuous part in the late Tory Government, and is credited by a more genuine ardor for the distinctive principles of the party—resistance to changes in the distribution of political power, the maintenance of the authority of the House of Lords, and an energetic—not to say aggressive—foreign policy. Thus his selection is looked upon as a triumph for what the Liberals call Jingoism, as an evidence that the tendencies which appeared in the Afghan and Eastern policy of Lord Beaconsfield are still in the ascendant among the Tories. The very fact that Lord Salisbury had drawn on himself so much of the hatred of the Liberals, that he had been so constantly attacked by them as the representative of what they most disliked in the recent developments of Toryism, commended him to the more vehement spirits in his own camp. There is, therefore, every reason to expect a period of continued bitterness in our political struggles, an uncompromising defence of aristocratic privileges and the "rights of property," and especially a bold advocacy of the right and duty of England to interfere actively in the affairs of the Continent of Europe.

Those affairs continue to wear a disquieting aspect. Just when the question of the Greek frontier seemed to be approaching a solution, for it cannot be said to have reached that solution until the cession of territory has been actually accomplished, a new source of danger arose in the French expedition against Tunis, which so speedily resulted in the submission of the Bey and the establishment of the protectorate of France over his territories. On the motives of France nothing need be said here: probably your readers understand them as well as we do. But the result has been to excite angry feelings in Turkey, and to throw the Sultan even more into the arms of Austria and Germany than before, and to make him no doubt less disposed to comply with the demands which the six Powers have still to make for the execution of the remaining articles of the Treaty of Berlin. The irritation in Italy has been such as to cause the fall of a ministry, and may probably produce a lasting coolness, not to say enmity, between her and France. She conceives herself menaced by the establishment of French dominion and a basis of French naval operations within so short a distance of Sicily, and she has, strange to say, a sentimental idea that Tunis ought to belong to her, because the conquest of Carthage was one of the first and greatest exploits of Rome. This alienation of Italy from France may have very important effects in disturbing the existing relations and harmonious action of the great Powers. Here, in England, public feeling has been much less moved, yet somewhat disquieted. There are certain newspapers and politicians who conceive British interests to be endangered by the establishment of France in a strong position in the centre of the southern coast of the Mediterranean, just where a comparatively narrow channel connects its eastern and western expanses, and not very far from our great naval fortress of Malta. This, it is said, will constitute a menace to the highway to India; will render our position in the Mediterranean no longer one of supremacy; will place Malta itself in danger. In Tunisian territory, at a place called Biserta, near the angle of the African coast, there is a large inlet which is capable with some expenditure, variously estimated at a few hundreds of thousands or a few millions of pounds, of being rendered an impregnable harbor and arsenal. It is suggested that France will forthwith spend the requisite money and gain a position from which she could not easily be dislodged, and whence she would, in case of war, be able to annoy us almost with impunity. This line of argument was actively taken up in the Conservative press and House of Commons. Reproaches were levelled against the Government for its apparent apathy in not interfering, in standing quietly by while France violated, it was said, the public law of Europe, deprived the Sultan of a dependent state, and settled herself in a place where she could seriously injure us. The military and naval world began to catch fire; there was a revival of the spirit we had been so familiar with during the early stages of the Afghan war.

Mr. Gladstone's Ministry refused to give any answer or express any opinion on the matter until they could produce the various despatches and other diplomatic communications relating to the conduct of France, and asked to have the discussion put off and judgment suspended till after these should have been printed. During the last few days the papers have been appearing at intervals, and have suddenly changed the whole face of the question. They show that in 1878, at the time of the Congress of Berlin, various conversations took place between Lord Salisbury, who was then our Minister of Foreign Affairs, and M. Waddington, who represented France at the Congress. Tunis, and French claims or designs on it, came up for discussion. Lord Salisbury declared that England had no interest in the matter, certainly none which could interfere with the plans of France. Italy might have, he said, and he did not profess to answer for her feelings. But so far as England was concerned, a French protectorate was unobjectionable, and if France were even to think of annexing Tunis, why should she not? It would be a good thing for the people. M. Waddington afterwards in correspondence referred to these declarations, and Lord Salisbury, though his despatch softens them off a little, substantially admits the accuracy of the French version. The revelation at this crisis of the language held by the English Foreign Minister, now leader of the Conservative party, three years ago, when England was supposed to have been at the highest point of her European prestige, has signally affected public opinion. It has shown how difficult it would be for the present Government to oppose the action of France, since the latter can at once silence us by pointing to the sanction which Lord Salisbury gave to her designs. (We are, of course, obliged to accept the principle of continuity in our dealings with foreign states, and to hold ourselves bound by previous declarations of our ministers, even when we disapprove them.) And it has also proved that the late Government, with Lord Beaconsfield at its head, did not think a French occupation of Tunis to be a matter which touched our interests or need cause us any uneasiness. Now, inasmuch as the late Government was exceptionally alive to British interests and British honor, their deliberate conclusion that North Africa was indifferent to us gives some reason to doubt the soundness of the view now put forward as to the significance of the French movement. Lord Salisbury's reputation for foresight has, no doubt, suffered a further shock; but the result is, and probably the result would in any event have been, that England abandons all idea of active interference. France has been told that we do not like either the arrangements she has made or the violent way in which she has made them; but the matter is one far too small for war, or even for a diplomatic rupture. It may cause some coolness, but the most serious result is the distrust with which it has inspired people as to the character of the policy of the Republic. The party in England which chiefly sympathizes with republicanism had persuaded itself (on slender grounds, no doubt) that France had bidden a long farewell to the aggressive militarism of the Second Empire, and was bent solely on the peaceful development of her internal resources. An expedition to chastise the Kroumirs would have been natural enough, but now that it has become plain that the Kroumirs were a mere pretext, and that the object of French policy was to obtain such a supremacy over Tunis as would exclude Italian influence, and virtually annex this rich and well-placed territory to Algeria, the resemblance to our unfortunate attack upon Afghanistan strikes everybody, and, while it makes us feel that we cannot cast stones at France, shows us also that a republic need not be any more moderate or scrupulous than the aristocratic party in our own country showed itself when, three years ago, it launched the Afghan war. Of course those who have watched the question know how sensitive the French have long been upon the subject of Tunis, and how great was the temptation to possess themselves of terri-

tories so desirable and so defenceless. The thing was sure to come. But it is another sign of the restlessness of the military Powers, and adds, by estranging Italy, another element of danger to the European situation.

After a debate of four weeks, two nights in each week, or eight nights altogether—a debate redeemed from dulness only by a speech of Mr. Gladstone's, delivered on the seventh night—the House of Commons has just divided on the Irish Land Bill, and carried it by a majority of two to one. The result surprised everybody, for though it was known that most Liberals and some Conservatives would vote for it, no such overwhelming victory was predicted. Even two hours before the division people talked of a majority of 110 or 120, or 140 at the highest, and when it was known that the majority had reached 176 the cheering was endless. How this result came about, and what are now the prospects of the bill, are matters which must be reserved for another letter. Its passing is by no means assured, so many and so various are the dislikes felt to it by the extreme Irish party, led by Mr. Parnell, as well as by the Tories. All Mr. Gladstone's skill will be needed to steer it through the rocks and shoals that lie round its course, and unfortunately his health has been lately disturbed by attacks, slight in themselves, but sufficient to cause uneasiness in the case of a man who has entered his seventy-second year, and who does not seem to know how to spare himself and reserve his strength for great occasions only. Y.

AN AMERICAN ARCHÆOLOGICAL INSTITUTE.

ROME, May 1, 1881.

AS there has recently been some talk of establishing at Athens or Smyrna an American Institute for the training of archæologists and as a permanent committee for archæological research and correspondence, will you allow me, who am deeply interested in the matter and believe it to be of prime importance for the future of classical scholarship in our country, to give a very brief account of the archæological institutes already established by other countries with like aims? These institutes are two, the German *Institut für archaeologische Correspondenz*, whose seat is at Rome with a branch in Athens, and the *École Française d'Athènes*, which has a branch in Rome. I will speak of them in order.

1. Founded in 1829 as a private society, and under the auspices of the Crown-Prince Frederick William of Prussia, by Blacas, Bunsen, Fea, Gerhard, Kestner, Millingen, Nibby, Panofka, Thorwaldsen, and Welcker, the Institute, in spite of its originally very cosmopolitan constitution, gradually gravitated toward Prussia, and when, in 1871, that country took the lead in Germany, it was formally adopted as an institute of the Empire. It then received a constitution, of which the following is a brief abstract: The purpose of the Institute, which has its domicile in Berlin and its permanent abodes at Rome and Athens, is, in matters of archæology and philology, to keep alive and regulate the relations between learned investigation and the ancient seats of art and science, and to publish as rapidly and fully as possible all new discoveries of remains of the Hellenic world. It is a corporation and has a private seal. Its direction is entrusted to a board, which holds its meetings in Berlin, and consists of eleven life members, of whom five are regular members of the Royal Prussian Academy of Sciences, chosen by the philologico-historical class, two residents of Berlin not belonging to said Academy, and four residents of other parts of Germany. The board chooses its own president, who has the privilege of a casting vote. It is also the legal representative of the Institute. The duties of the Board of Directors are: 1, to nominate to the Emperor persons proper to fill offices of secretaries in the institutes at Rome and Athens; 2, to provide for all extraordinary publications; 3, to take charge of the library and the regular publications of the institutes at Rome and Athens, and to send thither all necessary instructions; 4, to confer diplomas; 5, to assign scholarships; 6, to examine the publications of the Roman and Athenian institutes, and lay them before the Secretary for Foreign Affairs; 7, to make reports to the Royal Academy of Sciences, which, when called upon, is ready to make proposals and tender advice. The duties of the secretaries, who are imperial officials, and of whom the Institute at Rome has two, that at Athens one, are: 1, to edit the publications of their respective institutes; 2, to make all necessary arrangements with Greek and Roman publishers and booksellers; 3, to give advice to the home board of directors in regard to the conferring of diplomas and the disposition to be made of the reserve fund of the Institute; 4, to report, before the first of February of each year, the work accomplished by the Institute in the previous year; 5, to call regular meetings of their respective institutes once a week throughout the winter, and special meetings on Winckelmann's birthday and the day of Rome's foundation, and also to provide for lectures to be read at the same; 6, to aid all Germans studying in Rome and Athens in deriving proper benefit from all the museums and antiquities in these cities; 7, to manage the finances of their institutes, as well as the library and all apparatus belonging to them.

The Institute publishes in Berlin an archæological journal (*Archaeologische Zeitung*) and appoints its editor. It also confers, through its Board of Directors, diplomas of three grades—honorary, regular, and corresponding membership. The library of the Institute, both at Rome and Athens, is open, free of charge, to all scholars and artists who come properly recommended. A sum of money is annually set apart for the purchase of books, and this is expended by the resident secretaries according to their own pleasure. The apparatus of the Institute is under the charge of the secretaries, who are bound to make it as useful as possible to all scholars desiring to use it. Journeys are undertaken by members of the Institute, and sums of money are set apart for that purpose. Longer and more important journeys have to receive the sanction of the Board of Directors.

The property of the Institute consists of library, apparatus, furniture, a fund contributed by the state, the stock of publications, and a reserve fund. This last is employed for special purposes—excavations and the like—and is usually expended in accordance with the suggestions of the Roman and Athenian secretaries. Sums given or bequeathed to the Institute are applied in accordance with the resolutions of the Board of Directors. In order to impart life and reality to archæological study, and to train professors for universities as well as directors for museums and the Institute itself, there are five travelling scholarships of the annual value of 3,000 marks each. Candidates for these must have taken a university degree three years before they can be appointed, and must show that they are prepared to undertake the work expected of them. Their applications must be accompanied with copies of all their previously written works. Their duties are, during their stay in Rome or Athens, to attend all the meetings of the Institute, and at the end of the year to send to the Board of Directors a full report of what they have accomplished.

2. The French School, which was founded in 1846, and which for the last few years has had a branch in Rome, is under the authority of the Minister of Public Instruction, the patronage of the Minister for Foreign Affairs, and the scientific direction of the Academy of Inscriptions and Belles-Lettres. It is managed by a director, who must be either a member of the French Institute or a superior functionary of public instruction, and who is appointed by a decree for a term of six years. Candidates for appointment as members of the School must be under thirty years of age, and either doctors of literature or *agrégés* of literature, grammar, philosophy, and history. They are examined in Greek, ancient and modern, the elements of epigraphy, palæography, and archæology, and in the history and geography of ancient Greece and Italy. Drawing is also taken into consideration. This examination, which is partly oral and partly written, is conducted by a committee of seven persons appointed by the Minister of Public Instruction, in accordance with a programme prepared by the Academy. The members of the School are appointed by the Minister of Public Instruction, in accordance with the result of this examination; their number is six, and their mission lasts three years, one of which is spent in Rome. Every member of the School of Athens is bound to send to the Academy, through the Minister of Public Instruction, before the end of each year, an original memoir, to be submitted to the judgment of a special commission, which judgment is communicated to the Academy and published in its annual report. The Academy at its annual meeting announces the subjects for researches and memoirs which it has recommended to the School for the coming year. The members of the School, through the medium of their director, report to the Academy all archæological discoveries they make or hear of, and the memoirs written by them are published by the Minister of Public Instruction on the recommendation of the Academy of Inscriptions and Belles-Lettres.

It will be seen from what has been said that the two institutions, though differing considerably in form of government, have practically the same aim and the same modes of working. Both are represented by schools in Athens and Rome; both are under the direction of a home committee of scholars, and enjoy the patronage and support of the Governments of the countries to which they respectively belong; both send out young men, thoroughly prepared and examined and provided with scholarships; both demand from the young men original work; both have provisions for making original researches and, if need be, excavations; both are instruments in the hands of the most learned society in either country.

The question now arises: How far can or should we adopt the means which France and Germany, the two nations especially devoted to archæological research, have found most serviceable? It appears to me that only one answer is possible. We ought to adopt them as far as circumstances will allow. From want of museums and native archæologists we have thus far been obliged to depend for our knowledge of archæology mostly upon books, which knowledge, consequently, has been deficient in direct, living interest. It is unfortunate, moreover, that we have been obliged to adopt so many conclusions in history and archæology from the Germans, who, with all their wonderful patience and power of research, are very frequently most untrustworthy in their conclusions. In order to free ourselves from the bad results of their rash methods, we must send our young archæologists to live in the native lands of ancient art, to see its products with their own eyes, and to judge of them with their own faculties. For this end the most obvious provision would be the

establishment in these lands of an archæological institute, similar to those of France and Germany. Inasmuch, however, as it could not, like them, easily be connected with the Government, it must be a matter of private enterprise. It ought, on the other hand, like them, to be an instrument in the hands of the most learned society or societies in the country. Perhaps a feasible programme for such a school would be the following: That the institution should be called the *American Archæological School*, and have its seat at Smyrna; that it should have its domicile in Washington or New York, and be managed by a home board of directors composed of men closely connected with the leading universities, museums, and societies of architects; that this board should be self-recruiting; that it should manage all the financial affairs of the school, determine all the tasks to be undertaken by it, examine all candidates for membership, and receive, examine, and, if they see fit, publish all memoirs presented by members; that the leading institutions of learning in the country should be asked to confer, once in one or two years, a scholarship upon one of their most promising classical honor men, with the condition that he should take advantage of the school and conform to the regulations of the board of directors; that the school should be presided over by a first secretary, who should be well versed in Greek, ancient and modern, Greek history, epigraphy, and archæology, assisted by a second secretary, who should be an architect and draughtsman; that these secretaries, besides managing the school, its library and apparatus, should give all needful instruction to the younger members, superintend all undertakings entrusted to the school, purchase antiquities for museums at home, and publish a quarterly archæological journal; that each student of the school should be bound at the end of each year to lay before the board of directors, through the first secretary, an original memoir on some archæological subject, or subject thereto closely related; that he should acquire a fluent use of modern Greek, and, in connection with all tasks undertaken by the school—excavations and the like—perform the work assigned to him; that the school, as a whole, should be a standing committee of research and excavation, working under the direction of the home board.

Considering the enormous advantages which France* and Germany have derived from their archæological schools, I cannot but believe that a plan something like the above would lead to most desirable results. It would supply the materials and opportunities for archæological study; it would educate persons to make use of these; it would afford a chance for original investigations and excavations; it would give museums and private persons with means an opportunity to carry out special researches and obtain antiquities, and, finally, it would gradually create a public interest in archæology.

As to the cost of such an institution, after thoroughly examining the question in connection with the French and German schools in Athens, I find that there would be required $5,000 at the start to lay the foundation of a library and obtain the most necessary apparatus, and about $6,000 a year afterwards —$2,000 as salary to a first secretary, $1,500 as salary to a second secretary, $1,000 for house-rent, and $1,500 for library, apparatus, and printing. All excavations, etc., would have to be paid for out of a fund derived from gifts, bequests, or sums given by museums or private individuals for special purposes. The secretaries and other members of the school ought to have their rooms free, but find their own furniture and board. In the French School at Athens all the students take their meals in the building, hiring their own cook and waiter; those of the German Institute board outside. The former plan is preferable.

It may be asked, Why establish your school at Smyrna, and not in Athens? The reasons are various, but the most important are, that the country around Smyrna offers a much more promising field of research than that near Athens, or, indeed, than any part of Greece; and that Asia Minor, being still in Turkish hands, we should be able to obtain for our museums a part, at least, of the antiquities we might discover. One of the scholars who superintended the recent most successful excavations at Pergamon says: "What an endless field, virgin and uncultivated, does Asia Minor offer to our investigators and scholars! Wherever the peasant puts his plough into the soil, wherever after a shower the village children search in an old ruin, there are found relics of the old world, which thus appear only to disappear again for ever. Of the interior of the country scarcely anything is known. In Greek Asia Minor we could fill museums." In truth, Smyrna is the spot where could be studied with greatest advantage the relations, historical, political, literary, philosophic, and artistic, between Greece and the Orient. Sardis alone would, if excavated, solve more problems than Nineveh, Babylon, or Thebes. It was there, in the Lydian capital, that East and West met and influenced each other. There lies the key to many a dark problem in Greek mythology and art, and, in all likelihood, also to the whole great question of Etruscan civilization; for, not only the direct testimony of Herodotus, but likewise every fact we know about them, proves the Etruscans to have been emigrants from that region. The great Lydian civilization is thus far a book with seven seals, and yet it is by no means improbable that both Homer and the heroes whom he celebrates belonged to it.

In conclusion, let me say that, in my opinion, it would be well to establish the proposed school, first tentatively for five years, and then, if it proved a success, to erect a permanent building, and raise a fund sufficient to place the institution upon a firm footing. A building would probably cost from eight to ten thousand dollars (the French school at Athens cost $8,000), and a fund of $150,000 would, I believe, meet all further requirements.

THOMAS DAVIDSON.

* Rev. W. Wolfe Capes, in an article on the *Ecole Française* in *Frazer's Magazine*, says: "We shall find upon its roll the names of nearly all the French authors who have since done anything for classical antiquities or art. MM. Fustel de Coulanges, Perrot, Foucart, Dumont, Wescher, Heuzey, Burnouf, Gebhart passed a year or two as members of the School." The above list could easily be added to.

Correspondence.

THE BESSEMER STEEL MONOPOLY.

TO THE EDITOR OF THE NATION:

SIR: In the reply of "E. C. F." to my communication on the Bessemer steel-rail question he states that my doubly-protected monopoly is a "myth," and that "the manufacture of Bessemer steel is as free in the United States as the manufacture of cotton cloth." If such is the case it must be either that there never were any patents covering the industry, or that such patents have expired. We can dismiss the first supposition at once. The second one "E. C. F." evidently wishes the reader to infer, but he is guilty of disingenuousness in giving a very meagre amount of information in the case he quotes, and in giving that little so as to lead the reader to draw an incorrect inference. If I may again trespass on your space I will add a few lines to what I have already said.

The generic term Bessemer steel denotes a steel made essentially by blowing air through molten pig-iron, in a vessel called a converter. In addition to the original patents a number of others have been taken out by Bessemer, Holley, Thomas, and others, covering the buildings, machinery, and modifications of the process, all or nearly all of which have been secured by the Pneumatic Association. But a few months have passed since it paid Thomas and his associates $275,000 for what is known as the "basic process," by means of which ordinary pig-irons made from the general run of ores can be made into Bessemer steel. Before this process was invented only pig-irons made from ores of exceptional purity—and therefore comparatively scarce—could be used. It is well understood that the Pneumatic Association does not intend to issue licenses under this patent for any royalty it would be possible to pay; and this same policy it has pursued with all its patents, so that it has completely and absolutely controlled the domestic manufacture of Bessemer steel rails. But some of the original patents having very recently expired, the Pittsburgh Bessemer Steel Company have been able to commence this spring the manufacture of Bessemer steel rails. When I wrote I knew this company had started, but supposed it was making Bessemer blooms only, as the Directory of the Iron and Steel Association for 1880 stated the works were building and the product would be Bessemer blooms; and in the recent notices I saw of the works having commenced operations no allusions were made to steel rails being produced.

But, after all, wherein are the merits of the case at all affected? It is undeniable that the Pneumatic Association have entirely controlled this industry for a term of years up to a very recent date, and at present still cover most of the ground by existing patents, so that the business is by no means open to all.

The wrong, however, is not on this side of the question. The ownership of the patents carries the right to grant licenses on such terms as the owners see fit, or not to grant them at all. But after having had ample protection under patents which have proved exceptionally profitable, the imposition in addition of a tariff which amounts at the present writing to almost 100 per cent. is certainly a monstrous abuse. I compared the duty on steel rails with that on iron ore to show the gross inequalities of the tariff—the doubly protected finished product getting a duty of nearly 100 per cent. and the raw material but 20 per cent. But the steel ring buys ore while it sells Bessemer rails. One would suppose that their disinterested love for American labor and their extreme anxiety to provide a home market for the American farmer, which these highly-favored gentlemen have so often proclaimed, would lead them, for the sake of principle, to patronize domestic ore dug by home labor, to the entire exclusion of the slightly cheaper foreign article dug by pauper labor. But consistency does not seem to be one of their many virtues.

While not essaying to give technical instruction, I believe I have stated the case fairly, and that "my facts" are substantially correct. If "E. C F." needs further information I shall be happy to give it to him privately, as I have already occupied too much of your space; but I will assume he bears such a relation to one of these eleven favored corporations as to make it unnecessary.—Yours truly,

COMO.

PHILLIPSBURG, N. J., June 3, 1881.

ASSYRIAN INTERPRETATION.

To the Editor of The Nation:

Sir: In the article in the *Nation* of April 28, upon English Assyriological studies, I find a criticism on Mr. Budge's preface to his 'History of Esarhaddon,' in which allusion is made to his copying from Smith's 'Assurbanipal' the account given of the subjugation of Tirhakah, and to his following Smith even in some of his mistakes. An instance given is the translation of a certain phrase ('Assurb.,' p. 17, line 2), "I was walking," instead of "by a long journey." But neither version is correct. Smith translates: "I was walking round (*al-la-ku ha-an-tu*) in the midst of Nineveh." To make *ha-an-tu* mean "round" is evidently only a guess. It does not seem to be much better with the other explanation. The word in question means swift, rapid. It occurs besides in Smith's 'Assurb.,' 157, 2 (where one of the syllable-signs is wrongly transcribed), the true translation there being, "with the blade of the swift sword . . . I will destroy their lives"; also 'Assurb.,' 18, 7, where we should render, "for the speedy succor . . . I went down"; also in 'Assurb.,' 38, 8, in an adverbial form, "speedily they marched down." The form *hantu* is for *hamtu*, and the Semitic root *h-m-t* means "to hasten," as Prätorius has shown in the *Zeitschrift d. deutschen Morg. Ges.*, xxviii. 88 f. I take the liberty of making these observations as there is no complete Assyrian dictionary to which students can appeal. Norris (ii. p. 421) has but one citation for the word, which he translates "powerful."

J. F. McCurdy.

Princeton, N. J., May 4, 1881.

[The translation suggested for *hantu* is plausible, and is supported by the authority of Lenormant, who translates the passage cited from Smith's 'Assurbanipal,' p. 157, line 2, "swift sword," as does Professor McCurdy, and who also refers the word to the root *h-m-t*. See 'Études sur quelques parties des syllabaires cunéiformes,' p. 161, cf. p. 238. To the same root might be referred the word *hitmudis*, Smith's 'Sennacherib,' p. 132, line 9.—Ed. Nation.]

THE DECLINE OF CULTURE.

To the Editor of The Nation:

Sir: In your last number of the *Nation* (831) I notice a letter in which attention is called to the decline of culture, and it is asserted, "That the number of those persons who may fairly be called well-informed, well-read, etc., is fast decreasing, is shown most conclusively by the state of the book-market and by the reports of the public libraries." If the better class of magazines "have actually disappeared from the market," I do not see that it follows that they are less read; they are invariably to be found at all reading-rooms and public libraries, where they are much sought. Is not the disappearance from the market to be attributed to the largely increased number of institutions which make publications of this kind freely accessible, rather than to any falling off in the number of readers; may there not even be an increase in the number of readers notwithstanding the diminished market? As regards books on political economy, finance, and statistics, those, too, are accessible through the libraries, and I find no proof that the interest in this class of subjects has diminished; on the contrary, the establishment of societies for propagating knowledge on these subjects would seem to indicate that it has increased. It seems to me, therefore, that the foregoing premises hardly justify so mournful a conclusion as that of the decline of culture, and that so sweeping a statement is hardly warranted by the facts. S. M.

New York, June 3, 1881.

'THE YOUNG NIMRODS.'

To the Editor of The Nation:

Sir: A review of 'The Young Nimrods in North America,' in the *Nation* of yesterday, contains the following:

"Mr. Knox, in his introduction, states that the 'adventures of George and Harry are quite within the range of easy probability,' but a perusal of the book convinces us that it contains no more improbable statement than this. The boys whose experiences are narrated begin their exploits in the woods of Maine, where, under the care of a benevolent and accomplished doctor, they take their first lessons in woodcraft, and kill a bear and a moose. Afterwards, by rapid transition, they catch blue-fish and sharks in Great South Bay, try a few weeks' sport in the Adirondacks, then speed to the West, where buffaloes and Indians are successfully encountered, and wind up the season with a short trip to California overland, and some successful whale-fishing."

Your reviewer must have fallen upon a spurious issue of 'The Young Nimrods in North America.' In the volume written by me, and published by Harper & Brothers, the youthful heroes, George and Harry, are present at the killing of a bear, but take no part in the slaughter; they do not kill a moose, and do not even see one. They catch blue-fish near Great South Bay, but they do not catch a shark, and their only connection with the whale-fishery is to hear stories about it, and witness from the deck of a steamer on which they are passengers the capture and "cutting-in" of a whale.

Leaving your reviewer to the undisturbed enjoyment of his opinions, I ask, as a matter of justice, the correction of the above misstatements of fact.

Respectfully,

Thomas W. Knox.

New York, June 3, 1881.

[This confirms what we said about the confusing effect of Mr. Knox's narrative. In the case of the moose, it is true that only a story about hunting the animal is introduced. In the other instances our language was as correct as it would be for a passenger on a steamer to report "We rescued the crew of a sinking vessel," although he took no part whatever in the affair except that of a spectator.—Ed. Nation.]

Notes.

E. Steiger announces an abridged edition of Kiddle and Schem's 'Cyclopædia of Education,' published four years ago. The smaller and cheaper work will be called a 'Dictionary of Education and Instruction'—a somewhat redundant title for an abridgment. We should have been glad to have a promise that the serious omissions of the 'Cyclopædia' would be measurably repaired in the 'Dictionary,' and that the statistical portion would be brought down to date.——The late Mrs. H. C. Conant's 'Popular History of English Bible Translation' will be published in a revised edition, with additions to the present time, by I. K. Funk & Co. Dr. Conant, who edits the work, is the husband of the author, and was a member of the American Bible Revision Committee.——G. P. Putnam's Sons will, by arrangement with Messrs. Trübner, publish an American edition of the 'Autobiography of Mark Rutherford,' reviewed in our last issue.——Mr. Christern sends us the volume of Talleyrand's 'Correspondance inédite' which formed the subject of our last Paris letter; and also the new volume of Taine's 'Origines de la France Contemporaines: La Révolution: Tome ii., La Conquête Jacobine,' of which we shall speak fully hereafter.——The English version of Pallain's Talleyrand reaches us simultaneously with the original in a cheap edition bearing the imprint of Charles Scribner's Sons. A steel portrait serves as a frontispiece. The uniform reprint of the late Horace Bushnell's writings, in progress by the same firm, now includes that author's 'Work and Play' and 'The Moral Uses of Dark Things'—two very popular "literary varieties."——Karl Hillebrand's criticism of contemporary France, written mainly in 1872, but revised later, has already been translated into French, and now an English translation has been made from the third German edition, 'France and the French in the Second Half of the Nineteenth Century' (London: Trübner & Co.; New York: Scribner & Welford. 1881. Pp. 261). It is careful, and has apparently been scrutinized by the author himself. Perhaps it would have been better to leave fewer French phrases in the text.——John Wiley & Sons have added to their list of text-books 'The Elements of Plane Analytic Geometry,' by George R. Briggs, Tutor in Mathematics in Harvard University, which treats the subject in as clear and simple a manner as probably it is capable of being presented. If we were inclined to find any fault with the book it would be that Mr. Briggs seems to have avoided general views with a scrupulous care not required even by freshmen. For example, in the chapter on Conic Sections we find no allusion to the beautiful manner in which Boscovitch embraces the three curves in a single definition.——Mr. Thomas W. Knox's 'How to Travel' (Boston: Lee & Shepard) is the product of wide experience in all parts of the globe, American adaptability to circumstances, and, of course, American humor. It is sound and shrewd in its advice, and can be read pleasurably even by those who are chained to their own firesides. A lady furnishes special instructions for her sex, and a lawyer gives some useful legal hints. The chapter "Travelling without Money—Round the World for $50," is a warning, not a false guide. Pedestrianism is provided for, but not horseback journeys.——The 'Manual of Wood-working Tools,' just published by Ginn & Heath for the Boston Industrial School Association, is a model of clear and concise directions, while the illustrations have been most carefully prepared, with the aid of photography, even to the general attitude of the body.——Ex-Secretary Schurz's visit to Boston in March has been commemorated, by the Executive Committee of the dinner which brought him there, in a handsome volume with an artotype portrait.—MM. Édouard Noël and Edmond Stoullig have put forth the sixth volume of their 'Annales du Théâtre et de la Musique' (Paris: Charpentier; New York: F. W. Christern), as full of interesting matter as its predecessor, and like that, indeed, altogether too full, containing seven hundred and fifty pages. As usual, the few English and American names are

sadly mangled by the types. The preface this year is by M. Victorin Joncières, a composer of maturity, although scarcely known out of France; he advocates again the establishment of a third musical theatre in Paris.——The same publisher issues the second series of Zola's collected dramatic criticisms, under the title of 'Nos Auteurs Dramatiques.' Under the name of each author are gathered the articles written by Zola in the *Bien Public* and the *Voltaire* when the plays of the dramatist were revived or produced. It is very much the best of the four or five volumes of polemic criticism which M. Zola has recently put together. Due allowance made for the personal equation, he does not give an unfair view of the present French drama.——Trübner & Co. have published a 'Grammar of the old Friesic Language,' by Adley H. Cummins, of which the preface is dated at San Francisco. Koolman's 'Wörterbuch' of the living East Frisian dialect proceeds with its usual deliberation, having not quite cleared the letter K with its twelfth *Heft* (Norden: Braams). The dry bones of etymology are larded with curious proverbial and idiomatic examples, which do not spare the vulgarest phases of common life. Under *Kraie* we find "'De tîden worden alle dagen schlechter, sä' de kreie, as sê sag dat de galge ofbraken wurr'" (The times get worse every day, as the crow said, on seeing the gallows broken down.)——The thirtieth meeting of the American Association for the Advancement of Science will be opened at Cincinnati on the 17th of August, in the Music Hall. The composition of the local committee ensures a hospitable reception. The Association desires to raise the sum of three thousand dollars to reprint several volumes of its Proceedings.——The *American Art Review* announces an *édition de luxe* of the publication, each monthly part to cost $7 50, to be sold only to subscribers, and five hundred copies only to be printed. The number for May contains Mr. Riordan's second paper on "American Stained Glass," and, as an illustration to a review of the late Academy Exhibition, a woodcut by Mr. Closson of Mr. Fuller's "Winifred Dysarte." This is one of the finest things that have been done in the way of reproducing particularly elusive effects by wood-engraving. Any dissatisfaction with the plate must be referred to Mr. Fuller, whose work is here absolutely reproduced in black and white.——Entrance examinations for Cornell University have been appointed in Boston, Cleveland, Chicago, Washington, and in this city (at 146 Grand Street), for the three days beginning Tuesday next.——We regret to report the death, at the age of sixty, of Mr. Joseph Sabin, the veteran old-bookseller of this city. His monument is his unfinished but invaluable 'Dictionary of Books relating to America, from its discovery to the present time.'

—Somewhat unexpectedly, one of the most interesting and satisfactory articles in the Smithsonian Henry Memorial Volume is by Henry himself: we refer to the letter at page 149, written to a Princeton friend in December, 1876, recounting his scientific researches while connected with the College of New Jersey during the years 1832 to 1846. The remoteness of the epoch, the infancy of exact, experimental science, and the breadth and originality of Henry's researches make it impossible to overestimate the greatness of the man, even so early in his scientific career. Among the special addresses and discourses by the scientific colleagues of Henry, Dr. Asa Gray's is of particular value from his long and intimate acquaintance and association with Henry—in connection with the affairs of the Smithsonian Institution as well as elsewhere. President Welling's address on the life and character of Henry is a scholarly paper, and reveals the strength and depth of Henry's friendship most fully. Much the most satisfactory discourse of the volume is the careful analysis of the scientific work of Joseph Henry by Mr. W. B. Taylor, the author of the elaborate memoir on "Henry and the Telegraph," which occupies a large portion of the Smithsonian Report for 1878. Mr. Taylor has appended a list of Henry's scientific papers, extending over fifty-three years, and containing nearly one hundred and sixty entries. This discourse, as also the address of Dr. Welling, was originally delivered before the Philosophical Society of Washington (of which Henry was so long the President), and, in this more accessible form, these biographies will receive the wider circulation which they so abundantly deserve. Professor Newcomb's memorial address was, unfortunately, not undertaken until nearly the whole ground had been covered by others. It was read before the National Academy of Sciences at its Washington session a year ago, and is especially noteworthy from the author's intimate association with Henry for nearly twenty years at Washington, and also as bringing to light some features connected with the origin and early difficulties of the Smithsonian Institution which had not previously been dealt with. Professor Mayer's address on Henry as a discoverer concludes the volume. It was originally delivered before the American Association for the Advancement of Science at the Boston meeting in August last, and appears here for the first time, we believe, in permanent form. Professor Mayer's choice of the phase of Henry's life with which to deal was very happy. He feelingly attributes very much of whatever usefulness there is in him to the disinterested kindness and wise counsels of Joseph Henry.

—A recent bulletin of the Census Office shows the distribution of the population with reference to the mean annual rainfall and the rainfall of the spring and summer months—*i.e.*, the growing period for vegetation. The extreme range of annual rainfall in the United States is stated to be from 0 to 150 inches, the former extreme being reached on the arid plateaus of Arizona, Nevada, and California, while the latter is reported as an exceptional case on the coast of Puget Sound, Washington Territory. The classification is by groups of 5 inches of rainfall each, ranging from 10 inches and below to 60 inches and above. The heaviest rainfall is in the western part of Oregon and Washington Territory, and on the northern coast of the Gulf of Mexico. These regions are comprised in the first class. The cotton region is comprised almost entirely in the classes between 45 and 60 inches, while the densely settled region of New England and the Middle States is almost entirely between 40 and 50 inches. The prairies proper have between 35 and 45 inches of rainfall, while the rich wheat-lands of the Northwest have but 25 to 35 inches. The low density of population corresponds with slight rainfall in the arid region of the Cordilleran plateau. The average annual rainfall upon the surface of the United States, exclusive of Alaska, is approximately 29 inches.

—The principal facts of the second table, showing distribution of population with relation to the rainfall of the spring and summer, may be summarized as follows:

Inches of Rainfall.	Population.	Population per Sq. Mile.	Percentage of total Pop.
35 and above	79,777	4.0	0.16
30—35	1,278,007	17.5	2.54
25—30	9,137,053	28.0	18.22
20—25	30,918,062	47.2	61.65
15—20	7,290,866	15.3	14.54
10—15	971,416	1.9	1.94
5—10	395,573	0.6	0.79
Below 5	82,112	0.3	0.16

The heaviest rainfall is along the Gulf coast, whence it decreases slowly northward. The cotton belt is mainly in the class between 25 and 30 inches, while between 20 and 25 inches lie most of New England, the Middle States, the Atlantic slope of the Southern States, and the whole upper part of the Mississippi Valley. In this class are contained most of the cereal-producing portions of the country and nearly all the great cities, and the density of population is much greater than in any other. The average rainfall for the spring and summer months is approximately 17 inches.

—Mr. Daniel F. Tredwell, of Brooklyn, has published a 'Monograph' on privately-illustrated books, which will be found none the less pleasant reading because of the occasional exuberance and inaccuracy of the style (the writer speaks, for example, of "a more than unique copy" of a certain work) and the occasional naïveté of his remarks, as when he says: "Plutarch's Lives . . . is one of the greatest books in the world, only it should be supplemented with the lives of Faraday, Gladstone, Peabody, Lincoln, Theodore Parker, Charles Sumner, James Lick, and Lucretia Mott"—surely a singular choice of representatives of the modern world. Mr. Tredwell modestly passes over his own achievements in illustrating some 60 works or 120 volumes, and devotes most of his space to the possessions—acquired or built up—of other collectors in all parts of this country, yet chiefly in New York and its vicinity. A preliminary sketch of the slippery descent of the private-illustrator is sufficiently lifelike to be capable of leading the innocent into temptation, and the only warning given is against spoiling the identity of a fine book by enlarging its margins to suit the disproportionate engravings which have been selected to bind up with it. Nothing is said by way of protest about the vandalism of plundering good and maybe rare books of their frontispieces or other removable illustrations, thus diminishing the number of perfect copies in existence. Mr. Tredwell describes the process of accumulating prints, as the passion grows; the gradual training of the critical faculty in rejecting what is unauthentic or inartistic; the canons of good taste in mixing different styles of illustrations—photographs here receiving for their durability a better word than collectors commonly allow them; the business of the inlayer, who has to frame the text or the print—of the title-page duplicator—of the binder, sometimes found intelligent enough to expose the collector's blunders, and always disposed to take his own time, etc. The treasures of more than two dozen collectors are enumerated with knowledge at first or second hand. Two of the only three inlayers Mr. Tredwell can recommend are on the list, and two of our leading stage-managers are among the large number of illustrators who have more or less exclusively devoted themselves to illustrating the annals of the stage. Lawyers figure largely, one of them being the purchaser of the Gutenberg Bible at the late Brinley sale, to the not well grounded surprise of the public, as Mr. Tredwell makes apparent. Another has illustrated a catalogue of his own books—a curious whimsy. Still another has given an example of the most sensible and legitimate illustration in expanding a memorial of Anderson, the father of American wood-engraving. Lives of Washington have been most frequently illustrated. Other favorites are Dib-

din's works, Boswell's Johnson, Izaak Walton, the Waverley novels, Spooner's 'Dictionary of Painters,' Shakspere, Boccaccio, Ireland's 'Records of the New York Stage,' and Francis's 'Old New York.'

—"X." writes us:

"I visited to-day, at noon, the room, No. 520 Grand Street, of the New York Coffee-house Company, and ask leave to report as follows: Any laboring man can there get a meal satisfactory as regards quantity and of average quality for ten cents. The laboring men in the neighborhood seem to know and appreciate that fact. At the time of my visit there was no vacant chair at any of the tables in the room. So far well. The weak point seemed to me to be a lack of tidiness. Soiled plates were not quickly removed from the tables at which people were eating, but were often merely pushed aside. If cleanliness is next to godliness, it must come before even mashed potatoes and strawberry-shortcake."

—The current number of the *Princeton Review* contains an article by Professor W. D. Whitney "On the so-called Science of Religion," which is a concise but very complete statement of what may be called, almost without prejudice by this time, and *pace* some very eminent disputants, the rational basis of the study. The "so-called science" Professor Whitney describes as "an inseparable part of the study of prehistoric man," and he treats of it as he would of the kindred science of language. At the outset he rejects what, he says, "has been till recently and is still, to a considerable extent, the prevalent assumption"—namely, that the universality of religious phenomena among men argues a primitive revelation. As he says, the question is this: "Men being such as we perceive them to be, and their circumstances such as we know them, are the great mass of the religions of the world to be accounted for as results of the normal exercise of men's faculties under government of the usual motives to their exercise?" If this is found to be the case, he continues, "the scientific study of religions wins a very different basis." Different from that assumed by students whose investigation supposes the miraculous it certainly is, and though possibly Professor Whitney has the traditions of the *Princeton Review* especially in mind in hinting at its novelty, it is true that in this way the study "for the first time finds a basis at all." He proceeds to account for the rise of race-religions in this wise, rejecting at once the term "religious instinct"; as he very justly observes: "The application of the word 'instinctive' at all to the productions of human intelligence amounts to a confession of inability to say anything in explanation of them." At the bottom of primitive philosophy, which infers a creator from creation, is "the simple faith in the connection of cause and effect," he says. Anthropomorphic agencies are naturally inferred. Their action is found to be internal as well as external, whence propitiation by conformable conduct—*i.e.*, morality. A community formulates its common notions, and has thus a religion which Prof. Whitney defines as "the belief in a superhuman being or beings, whose actions are seen in the works of creation and in such relations on the part of man towards this being or beings as prompt the believer to acts of propitiation and worship, and to the regulation of conduct." He then discusses the distinction between religion and superstition, admittedly alike "in their origin and essential nature," to determine which he deems necessary the aid of physical science—that is to say, of course, when the superstition is an accretion and not a preliminary of a religion. Next the steps of progress of religions from significance to conventionality and formalizing by tradition are traced, and the conclusion reached that "the normal tendency of a religion, when once formulated and established, is toward decay." The difference between race-religions (between which and languages there exists a close analogy) and the universal religions proceeding from an individual founder, such as Zoroastrianism and Christianity, is not confined to origin. The latter have a very different propagative force. On this point Professor Whitney touches but lightly, as its elaboration doubtless did not lie within his scheme. But it is clear that the really interesting question at present is how far it is possible to apply to the universal religions the principles here laid down. How far do these religions, as we know them, share the race-religions' "unconscious growth of generations," however definite the character of their origin may be believed to have been in each case? How is it possible to prevent Calvinism, let us say, from being adjudged an accretion not found in the "new body of doctrines" promulgated by the individual founder of Christianity, according to the view which leads Professor Whitney to maintain that the Mass is a "metamorphosis of the simple commemorative Lord's Supper into a miraculous sacrifice"? However, it is only the religion "that does not itself contain and teach the absolute truth" which has need to view with fear "those who, unsubmissive to its authority, are searching after more and truer truth."

—The French Academy has just lost the member who was kept out of it for eight years by the opposition of Bishop Dupanloup, entering it at one door while the irreconcilable prelate flung himself out at the other; the French Senate, a member *inamovible*, who took up arms in the revolution of 1830, and who refused the decoration of the Legion of Honor—Maximilien-Paul-Émile Littré. M. Littré's life began with the century, and was, in respect to longevity and incessant intellectual activity, comparable to that of Thiers, from the opposite quarter of France. Littré was of Norman parentage, Huguenot till the incautious pleasantry of one of his ancestors made a conversion to Catholicism expedient. Our readers will remember the incident of this goldsmith being called upon to repair a copper group of Michael and Satan, and proposing to substitute the one for the other, on the equivocal ground that Satan *avait du bon*, while Michael *ne valait le diable*. Littré's mother was a Protestant, and an original and courageous character. From his father he inherited a powerful constitution which, in his youth, made him an athlete capable of lifting *à bras tendu* a comrade of nineteen seated in a chair; but this robustness presently gave way under ten years of gastritis, and left him a permanent invalid. His father, moreover, who died in 1827, was a self-taught man, who learned Greek and Sanskrit, and acquired a standing among Orientalists. Littré was the first scholar in his college classes, and knew German, English, and Italian well by the time he was of age. Chance decided that his fame should rest, with posterity, chiefly on his lexicography. He took one year's course in mathematics out of college, and then began a study of medicine in the most thorough manner, but, though he became a member of the Academy of Medicine, he never assumed the title of M.D.; and though till within a few years he used to practise without fee among the poor of his country neighborhood, he always in the more serious cases called in a regular physician. His first great work was the translation and editing of Hippocrates—"mon long travail," as he called it, undertaken in 1834, and published in ten volumes during the interval 1838–61. In 1839, just after the appearance of his translation of Strauss's 'Life of Jesus,' he was elected a member of the Academy of Inscriptions, and being placed on the committee on the literary history of France he was led to the study of the language, and by this, five years later, to undertake his immortal Dictionary (published 1863–72). Meantime his acquaintance with Auguste Comte involved him in a new line of thought and literary production, and in his 'Analyse raisonnée du cours de philosophie positive' he is reputed to have done for his master what Dumont did for Bentham. In 1867 he founded the review called the *Philosophie positive*. Other diversions were a translation of Pliny (1848); a translation of the 'Iliad' into French verse of the thirteenth century, and the 'Inferno' into French verse of the fourteenth; contributions to the *Journal des Savants*, the *Débats*, the *Revue Germanique* (including some youthful translations of Schiller), the *Revue des Deux Mondes* (1836, etc.); besides articles for the medical dictionary known from the number of its volumes as the "en 30," editions of his own works and those of his friends—his last being 'Études et Glanures' (1880). Sainte-Beuve, from whose appreciative notice of Littré in the *Constitutionnel* of 1863 we have borrowed freely, says that he was after 1859 habitually a night-worker, beginning at 6.30 P.M., and breaking off at three in the morning.

—According to the *Débats*, there is to be found among the MSS. of Conrart in the Bibliothèque de l'Arsénal at Paris an amusing story of the poet Malherbe (a contemporary of Shakspere's), to this effect: A loose and witty literary friend of his, named Chazeray, having in a penitential mood retired to the cloisters of the Vauvert quarter (garden of the Luxembourg), Malherbe felt a strong desire to make a psychological study of him, with a view to observing what effect his devotions had produced upon his temperament. To that end he joined with him the Marquis de Racan, a poet mentioned like himself by Boileau in his *L'Art Poétique*, and, on the way, Daniel de Moustier, a poet-painter, both of whom had a sympathetic side for the gallantries of Chazeray. At the convent the coveted interview in the latter's cell was granted reluctantly by the superior, and only on condition that the three visitors should before entering repeat aloud a *pater* and an *ave*, which they loyally did, but had no sooner concluded than the bell rang for vespers, and Chazeray, with only a shake of the hand, was obliged to hurry off to the chapel. Thus thwarted, Malherbe grew very indignant, and, as he turned to the porter to be let out, exclaimed: "Qu'on me rende au moins mon *pater* et mon *ave!*" (At least they might give me back my *pater* and my *ave*).

—M. Paul Delair, a young French poet, whose 'Garin' was brought out a year or so ago at the Théâtre-Français, has recently published a volume called 'Les Contes d'à présent' (Paris: Ollendorf; New York: Christern), in which he has gathered together a score or more of poems written to be recited. The book is dedicated to M. Coquelin, of the Comédie-Française, and most of the pieces have apparently been written at his request and recited by him. What gives the volume special value is the letter from M. Coquelin prefixed to it in guise of a preface, in which he discusses the art of recitation and of delivering a monologue. Of late the monologue, comic or tragic, lyric or melodramatic, has become very popular in Paris, and its popularity is owing for the most part to the two Coquelins. The elder, while not disdaining comedy in monologue, has by his delivery of their poems brought into favor half a dozen young lyrists, among whom may be noted MM. Coppée, Manuel, Déroulède and Guiard (the two nephews of M. Émile Augier), Jacques Normand, and Delair himself. To the younger Coquelin is due the invention, or at least the introduction into France, of a sort of American humor, and in the delivery of an extravagantly fantastic monologue of a Mark Twain kind he is unsur-

passed. His brother's preface to M. Delair's volume deserves to be translated into English.

—The famous 'Historia Karoli Magni et Rotholandi,' attributed to Turpin, Archbishop of Rheims, has recently been made accessible to students in an excellent edition by M. Ferdinand Castets (Paris: Maisonneuve & Cie. 1880). Prior to this publication (the fifth in order from the first), the only separate edition of the 'Historia' was that of Ciampi, Florence, 1822, which had become very scarce. M. Castets follows in his text seven MSS. of Montpellier belonging to the second group of versions established by Gaston Paris in his essay 'De Pseudo-Turpino' (Paris, 1864). Of this group the editor says: "If not the primitive Turpin, it is the one that early became the official Turpin; it is the one that has been unceasingly read, translated, and imitated during the Middle Ages, and which the Italian romancers, from Nicholas of Padua to Ariosto, have accepted as the titular chronicler of the lofty deeds of Charlemagne and Roland." M. Castets has given in an appendix the letter concerning Turpin attributed to Pope Calixtus II., and several other documents of interest, and has added some valuable notes on the names of places mentioned in the third chapter of the 'Historia,' and on the twelve *pugnatores* of Charlemagne in the eleventh chapter. The latter note leads to a discussion of the influence of Turpin's work on the posterior *chansons de geste*. For all concerning the author and the historical and legendary value of his work, the editor refers the reader to the dissertation above mentioned by Paris, and the same scholar's invaluable 'Histoire poétique de Charlemagne' (Paris, 1865).

RECENT WORKS ON GOETHE.*

MEN are not really on the highest niche of permanent fame until they become the themes not merely of biography, but of bibliography. There must not merely be books written about them, but books upon books, whole alcoves of books, until they have a department to themselves in every large library. Anybody may have his memoir written—no peaceful country clergyman is safe in these days from that doom; but this biography may be as perishable as his published sermons, which Hawthorne thinks the most short-lived of all printed things. Real fame must be made up of many voices, reflected in many books. There will never be a time when new histories of Cæsar and of Cicero are not appearing. The public libraries are constantly obliged to increase the shelf-room given to books about Shakspere, Voltaire, Napoleon Bonaparte. It is a donation to be heralded across the Atlantic when Carlyle bequeaths to Harvard University his collection of books relating to Cromwell and Frederic the Second. But it goes without saying that, whether Goethe be the greatest of modern men or otherwise, he is certainly that one about whom books are most multiplying and likely to be multiplied. It is useless to philosophize farther upon the matter; let us proceed at once to the three new publications that lie before us.

All three of these books are translations, and two of them illustrate that especial zeal for translation which has for some years marked America more than any other country. This zeal has heretofore been directed largely upon German literature, and has been marked by a great range of theme and execution, from Mr. Brooks's laborious and accurate renderings of Jean Paul to Mrs. Wister's capital condensations of the long-winded novelists of to-day. But seldom has a translator had a more agreeable task than in dealing with Herman Grimm, whose books have, even in the original, the rare gift of being readable, and whose agreeable style also flows smoothly in the rendering by Miss Adams. It is possible to pick flaws in her translation, as in all; to find instances of misconception, as where she calls Werther and Lotte "two radical German natures," instead of "radically German" (p. 147); of inelegance, as where she says that Goethe "started out himself as a writer" (p. 324); of confusion, as where she says, "It is believed that Gretchen in 'Faust' is to be traced back to Frederika, but she [which?] bears a closer analogy to Marie Beaumarchais in 'Clavigo'" (p. 73); of incongruity of method, as where she speaks of "the Herrgottsberge, in Bessungen-wood" (p. 86)—translating the one proper name and leaving the other untranslated. But these are slight and incidental blemishes in a piece of work essentially faithful and excellent.

The first impression made or renewed by every good life of Goethe is the sense of remoteness which now attaches to the period when he lived. For some reason or other, the life of Greece and Rome seems not so far off to Americans as the life of the little German states before the French Revolution. It is like the sensation felt by the traveller in going from the modern streets of Frankfort to the narrow streets of the Jews' quarter; it seems incredible that any human beings should have consented to live in these high, pinched, picturesque houses; yet it was from these narrow doors that the powerful race of Rothschild came forth. It seems equally incredible that Goethe was reared in a time when, as Grimm reminds us, "the castles and monasteries along the Rhine were still filled with rich ecclesiastical and secular nobles"; when the Greek plays were performed by German actors in wigs and knee-breeches; when the Rome which Goethe visited was a remoter discovery than any of Schliemann's buried cities seem to-day. No English or American biographer of Goethe has fully done justice to this remoteness, and indeed pettiness, of the *milieu* in which Goethe was reared. Grimm comes nearest to it; he gives long episodes, in the German manner, to illustrate the rise of the modern European stage, of the novel, of history, of landscape art, and these excursions are always interesting. Yet, after all, he only inadequately touches the essential point—the inconceivable distance between our own times and the period of Goethe's early life.

It is, perhaps, in despair of doing this that he dilates with almost wearisome amplitude upon the maidens and matrons of Goethe's world—that fair coterie of which the readers of all nations already know so much. In doing this he only follows the German tradition. In the Goethe-House at Frankfort they preserve ample memorials of Frederika, Lotte, Lilli, and the rest—a *silhouette* of one, the album of another, a pattern of the flowered dress of a third; and Herr Grimm shows a similar interest in these heroines. It is, in truth, an endless investigation; the poet himself says that his early days in Weimar were "perplexed by multifarious love-affairs," and Herr Grimm laments with a biographer's repining that we do not know, for instance, in 'Wilhelm Meister,' who were the originals of Marianne, or Mignon, or Philina. But it is fair to say of our author that he depicts with as much interest the men as the women who influenced Goethe; and that we have here better pictures than ever before of his relations with Herder, Merck, Lenz, and, above all, Schiller, who becomes for the first time, in Grimm's hands, a genuine and living man, full of strength and weakness. Nor can anything be better than the easy way in which Grimm disposes, by a single *obiter dictum*, of whole classes of people whom previous biographers have thought it necessary to give in fuller detail. Thus, he says, in connection with Stein and the Jacobis, "every educated nation produces a certain quantity of second-class literary writers who associate together, and, sustained by a cheerful complacency, often lead a very happy existence" (p. 184). Again, in speaking of Klopstock's spending a year with the Margrave of Baden, he says: "There were, in those times of philanthropic enlightenment, a number of small princes in Germany to whom intercourse with such men seemed a vital necessity" (p. 210); a quiet remark which sums up the whole relation between the titled and untitled aristocracy of that time and place.

Herr Grimm gives, on the whole, a more natural and human delineation of Goethe than has any predecessor; he reverences him too thoroughly to feel tempted to withhold or consciously misstate anything. Nothing can be franker than the analysis of the love-affairs, for instance. "The moment Goethe divined that he had conquered a heart, an involuntary perception sprang up in him that the end was reached." "As soon as he was officially announced a bridegroom, his thoughts centred about the one idea of getting free again." "Goethe's demoniac impulse to free himself from all bonds, even the dearest, led him to rend and break these which had been so tenderly woven and so firmly joined." If this is the verdict of a friend, what is left to be said by an enemy? And all this is done with a fidelity of analysis and a thoroughness of enquiry which must command our admiration. In a capital anecdote preserved by him there is described a certain painting of Noah's flood, in which a man is swimming for life with a roll of parchment in his hand, while from his lips issues the remark, "Sauvez les papiers de la famille Montmorency." Herr Grimm thus prizes the minutest scrap of the Goethe papers, and though, unlike most Germans, he is more *littérateur* than archæologist, the tact of the literary man simply leads him to save the best things. As he is, if we mistake not, the son-in-law of that still attractive writer, Bettina Brentano, we might have looked for some untold circumstances about her, but he has passed her lightly by, only vindicating her truthfulness in one of the many instances where it has been doubted. The sonnets which she prints as addressed to herself by Goethe, and which were also claimed as written for Minna Herzlieb, are shown by Grimm to have been conveniently duplicated for several ladies (p. 470). As he critically adds, the poems themselves are less passionate than academic.

The standpoint of all Grimm's analysis of Goethe's imaginative creations lies in this assumption, that each was a personal confession, the transmutation of his real life into poetry. From this he proceeds to explain most acutely and ingeniously the far greater variety visible in the poet's women than in his men. The women, he says, were drawn from a hundred women, or were at least suggested by them. The men were all the delineations of one man, Goethe himself. Hence, while the women are complete women, the men are incomplete men; "they all lack a certain robust vitality, without which a perfect man is inconceivable" (p. 497). It is only when we come to Faust, he holds, that we obtain the crowning success. "Faust will in coming periods save all his weaker younger brethren—yea, even Goethe himself—from the sea of oblivion, as

* 'The Life and Times of Goethe. By Herman Grimm. Translated by Sarah Holland Adams.' Boston: Little, Brown & Co.

'Goethe's Mother. Correspondence of Caroline Elizabeth Goethe with Goethe, Lavater, Wieland, Duchess Anna Amalia of Saxe-Weimar, Friedrich von Stein, and others. Translated from the German, with the addition of Biographical Sketches and Notes, by Alfred S. Gibbs. With an Introductory Note by Clarence Cook.' New York: Dodd, Mead & Co.

'Faust: A Tragedy. By Goethe. Translated into English Verse, with Notes and preliminary remarks, by John Stuart Blackie, Professor of Greek in the University of Edinburgh.' Second edition. London and New York: Macmillan & Co.

Moses saved the Israelites" (p. 498). So far the criticism of Herr Grimm is masterly, but when he unites Gretchen with Faust as a subject of equal enthusiasm; when he declares that Antigone, Iphigenia, Ophelia, Imogen, Juliet, are all inferior to her as creations, one cannot help thinking that our biographer is himself overwhelmed in the Red Sea of his own enthusiasm, and that he needs a Moses to draw him out. But for all this his book must be pronounced to be, up to this time, the best single work on Goethe to be put into the hands of old or young.

If anything could make the Frankfort civilization of the last century seem to that of the present time anything but remote it would be the memory of that most amusing, racy, and delightful woman, the Frau Rath ("Lady Councillor") Goethe, mother of the poet. The second book on our list, by the late Mr. Alfred S. Gibbs, is much more than a translation, much more than a selection of letters. It is so copious in its information, so varied in the sources from which it is drawn, and so ample and careful in its annotation, that it really surpasses any of the separate German books from which it was drawn; and it awakens real regret for the early death of the young American scholar who here made so admirable an entrance into literature. It is not too much to say that through the acquaintance which it gives with Goethe's mother we obtain of the poet himself more familiar and life-like glimpses than have come to us in any other way.

Readers of Bettina Brentano will remember that we owe to one of her fortunate conversations with Goethe's mother the best record preserved of the opening scene of the poet's history—the precarious beginning of his mortal career. She thus writes, the translation also being her own:

"The bed in which your mother brought you forth had blue checkered hangings. She was then seventeen [eighteen] years old, and one year married; hereupon she remarked you would always remain young, and your heart would never become old, since you had the youth of your mother into the bargain. Three days did you consider about it before you entered the world, and caused your mother heavy hours. Through anger that necessity had driven you from your nature-home, and through the ill-treatment of the midwife, you appeared quite black, and without sign of life. They laid you in a butcher's tray, and bathed the pit of your heart with wine, quite despairing of your existence. Your grandmother stood beside the bed. When you first opened your eyes she exclaimed: 'Daughter, he lives!' 'Then awoke my maternal heart, and lived since then in continual enthusiasm to this very hour,' said your mother to me in her seventy-seventh year" ('Goethe's Mother,' Introd. p. xxiv.)

The further conversations of the Frau Rath with Bettina have given to most English-speaking readers the best impression of the elder lady, and are so charming that it seems almost cruel in the present volume to give us in return the Frau Rath's lively sketches of her young visitor, whom she seems to have valued as an unfailing auditor, but otherwise to have regarded as a sort of lively young mosquito, who was always pestering Goethe, and must be brushed away as far as possible. She writes to Goethe's wife:

"So the little Brentano has at last had her wish, and seen Goethe. I believe, in the opposite case, she would have gone mad. For I never saw the like. She wanted to disguise herself as a boy, and run on foot to Weimar. Last winter I was often really anxious about the maiden. Thank heaven, she has at last had her wish in a proper manner" (p. 226).

Thus intolerant in all ages have been the mothers and wives of poets in respect to the ecstasies of girlish adorers!

There is evident in every page of this book that hearty correspondence of temperament between Goethe and his mother which can never be better stated than he himself has put it, in well-known words:

"Vom Vater hab' ich die Statur,
Des Lebens ernstes Führen;
Von Mütterchen die Frohnatur,
Die Lust zu fabuliren."

Viehoff, one of his German biographers, has well pointed out that the poet got the freshness, the humor, the feeling of his life from the mother; and from the father his methodical and laborious ways, and the gravity shown in his later life. Goethe recognizes this fully when he sends the young Fritz von Stein to Frankfort in 1785, consigning him to the Frau Rath, and writes to him:

"Greet my mother and relate to her a great deal. As she is not so grave as I am, thou wilt fare better with her" (p. 132).

A month later, when the boy has returned, Goethe writes of him to the Frau von Stein:

"He is merrier than ever before. He has in Frankfort first rightly learned to know freedom, and my mother has first fully taught him the philosophy of a cheerful life. Thou wilt be astonished to see how much he is improved in every respect" (p. 133).

What were the Frau Rath's conceptions of freedom for young people can hardly be forgotten by those who have read Bettina's account of a certain incident, or have seen the historic pump in the court-yard of the Goethe-House at Frankfort, and have heard on the spot the story of the two young princesses of Mecklenburg. They were two nieces of Queen Charlotte, of England, who were assigned to this house as guests during the coronation of the Emperor in 1790. The young girls, delighted at being freed from court etiquette, and overflowing with jubilant spirits, seized upon the pump-handle soon after their arrival and insisted on pumping without limit. The horror-stricken governess restrained them, and they appealed to their hostess, who at once settled the matter by pushing the governess into the door of her own apartment, and turning the key on her.

There is not to be found in the whole range of biography a more charming picture of a sunny and vigorous old age than that contained in this volume. The hospitable lady declares in one of her letters that no visitor ever went away from her house except with kindly feelings towards her:

"True, I have the grace from God that as yet no living soul has ever left me dissatisfied, of whatever rank, age, or sex. I love human-kind, and old and young feel it. I go without pretension through the world, and that pleases all earth's sons and daughters" (p. 135).

But the truth is that for Goethe's mother no pretensions were needed; she could claim nothing higher than she had. During one of the Frankfort fairs, when many strangers visited her, she writes:

"That my son pleased the Most Serene Duke of Brunswick touched very softly my motherly heart. It fares with me well-nigh as with the old knight whom Geron der Adeliche [in Wieland's poem] came upon in a cavern, who lived solely by this, that the spirits brought him so much good news of his grandson Hector. What life-balsam I have again received just during the present fair!" (p. 115).

Yet the most charming aspect of her character is not the social brilliancy and animation which delighted everybody, but rather the way in which her joyous nature made her almost as happy during the long, dull epochs when no interesting strangers came to Frankfort and she dwelt almost wholly alone. Thus, she writes to her son in November, 1786:

"Of my inner and outer life here follows an exact and faithful description. My life flows quietly on like a clear brook. Disquiet and commotion were never agreeable to me, and I thank Providence for my days. To thousands such a life would seem monotonous, but not to me; the quieter my body is the more active in me are my thinking powers. Thus I can pass the live-long day entirely alone, wonder that it is evening, and be as happy as a goddess; and one needs not in this world more than to be happy and contented" (p. 145).

Yet this was the woman who would sing, in the midst of a gay company, her son's songs, especially that in 'Faust,' "Es war einmal ein König." In singing it she would arrange her companions round her for a chorus, and at the conclusion would lay her hand on her heart and say, "Den hab' ich geboren"—"He is my son!" (p. 263).

In her last years, when suffering under infirmities, she once said to a visitor:

"Yesterday I could stand myself no longer. I gave myself a good scolding and said: 'Ay, art thou not ashamed of thyself, old Räthin [councilloress]? Thou hast had good days enough, and Wolfgang besides, and now when the evil days come thou shouldst make the best of them, and not pull such a wry face. What does it mean that thou art so impatient and naughty when the blessed God lays a cross on thee? Dost thou want, then, to walk upon roses for ever, and art past the goal, over seventy years old?' Look you, this is what I said to myself, and directly there set in an improvement, and I grew better because I was no longer so naughty" (p. 237–8).

The mother of Goethe died September 13, 1808, in her seventy-eighth year, and her son wrote of her to Zelter:

"She led a strong, hearty life in the Old Testament fear of God, and full of trust in the unchangeable God of the people and the family; and when she herself announced her own death, gave orders for her funeral with such accuracy that the kind of wine and the size of the cracknels for the refreshment of the attendants were precisely determined" (p. 220).

It is a tame affair to turn from this delightful picture to the third book on our list, which is simply another translation of the First Part of 'Faust,' neither better nor worse than many which have preceded it. It affords no easier reading, and indicates no more of poetical power in the author, than was to be found in his previous rhythmical volume 'The Wise Men of Greece.' Yet inasmuch as he has thought it best to rewrite his version after forty years, and to explain its history in a preface, it is worth while to point out the hopelessly false theory on which it is written. Never yet was there a prosaic man who felt moved to translate a poem without soon satisfying himself that "a literal version of a great poem never can be a graceful one," in the words of Mr. Blackie's preface. And the remark is an infallible truth, so far as relates to the man who makes it. Unluckily, while he is making it, some better translator comes along and effects the precise combination just pronounced impossible. In this difficult feat Longfellow perhaps stands at the head; but in dealing with Goethe both Brooks and Bayard Taylor come very near him, and there is something really touching in the innocence with which Mr. Blackie gives us page after page of translation, far less graceful than theirs, and also incomparably less literal.

Take, for instance, the exquisite prelude to the later editions of 'Faust,' a prelude whose most touching verse begins :

"Sie hören nicht die folgenden Gesänge,
Die Seelen, denen ich die ersten sang;
Zerstoben ist das freundliche Gedränge,
Verklungen, ach! der erste Wiederklang."

Mr. Blackie translates this :

"They hear no more the sequel of my song,
Who heard my early chant with open ear;
Dispersed for ever is the favoring throng,
Dumb the response from friend to friend so dear."

Turn now to Bayard Taylor, who, although not ranking high as an original poet, had great talent for translation, and see how much stronger, how much freer, and yet how incomparably more literal is his rendering. There is no "with open ear," no "friend to friend so dear," to eke out the rhyme, but most of the version is almost verbatim in all its apparent freedom :

"They hear no longer these succeeding measures,
The souls, to whom my earliest songs I sang;
Dispersed the friendly troop with all its pleasures,
And still, alas! the echoes first that rang."

Turn now a few pages to another well-known and oft-translated passage, the magnificent chant of Michael, in the "Prologue in Heaven" :

"Und Stürme brausen um die Wette
Vom Meer aufs Land, vom Land aufs Meer,
Und bilden wüthend eine Kette
Der tiefsten Wirkung rings umher.
Da flammt ein blitzendes Verheeren
Dem Pfade vor des Donnerschlags.
Doch deine Boten, Herr, verehren
Das sanfte Wandeln deines Tags."

This is Mr. Blackie's version :

"And storm meets storm with rival greeting,
From sea to land, from land to sea,
While from their war a virtue floweth
That thrills with life all things that be.
The lightning darts his fury, blazing
Before the thunder's sounding way;
But still thy servants, Lord, are praising
The gentle going of thy day."

It will be seen that the translator frees himself from half the restraints of rhyme, to begin with, and from all those of literal rendering. Yet he fails to make the verse even impressive ; all the magnificent grasp of it, and the sudden transition from the thunderstorm to the peaceful flowing of the unbroken day, disappears in his hands ; and still the verse is not even graceful. See now with what power Bayard Taylor grasps the passage, and yet how much better this transition comes in, while the rhymes also are preserved :

"And rival storms abroad are surging
From sea to land, from land to sea,
A chain of deepest action forging
Round all, in wrathful energy.
There flames a desolation, blazing
Before the thunder's crashing way;
Yet, Lord, thy messengers are praising
The gentle movement of thy day."

When we compare, for instance, the splendidly vigorous and yet absolutely literal line,

"There flames a desolation, blazing,"

with the tameness of

"The lightning darts his fury, blazing,"

we see the difference between a poet's version and that of a more prosaic mind. It is almost needless to add, after this, that Mr. Blackie takes precisely the view of the Second Part of 'Faust' which prevailed forty years ago, and sees in it only a hopeless blunder of Goethe's old age ; whereas the greater part of it is now known to have been planned, and a part of it written, in the prime of Goethe's life, and before the publication of the First Part.

RECENT NOVELS.*

A GOOD novel by Henri Rochefort must be admitted as convincing testimony to the truth that it is difficult for a Frenchman to write a bad one. It is easy to imagine what a bad job Bradlaugh, say, or any of our own statesmen who may be considered to occupy a position analogous to Rochefort's, would turn out if he should set himself to the composition of a work of fiction ; and it must be confessed that the contrast between such political writing as the French Communist is guilty of and 'Mademoiselle Bismarck' is surprising, even when one remembers how well every Frenchman who respects himself understands his own language. 'Mademoiselle Bismarck' is in form and construction an excellent novel, and in these respects might have been written by an academician, so far as it is possible to judge from a translation. It is, besides, entertaining from cover to cover, and contains at least one portrait which is a character-study of a good deal of acumen. This is the heroine, whose tact in social diplomacy gave her the title of the book, her name being Antoinette Alibert. Mademoiselle Alibert's father is a professor in some educational institution, and has but a small salary. Her mother is dead. She develops astuteness early. Realizing, "at the age when little girls are cutting dresses for their china dolls," that she never will be pretty, she begins to endow herself with other attractions. She devotes herself to German, English, and Italian, not because she desires to read Goethe or Byron or Tasso, "but because she wished it to be said of her when she entered a drawing-room : 'You see that young lady ; would you believe it? She knows three languages.'" The next end to compass is the entrée of some drawing-room. After she has accomplished that, her effort is to engage the affections of some important personage, and she succeeds finally in entrapping no less distinguished game than the President of the Chamber of Deputies, M. Talazac himself. To do this, however, she has been obliged to forge love-letters from a member of the old *noblesse*, who finds her out, and, having her in his power, makes a very base use of it, compelling her to sacrifice either herself or her hopes of Talazac. She chooses the former, and the Viscount falls in love with her. As she will not recognize him and returns his letters unopened he falls ill, and his cousin, who is in love with him and is his nurse, finds the letters and sends them to Talazac. The wedding, for which every preparation had been made, is thereupon broken off, and Antoinette tries to secure the Viscount ; but his sickness and her rejection by Talazac have quenched his flame, and she fears the *pis-aller* of falling back upon a young clerk to whom she has all along been engaged. She makes a last attempt, however, to win back Talazac's affection by pretending to drown herself before his eyes ; but a boat which she has had sunk in a deep part of the Seine has drifted away, and she finds fifteen feet of water instead of five and drowns in reality. Talazac is filled with remorse and never discovers the truth about her. Talazac is, indeed, the weak part of the book. He is, of course, a caricature of Gambetta, for whom Rochefort has all the hatred of ingratitude and jealousy, and his introduction here, and the way in which it is managed, are absurd improbabilities. The reader feels that of the society at Mme. Maunoir's (Mme. Adam) the author knows nothing whatever, and the effect of his heroine's shrewdness is in great measure spoiled by the impossible things he makes her accomplish in order to set forth the opportunist coterie in a ridiculous light. This is too bad, for Antoinette's character is in the main admirably sketched, and in point of art she deserves to be ranked with more celebrated portraits of the same type, which is a favorite one with French novelists. It must be said, however, that though the book is written to gratify a personal motive of the vulgarest kind, this purpose is, in detail, very well concealed, and there is no invective or other clumsy evidence of spite apparent in the depiction of Talazac. If Gambetta were really a rather contemptible character, one would say he had been very delicately shown up in 'Mademoiselle Bismarck.'

There is not, at all events, on our present list another book which reads itself so well. 'By the Tiber' goes particularly hard. It is utterly formless, and one would be at a loss to account for it if he had nothing to go upon but the book itself. The heroine, an American lady of thirty-five, residing in Rome, and pursuing her vocation of writing books, says to herself (p. 224) : "I will write a book which shall be a fragmentary piece cut out of life, like a square of turf you cut, with perhaps no full weed in it ; and people who like a story will be disappointed because nothing is concluded." The writer is evidently the heroine, and this remark is designed to apply to the present book. But her consciousness that she is disappointing "people who like a story" does not prevent the fact of disappointment, and these people have long been, it should be borne in mind by novelists, the great majority of those who read novels. Only a genius of the first-class can be trusted to give us "fragmentary pieces cut out of life," and not one book in years where "nothing is concluded" deserves to be read. Nevertheless, there is a good deal of the power and much of the cleverness which marked 'Signor Monaldini's Niece' in 'By the Tiber.' There are two stories interwoven in it having no real connection with each other : one a tale of intrigue and daggers, and the other the imprisonment in a lunatic asylum of a lady, the heroine aforesaid, for having unwillingly witnessed some of the events of the former. In the former the author takes no interest beyond that of disgust, which is of course fatal to it ; and in the other, the only interest possible to the reader arises from the feeling that so many pages wasted upon the unjust imprisonment and death of a lady in a madhouse must indicate that the story is in part a record of real events. The reflection that it is thus historic arouses the sympathy which every one feels in reading of a gross outrage, but this is a feeling that can only be gratifying to the writer as a historian, and can be in nowise flattering to her as a novelist. For the rest the book owes its merits and defects in nearly equal proportion to that brooding intensity which marks the work of writers of potentiality rather than power, and who are accordingly disappointing not only because their view of life is necessarily a contracted one, but because they have employed the portion of life visible to them as a stimulant to an already overactive susceptibility rather than as material for observation and study. Certain pages of this writer's rhapsodies upon nature, for example, are sympathetic and really interpretative. Certain others make one lament the tendency of so many novelists of her sex to make every book they write, whatever else it may be, an epitome of their "highest convictions upon Life and Art," as Mrs. Browning says.

* 'Mademoiselle Bismarck. From the French of Henri Rochefort. By Virginia Champlin.' New York : G. P. Putnam's Sons. 1881.

'By the Tiber. By the author of 'Signor Monaldini's Niece.'' Boston : Roberts Bros. 1881.

However, it is decidedly a step down to the latest of the "No-Name" novels. 'Manuela Parédes' shows everywhere unmistakable marks of the 'prentice hand of a rather novel description, though it is becoming tolerably familiar under the fostering influences of an anonymity devised to pique curiosity. We feel secure in saying that this must be the author's first book, because the assertion is at all events clearly in her interest. The distinguishing mark of this recently developed type of novel-writing tyro is the singular character of its unquestionable intelligence It is difficult to reconcile so much literary information with so much bad taste, and such critical perception of certain kinds of character with the general ignorance of the world that accompanies it. Perhaps this order of tyro has lived longer than the old-fashioned beginners were content to live before composing romances, and has beguiled a somewhat monotonous existence with vague aspirations and the reading of books interpreted only by an emotional consciousness. This is the story of 'Manuela Parédes': Mr. Robert Audran and his brother Walter meet in Switzerland Mrs. Dysart, her daughter Helen, her son Eugene, and Miss Alice Carroll, who are making a short European tour, as are the Audrans. The young ladies, young Mr. Dysart, and the Audrans go off on an Alpine tour, sustained by a patriotically American sense of rectitude and defiance of European conventionalities that ought to make Mr. Henry James feel as if much of his recent teaching on the subject had been as good as thrown away. But the author's point of view is peculiar and weakens her case. Helen is saved by Mr. Audran from a watery grave, but at the expense of a dislocated shoulder. There is no surgeon near, and Audran is obliged to operate himself. He chloroforms her, being naturally provided with the drug, and then "turned back the ripped dress, and uncovered her neck and shoulder, round and firm and fair as ivory," after which, of course, all was plain sailing. When she recovers consciousness she kisses him, and thenceforth, it appears, they are mutually in love, though they only quote a great deal of poetry to each other at first. But before long he concludes to say that if all his property were not tied up in a Colorado ranch he would like to ask her to marry him, and she puts him on probation. She really loves him, and besides, "as before her dressing-glass she unrobed her round white shoulders and dimpled arms," she says to her reflection, half-aloud: "It is a sin against nature for me to be an old maid." Moreover, she has little time to lose, being already on the verge of thirty; rather older, we may remark parenthetically, than we like heroines in novels of this quality to be. Just here Manuela appears. She is the Baroness Waldeyer, who explains to the putative Mrs. Dysart that she (Manuela) is the real owner of the name, not having been drowned, as was supposed, when she eloped with the Baron Waldeyer. She is also Helen's mother, and yearns for a daughter's love and companionship. On her return Helen learns the secret and rejoices in two mothers. Mr. Audran goes to America, and the rest all repair to the Baroness's château in Alsace. Mrs. Dysart has some qualms, but her husband has written her to conciliate the Baroness, who is besides a very winning person. She has developed an unusually fine character under the influence of the late Baron, who ran away with her, and who, it seems, "was a wonderfully good man—an enthusiast, whose soul had revolted from the common restraints of life, because of the tyranny of schools and priests." At the château Mrs. Dysart has a paralytic stroke, and her husband is telegraphed for. He in the meantime has had his life saved from murderers and his property from thieves by Audran, and speedily arrives with his daughter Julia. There is a pretty reconciliation with Baroness Manuela; Mrs. Dysart has recovered, and when dinner is announced:

"'Come, my dear,' said the Baroness, offering her arm to Julia. 'Mrs. Dysart, will you conduct your husband? Keep your own place on my right; the next is for Mr. Dysart. And you, Miss Julia, are to sit here, next to Helen. I cannot spare her from my left.'"

The great mistake in the book is in killing off the Baron, who should certainly have sat between Mr. Dysart and Julia at this feast. Audran comes soon after, and every one (except Mr. and Mrs. Dysart) gets married. Audran subsequently goes to Congress, where his first speech on the currency "surprised and delighted Secretary Sherman."

'A Nameless Nobleman' leads off an anonymous "Round Robin" series with reasonable credit. It is full of improbabilities, which are apparently to be ascribed to the laziness of the writer, as they might have been avoided with a little effort; but it is in the main agreeably and intelligently written. The average novel-reader will be apt to finish it, though the real climax comes long before the close, and after that the expedients to sustain interest are rather weak. A young French baron of the time of Louis XIV. is in love with his cousin Valerie, who, however, consents to wed his brother at the King's command. François thereupon abjures his native land, and we next hear of him shipwrecked near Plymouth, Mass., and nursed through a sickness by Molly Wilder, a pretty and charmingly innocent young Puritan, who hides him in the attic of her father's house unknown to every one, and where he escapes the search for French prisoners (England and France being then at war) until his old Jesuit tutor rescues him. Before he leaves the house the priest marries him to Molly secretly, and when peace is declared he comes back from Canada and claims her. The priest tries to prevent him from thus entangling himself with a peasant, and assures him that his marriage service was only a hocuspocus invented for the occasion. François, however, is contemptuously immovable, and in the same spirit resists the importunities of Valerie, who, upon the death of her husband, returned to her first love and crosses the ocean to try to win him back. The next book by this author will be likely to be better, we should say. As in 'Manuela Parédes,' there is a disproportion between the execution, which is generally very good, and the substance, which is rather weak and ill-sustained. The reverse is usually true in English light literature of this rank, it may be observed.

'Under Life's Key, and Other Stories' is a collection of Mrs. Mary Cecil Hay's tales, and we should think that by this time her monotonous voluminousness would have outworn the interest her earlier stories excited. These, moreover, keep no measure nor probability. In one the heroine marries a rich Englishman with two sons her own age. When her own son is born she is led into jesting about his future, and into remarking that, though there is no prospect of his becoming the heir, it is permitted to mothers to be ambitious. Then, going to meet the elder son by the river-side, she alone sees him carried over the falls; he had fallen asleep in a boat, and his brother had cast it adrift in a moment of temptation. The latter, trusting to his young step-mother's never revealing the crime she saw him commit, fills his father's mind with suspicion by dwelling on her ambition. During the father's absence from home the heir falls ill, and is nursed by his step-mother, who calls no doctor, as he fears confessing his crime in delirium. He is just dead when his father arrives. The latter, feeling that his wife has caused the death of his two sons, separates from her without scandal, retaining her child, who also becomes ill and dies just after the arrival of his mother, who has been sent for. At the same time arrive the second son's effects, which have been disinfected and can now be handled without fear of contagion, and among them is a letter of confession. Husband and wife are reunited, and five years after we have a glimpse of their happiness in a second family. The heroine of another story falls in love with the second son of a man who has selected her because of her wealth for the wife of his heir. The heir is in love with a penniless young girl. The two ladies visit the family together, and the heiress makes herself so disagreeable to every one that the father himself is glad to have his eldest son follow his own wishes. Whereupon, in a second visit, the heiress is as bewitching as she had been repellant, and explains her conduct by her desire to make the lovers happy. This results in her becoming happy also. The rest of these fourteen stories are of similar moment.

'The Rebel of the Family' is an apotheosis of the ugly and truthful member of a family reduced to great straits to keep the position to which they were born. The struggle is always mean and unlovely, but if anything could lift it to the level of a respectable ambition it would be the contrast afforded by the adventures of the "rebel" and the conduct of her worldly sisters. The former exposes all the family economies, chafes under maternal restraint, makes friends with an outrageously vulgar leader of the woman's rights movement, and is rescued by falling in love with a chemist who chances along. The book closes with her happy union with him, just as her sisters make wealthy but loveless matches Something might be made out of this, possibly, by an author who should depict as likely to be equally unfortunate the fate of both obedient and disobedient daughters of such a mother as is here portrayed. But for this sort of thing Mrs. Lynn Linton would be one of the last to care a straw, which is undoubtedly wise after all, since it takes her books entirely out of the province of criticism. A child of ten years could not sympathize more completely with or more heartily approve her impulsive and impossible heroine than she does herself; yet she is a veteran novelist. How does it happen that novel-writing is one of the few human occupations which one may pursue for years without learning anything?

Helmholtz's Popular Lectures on Scientific Subjects. Translated by E. Atkinson, Ph.D. Second Series. (New York: D. Appleton & Co. 1881. Pp. 265.)—This volume contains an in-memoriam address on Gustav Magnus, 1871; and lectures on the origin and meaning of geometrical axioms, 1870, on the relations of optics to painting, on the origin of the planetary system, 1871, on thought in medicine, 1877, and on academic freedom in German universities, 1877. The second of these lectures, it will be remembered, is the attempt to popularize the mathematical conceptions of the fourth dimension of space, for which Zöllner and Dühring accused the author of making an indiscreet appeal to the popular imagination which indirectly

favored spiritualism. Precisely how this resulted it is not easy to see. The third and longest is the substance of a series of lectures applying the author's optical theories to the arts of color and form, and delivered many years ago. The fifth lecture sketches the remarkable progress of German medical sciences during the last generation. In the last lecture the translator has "availed himself of a liberty granted by Professor Helmholtz" to omit some passages and to modify others, in which the conservatism and the narrow curriculum of the English universities are very unfavorably contrasted not only with German but even with French universities. Helmholtz's language in the original is strong and severe in condemnation of the lack of true academic freedom in England, and most of this, which the translator omits under the general permission of the author, is as true now as it was when it was uttered four years ago. The omission is inexcusable. The animus of what Helmholtz really said is quite reversed. The quotation is too extensive to make here, but we refer the reader to the original. On the whole, the translation is clear, the type large and plain, and the volume is hardly less valuable or interesting than the first of the series.

William Law, Non-Juror and Mystic; author of 'A Serious Call to a Devout and Holy Life,' etc.; formerly Fellow of Emmanuel College, Cambridge. A sketch of his life, character, and opinions. By J. H. Overton, M.A., Vicar of Legbourne, etc., etc. (London: Longmans, Green & Co. 1881.)—William Law is known to a small number of persons at the present time as the author of the 'Serious Call'; the book itself remaining unknown to the generality of those able to detect the pun in Lowell's "Fable for Critics"—

> "(Who was born, as her mother, a Calvinist, said,
> With William Law's serious caul on her head.)"

To a smaller number of persons he is known as the tutor of Edward Gibbon and the chaplain in his father's house at Putney. He was, however, remarkable for force of mind; he was singularly original, and, despite his retirement, the influence he exerted on his time was considerable and important. If we had only the opinion of his present biographer in support of these assertions they might well be received with some degree of caution; but the standpoint of Mr. Leslie Stephen in his 'History of English Thought in the Eighteenth Century' is as different as possible from Mr. Overton's, and yet his opinion of Law's abilities is equally high. Moreover, as joint author with Mr. Abbey of 'The English Church in the Eighteenth Century,' Mr. Overton earned the right to speak authoritatively on any correlated subject.

Of that type of thought which is called mystical, Law is a better representative than any other Englishman. The average reader encountering this statement would immediately conceive of Law as a man of vague and dreamy aspirations and of dim and incoherent speech. He could not be more mistaken. The popular idea that a mystic is one who is misty in his thought and in the expression of his thought does not find in Law a particle of justification. Before his mystical tendencies had become developed he had won the reputation of a first-rate controversialist. His antagonists were Bishop Hoadley and Mandeville, of the famous "Fable of the Bees," which maintained the thesis that private vices are public benefits. John Sterling wrote concerning the "Remarks" on Mandeville: "I have never seen in our language the elementary grounds of a rational ideal philosophy, as opposed to empiricism, stated with nearly the same clearness, simplicity, and force." Law's 'Christian Perfection' was probably the book that first attracted to him the attention of the brothers Wesley. In the 'Serious Call' there is such a distinct foreshadowing of the Methodist movement that Bishop Warburton's saying, "Law begot Methodism," does not seem extravagant. "I was at one time," says Law, "a kind of oracle to Mr. Wesley." This was in 1729, when Law was "the much-honored friend and spiritual director of the whole family" at Putney, from which Edward Gibbon was now absent making the grand tour. The Wesley brothers walked from Oxford to London three or four times a year to consult Law on spiritual matters. But what attracted them to him was not his most characteristic thought. This was not revealed till after the elder Gibbon's death, when Law retired to his native village in Northamptonshire, and presided in a modest way over a religious house of which Miss Hester Gibbon was a conspicuous member. This manner of life continued twenty-two years. Schools were founded, and such "almsgiving" as was certainly "no charity" was practised with indiscriminate zeal. His study of Jacob Behmen and other Continental mystics had begun at Putney, and it was now carried on with deeper enthusiasm. Mr. Overton introduces his account of Law's mysticism with three chapters on mysticism in general. These chapters are carefully written, and with much intelligence. It would be interesting to know if Carlyle was ever a reader of Law's mystical writings, and if he met and recognized his own thought in them in any degree. Certainly the idea of Law, that the visible world is but a revelation and parable of the invisible, is not exceedingly remote from the philosophy of clothes developed in 'Sartor Resartus.' With his mystical development his controversial ability did not die out, some of his ablest controversial writings belonging to the last years of his life. Even the burly Warburton found him more than a match for his truculent fierceness.

The Caliph Haroun Alraschid and Saracen Civilization. By E. H. Palmer. (New York: G. P. Putnam's Sons. 1881. 12mo, pp. 228.)—Mr. Palmer, who is a professor of Arabic in the University of Cambridge, has, perhaps, the most complete acquaintance with that language of any living European. Having thoroughly studied it in Europe, together with several other Oriental languages, he spent some years in the East, while still a young man, and this combination of study and practice has made it almost, if not quite, as familiar to him as his mother-tongue. An Arabic grammar, a Persian dictionary, and, most remarkable of all, a translation of "Lalla Rookh" into Arabic verse, are among his achievements in Oriental scholarship. We recall these facts because the present volume must depend in a large degree upon a knowledge of the author's equipment for its hold upon the reader's confidence. It gives an account not only of Haroun Alraschid, but also of the famous family of the Barmecides, who made him great and whom he rewarded with utter destruction. All who have read the 'Arabian Nights' will be glad to learn something of the vizier Jaafer, who accompanied Haroun in search of adventures in his nightly wanderings through the streets of Bagdad. The book is drawn entirely from Oriental sources. As many of these exist only in manuscript, or in printed books almost equally inaccessible to the general reader, and as Professor Palmer gives no special references to his authorities, we must, of course, rely only upon his judgment and discrimination in the use he has made of them. If his object were merely to leave upon the mind of his reader a vivid impression of the personality of the caliph and to make an entertaining book, he has been most successful; but if, as the title seems to indicate, he intended to give a clear account of "Saracen Civilization," that intention must have slipped his mind when he took up his pen. He tells us in general terms that Alraschid was a patron of literature, science, and art, but as to who were the men distinguished in these several departments, what they did, how their achievements compare with those of the different periods of European culture, what they added to the "fixed capital" of the intellectual world, we have hardly any information.

In an introduction, Mr. Palmer gives a sketch of the history of the caliphate previous to the accession of Alraschid. The biography is divided into two parts, not very unequal in size, the first giving the historical, the second the legendary caliph. But it is difficult to see any good ground for this division. The historical portion is largely made up of personal anecdotes. The legendary portion consists entirely of these, but Mr. Palmer vouches for the historical accuracy of the larger part of them. The division is of little consequence, as the two parts are entirely consistent. The same man appears in both, and, if we mistake not, most readers who have been accustomed to hear the epithets "genial," "wise," "just," "good," and "great" coupled with the name of Haroun Alraschid will rise from the perusal of Mr. Palmer's book with the regretful exclamation, "One more hero vanished from history!" Mr. Palmer possesses so many requisites for presenting a trustworthy picture, his book has so much internal evidence of truthfulness, the effort to represent his hero in as favorable a light as the facts will admit is so plain, that we are forced to admit that the Haroun Alraschid of our boyhood is a very different person from the Harūn-er-Rashīd ("Aaron the Orthodox") of historical criticism. This genial companion murders his sister and her children on account of the consequences of an alliance which he had forced upon her under absurd and unnatural conditions, in order that she might be present at his drunken revels. This wise philosopher is continually tormented with the most ridiculous superstitions. This just ruler is never at a loss to find excuses for confiscating the property of a wealthy subject. This good man indulges in a sensuality transcending the limits set even by the prudence of pleasure. This great monarch leaves his empire declining towards ruin. He patronizes men of learning because he likes to be talked about, lawyers because they find crooked ways by which he may escape from the entanglements of his own illegal acts, poets and musicians because they add a zest of refinement to his revelry, and physicians because they prescribe copious draughts of the wine which the Koran forbids him to taste. Mr. Palmer, indeed, does not present all this in the abrupt manner which the space at our disposal compels us to adopt. But the legitimate inference from his facts is, that Haroun Alraschid was a representative Oriental despot.

The book can be read through in a few hours, and the great number of short anecdotes that it contains render it very interesting and often very amusing.

Sister Augustine: An Old-Catholic. (New York: Henry Holt & Co. 1881.)—At first sight this book might be thought simply a record of self-devotion such as we have known in Alexandrine de la Ferronays or Sister Dora, but the interest and value of it are really quite other and quite its own. As biography it is a strong appeal to the heart, but as history it is a graphic sketch of the state of parties in the Rhineland, and of the phases of feeling

which preceded and prepared the way for the "Old-Catholic" movement. Remote as we are in fact and in sympathy from Roman Catholic Germany, it has been difficult for us to conceive either of the nature or the force of this movement. We have heard the echoes of theological discussions and vigorous protests from the pulpit and the professor's chair, but this life of Amalie von Lasaulx ("Sister Augustine") reveals it to us in the homes and hearts of the people.

She became a nun, forty years ago, from no fond illusions about convent life, but simply to devote herself to the nursing of the sick. To this her whole life was given, either in the hospital at Bonn, where she was the superior, or with the Prussian army. Her sweet and cheery temper, her perfect sincerity, her breadth of view, the steady poise of her whole character, made her Protestant friend, Professor Perthes, in hearty admiration, and the lady-superior of her order, in bitterest unkindness, agree in pronouncing her "quite different from all other Sisters of Charity." To such a nature submission to the decrees of the Vatican Council and belief in Papal infallibility were impossible. Against this refusal to accept the new dogma her whole faithful lifetime counted as naught, and cruel persecution fell upon her. Already stricken with mortal disease, she was deposed and excommunicated. Alone and almost by stealth she sought refuge in a little village hospital, and there, though refused "what was more precious than anything else—the Holy Sacrament," she calmly awaited death. No martyr at the stake is a nobler figure than "Sister Augustine, sitting in her chair, bent with sorrow and sickness; her ideal of Church and convent long since shattered, and herself now rejected and contemned by the very order which she had so faithfully served for thirty-two years." No legend is more eloquent and pathetic than the story of the corpse stripped of the sister's robe, which they dared not take from her living, the lonely coffin ferried over the Rhine in a solitary boat, sent with purposed unkindness too early for reverent and expectant friends to meet it. Left deserted by the river-side, it was found hours after with the children playing around it. The excommunicated priests had offered to perform the funeral service for her who had so truly been a martyr—a tried witness—for the old faith, but her friends with a wise and singular moderation declined, lest "a public funeral would not so much have given the impression of a grave and obligatory duty in time of need, as of an opposition demonstration against the rightful ecclesiastical authorities." But love and honor were not wanting as friends, clergy, professors, and citizens thrice repeated the Lord's Prayer over the grave, and then heaped it with flowers and palm-branches. The life has been written in the same temperate spirit. There are no reproaches, no criticism beyond the strict demands of justice. Its effect in the Rhineland was profound, and it cannot fail even here to be widely read and deeply felt.

What Shall We Do with Our Walls? By Clarence Cook. (New York: Warren, Fuller & Co.)—*The Art of Furnishing on Rational and Æsthetic Principles.* By H. J. Cooper. First American from the second English edition. (New York: Henry Holt & Co.)—*Woman's Handiwork in Modern Homes.* By Constance Cary Harrison. (New York: Charles Scribner's Sons.)—Mr. Clarence Cook has written for manufacturers of wall-paper a brochure entitled 'What Shall We Do with Our Walls?' and intended to enforce the answer, "Upon the whole, paper them." Some of the designs by Messrs. Colman and Tiffany, which illustrate the text, contribute much persuasiveness to the argument, but an important point is overlooked altogether—namely, the cost of such beautiful paper. If, as we suspect, its expense is greater than water-color, we can hardly agree with Mr. Cook's implication that it is preferable for people of modest means. And even on the same terms the preference for one or the other is very much a matter of taste. Mr. Cook says distemper can't be cleaned, and oil-color is expensive and inferior in artistic effect, whereas paper can be renewed as often as necessary. This need not be disputed before asking for some details as to the comparative cost. Can paper be renewed more cheaply than distemper, or does it need renewal less frequently?—we mean such paper as is here presented in Mr. Colman's and Mr. Tiffany's designs. There is, however, the consideration that it is possible for the general public to get good wall-paper, and impossible to get good frescoing done at anything like the same cost. Mr. Cook rightly makes the most of this, and all that he says of our house-painters is unhappily true. We suppose the general public will have better-looking walls if they paper them with the paper that is now abundant than if they call in the services of the professional decorator. To improve the general stock of wall-paper Messrs. Warren & Fuller have "invited artists to design them wall-papers that shall have decided artistic qualities, and yet shall be suited to actual needs, and that shall command a place in the market." After these become the fashion, as, of course, they constantly tend to become, people's houses generally will look better. But why should not the decorators as well as the wall-paper manufacturers take advantage of the demand for better household art, so that in the end it will be as cheap to have one's walls painted in good taste as it is now expensive? There is, we believe, no question that people of taste can contrive to suit themselves just as well with distemper as with the best wall-paper; at least, if they stand up to their painters with firmness. But we appreciate the fact that Mr. Cook has in mind people in general, and of course those who have to depend upon the few firms who decorate will find it expensive. The truth is that before household art can amount to anything, seriously considered, there will have to be a more general appreciation of beauty and propriety, and a corresponding ability to dispense with such literature as the subject has lately given rise to. The real service which this performs is to convince people who need to be convinced of the fact that household taste is a good thing. Any specific advice in regard to furnishing and decorating is apt to be ludicrously unpractical. No one who can appreciate Mr. Cook's agreeable writing about what to do with our walls really needs his advice. If it were not so evidently a labor of love to him we should say it was time thrown away. But in the sense referred to it probably does perform a missionary service.

As to the specific counsel, a great deal of refined ingenuity is displayed, and the writer is probably interested in hunting his ideas to their fastnesses; but of what practical value to grown people is such a suggestion as this?—"The decision here depends on whether the husband or the wife is the one more concerned in the matter, for I believe it is commonly seen that men like a great deal of sunlight in the house, and are pleased with a decoration of gold or red, or colors in these keys, be they strong or pale, while ladies, for the more part, like sombre tints, or such at least as absorb rather than reflect the light." Quite as practical and quite as valuable advice would be some suggestion as to how husband and wife, before decorating a room, are to decide as to which is "boss," vulgarly speaking—at any rate, if it be a room in which they are both equally concerned. It is all very well to note that the point will have to be determined somehow, but how is the very pinch of the matter; and here Mr. Cook fails us.

Mr. Cooper's 'Art of Furnishing' is similarly vague and otherwise unsatisfactory. *E.g.* (p. 20): "We would rather, as a general principle, treat a wall as a wall, preserving its flatness (or vertical plane), at the same time endeavoring to avoid monotony and crudeness either of design or color." So would we, if we were puzzled about the matter; but how to do this Mr. Cooper does not tell us. And he does not, simply because he cannot, and no one but one's self can. Now and then he is more specific, but we should like to ask Mr. Colman or Mr. Tiffany what he thinks of such a statement as (p. 21), "Gold is of doubtful service in enhancing the effect of a paper, especially if the design be good." On the other hand, who will object to this (p. 58): "Take care to get the best proportion and sizes possible for your dining-table, as much comfort depends on this. If the top is too narrow, plates and dishes will be huddled together; if too broad, the room-space on either side will be infringed upon." Or this (p. 60): "Sometimes, however, it happens that we get a real easy chair, and even then find it does not suit us." In the drawing-room, where "the sweets of life only are distilled, the flowers of life gathered," the furniture should be "suited as nearly as can be to the varied purposes of recreation, social and intellectual, uniformly associated with its name." Therefore "it is useless to have a lot of stiff high chairs," although you mustn't have them too low for "elderly gentlemen, who object to being dropped into a seat from which they find it impossible to lift themselves without assistance" (p. 74). Mr. Cooper does, indeed, describe in detail one apartment he knows of, in which "any ruffled feelings which you might have had on entering must involuntarily have been smoothed down before you had been seated ten minutes" (p. 73); but this is evidently a very remarkable room, which it would cost a good deal to duplicate.

Mrs. Constance Cary Harrison's work is much more elaborate, but we should be inclined to say even of it that its usefulness consisted chiefly in awakening in its general subject the interest of people who have hitherto paid little attention to it. Ninety-five of its two hundred and thirty-five pages are devoted to embroidery, and a great many stitches are described, some of them with illustrative diagrams. But these are not described explicitly enough to take the place of an instructor, and, indeed, are not apparently designed to do so. Like the rest of the book, they seem rather an account of what is now being done and has been done in the art of needlework, from seeing which any one may get a general idea of its attractiveness and variety. As the writer says, her purpose has been to suggest "models of infinite value in forming the taste of the student," and to call attention to the accessibility to New-Yorkers of "admirable specimens bearing the sign-manual of many ages and nations." In short, her work is a cyclopædia rather than a manual. A visit to the rooms of the Ladies' Society of Decorative Art, or at least several visits, would probably be of more practical utility to the beginner in embroidery, but in the many "modern homes" throughout the country intelligence as particular as this of what is going on here in "woman's handiwork" will doubtless be welcome and prove generally stimulating. Various details as to the cost of materials, etc., are of especial value, and a young lady in Peru, Indiana, say, who knows something of stitches, may find something imitable in a design for a screen by Miss Dora Wheeler on page 70, or something suggestive in the piece of Cinquecento appliqué reproduced on page 60, to select from many examples. To her also it may be serviceable to learn (p. 162) that "Poe knew the witchery of hanging stuffs when he wrote of the 'silken, sad, un-

certain rustle of a purple curtain,' and Keats, when he portrayed his lady's dream 'shaded by the dusk curtains' and all 'entoiled in woofèd phantasies.'" To readers nearer the metropolis the work may be useful as a compendium, and we do not hesitate to predict great popularity for it among those—and there are many—who like to read what is written on this subject, although it may give them little instruction. It is the product of much research and intelligent industry, and is very prettily got up and illustrated by, among others, plates in colored lithography from designs by Messrs. Tiffany, Colman, and George Gibson, and Miss Rosina Emmet.

Germany, Present and Past. By S. Baring-Gould. (London: C. Kegan Paul & Co.; New York: Henry Holt & Co.)—Mr. Baring-Gould's name is well known, though not in that branch of literature to which the volume before us belongs. He seems to have lived some time in Germany, and as there is no English book which gives a general view of the history and society of that country it may have occurred to Mr. Gould's publishers that such a work would be profitable, and that Mr. Gould was a person competent to write it. Perhaps he was, but it is very evident that in preparing it he was guided by his own taste rather than by a consideration of the needs or likings of the public.

It is incumbent on the reviewer to say this, not only because the book does not fulfil the promise of the title, but also because the false idea caused by the name will be strengthened, for the American reader, by the fact that it comes to him from the same publishers, and in the same shape, as the works on Russia, Egypt, and England, by Messrs. Wallace, McCoan, and Escott. There are nineteen chapters, and their subjects are, for the most part, inviting; but inspection shows that the author's standpoint is that of an antiquarian, not that of a traveller or observer. Thus, the chapter on women gives us, not a description of their position, character, and habits, but a synopsis of the 'Niebelungen' and of the literary history of the Weimar period. The chapter on marriage treats not of married life, but of the development in Germany of the legal idea of marriage, beginning with the provisions of the Lex Salica. The chapter entitled "Culture" should have been called "Culturgeschichte," for it is devoted to the court scandals of the last two centuries. The chapters on Social Democracy, peasant-proprietors, forest-royalty, the church, labor, and education, are much better, because more suited to statistical treatment. Those on the stage, the nobility, the universities, are dry historical retrospects.

Mr. Baring-Gould does not believe in that quixotic literary honesty which requires the acknowledgment of the writer's immediate authority when quoting at second-hand. Vehse, for instance, is transcribed by the page, but his name occurs only in the list of works consulted. A more serious fault is the author's loose manner of statement, in treating the present as well as the past. A list of the instances we have noticed of such cases of carelessness would exceed our space; two must, therefore, suffice. In the chapter on Social Democracy Mr. Baring-Gould asserts that "The state now monopolizes the telegraphs, the railways, the post-office, the sugar-culture, the saltmines, and proposes to monopolize tobacco-growing." So far is the state from "monopolizing" the railways that the Governments do not own half of them, while as regards the sugar and tobacco culture, the statement is not merely incorrect, it is absurd. The Government proposed to assume, not the cultivation of tobacco, but the trade in it, as in France, Italy, Austria, and other countries. Mr. Baring-Gould's acquaintance with mediæval history may be inferred from his mention of "Emperors of Austria" in the fifteenth century.

The Family Medical Guide: a complete popular dictionary of medicine and hygiene. Edited by Edwin Lankester, M.D., F.R.S., etc. American edition, revised, with additions and amendments. (New York: E. B. Pelton & Co. 1881. 8vo, pp. 496.)—This dictionary aims to cover the whole ground of medicine and surgery, including diagnosis, therapeutics, and *materia medica*, in a single volume. Its execution is naturally unequal. Some of its articles—as, for instance, "Diphtheria," "Alcohol," "Keloid"—give the substance of what is known upon the topics discussed. A greater number are insufficient, as "Hygrometer," "Dew-point," and the related captions, or "Weight and Height," in which the tables take no account of age as a factor; or misleading, as "Health Resorts," under which the American editor (presumably) says that "in the south of Florida the temperature scarcely changes the year round," a statement which is true only of some of the keys on the edge of the Gulf Stream; and that in Minnesota "all the seasons are remarkably free from sudden changes." In the article "Croup," again, there is a grave error of omission in the failure to indicate the clinical thermometer as an almost indispensable means of distinguishing that disease at the outset from *laryngismus stridulus*. But in a work so condensed as this, and yet of such wide scope, accuracy is seldom or never obtainable. An authoritative résumé of such a multitude of subjects as are touched upon in the 'Medical Guide' requires the collaboration of many writers who are experts in their provinces; and expert knowledge does not find its best market in short, unsigned dictionary articles.

HENRY HOLT & CO., New York.

New English Books
At 25 cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

Le Français,
Revue mensuelle de grammaire et de littérature.

The ninth number is just out, which closes the first year. The first number of the second year will be issued on (or a little before) the 5th of October next.

Terms of Subscription:

Per Year (nine numbers, from October to June), in advance, post-paid $1 50
Single Number, in advance, post-paid 20

The nine numbers of the first year sent, post-paid, on receipt of $1 50. Persons looking for some French summer reading could hardly find in any volume a finer collection of pure and bright novels and comedies, not speaking of a great variety of other matter.

Le Français is sold by the principal newsdealers in all the large cities of the United States.

301–305 Washington Street (opposite Old South), Boston, Mass.

The Nation.

NEW YORK, THURSDAY, JUNE 16, 1881.

The Week.

THE proceedings at Albany were varied last Thursday by the explosion of a "bomb-shell" by Assemblyman Bradley, of Cattaraugus County, who rose to a question of privilege in the Assembly, and announced that he had been given $2,000 to vote for Mr. Depew for Senator, that he had deposited the money with the Speaker, and that he demanded a Committee of Investigation upon the subject. The Speaker thereupon, in the midst of profound stillness, declared that he had the aforesaid sum in his pocket. Mr. Alvord was equal to the occasion, and expressed his conviction that "this money came from the other side"—that is, the Conkling side. An investigating committee was immediately appointed, and since then Bradley and his alleged corrupter, Senator Sessions, have been on trial before it without anything having been elicited except the reaffirmation on Bradley's part and the denial by Sessions that the latter offered money to the former in exchange for his vote for Depew. Public opinion, which it is to be observed has very little to go upon, is divided. In support of the notion that Bradley was bribed it has the files of the *Tribune*, wherein Sessions has been called very bad names, to the deep present regret of that journal, and a number of certificates of his fellow-townsmen to Bradley's good character, and the unlikelihood that a "job" of this kind would be "put up" in such clumsy fashion. On the other hand, it is to be said that Sessions, if his character be as bad as it is called, would naturally be a good person to attribute such an attempt to; that Bradley's reputation is none too good, the man having once been in an inebriate asylum, for example; and that there are certain infelicities in his testimony, and in Speaker Sharpe's, which prevent the idea that they have been perfectly frank and outspoken from the first. It must be confessed that the seven minutes which Sharpe and Bradley spent together sufficed for the transaction of a great deal of business.

General Grant's indignation about the opposition to his friend Mr. Conkling seems to grow deeper as he comes North and West, and will be really serious by the time he reaches the Atlantic coast. He could scarcely contain himself when he got to New Orleans, but he did. At St. Louis, however, he unburdened himself to a reporter in some very coarse abuse of the Administration, and particularly of Mr. Blaine and Mr. Schurz, on the latter of whom he bestowed a volley of vituperation, and followed it by a warm eulogy of Boss Shepherd, of Washington, whom he described as a misunderstood man, who had lost his money, but who would, he hoped, soon "return to Washington a very rich man, to spite the Bourbons who had opposed his every effort to make the capital a city worthy of the nation." Evidently, in the General's opinion, any one who "can return to Washington a very rich man" may well despise all that his enemies can say of him. At Chicago his wrath got the better of him again, and he unbosomed himself to another reporter about the wrongs of Mr. Conkling. He said the way he (Mr. Conkling) had been treated by the President and by his colleagues in the Senate was "outrageous"; that much as he (General Grant) owed Mr. Conkling, President Garfield owed him far more, inasmuch as he owed his election to him; that when Mr. Conkling resigned he was "sick and disgusted" with the treatment he had received, which was "insulting"; that the "courtesy of the Senate" is a sound custom, and that the offer of the Collectorship to Mr. Robertson was probably the work of Mr. Blaine, and was an intentional insult to Mr. Conkling "on the part of Garfield"; that now, probably, Mr. Conkling being "a proud man," said to himself, "I will show them what I can do; I will go back and I will fight them."

General Grant also complained bitterly of the treatment of his brother-in-law, Mr. Cramer, at the hands of the Administration. Cramer was formerly a Methodist minister, but was flung into the diplomatic service by General Grant, and has been there for twelve or thirteen years. He was minister to Denmark when General Garfield came in, and was sick, and wanted a post in a good climate in Southern Europe. This General Grant thinks he ought to have, and is very angry because he has not obtained it, but was sent to a mountainous country like Switzerland. He evidently considers that Cramer is entitled to a place in the service, with a good climate, for life, sick or well. He is also angry on account of General Badeau, his private biographer and "brigadier-general in attendance," because he was sent to Denmark in Cramer's place from the consul-generalship in London. In fact, he is full of grief of one sort or another.

This is all doubtless very painful reading to the millions who used to be General Grant's admirers, but he is not so much to blame as he seems. He is the victim of the parasites and flatterers who have been hanging about him ever since his first term, and have grown bolder as his want of discrimination became more apparent. This worship, ridiculous as it has seemed to outsiders, was too much for a simple soldier who had reached middle life with but little social experience, and it has gone a good way to destroy a splendid reputation. If they were capable of repentance for anything by which they did not lose money they would suffer a good deal in reading the talk of the once "Silent Man," but they probably regret nothing about it except that the General's indiscretions have destroyed their own chances of another "hack," as they would say, at the government.

The epithet "Stalwart" as applied to a class of politicians was first used by Mr. Blaine in 1877 to designate those Republicans who were unwilling to give up hostility and distrust of the South as a political motive. In the present contest at Albany it has by a curious transformation been appropriated by the followers of Mr. Conkling to distinguish politicians faithful to his Machine. A "Stalwart" there is a man who votes for Conkling or Platt, "first, last, and all the time," because Conkling was "insulted" by Robertson's getting the Collectorship. All reference to the South has dropped out of the term. In fact, the Albany row is every day adding to the political nomenclature. The "Half-Breed" is a Republican who is dissatisfied with the Conkling Machine and acts against it. The "Jelly-Fish" is a man who hesitates to vote decisively for or against the Machine. "Taking the command of his forces" means hiring a bedroom in a hotel and sallying out from it to ask members of the Legislature for their votes. George C. Gorham, who lately figured as the Republican candidate for the Secretaryship of the United States Senate, was during his brief stay in Albany "the Pole-cat." Platt is known as "Me-too."

Governor Foster was renominated without opposition by the Republican State Convention of Ohio last week, and the rest of the ticket chosen without substantial opposition. Senator Sherman was the permanent chairman of the Convention, and made a speech congratulating his hearers on "the auspicious opening of the Administration of James A. Garfield," and eulogizing his successor, Secretary Windom, for the success of the recent refunding measure. The resolutions, unanimously adopted, echoed the Senator's "endorsement" of the Administration's policy, declared in favor of protecting home labor and of discriminating in favor of American production, and appealed to the people on the prohibition question. This last plank of the platform was the only one which was not determined upon as a matter of course, and the phraseology of it will possibly give the party some trouble during the campaign. The exact wording of it is: "The public interests require that the General Assembly should submit to a vote of the people such amendments to the constitution of the State relative to the manufacture, sale, and use of intoxicating liquors as shall leave the whole matter to legislation."

This may be taken to mean much or little, and was, of course, so intended.

The North Carolina Republicans have taken the plunge for which we prepared our readers last week. The Republican Executive Committee met last Thursday and agreed to issue an address to the people in opposition to the prohibition bill now before them for ratification or rejection. Anticipating this action, their chairman, J. J. Mott, who is also Collector of Internal Revenue, sent out a begging circular explaining that the committee had taken ground against the prohibition movement "because of the legislation it contains against citizen rights, and in favor of rank and classes," and indulging in other marvellous rhetorical expressions on behalf of "Liberty and Progress." Simultaneously with these performances the address of the late Anti-Prohibition Convention was given to the public, in terms which imply a high average degree of culture in the North Carolina voter, and the most beautiful moral aims. It brands the interference of the clergy as "a new alliance between Church and State," which "history shows on every page of its record" to be a bad thing for both parties, producing in the latter a very complicated form of disease, since "weakness and demoralization creep upon the State to canker the very heart of government, and sow beneath its foundations the seeds of corruption and decay." It concludes that "the rejection of the act by the electors at the polls is the first great step in the cause of temperance reform possible to the people of North Carolina." The first signer of the address was T. N. Cooper, Mr. Mott's predecessor as the head of the Republican Executive Committee, and this unanimity of sentiment may entitle the party to some "attitude" from the Administration at Washington. Decent opinion in all other quarters, meantime, will rate the "Republicanism" of North Carolina as beneath the level of the article either to the North or South of it.

The Republican Executive Committee of Virginia held a meeting last week and adopted an address, prepared by General William C. Wickham, the chairman, calling upon the Republicans of the State to "stand squarely by their colors" and to put forth their efforts to prevent Republican voters, who would have carried Virginia for Garfield last November had it not been for "the interference from outside parties and treason on the part of some within our own lines," from deserting their own party and coalescing with "one which refuses to acknowledge allegiance to Republicanism." The address calls attention to the fact that the Democratic factions are more "bitterly divided" than ever, and expresses the conviction that if the Republicans are true to their convictions they will "attract the support of very many of the most solid people of the State." Together with this address, however, a resolution was adopted, calling a meeting of the State Central Committee on June 29, "for the purpose of deciding whether or not a State Convention shall be called." So that, considering the increased rumors during the week that the "position of the Administration" is less uncompromising towards the Readjusters than it has generally been supposed to be, it seems useless to predict before June 29 whether the Virginia campaign will be "three-cornered" or not. But, as matters stand, the professed readiness of the Republicans to play the game alone implies that "a fair ballot" is not the main question in Virginia, and that the whitewashing certificate awarded on account of it to Mahone and Riddleberger by Mr. Sherman and the Massachusetts Senators was altogether misconceived and misdirected.

New Hampshire is furnishing an illustration of the inconvenience of biennial legislative sessions, a tendency towards which is observable in many States. The Legislature now sitting is divided as to its powers and duty under the Federal law requiring the election of United States Senators by the Legislature chosen next preceding the beginning of the Senatorial term. Literally construed, this devolves the election upon the Legislature to be voted for in November, 1882, and there would be no excuse for any difference of opinion if that body met promptly in January, but in fact it does not meet till June, so that for an interval of three months, at least, the State must perforce go half-represented in the Senate, unless, as was done in a similar emergency, the Governor make a temporary appointment. The present Legislature is, therefore, manifestly the only body that can fulfil not perhaps the statute but the intent of the Federal Constitution, that each State shall have the right to uninterrupted representation in Congress, and so the Supreme Court of New Hampshire has just decided on application of the State Senate. The hardship of this is that the judgment of the State is demanded so long in advance; but this ought not to be shocking to a people content to let seven months elapse between the choice and the assembling of a Legislature, and which sees with indifference every new House of Representatives voted for a twelvemonth in advance. Those who complain of it are naturally the politicians who expect to profit by delay—on the one hand the Democrats as a party, who are in New Hampshire gifted with a great capacity for hoping that something will turn up; on the other, the Republican aspirants for Mr. Rollins's place, and particularly Mr. William E. Chandler, chairman of the Judiciary Committee of the New Hampshire House. This committee reported almost unanimously against the legality of any action by the present Legislature; and in spite of a Republican caucus resolution that the election ought to take place on Tuesday last, the House postponed it in favor of the next Legislature.

The statements of the New York banks continue to show the effect of the recent large settlements which have been made here for the account of various corporations, but the loan market continues easy for borrowers and at low rates; and this is likely to be the case for several months, because (1) the Treasury is committed to the payment of from $80,000,000 to $100,000,000 cash in connection with refunding; (2) the rates of exchange are likely to rule below the gold-exporting point as the result of the movement of securities between Europe and America; and (3) because the drift of currency between New York and interior cities is always in favor of New York from May until late in the summer. The loans of the New York banks are, however, larger than ever before, and a feeling of security would undoubtedly be promoted if the expansion in this particular were checked. Several new loans of magnitude were marketed during the week, one having been for $10,000,000, issued by the Pennsylvania Railroad on the security of the Philadelphia, Wilmington & Baltimore Railroad stock recently bought. This loan bears only 4 per cent. interest, and is selling at 99 to 100. Another was a loan of the Chicago & Northwestern Railroad, $3,500,000 in amount, which bears 5 per cent. interest, and which was eagerly taken at 102½.

The trunk-line railroad managers met during the week, and the result, in a word, was that harmony prevailed. Undoubtedly some of the lines had been cutting rates, but this was met by putting all on the same footing, and one favorable for meeting the water-ways which are the common rival of all the roads during the months of open navigation. The crop advices are as good as could be expected, considering the unseasonable weather. The volume of mercantile business is large, as is shown by the Clearing-house returns all over the country, exclusive of speculative centres; and business men report that profits are satisfactory, and that there is an absence of the speculative spirit in trade which was so noticeable last year and the year before. The price of silver bullion continues to drop, having fallen in London to 51¼*d.* per ounce, which is a practical recognition of the fact that little is expected to result from the International Conference at its next meeting. The bullion value of the "buzzard dollar" at the close of the week was about 86¼ cents.

In these peaceful times our great soldiers can do little else than fight their battles over again, in the interest either of their personal reputation or of the "truth of history." General Sherman opened the warm season, in which such kind of warfare is as natural as the real thing, by undertaking to prove that the Union army was not surprised at Shiloh, and became at once engaged with the Cincinnati *Gazette* and other hostile critics. Badeau's 'Life of Grant' was found to depreciate Thomas, and,

while the combat deepened over this injustice, General Schofield gave it a living interest by denying Thomas the credit of the Nashville campaign. Meantime, Jefferson Davis's ponderous vindication of himself and the Confederacy appeared, and attracted General Sherman's attention by its statements in regard to the removal of the non-combatant population from Atlanta, and the burning of Columbia. The meeting of the Army of the Potomac at Hartford last week gave him the opportunity of rectifying them publicly, which he did with his accustomed frankness and incisiveness, and without bitterness. He proved conclusively that the removal was accomplished in a manner so humane, and so satisfactory to the Confederate officers detailed to superintend it, that to compare it, as Davis does, to Alva's atrocities in the Netherlands, "is simply absurd." As for Columbia, and his alleged responsibility for the burning of it, for which General Sherman is likened to Wallenstein, he spoke as an eye-witness in supreme command at the time, and attributed the destruction of the city to the firing of cotton bales by Wade Hampton's retreating cavalry, and the preservation of what was saved to Logan's corps. He would not have hesitated to burn Columbia openly, if such had been his intention, as an act of war, but his orders to General Howard were given in writing two days before Columbia was entered. The conclusive argument as to the origin of the fire was found in the action of the Mixed Commission appointed under the treaty of May 8, 1871, which unanimously rejected every one of the twenty-three British claims brought against the United States for cotton destroyed at Columbia.

The victory of Iroquois at the Derby in England was followed on Sunday by the victory of another American horse, Foxhall, owned by Mr. Keene, at the French Derby—the "Grand Prix" of Paris. Foxhall was more truly an American horse than Iroquois, as he was not only born in this country, but both his parents were American. His triumph is, therefore, better calculated than Iroquois' to make the European despots and their pampered nobles quake in their shoes or boots. There is no doubt, comic as it may seem to persons in this country unfamiliar with the part horse-racing plays in the English social system, that these two American victories, coming in the same year, will make a deep and not very exhilarating impression on the English mind. What they mean is, that the causes which for the last century have made England pre-eminent over all other countries in breeding and training horses have begun to work here, and are likely to produce very remarkable results. It is plain enough now that the thoroughbred does not degenerate in this country either in speed or bottom. In fact, it seems not unlikely that the climate and forage suit him well. It is plain, too, that we are to have what England alone has so long had, a body of rich men willing to devote unlimited money and pains to discovering and training good race-horses. This means, of course, the careful breeding of great numbers of thoroughbreds, because only about one colt in fifteen displays the qualities which give a fair promise of racing victories. We may, therefore, look during the next twenty years to greatly increased activity in the American horse-trade, both through the home and foreign demand. This is a pleasing picture enough, but it has a reverse side in the stimulus that racing gives to betting. We see that Mr. Keene thinks betting on horses an improving custom, because it turns young men away from the gambling-table. This may be true of rich young men, but it seduces hundreds of thousands of poor young men into gambling in England who would never think of staking money on anything but horse-races, and most of whom know no more about horses than about locomotive-engines, and never see the animals on which they take or give "odds."

Mr. Froude is again in trouble with the family of Mr. Carlyle. He sent a check to Mrs. Alexander Carlyle for $7,500, the proceeds of the sale of the unfortunate 'Reminiscences,' which she acknowledged as if it was her due. He was then advised by his lawyer that if he allowed the money to be taken in this way it would make him legally liable to the family for the proceeds of all subsequent sales of this and other publications of Carlyle's papers, and he therefore stopped payment of the check, Mrs. Carlyle apparently not having been prompt in making her deposit. Fresh illustrations of the unfortunate effect of the publication of the 'Reminiscences' in the shape of protests and remonstrances from the surviving relatives of the persons maltreated in them continue to appear, and must make Mr. Froude's position one of singular discomfort. The only compensation for his great blunder is to be found in the fact that the trouble it is giving him has probably drawn his attention away from the Irish question, which has a remarkable fascination for him, and on which in his ordinary mood he would probably by this time have written copiously in spite of his having given it up as insoluble last summer.

There are signs that the Irish Irreconcilables have abandoned the policy of obstructing the Land Bill in committee, and it is now advancing with considerable rapidity. Several amendments have been rejected by large majorities, and a great many minor ones have been dropped, so that there is a fair prospect of its reaching the Lords early in July. Its probable fate there, and the probable consequences of its rejection, are discussed by our London correspondent. The riotous opposition to evictions continues with some unpleasant signs of weariness on the part of the police. A private circular of the Government, addressed to the county inspectors who command the force, charging something like remissness in the performance of their duty, has been brought to light, and caused for a moment a little shiver of alarm, as, if the Royal Irish Constabulary, as they are called, were to go to pieces, it would be a very serious aggravation of the situation. There would be no substitute for them, in spite of their deficiencies as detectives. They are physically much finer men than the regular troops, and are better educated and more intelligent, and as well drilled, and know the country, and until now have never shown the least sign of disaffection.

On Thursday last the French Senate refused, by 148 to 114, to take up the bill sent up from the Assembly establishing the *scrutin de liste*, or election by general departmental ticket. M. Gambetta, who had set his heart apparently on its passage, and has been talking of it at Cahors, his native town, where he has been much fêted, as the crowning of the Republican edifice, is taking the defeat very seriously, and does not conceal his chagrin. His paper, the *République Française*, compares the performance of the Senate to the doings of the famous 16th of May, and proposes a change in the constitution of the Senate, doing away with life Senatorships, and reducing the term of the others from nine years to six, and denounces bitterly the moderate Republicans, headed by Jules Simon and Waddington, whom it holds responsible for the failure of the measure. This, of course, warrants the Right in proclaiming that the defeat of the measure means the overthrow of Gambetta's dictatorship. There is no sign of any such popular demand for it as to make its rejection call for an amendment to the constitution. Gambetta's attitude about it is the more singular because at Cahors he has been strongly deprecating hasty constitutional changes, and has held up the United States as a model in this respect. A movement, emanating from him also, doubtless, to hasten the dissolution of the Chamber, so as to have the election while the question is hot in the public mind, has been repudiated by the bulk of the Left, and there will be no adjournment till the Budget has been voted.

The display of heat about the *scrutin de liste* is going to make the attitude of the country towards it, both now and at the elections, a very important matter for M. Gambetta. The way he has been received at Cahors, his native place, and a Bonapartist district, has been creating a widespread belief that the French were once more going to submit themselves to personal government, that they had borne the rule of mere law as long as they could, and were now about to set up once more, even under republican forms, a man representing the law. M. Gambetta's anger with the Senate will strengthen this belief, and make any failure at the elections very damaging to his influence and prestige, though, of course, he cannot cease to be a great figure in French politics, or to wield the dictatorship which his admirers ascribed to him at Cahors, "of genius, reason, and eloquence."

THE ALBANY STRUGGLE AND THE BOSS SYSTEM.

THE struggle at Albany has continued during the week, and, even if it does not constitute a very elevating spectacle, is a very valuable political lesson and illustration. No amount of writing or speaking against the Boss system would have brought home its real nature to the public as effectively as the performances of Mr. Conkling and his friends have done during the last three weeks. If he had been hired by the Civil-Service Reform Association to furnish examples and proofs of the evils which they denounce, he could not have done the work more efficiently. For instance, thousands of persons in this State to whom Mr. Conkling is now a most objectionable and, indeed, preposterous public man, never would have believed it if he had not resigned. Moreover, only a small handful of voters would have ever perceived what a sign of political degradation Platt's election was, if he too had not resigned. His resignation, so to speak, lighted him up, and he then reflected light on the nature of the influences which made it possible for such a person as he to be made Senator from a State like this. No accounts of him would have made it clear to people what he meant and what he stood for. At last he took himself in hand, if we may use the expression, and in a few days the immensity of the mistake committed in giving him any place of importance was known, to use Mr. Conkling's expression, at all "the kneading-troughs" in the State. There is, too, a curious but most useful perversity about them both. If they had stopped short at the resignation, and had retired from the scene and shown or affected indifference to re-election, it is not at all unlikely that a reaction would have set in in their favor. Their attitude, or at least Mr. Conkling's attitude, might have had an appearance of dignity, which would have at least touched the imagination of his old admirers, and have brought him back into public life at no very distant date with, perhaps, a stronger hold than before on the politicians. But this chance was promptly destroyed by their both beginning immediately to make eager efforts to prevent their resignation from being accepted, which, of course, gave the resignation itself an air of farce. To make retirement from any position effective as a demonstration it has to be thought sincere. To confess that it is not meant always annoys the persons to whom it is addressed, because it reveals that they have been selected as good victims of a piece of deception. In humbug, as in other things, art consists in concealing art.

Even at this stage, however, the case of the two ex-Senators was not, perhaps, hopeless. They might have made several fair excuses for pushing their own claims to re-election, which would have had more or less efficacy if they had abstained from going to Albany to push their claims in person, and from dragging the Vice-President with them. There was a vague belief afloat, even among Mr. Conkling's enemies, that his personal presence was his strong point, and if he brought it to bear upon a Legislature which had at the time of Platt's election shown itself so anxious to ascertain his will and execute it, he would carry everything before him. This belief was a most useful thing, and a more prudent or shrewd man would have cherished it as a most valuable possession, and would have refrained from putting it to any severe test except in some dire extremity. Mr. Conkling, however, rushed to Albany in the very beginning of the conflict and destroyed the belief in a day. He showed himself in person, surrounded by his chief lieutenants, canvassed like any ordinary "worker," and the personal-presence prestige vanished at once. He came and nobody was frightened, and he went away and no one felt either disheartened or relieved. Even here, however, his affairs were not at their worst. There was still one mistake to be made or avoided, and that was assailing the reputation of all who wished to take him at his word and accept the resignations as final. This Mr. Conkling has now committed. The Republicans of the present Legislature have been elected for the most part under the auspices or with the approval of his Machine. The majority were supposed to be devoted to him, and were devoted to him only six months ago. It would have been decency as well as good policy to assume that in opposing him they were the victims of a great delusion, and were to be pitied rather than disliked. But he has actually reached the last extreme of folly by attacking them as corrupt rascals, who are taking pay for not sending him back to the Senate. He is telling the world, through his agents at Albany, that the Republican members of the Legislature, elected by the party of which in this State he has for many years been the recognized head, and to whose judgment he solemnly submitted his conduct in his letter of resignation, are for the most part purchasable men. It would be difficult to find a parallel for this, as mere bad management, in recent political history.

This is true whether the Bradley bribery charge be true or false. Even if there were no doubt that an attempt had been made on Bradley's virtue, it would be very injudicious on Mr. Conkling's part to parade the incident as a fair specimen of what was going on among all the supporters of Mr. Depew. No one can blacken his late associates with impunity, because nobody believes in the sudden access of depravity. If Mr. Depew's supporters are such bad men, they must have been bad when they were Mr. Conkling's supporters. But there are many reasons for doubting the truth of the Bradley story, such as the avowed expectation of some of Mr. Conkling's friends, two or three days in advance, that there would be a terrible revelation very damaging to his enemies before long; the apparent readiness of the Speaker, Mr. Sharpe, for this very startling information, and for the receipt of the money. We are not concerned, however, so much with the truth or falsehood of the tale as with its effect. It has not been generally believed, and it has apparently not influenced the voting at all, or only influenced it in a sense unfavorable to Mr. Conkling. So that, even if true, it seems as if the manner and time of its production constituted another blunder of management. It has, indeed, if true, been made known in a way which deprives it of all value for electioneering purposes.

All these things taken together make the re-establishment of the Boss system in this State, at least for some time to come, very unlikely. It could stand almost anything except want of success as a system of management. It is not necessary to its permanence that it be a fountain of pure politics or sound political philosophy, but it is necessary that it keep its hold on those who have been bred in its service, and have for a long time believed in its methods.

THE ENGLISH AND FRENCH TARIFF TROUBLES.

THE negotiations between France and England for the renewal of the commercial treaty have begun, and are apparently going on favorably, both sides declaring that they really desire to maintain the leading features of the old treaty. The French Government stoutly assert that they have never had the least intention of making any change of importance in the commercial relations of the two countries. Nevertheless, these declarations by no means put an end to the anxiety with which the negotiation is evidently watched by the English public, because any treaty that is concluded will have to be ratified by the new French legislature which is shortly to be elected, and which, it is believed with good reason, will be more protectionist than the present one, for the protectionists have really not had their way with the new tariff which has just been enacted as much as they expected, and as much as the state of popular feeling in France perhaps warranted them in expecting. In fact, such increase of duties as has taken place is largely derivable indirectly from the substitution of *ad-valorem* for specific duties, and it only covers a small number of articles. The increased strength of the protectionists in France is due to causes some of which are also operative in England—that is, to the increase of taxation caused by the war, to three or four years of bad harvests, aggravated by American competition (or, as M. Pouyer-Quertier calls it, "the discovery of agricultural America"), and to the alarm with which the popular mind in thrifty countries regards an excess of imports over exports. In spite of all the labor of the economists and statisticians, the old theory of the "balance of trade" maintains a firm lodgment in the secret recesses of the ordinary man's brain in every country in the world. He may not be able to meet the free-trade economists in argument, but he nevertheless remains convinced, in spite of all demonstration, that a nation which exports $100,000,000 worth to the foreigner and imports $150,000,000 is on the road to ruin. He knows that if a private family lived in this way its ruin would be speedy, and he will not believe that the national balance-sheet is made out by any other processes than those by which an individual gets at the true state of his affairs. The strength of this belief may be estimated from

the fact that it is not shaken by the spectacle of growing prosperity during a long series of years in conjunction with a steady annual adverse "balance of trade." In France before the treaty of commerce with England in 1860 the exports generally exceeded the imports. Within the last few years the tide has begun to run the other way, and no signs of general or growing prosperity will convince a large portion of the French public that the country will not be ruined if this tendency is not reversed. The alarm on this subject began as long ago as 1866, and it has reigned ever since, and is now stronger than ever, and has spread from the manufacturers to the farmers, who formerly did not share it. Three or four years of bad harvests have greatly increased, as in England, the importations of food from America, and the French mind is, therefore, experiencing the shock which the English mind passed through nearly forty years ago and has now almost forgotten, caused by the realization of the idea of dependence on the foreigner for the national subsistence. The Englishman has now for long years failed to raise bread and meat enough for his own sustenance. Before 1846 he thought this would be something very dreadful, but he has come to look on it with no more concern than his dependence on the foreigner for wine and tea. To the Frenchman the prospect has as yet lost none of its horrors, and the French farmers are consequently for the first time supporting the manufacturers in their demand for a higher tariff, and are dissatisfied with the small amount of protection given under the new tariff to agricultural produce, as compared with that given to manufactured articles. The French manufacturer is the old and original and steadfast protectionist, as Colbert bred him. The farmer has not until now given him much assistance, mainly owing to the fact that so large a proportion of the French agricultural interest lies in products, like wine, of which sun and soil give France a natural monopoly. But the wine-crop has been for four or five years a failure. France is no longer able to retain the foreign markets for her cheaper clarets, or to keep out the American pork and beef and grain, and the "cultivateurs" think it is high time that something should be done by the Government for them too.

In England the history of protection has been somewhat different. The farmer was at the close of the French wars the great protectionist, and it was against him the free-trade battle was fought by the manufacturers. He was beaten, and until the last four or five years stultified himself by growing rich under the régime which he had expected to ruin him. Now, however, when real ruin seems staring him in the face through bad harvests and American competition, he is receiving very unexpected support in the maintenance of his old theories from his old enemy the manufacturer, who in his turn has had his faith in free-trade shaken by the refusal of so many foreign nations to adopt it, and by the consequent closing of some of his best markets through high tariffs. England, also, as now begins to be recognized, seriously damaged her position before all the world as the apostle and champion of free trade when she negotiated the commercial treaty of 1860 with the French Emperor, and the effect of the mistake is showing itself in the French hostility to any renewal of it. The manner of the negotiation was unfortunate. It was carried out almost secretly between the Emperor and Mr. Cobden, and when concluded was literally forced on the French people by imperial authority without consulting them. The best part of the French people were, therefore, deeply wounded by it in their *amour-propre*. It was, however, part and parcel of that unreserved committal of herself to Louis Napoleon and his régime, in apparent indifference to the feelings or opinions of the French, into which England fell both through the Court and the press and "society," after the *Coup d'État*, and of which there was a faint but unpleasant reminiscence in the attempt to erect a monument to the late Prince Louis in Westminster Abbey. But it was something in which Mr. Cobden ought not to have allowed himself to participate, and the result was unfortunate, not only in creating a prejudice in the minds of liberal Frenchmen against treaties of commerce, but against the Manchester School and the theory of free trade in general.

This was, however, but a passing evil. The sacrifice of position made by the free-traders in the transaction was a permanent evil, and is seriously felt both in France and England in the negotiation for a new treaty now pending. In fact, in England the willingness of the free-traders to make treaties of commerce is furnishing the advocates of reciprocity and retaliation with their strongest argument. A free-trader of the Cobden school ought, if consistent, to hold that free trade is good for any one country independently of the action of all other countries; that every government is bound, as far as its fiscal interests will permit, to leave industry and exchange free; and that if any nation chooses to burden itself with a high tariff so much the worse for it. The treaty of commerce denied all this. It admitted that the success of a free-trade policy depended on the action of other countries, and that it was not safe to admit foreign goods free or at low rates unless you got admission for yours free or at low rates in return. If this be true, the reciprocity men now say, why make any treaties of commerce at all? Why not preserve your legislative freedom, and so frame your own tariff as to make it serve the purpose of a treaty of commerce with every country with which you trade—that is, as a means of punishing nations which shut out your products and of rewarding those which admit them freely? The English free-traders, however, have but little to fear in reality from the reciprocity movement, because the manufacturing and agricultural interests could not possibly unite on any scheme of retaliation. The countries from whose competition in the home markets English producers suffer most are France and the United States, and yet English exports to France are only one-tenth of the whole, and if wine and silk were taken out of the imports from France it would be found that there was very little left to furnish materials for such coercion as would give much relief to English industry. The importations from the United States, on the other hand, are almost wholly of food and raw material of manufactures, and retaliation could only be carried out by striking at one or both of these. To strike at either would be ruinous to the English manufacturer, however much it might please the farmer. So that, no matter what may be said against the policy of free trade, the difficulty of finding any substitute for it, now that a vast system of industry has been built up on it, will probably save it from any direct legislative attacks in England. Nothing, after all, is doing so much for free trade as the wonderful example of its success furnished by the United States, which have thriven so steadily since the abolition of their custom-houses. And yet if it were not for the Federal Constitution there is hardly a doubt that every State in the Union would little by little drift back into protection, so strong is the desire of the natural man to control the markets by other means than cheapness or superiority of quality. There is hardly a year in which the Supreme Court is not called on to set aside some piece of State legislation intended to exclude some kind of competition from other States. One recently declared invalid was a Texan act taxing heavily, in the guise of a temperance law, the sale of liquors within the State other than wine and beer of Texan manufacture. Another was a Virginia act taxing commercial travellers from other States engaged in soliciting orders within the Virginia borders. These things show what we might expect if the Constitutional provision "that no State shall without the consent of Congress lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws," were abrogated.

THE DANGER OF THE HANSEATIC CITIES.

FROM late German papers we gather an account of the proceedings by which the city of Hamburg is at last being forced to consent to its incorporation in the Zollverein. Having failed to overcome the resistance of its ruling classes by negotiation, Bismarck, with characteristic pertinacity and impatience, brought a pressure to bear which proved irresistible. He threatened to extend the customs-lines of the Zollverein across the lower Elbe from one extreme point of the Prussian shore to the other, and there to subject the foreign commerce of Hamburg to vexatious treatment. The Imperial Custom-house at Hamburg, where goods intended for the Zollverein are now entered, was to be removed to the actual frontier, and the entrepôt now existing in Hamburg, where the products of the Zollverein can be held and offered for consumption or export with the privilege of being returned free into the Zollverein, was to be abolished. The legality of these measures was disputed in the Reichstag, and their probable effect was shown to be most detrimental to the Zollverein itself; but the threat alone was suf-

ficient to break down further resistance on the part of the Hamburg Senate, who, between the two evils placed before them, concluded to choose the one which had at least the appearance of a sacrifice for the common good.

The following are the principal stipulations of the preliminaries just agreed upon, which require and undoubtedly will receive the sanction of the Imperial Council and of the popular assembly of Hamburg: The city is to enter the Zollverein at a period not earlier than October 1, 1888, when its present annual contribution to the Imperial Treasury, in lieu of the duties paid by the members of the Zollverein, is to cease, and the stock of foreign goods in the hands of traders is to pay the regular duties. The privileges of a free port are not to be entirely abolished, but they are to be confined to a district embracing a considerable portion of the river and harbor, a small part of the city already occupied by warehouses, and several islands in the river, on which the manufacture of foreign material into articles of export is to be carried on free, the whole district being guarded merely on its circumference. The customs administration is to be in the hands of officers appointed by the state government, this being the rule in all the different states composing the Zollverein, subject only to the rules and general supervision of the Imperial Government. Vessels bound to this free district are to have free access to it from the sea. The Empire, finally, is to bear one-half the expense of constructing the quays, warehouses, etc., necessary for the proper fitting out of the free district, provided, however, that this contribution shall not exceed ten million dollars.

The free city of Bremen has likewise been invited to enter into negotiations, and a completion of the treaty with Hamburg, it is expected, will speedily be followed by the incorporation of the sister city under similar conditions, with such modifications as will provide also for the outport at Bremerhaven. It is not to be wondered at that the citizens of these old Hanse-towns are loath to part with the commercial freedom in which they and their commonwealths have grown up, and which has enabled them to preserve an active spirit of enterprise during the long period in which this virtue found little scope in the interior of their country. Nor is it to be expected that a change like this can be accomplished without individual losses and sacrifices in communities whose prosperity has been built on foundations so peculiar to themselves. But, unless the rest of the civilized world is greatly in error in not creating free ports after their fashion, there must remain to these cities plenty of room not only for existence but for prosperity, if they now throw in their lot with a united back-country and share the great industrial development of the Zollverein, whose business with foreign countries has so far been largely independent of the Hanseatic cities.

A good part of their opposition to the annexation, we notice, arose from the prospect of a great depreciation of warehouse property as a consequence of the establishment of large Government stores in a limited free district, and we are somewhat surprised that our own inexpensive bonded-warehouse system has not commended itself to the acceptance of these governments, to whose circumstances it would appear to have been admirably suited, as it would have saved not only the loss by depreciation of existing warehouses, but also a large portion of the expenditure for the erection of new ones in the free district. But both parties seem to have started with a belief in the necessity of such a concentrated free port, and we find no mention whatever of any other plan having been considered. The antipathy of the Hanseatic merchants to their absorption in the Zollverein undoubtedly has been aggravated by its recently introduced protective tariff, and by the pertinacity with which the Chancellor clings to the tobacco monopoly as the great panacea for the ills of the Imperial Treasury. Nor is it any wonder that, though their present position is felt to have become untenable, the future set before these communities is found to be too uncertain to attract them, and that the appeal of the interior to their patriotism should to them have a sentimental sound.

Nevertheless, we suspect that the despondency now so prevalent in the higher circles of both cities is not entirely owing to the anticipation of economic evils. This feeling, no doubt, has been increased by the silent fear that with their commercial freedom their political independence also is destined to fall; and such apprehensions will not appear unreasonable when the financial aspect of the proposed change is considered. In order to sustain their isolated position both cities have in past days, and even up to the present time, been obliged to undertake at their own cost great public works, which elsewhere are carried out at the expense of whole nations only, such as the improvement of rivers and harbors, the lighting of coasts, etc. In doing this they have been obliged to run heavily into debt and to submit to onerous taxation. If, therefore, by their entering into the Zollverein this public burden is to be largely increased, the danger, which has already loomed up in the distance, may become great, and what remains to them of political independence may become too expensive a luxury to be maintained much longer.

IRELAND AND THE IRISH LAND BILL.

LONDON, May 31.

THE introduction of the Land Bill has by no means removed the difficulties of the Government in Ireland. Your readers, no doubt, remember that in March last the so-called Coercion Act was passed, enabling the executive to arrest and imprison, without bringing them forthwith to trial, persons reasonably suspected of having been guilty of certain offences. This suspension of the ordinary law was advocated on the ground of the disturbed state of Ireland, and the difficulty, amounting often to impossibility, of getting witnesses to swear against, or jurors to convict, persons accused of agrarian or political offences. It was pointed out at the time that the incidental consequence would be that landlords would be able to carry out evictions, and so dispossess the very tenants whose interests the coming Land Bill was to secure. But it was thought that under the circumstances landlords would not press their legal rights very strictly, and that anyhow the country would, with these exceptional powers in the hands of the Irish Government, become quiet and orderly. For a little while that result seemed to have been attained; but as the landlords, who had been panic-stricken during the winter, renewed their spirits and began a new set of evictions, the outrages reappeared. In excuse for the landlords, it must be said that many of them were themselves in distress, having received little or no rent for two years past, and that they knew that some of the tenants were perfectly able to pay. But this did not prevent the people from returning in some districts to those violent courses which it was hoped that the Coercion Act had effectually checked, and they were, unfortunately, encouraged to do so by the use of inflammatory language by some of the more fiery popular leaders. Thus, as the outrages increased the Government went on arresting one man after another, and at last Mr. Dillon, member for Tipperary, one of the boldest and most vehement heads of the Land League, and, within the last few days, Father Sheehy, a priest in the county of Limerick. These two captures raised angry protests from Mr. Parnell's party in the House of Commons, which have found expression in repeated debates there, by which the course of public business has been seriously interrupted and men's minds exasperated.

The position of the Government is a difficult one, for they are placed between two fires. The Parnellites complain of the Coercion Act and of everything done under it, pointing to the suspension of habeas corpus and the exertion of irresponsible power as evidence that England is still, even when ruled by a Liberal Ministry, the old tyrannical enemy whom Ireland has learned by such long and bitter experience to hate, and from whom justice, much less benevolence, need never be expected. No opportunity is lost of putting all Mr. Forster's conduct in the worst possible light and exciting the suspicions of the people against him. On the other hand, the Tories denounce his timidity, insist that he ought to show much more vigor in dealing with men whom they think substantially rebels, and ask what is the use of trying to conciliate people so unreasonable, so bitter, so profoundly hostile to England as the Irish are. "Your Land Bill," they say, "will fail, as so many previous attempts to satisfy Ireland have failed; you cannot satisfy Ireland; nothing less than independence will satisfy her; you had much better give up the attempt and content yourselves with ruling her by main force. Administer the law with unshaken severity, and when the Irish see that nothing is to be gained by agitation they will forsake it; these dangerous demagogues will lose their influence, tranquillity will reappear, and if you then try remedial measures, they will not seem extorted by sedition, and will have some chance of doing good, which cannot be the case in the midst of this passion and violence." Mr. Forster and his colleagues have, therefore, the difficult task in each instance where their conduct is arraigned of showing that they are at the same time vigorous and moderate, of proving to the Tories that they ought not to go any further in the direction of repression, and to the Parnellites that they have been compelled to go so far as they have done. As they sometimes make mistakes, and every mistake is sure to be detected and set in the strongest light, this is no easy task. Nothing less than the extraordinary loyalty which the Liberal majority in the House of Commons continues to show to Mr. Gladstone would enable them to succeed in it, or rather to dispense with success.

Many of the Liberals don't at all like the position. Some secretly think the Tories are right, and that there is very little use in trying to conciliate Ireland. Others, probably a greater number, hold that the Coercion Act was a mistake, and that measures of land reform ought to have come before any executive repression. But all agree that the only chance for the party is to stick together and follow Mr. Gladstone wherever he chooses to lead.

Difficulties and perplexities are by no means confined to the Liberal leaders, but press with at least equal force upon the two parties which oppose them. It is not often that the same conjuncture is almost equally disagreeable and puzzling to all sides. Since the Land Bill was brought in, nearly two months ago, Mr. Parnell and his friends have been apparently unable to make up their minds whether to bless or to ban it. It goes further than they expected or predicted, but, of course, not as far as they demanded. It meets in substance most of the needs of the tenants, but it does so in an intricate fashion that does not gratify their desire for sweeping change, and that leaves its operation in some respects uncertain. It does not carry with it the extinction of "landlordism," which they have declared to be the great and crying necessity for Ireland. The machinery it provides for enabling tenants to acquire the ownership of the soil will work so slowly that no large part of the present generation can hope to become absolute proprietors. Some of this extreme party are probably quite honest in thinking that there is no solution of the Irish problem possible except a separation between England and Ireland, and therefore that any palliative measure will only prolong the disease and delay the application of the one needful remedy; so that the best thing is to keep up a constant irritation which will intensify the wish of Ireland to go, and ultimately make England glad to let her go. They are thus, from these several points of view, displeased with the Land Bill, and would like to join in defeating it. But they nevertheless perceive that it might remove some pressing evils, and they know that a large part of the Irish people wishes for it and would greatly regret its loss. They know that it might be some time before any equally liberal reform would be again brought forward, and that they would incur much blame if suffering tenants could charge its loss upon them. Hence they have hesitated, and have been with some difficulty kept together. Very few of them spoke in the debate on the second reading. At the conferences which they held by themselves Mr. Parnell succeeded in getting a majority to adopt his dislike to the bill, but an influential minority was in its favor. When the division took place he and this majority, together with a few others who did not like to betray their dissension to their opponents, quitted the House without voting. A few, and among them one of the ablest —Mr. O'Conor Power—voted with Mr. Gladstone. For this vote they have been subsequently denounced in injurious terms by some of the Land-League leaders, and it is not impossible that this difference of opinion may end in severing them and some others of the more moderate men from the Parnellite party.

The perplexities of the Conservative party have been different, yet not less grave. About their feelings there was no doubt. Almost to a man they dislike the Land Bill. It is opposed, as they believe, to the interests of the Irish landlords, with whom the English Tories, of course, sympathize. It sets a precedent which (in their view) may be some day followed in England—the precedent of diminishing a landowner's rights without pecuniary compensation. It has been extorted by agitation, and may naturally appear to be a concession to clamor and even to violence. It will probably lead to the withdrawal from Ireland of a certain number of more or less well-placed English families, and thus weaken the hold of England on the sister island. These sentiments are more than sufficient to make the English aristocracy regard Mr. Gladstone's measure as a dangerous, unjust, in fact revolutionary proposal, even were they not disposed to suspect anything emanating from him. But the situation was not one in which sentiment could be indulged with impunity. They had to calculate, first, whether they were strong enough to defeat the bill; secondly, what would follow upon its defeat. Plainly, they could not throw it out in the House of Commons; Mr. Gladstone's Liberal majority is too large and too obedient for any such attempt to succeed. That majority might, indeed, be lessened by the defection of a few Whigs, members of the landowning class, who would be imbued by feelings like their own. But then, neither would the whole of their own strength be available. Ulster, the most Protestant part of Ireland, returns a number of Tory members, who on most questions are singularly loyal members of the Tory Opposition. But the opinion of the Ulster constituencies, mainly composed of tenant-farmers, is so strongly in favor of the bill that if these members had voted against it they would have been certainly rejected at the next general election, and Toryism would have been extinguished in Ulster. Some consideration was due to these members, not to add that their absence from the division would have weakened the Tory ranks. However, though they could not defeat the bill in the House of Commons, they might easily do so in the House of Lords, three-fourths of which assembly follows the Conservative standard; and it has grown to be almost a rule with us that where a bill is to be seriously opposed in the House of Lords it ought to be also opposed in the House of Commons. But then the second question presented itself. Suppose the bill rejected in the House of Lords, what would follow? Mr. Gladstone might take one of three courses. He might resign, in which case the Conservatives would have to come into power with a majority opposed to them, and the enormous difficulty of governing Ireland, already disturbed and likely to break out into far worse disorders if the prospect of redress were removed. Or he might bring in the bill a second time, perhaps in a stronger form, and send it up again to the House of Lords, challenging them to set their will, if they dared, against that of the popular House. This would be a trial of strength which the Lords are hardly likely to risk. It is well to avoid it. Or, thirdly, he might dissolve Parliament. In that case it is, no doubt, possible that a somewhat less Liberal House of Commons might be returned. But it is not probable that the Conservatives would have a majority; and the authority of the House of Lords would have seriously suffered, because in the general election many hard things would be said and popular feeling very greatly stirred against their powers. Besides which, the condition of Ireland would be going from bad to worse, and the landlords, who have already lost a good deal of rent, would have been reduced to serious straits by getting none at all.

With all these issues to forecast, it will be understood that the Conservative leaders have had no easy problem. They must often have wished for Lord Beaconsfield's long experience and cool head to guide them; and their policy certainly has shown a want of that decision which he possessed. They have evidently hesitated between the two extreme courses of acquiescing in or opposing the bill, and have weakened themselves by taking a middle course. For a long time it remained uncertain whether or not they would go to a division upon it. They talked of an amendment, and actually had one moved, which declared that what Ireland required was not such violent changes in land-tenure as the bill proposed, but rather the development of domestic industries by help from the state. Afterwards changing their minds, they gave their support to another amendment, moved by an independent member of their party, took the division upon this, and were beaten by a majority of two to one. This result laid bare their mistake in tactics. The adverse majority was a great deal larger than had been expected. If they had not gone to a division no one would have known how weak their opposition really was. If, on the other hand, they had from the first with a united voice denounced the bill, and taken the division directly upon it, instead of playing with amendments, they would have laid a better foundation for subsequent resistance in the House of Lords. As it is, the result of this wavering policy, which may be plausibly ascribed to divided counsels (Lord Salisbury being naturally more inclined to resolute resistance and Sir Stafford Northcote to compromise), has been to give additional confidence to the Liberal party and a new impetus to the bill. There is now every probability that it will get through the stage of committee, on which it is just entering, without suffering any greater changes than Mr. Gladstone chooses to consent to. But how long will the process take? Notice has been given of more than one thousand amendments, covering some seventy-odd folio pages. They proceed from all quarters—from the Tories, who desire to overthrow the bill covertly; from the discontented Whig landowners, who would water it down; from the Ulster tenant-right party, who want to make it stronger in some points of detail; from the extreme Home-Rulers, who regard it as quite inadequate. It would take many months to consider all these, but if the bill is to pass it must go to the House of Lords early in July. Hence the Government may be expected to endeavor to cut the discussion down as much as possible, and answer each section of critics by pointing to the opposite objections of the other section. And before long the assembly will probably, under the influence of hot weather and general lassitude, be willing to vote any way their leaders tell them for the sake of getting rid of a wearisome business, from whose conclusion even the most sanguine can hardly, with the present state of Ireland before their eyes, expect the re-establishment of peace, good-will, and prosperity.

Y.

OPERA AND MUSIC-DRAMA IN BERLIN.

BERLIN, May 30, 1881.

ABOUT the year 975 A.D., according to operatic reckoning, *Otto II.*, king of the Germans and emperor of Rome, undertook a journey in order to meet his bride *Theophania*, daughter of the Greek emperor. She had been entrusted to the care of *Anarchos*, a counsellor of the Greek emperor. *Anarchos*, however, was a bold, bad man, who had long formed the wicked plan of cheating *Theophania* out of the crown, and securing it for his own sister, *Hatmaris*. His first step to that end consisted in substituting his sister's picture for one of *Theophania*, which was to be forwarded to *King Otto*. Then he hired a band of highwaymen to kill the bride and all her escort. Shortly after this brave and daring feat he meets the king, and introduces *Hatmaris* as the real bride. While she recounts her adventures to the king a sort of "pilgrims' chorus" is heard, consisting of monks from

a neighboring monastery who had come to bury the victims of the massacre. To this monastery the king conveys his supposed bride to celebrate the nuptials. The real bride, however, had been saved by operatic fate from the hands of the assassins, and found refuge in the house of a peasant. When the peasants hear of the arrival of the king in the monastery and his matrimonial intentions, arrangements are at once made for a festival on a grand scale. Among other things, a wreath is to be presented to the king by the fairest maiden in the community. As each maiden, however, backed up by her lover, claims to be that person, the quarrel is decided by choosing the stranger-maiden, *Theophania*, to greet the king. But to every one's astonishment and indignation she refuses to accept the honor. The king, meanwhile, although struck by the beauty of *Hatmaris*, does not find her up to his ideal, and takes a walk in the forest to meditate on his bad luck. Here he meets *Theophania*, and hears from her lips that he has been deceived and that she is the real bride. *Anarchos*, who has arrived on the scene meanwhile, declares her insane, and as the king seems to take an uncommon interest in her, the crowd, who had already become convinced of her insanity through her peculiar conduct in refusing the honor proffered her, accuse her of having bewitched the king and hurry her off to the stake. Here she confronts *Hatmaris*, and sees hanging around her neck a chain which had been among the objects taken from her by the brigands. She begs the king to examine the little picture attached to this chain. It is her own picture with her signature. *Hatmaris*, on beholding it, confesses all and is sent to a nunnery, while her brother is delivered over to the executioner.

Such, in brief, is the plot of the latest operatic novelty produced in Berlin, "König Otto's Brautfahrt," music by Adalbert Ueberlée. As operatic librettos go, it cannot be called bad. Indeed, it contains situations of genuine dramatic interest, which a composer of some talent might have turned to good account. But if composers who can write good ordinary music are rare, those endowed with the dramatic sense are rarer still. Ueberlée is not one of them. He is a first-rate local organist—court-organist to the Crown Prince, I believe—and has composed an oratorio and some other things which, after seeing his opera, I do not regret to say I have never heard. The local critic who observed that he had never had an adequate idea of a great desert until he heard "König Otto's Brautfahrt," did not exaggerate so very much. It is *Capellmeister* music pure and simple, and must be ranked with the compositions of Brüll, Hiller, and others. The absence of all melodic or harmonic ideas and refreshing rhythms is bad enough of itself; but in Ueberlée's opera it is coupled with an ambitious striving after certain effects well known to frequenters of the opera, such as horn calls and echoes, trumpeters on the stage, a pilgrims' chorus, etc., which, to those who have heard the originals of these effects, suggest the idea of a crowd of boys "playing soldiers," or something of that sort.

The opera was only given three times, and, although the last performance was on a Sunday night, the most favorable evening in the week, the house was not half filled. There is no danger, accordingly, that it will be played again. Nor should I have considered it worth while to send you an account of it were it not that it so admirably characterizes the spirit and attitude of the intendant-general of the royal theatres of Berlin, Herr von Hülsen. It is a good thing for a city to have an opera-house supported to a large extent by royal patronage, but there are disadvantages connected with such an arrangement. The manager is, indeed, rendered independent of the vacillating taste of the public in the choice of the works to be performed, but he is also able to play the autocrat and refuse to accept an epoch-making work by a great genius if the latter happens to be a personal enemy of his. By producing at the royal opera such a trivial work as Ueberlée's at the same time that Wagner's Trilogy was performed at a private theatre in the city, with a private orchestra and foreign artists, Hülsen has secured for himself a place in the history of music, or, as the Germans would say, "er hat sich unsterblich blamirt." Hülsen, after hearing "Die Walküre" some years ago, confessed that it excited his enthusiasm, and applied to Wagner for permission to produce it at the Royal Opera. Wagner's reply was, either the whole Trilogy or none of it; and this put a stop to the negotiations for a while, so that twelve cities, namely, Munich, Bayreuth, Vienna, Leipzig, Hamburg, New York, Schwerin, Weimar, Mannheim, Cologne, Brunswick, and Rotterdam, got the start of Berlin in hearing the whole or part of the Trilogy. The Berliners, however, did not despair, for they knew that the most popular work now on the stage, "Lohengrin," was similarly kept in quarantine outside of Berlin, not so many years ago, until some folks at Leipzig conceived the plan of coming over and giving the Berliners a chance to hear it. This same plan was revived by Director Neumann a year or so ago with reference to the "Nibelungen," and when Hülsen saw he was in full earnest about it he got alarmed and endeavored to throw some of the reproach off his shoulders by offering him the Royal Opera-house for his troupe. But this aroused the indignation of the artists connected with the Royal Opera, who justly maintained that if the Trilogy was to be given in their theatre they were competent to undertake it themselves, and Hülsen was in consequence obliged to abandon the plan, although it had already received the Kaiser's sanction. And thus it has come about that the "Ring of the Nibelung" made its first entry in Berlin, not in the Royal Theatre, where it belongs, but in the suburban Victoria Theatre, whose walls must have looked with astonishment on the strange proceedings and the stranger sounds, never before heard there.

In one sense the Berliners have reason to congratulate themselves on having heard the Trilogy in this irregular fashion. For although the local opera has in Herr Niemann, Herr Betz, and in Frau Mallinger, Frl. Brandt, and Frl. Lehmann vocalists of the first rank, yet they would not have made an *ensemble* equal to that which Neumann collected from the several German capitals, and which included Herr and Frau Vogl, Frau Materna, Herr Scaria, Herr Schelper, Frau Reicher-Kindermann, Frau Sachse-Hofmeister, and others. To hear and compare in two successive weeks the two greatest living impersonators of *Brünnhilde*, Wagner's grandest female character, is a privilege that one enjoys but once in a lifetime. Of the two, Materna has the most dramatic passion, and her conception doubtless approaches as near to Wagner's ideal as he himself can desire. Herr Vogl as *Siegfried* is equally perfect. If intensity of emotion be the true measure of æsthetic enjoyment, the manner in which these two artists sang together during the third cycle, especially in the last act of "Siegfried," the finest of the Trilogy, was equivalent to a whole season's ordinary concerts and operas. Even the Kaiser, who is not much of a musician, was so impressed that he assisted in the six recalls at the close of the act, and on the following night, in spite of his age and habit of retiring early, he remained through the five hours and a half of "Die Götterdämmerung." The Crown Prince attended several cycles with his family, and there can be no doubt that if the Kaiser does not now order Hülsen to purchase the right to perform the "Nibelungen," the Crown Prince will do so at an early date after his accession. To one of the performances of the "Walküre" Bismarck, who has not been inside a theatre for fifteen years, had also promised his friend Scaria, of Vienna (*Wotan*), to come. But he was prevented from so doing, and sent his whole family instead. It would be hardly worth while to mention the many famous people present. On none of these, however, were so many opera-glasses levelled as on a boy of about eight years who sat by the side of his sisters in Wagner's box during the last cycle, which ended last night. It was Siegfried, son of Wagner and grandson of Liszt. If this boy does not turn out a great musician the hopes of those people who believe it to be possible to breed genius will receive a hard blow. Wagner himself sat behind his children and applauded the performance as vigorously as anybody in the house, although he must have felt keenly some of its shortcomings.

Almost in every city where the Trilogy has thus far been performed the critics, both hostile and friendly, have asserted with comic regularity that the performance was superior to that at Bayreuth. This is partly due to the fact that after a second and third hearing these critics have found the work so much more enjoyable than after the first that they are inclined to attribute this to the superiority of the performance. Partly, also, local patriotism and pride play a rôle in this assertion. As I have heard the Trilogy in six cities, to none of which I am bound by local feelings of this sort, my testimony may be considered free from prejudice. It amounts to this, that although in some one department or vocalist this or that city may have surpassed Bayreuth, yet the total impression produced by those first performances has never been surpassed, if equalled. The Berlin performances were superior to those at Bayreuth in one respect only—a very important one, it is true. The vocalists were not only selected from several German cities, but they were selected from among those who have in the last five years especially distinguished themselves in this particular work. And those of them who sang at Bayreuth (Materna and Vogl) have naturally greatly improved since then, so that one can now clearly see in their case what Wagner meant when he insisted on the necessity of developing a new style of vocalization. When Materna or Vogl sings it is easy to understand almost every word, while the declamation does not sound harsh and broken, but quite melodious; and the acting as closely follows the sense of the text as does the music. Unfortunately, the scenery and orchestra at the Victoria Theatre did not fully harmonize with such perfect acting and singing. Although the theatre lives on *Ausstellungsstücke* of the Jules Verne order, some of the devices needed for the Trilogy were found to be beyond the powers of the machinists of the theatre; and Director Neumann's plan of bringing over the scenery from Leipzig failed because he could not get the necessary permission from the city magistrates. Especial difficulty was occasioned by the necessity of having steam, which plays such an important part in several of the dramas. The apparatus for supplying it was declared to be dangerous by the chief of the fire-brigade, so that ultimately the steam had to be conveyed in pipes from a neighboring distillery. *Grane, Brünnhilde's* noble steed, was brought up from Munich by permission of the King, but on the condition that he should be lodged in the imperial stables, for which special permission had to be obtained from the Kaiser. Whether he was conveyed from Munich first-class or by special train the papers do not state.

The orchestra was more satisfactory than the scenery, but it was very far

from perfection. It consisted of the Berliner Symphonie-Capelle (not the Royal), enlarged by musicians from the Leipzig Stadt Theatre. Considering that this orchestra has always ranked as second-class, it accomplished its task in a highly creditable manner, thanks largely to the excellent training and conducting of Anton Seidl, of Leipzig. Of such an orchestra one cannot expect the sensuous beauty of tone, the precision, and the dynamic effects of a royal orchestra; but it is well known that the lack of those qualities can be to some extent covered up by earnest effort and enthusiasm, and these qualities the Symphonie-Capelle possessed in abundance. It occasionally reminded one of a mediocre instrument played by a man of genius. Such a performer can at times, though not always, make one forget completely that he is not playing on a perfect instrument. Many little slips and rough passages were not noticed by the audience, to most of whom the work was new. Certainly they did not dampen the enthusiasm, or prevent the success of the performances from being so great that Director Neumann has every reason to congratulate himself. May is not a good month for such an undertaking in Germany, where the musical season begins early, and most people have by this time exhausted their capacity for enjoyment, no less than their purses. But, although the tickets cost from thirty to thirty-two dollars for four nights (before they got into the hands of speculators), and were therefore as high as on Patti nights, the house was full every time, and generally crowded. At the fourth repetition of "Rheingold," indeed, there were a few rows of empty seats in the parquet. For this two reasons can be assigned. "Rheingold" is the least attractive and least popular of the four dramas, and on the night of its performance, moreover, another of Wagner's latest works, "Die Meistersinger," which enjoys great popularity in Berlin, was given at the Royal Opera-house. On the other three evenings when "Rheingold" was given at the Victoria Theatre, "Tannhäuser," "Lohengrin," and the "Flying Dutchman" were performed at Hülsen's establishment. This cannot have been accidental. I am convinced that Hülsen's aim was to attract the Wagnerites so that the Victoria Theatre might remain empty on one evening at least, as he could then justify his conduct by saying the Berliners did not like the "Nibelungen." Excepting those few empty seats, however, his plan failed, and he merely gave the Wagnerites an opportunity to point with pride to the fact that the two largest theatres in town could be filled on the same evening with those desiring to hear Wagner, while at the same time two other theatres were entertaining the crowd with parodies of the "Nibelungen."

The change of public opinion in regard to "the later Wagner" which has taken place in Berlin during the last four weeks is indeed remarkable. There are, of course, still some newspapers which persist in their hostile attitude, but the majority of them have now got so far that instead of dwelling only on the faults of the work and mentioning its merits in parenthesis, they adopt the opposite course. Formerly, also, it was from the hostile camp that all the sarcasm proceeded, so enraging the Wagnerites that it was justly maintained they should not be allowed to go about without a muzzle. Now, on the contrary, the sarcasm and jokes proceed from the Wagnerites, stimulated by the consciousness of victory, while the defeated opponents, such as Hanslick and Blumenthal, almost foam at the mouth every time they mention Wagner or any of his admirers. Among the converts over whom the Wagnerites particularly rejoice is Paul Lindau, whose entertaining 'Nüchterne Briefe aus Bayreuth,' now in the tenth edition, contains many things he would not now say. Those who have heard the Trilogy and understand the Berlin dialect will find considerable fun in Moszkowski's 'Schultze und Müller im Ring des Nibelungen,' and in another comic pamphlet, 'Die Nibelungen Festspielerei,' both of which have just appeared here. Americans who come abroad this summer and remain till autumn will have an opportunity to hear two cycles of Wagner's works in Munich in September and another in Leipzig. It appears to be quite certain now that London is to hear the "Nibelungen" next spring, as the German musical papers already contain advertisements for members of the chorus. Director Neumann also proposes to give "Lohengrin" in Paris next winter. Here in Berlin "Die Walküre" is to be repeated once more to-morrow night, by special order of the Kaiser; and two days later there will be at the Royal Opera a model performance of "Lohengrin" with Herr Vogl as *Lohengrin*, Frau Vogl as *Elsa*, Materna as *Ortrud*, Scaria as *King*, and Betz as *Telramund*. It will be such a performance of "Lohengrin" as never was before.

Correspondence.

THE DECLINE OF CULTURE.

To the Editor of The Nation:

Sir: In reading the *Nation* of June 2 (No. 831) I came upon a letter entitled "The Decline of Culture." Whether or not the writer be a resident of St. Louis is of little consequence; but it is necessary that such a letter, in the leading critical paper of America, should be controverted. From generalizing upon the decline of culture in the present age your correspondent drops like a shooting-star upon America, the West, and the news-stands of the city of St. Louis.

It might be unbecoming a resident of this city to sing its praises, but as I am only a sojourner of a year it is my privilege to say that the impression made by your correspondent is not only incorrect, but unjust and false. He says: "The better class of magazines have actually disappeared from the market." In reply to this, I will say that, although they may have disappeared from news-stands, they are still to be found in the leading shops, and are upon the files of the leading clubs and libraries, and in many private houses. The management of the club where I am now writing obtain the larger number of their magazines through a book-dealer in this city. There are upon the files of this club the leading magazines of every nation. At the great libraries are found a similar array, and it is but a short time ago that I saw duplicate copies of the *North American* of recent date lying in the library rack, with leaves soiled and covers gone. If you will kindly glance at the list of your subscribers, you can tell of the preposterous statement of your correspondent in regard to the *Nation*, at least.

Much is to be said against the local book-dealers. They are persons native to the soil, and cater to the plebeian wants and their own interests. Whenever an Eastern house plants a branch here the effect is immediate improvement; and such is the case in respect to the leading law-book house in this city, the management of which has brought with it not only great enterprise, but a deep knowledge of books and the faculty of making new publications known.

It is always difficult to get at a writer's motive, but I feel no hesitancy in saying that truth was not the essential one with your correspondent. He says: "The fact is, that very rarely can any one be found who has informed himself except through daily papers and novels," thereby giving the impression that the thousand and more students at our university, and the pupils in our schools, are fatted upon the gleanings of reporters; and that instructors know no other text-book save your Eastern *Heralds* and pamphlet libraries. He continues: "Therefore the tone of society is declining, and few persons can be found with whom a conversation on any subject of general interest can be enjoyed." This would be beneath notice were it not on the page of your paper. How can such be the case when there are twenty clubs devoted exclusively to Homer, Virgil, Shakspere, Dante, and Hegel? In the Hegelian club alone there are two hundred students, and every one of them there for an object. It would be useless for me to name, particularly, book-clubs and the like. A month is not yet passed since a beautiful structure was dedicated to the purposes of art, and its noble donor gave it, with its permanent exhibition of statuary, to the uses of the people of the Mississippi Valley. In its halls were hung the private donations of paintings by the masters of the leading schools of Europe. Is this the sign of decay and decline of culture? The marketable value of these paintings and the cost in dollars and cents of the edifice, interesting as it may be, I will leave to be computed at the financial centre of our country.

There is much worth in the Western people. They realize that they, nor no others, can ever arrive at that supreme state of æsthetic refinement which sheds its halo about the gilded dome of Boston, and although unable to attain that state of deep and hereditary sentiment of self-satisfaction, they beg, at least, to say that they know what culture should be.

Yours, truly, George P. Messervy.

St. Louis, Mo., June 5, 1881.

PICTORIAL MISREPRESENTATIONS.

To the Editor of The Nation:

Sir: In Mr. Thomas W. Knox's letter, which appears in your last issue, he asks as a matter of justice the correction of certain "misstatements of fact" which are supposed to have been made by your reviewer of his 'Young Nimrods.'

Putting aside the question between the reviewer and himself, I should like to call Mr. Knox's attention to the many misstatements of facts which are to be found in the illustrations of his juvenile books. In the 'Boy Travellers,' for instance, we find pictures which are familiar to all the old readers of *Harper's Magazine*, doing service in out-of-the-way places of the world "far from their native land." We find in the last volume volcanoes, ruins, village and river scenes of Central America in some magical way transported to Siam and Java, and are led to believe that they are volcanoes, ruins, etc., which are actually found in those distant parts. There may be a great similarity between the natural scenery of Central America and that of Java, but when the great Calendar stone of the grand plaza of the City of Mexico turns up in Siam we must protest and question the statement of fact, and ask Mr. Knox, as a matter of justice to his younger readers, for a correction. F.

New York, June 13, 1881.

Notes.

THE thirteenth annual session of the American Philological Association will be held at Cleveland, Ohio, in the Public Library Building, commencing Tuesday, July 12, 1881, at 3 P.M. The address by the president of the Association, Prof. Lewis R. Packard, of Yale College, will be delivered in the evening of the same day. Arrangements have been made for the reception of the members of the Association at the Forest City House. Further information may be had of the Local Committee at the place of meeting. Gentlemen intending to read papers at the coming session are urgently requested to notify, at as early a date as possible, the secretary, Prof. Charles R. Lanman, Cambridge, Mass.——A novelty in text-books is announced by Ginn & Heath, Boston: 'An Illustrated Vocabulary to the First Four Books of Xenophon's Anabasis,' by John W. White, Assistant Professor of Greek at Harvard University.——J. R. Osgood & Co. will publish a limited edition of Walter Crane's 'The First of May,' a fairy masque, reproducing the engraved plates by heliotype. The disproportion in the cost of the copy and the original is naturally very great.——Jansen, McClurg & Co., Chicago, have in press 'Governor Edward Coles and the Slavery Struggle of 1823–24,' by E. B. Washburne, an important contribution to the history of Northern free soil. The same firm have lately completed and bound the first volume of their *Dial*, "a monthly review and index of current literature," which has no rival west of the Alleghenies, and whose prosperity must be taken as a sign of anything but a "decline of culture" in that region.——The 'Emerson Birthday Book' just issued by Houghton, Mifflin & Co. is a very judicious compilation, whose fragmentariness corresponds to the philosopher's style, and therefore does him no injustice. His 'Representative Men' and other prose works have greatly aided in the selection, so that we have against their birthdays allusions to Plato, Shakspere, Montaigne, Franklin, Swedenborg, Dante, Lincoln, etc., and occasionally both the prose and the verse extract are distinctly apposite, as in the case of Michael Angelo. The Concord Ode is, of course, set against April 19. A few poems are given entire, and the thrilling "Terminus" fitly concludes the volume.——Harper & Bros. have added to their retaliatory series—the seemingly endless offspring of the dispute over Carlyle's 'Reminiscences'—Pallain's 'Correspondence of Prince Talleyrand and King Louis XVIII.'——Principal Macy, of Iowa College, has prepared a pamphlet 'Outline,' for use in common schools, on Civil Government in Iowa (Grinnell, Cravath & Shaw). It is designed for teachers, and not as a text-book, and is to be commended as an example to instructors in every State. It is a proper adjunct to the study of local geography. ——With the June number M. Jules Lévy's *Le Français* (Cambridge, Mass.) closes its first volume, curtailed of the three months July-September, according to the prospectus. It is decidedly the most sightly and best-edited periodical of the kind yet attempted in this country, and it seems to have taken root.——To Mr. Blaine has been ascribed, and we believe correctly, the first use of the term "stalwart" as the title of a Republican faction (despatch of April 10, 1877, to the Boston *Herald*), though it is now monopolized by the adherents of his arch enemy. The Albany *Argus* professes to have coined the useful locution, "carpet-bagger," and it credits "Collector Gould, of Buffalo, Mr. Garfield's latest nominee," with the authorship of the "half-breed" metaphor, "in a squib which he wrote for the Buffalo *Commercial Advertiser*."——Yesterday was opened for the season the Sea-Shore Cottage at Atlanticville, near Long Branch, N. J., which has already proved its worth as a summer resting-place for the young working-women of this city. A circular from Mrs. Fletcher Harper, jr., informs us that application should be made at the rooms of the Young Women's Christian Association, No. 7 East 15th Street, from 11 to 1 o'clock and from 7 to 9. References are required.

—With characteristic earnestness and activity the Civil-Service Reform Association of Boston offers two prizes, of one hundred dollars and of fifty dollars respectively, for short essays upon the reform. "Competition is open to undergraduates of this date of any college in Massachusetts, and to residents of Massachusetts who are now either students, or graduates of not more than five years' standing, of any college." The essays must be sent in by November 1 to Arthur Hobart, Secretary, P.O. Box 1158, Boston, who will on application furnish full particulars, with references to the literature of the subject. The examiners will probably be President Seelye of Amherst, Prof. Dunbar of Harvard, and Mr. Hamilton A. Hill of Boston. Nothing could be better calculated "to encourage the study," as the Association proposes, and we hope the essayists will be legion. Since, however, "the successful essays and others of decided merit will be printed," it behooves the writers to reflect that their object is persuasion, and to have distinctly in mind the class or classes who (outside of the political managers themselves) are the great obstacle to the speedy adoption of the reform. We may designate the farmers and the small traders as among those to whom a specific argument would profitably be addressed—as, for example, in pointing out the essentially democratic nature of a non-partisan service. The growth of public interest in the reform is shown by the fact that societies for its promotion have been formed, or are forming, in four other Massachusetts towns and cities, in Providence, R. I., Brooklyn, N. Y., Buffalo, Philadelphia, Baltimore, Cincinnati, St. Louis, St. Paul, Milwaukee, San Francisco, and New Orleans. The report of the Executive Committee of the New York Association shows a growing membership of nearly six hundred in all parts of the Union, an extensive sale of its publications, and much judicious effort in shaping legislation and bringing public opinion to bear on Congress.

—Our readers had already been apprised, before the publication of Mr. Davidson's letter last week, of the fact that the Archæological Institute of America has at heart the establishment of such a school as he advocates, though, in consideration of the scholarship and the libraries of Athens, and the presence of the German and French schools, preference is given to that city over Smyrna or any other place. It will do no harm to repeat that its Executive Committee have in their two annual reports urged the matter as of great importance to the advance of classical studies in this country, and that at the last annual meeting of the Institute, on May 21, a committee consisting of Prof. John Williams White of Harvard, Prof. Harkness of Brown, Prof. Gurney of Harvard, General F. W. Palfrey of Boston, and Mr. T. W. Ludlow of New York were appointed to correspond with the universities, colleges, and institutions likely to be interested in and benefited by such a school, as well as with individuals who recognize the importance of such an addition to our resources for classical study; also to perfect a scheme for the school, and to make a report as the basis of an appeal for support.

—The courses of study of the Harvard "Annex" for the year 1881–82 have now been published, and it is announced that examinations for admission to them will be held in Cambridge on June 30, and July 1 and 2, and again on the last three days of September. Examinations will also be held on the dates first mentioned in New York, Philadelphia, and Cincinnati. Further information may be had on application to the Secretary, Mr. Arthur Gilman, 5 Waterhouse Street, Cambridge. The most important addition to the corps of instructors is Professor Gurney, whose province will be Roman History to the Fall of the Republic, and Later Roman and Mediæval History. It is now apparent that the professors are more than willing to teach young women, and that there is a class of women desirous of pursuing the higher instruction, and quite capable of doing so without undue physical or mental strain. During the year just closing these students have done their work to the entire satisfaction of the professors and managers. A considerable number are now preparing to enter on the regular course of four years. Teachers have found the "special courses" of great advantage to them, and a steady increase in their attendance is to be expected. The deportment and application of all the young ladies have been perfect. Funds sufficient to carry on the courses to the close of the year 1884–85 have been contributed, but the experimental stage has demonstrably been passed, and the wisdom of an endowment can now no longer be questioned. The honor of it would be so great that we cannot believe it will be long delayed.

—Mr. Nicholas Flood Davin writes us from Ottawa in reply to the excuses made by the editor of *Quiz* for the "literary outrage" of which he had complained in these columns (*Nation*, May 12 and 26). His letter is too long to print entire. In regard to the editor's denial that his pamphlet on Lord Beaconsfield had had any sale in the United States Mr. Davin says:

"I enclose you a letter from Belford, Clarke & Co., of Chicago. These gentlemen, who also have a house in Toronto, Canada, are my publishers. In this letter, as you will see, the head of the firm, who writes from Chicago, says: 'Your pamphlet on the Earl of Beaconsfield which we published for you *sold mainly in the United States*. If my memory serves me right, over three-fourths of them were sold in this country.'

"Before concluding, I may be permitted to say that I sat for four years in the gallery of the English House of Commons—namely, during the years 1868, 1869, 1870, and 1871, representing successively the *Star*, the *Pall Mall Gazette*, and the *Standard*. My powers of observation must be abnormally low if, with such opportunities, I did not seize some traits and carry away some points connected with so picturesque and dramatic a figure as the late Lord Beaconsfield which had not struck others."

—Eleven years ago, in the second volume of the Collections of the Connecticut Historical Society, Dr. J. Hammond Trumbull authoritatively discussed the "Composition of Indian Geographical Names," with illustrations drawn from the Algonkin languages. The subject has never since left his mind, and he has continued to add to his material and to revise his derivations, without, however, finding time to exhaust the field. He has now recast the whole in dictionary order, and printed it in a limited edition ('Indian Names of Places, etc., in and on the Borders of Connecticut: with Interpretations of Some of Them.' Hartford, 1881). He leaves to others, he says, the work of correction and completion; but how few are competent to analyze and interpret as he does, is known to everybody. The list regularly includes the Narragansett country once claimed by Connecticut, and either directly or indirectly embraces localities, not only in other parts of New Eng-

land, but also to the West and South. In a very readable introduction Dr. Trumbull remarks that all Indian proper names had a meaning, and generally a precise meaning, so that, for example, Hoccanum, a tract of land in East Hartford, signifying "hook-shaped" because of the bounding stream, lost its identity when a change in the bed of the Connecticut took away the "hook." White ignorance of these significations led, of course, to all sorts of misapplications—names of lands to rivers, names of places to persons, etc., and vice-versa. To be sure, the Indians themselves called Powhatan after the 'river-falls' near which, according to Captain John Smith, he was born (his true name being *Wahunsenacawh*)—probably the nearest Indian analogy to the *de* and *von* of the Old World. The phonetic misrepresentation of these names by our worthy but illiterate and lazy-tongued ancestors has in a great number of instances made all attempts at interpretations hopeless. Thus, *Ogusse-paugsuck* was transformed into "Oxyboxy"; and *Tomheganompskut* into "Higganum."

—Nine-tenths of the New England Algonkin proper names, says Dr. Trumbull, were composed of an adjectival and a substantival element, and of the commonest of these he gives a list which will tempt the unwary into reckless use of it as a key to their own etymologizing. For instance, *missi* (*massa*) unites Mississippi, 'great [or long] river' (*sepu*), and Massachusetts, 'at [or near] the great hills' (*wadchu* or *-adchu*). The last element occurs also in Wachusett; but it is the Blue Hills of Milton—the mariner's landfall—that give its name to the Old Bay State. A similarly pleasing association is found in Narragansett, 'at [or above] the point' (*naiag*, compare Nyack and Norwalk)—Point Judith, namely. *Quinni* signifies long, as in Connecticut, *i.e.*, land 'on the long [tidal] river' (*tuk*, as in *missi-tuk*, Mystic). *Sauk* indicates an outlet of a river or brook, or discharge of a pond or lake, as in Saco, Saguenay, Winnipiseogee. Montauk Dr. Trumbull now connects with Manatuck, a 'lookout place'; Poquonnoc he renders 'cleared land,' and recognizes with a decayed locative prefix in Tippecanoe. An enduring memorial of a natural landmark is found in Naugatuck, 'one tree.' The Mohegans derived their appellation from the 'wolf' (*maingan*); the Pequots were properly branded the 'destroyers' (*pequttôog*). The way in which one civilization overlies another is illustrated by Montowese, now a post-office and railroad station, but formerly commemorating a chief's son, 'Little God' (diminutive of Manito). One can but admire the service which Dr. Trumbull has rendered to students and antiquarians, and all who own a sentimental interest in the aborigines.

—Every one knows the great impulse given to the scientific study of French by Brachet's admirable little grammar, which made accessible to the general public facts with which scholars had long been familiar. This work was, however, defective in all relating to syntax, which generally is the weak point of French grammars, whether native or foreign, and M. A. Chassang, in his 'New Etymological French Grammar' (Paris and London, 1881), has endeavored to present to the advanced student a grammar combining the advantages of Brachet and the ordinary grammars of the modern language. A practical grammar of modern French containing such historical references as are necessary to explain exceptional forms and constructions has been attempted, with no great success, in several recent grammars, notably in Breymann's (Macmillan & Co., 1874) and in Wall's (Harper & Brothers, 1878). The former keeps the historical illustrations for a supplementary chapter, and in the only volume yet published does not take up syntax at all; the latter also separates the historical portion, and the part devoted to syntax is very meagre, but otherwise it is an excellent and scholarly work. Chassang has very wisely dispersed his illustrations through the body of the text, and has treated syntax with unusual fulness, confining himself exclusively to modern French—*i.e.*, from the fifteenth century. We cannot feel great satisfaction at the way in which he has performed that part of his task on which the title lays the most stress—namely, the history of French syntax. As Mr. Blouët tells us in his introduction, "not only are French words of Latin origin, but the syntax is Latin," and yet the author makes almost no reference to Latin syntax. The historical references are interesting and valuable. It may not be amiss to state that Chassang's Grammar, in spite of its English title-page and introductory remarks, is in French.

—The appearance of Professor Campbell's second volume of Sophocles (Oxford: Clarendon Press; New York: Macmillan & Co.) has been delayed by the preparation of a second edition of the first volume. The sumptuous book contains the "Ajax," "Electra," "Trachiniæ," "Philoctetes," and the Fragments. In his preface Professor Campbell assigns his reasons for dissenting from Paley, and declines to give an account of previous editions of Sophocles, which he had led us to expect in this volume; nor has he found space in his 572 pp. to indicate his special obligations to any but his immediate predecessors. After a very brief outline of the history of the text, he renews the statement of his conviction that the exaltation of the Laurentianus has brought about an undue depreciation of the "so-called apographa." Mr. John Masson has examined for this edition an Oxford MS. of Sophocles, containing the "Ajax," "Electra," and "Œdipus Tyrannus," and publishes a minute collation for "Electra," with the conclusion that O (Oxoniensis Auct. F. 3. 25) belongs to the same family with A, and is a more correct MS. The introductions to the several plays are scant in comparison with the size of the book; and the commentary, except in simple passages, is too irresolute to be satisfactory. There is no denying that Professor Campbell is very much in love with his author and has a most ardent desire to appreciate him, and to make others appreciate him, but he is not a comforting *ductor dubitantium*. One wearies of "either (1) or (2) or (3)" without a decisive word from the editor. This is not the place to quarrel with his grammatical views, as laid down in his preliminary treatise on the language of Sophocles, to which he refers frequently in his discussion of moot points, but it may be remarked in general that he is too fond of accounting for apparent anomalies by twists and confusions in the current of expression, and too prone to keep a word balanced between two governments. Occasionally he fails to mention notorious difficulties, as in Electra v. 780, where there is an irregular negative that has sorely troubled the grammarians. In the handling of the choral metres Professor Campbell has paid some regard to recent developments, which so many English editors ignore. The notes are lighted up by parallel passages from English poetry, although the parallelism must not always be scanned too closely, and genuine feeling of the poetical situation is often shown, although one resents having so much reasoned out. To say that the proof-reading might have been better is to say that we are all human; and yet the citation from Herodotus, i. 68, on Electra v. 758, which exhibits three false accents and one false gender in twelve words, is a bad blotch on the beautiful page. As the work of a true lover of Sophocles the book will appeal to true lovers of Sophocles, but it is not an edition after which we can draw a long breath and bid Sophoclean study rest awhile.

THE OLD TESTAMENT IN THE JEWISH CHURCH.*

SIR HENRY MONCRIEFF, Doctors Wilson and Adam, and their friends have carried their point—the General Assembly of the Free Kirk has decided that Professor Robertson Smith is unfit to teach Old-Testament criticism in Aberdeen College, his critical principles not agreeing with those of the majority of the Assembly. It is a victory for the ultra-conservatives, but one that is likely to cost them dear. Apart from the theological aspects of the question, the high-handed procedure of the traditionalist leaders for some years past has provoked opposition among those who wish to see fair play. After Mr. Smith's suspension by the Commission last fall he was invited by six hundred prominent members of the Free Kirk in Edinburgh and Glasgow to deliver a series of lectures on Biblical criticism, and the favor with which these lectures were received in the two cities shows that there is a strong body in Scotland not only determined to know on what grounds the Aberdeen Professor is condemned, but by no means sure that he ought to be condemned at all. His book will give him a larger audience than the college could provide, and the shrewd sense of the Scotch religious public will form its own conclusions on the points involved. For the present the Assembly is satisfied with its work, but it can hardly stop here. It has already shown a disposition to lay its hand on A. B. Davidson, Professor of Hebrew in the New College, Edinburgh, the teacher of Professor Smith, and the author, it is said, of all this trouble. It will be strange if he escapes Sir Henry Moncrieff's vigilant eye.

According to the title-page the subject of Mr. Smith's lectures is "Biblical criticism." In fact, they deal only with the Old Testament, but by methods that apply equally to the New Testament, and we may hope that the Free Kirk will produce some devout scholar who will do as much for the Christian Scriptures as these lectures do for the Jewish. The Old-Testament field is large enough for one man, and in almost every part of it fresh work has been done during the last ten years. The origin of the early chapters of Genesis and of the patriarchal histories, the parts played by the prophets and priests respectively in the development of the Israelitish religion, the growth of the philosophical and lyric literatures, the separation of the legislative portion of the Pentateuch into its historical layers, the dates and historical settings of the various books of the Old Testament, the critical value of the ancient versions, the mode of preservation and transmission of the Hebrew text, and the history of the collection of the books into a sacred canon—all these points have been worked up with greater thoroughness, and with something like approach to definite conclusions. Professor Smith selects for his topics the scribes, the Septuagint, the canon, the psalter, the history, the prophets, and the Pentateuch—a wide range of subjects, which he handles with learning, acuteness, and candor. If he does not touch the Genesis questions (for which he had hardly space) it is not because he has not sufficiently definite opinions about them. His general position is that of the most advanced critics, the contrast of which with the old view is striking enough. Not long ago it was generally believed that the Israelites received the whole of the levitical law at Sinai and

* 'The Old Testament in the Jewish Church. Twelve Lectures on Biblical Criticism. By W. Robertson Smith, M.A.' New York: D. Appleton & Co. 12mo, pp. xii. 446.

brought it with them into Canaan; that there they systematically ignored it for many centuries, though it formed the theoretical basis of their religious life; that they were punished by God for this neglect, and that, finally, the persistent efforts of reformers, kings, priests, and prophets forced them back after the Exile to the standard that Moses had set up. Professor Smith, in common with the great body of German critics, discards this view, and regards the religion of Israel as an historical development. In the times of the Judges there was a very simple, unorganized cultus, with no well-fixed priestly class, with various sacred places, great individual liberty, great religious ignorance, and a low morality—elsewhere (*Journal of Philology*, vol. ix.) he has collected evidence to show that the totem-system existed at this time. A century or two later the prophets became the guardians of the popular religion, laying stress on the moral element of the Torah (the Instruction or Law), commonly unfriendly to the sacrificial and ceremonial, and gradually leading the people to purer conceptions of God. At the same time the priests were slowly elaborating the ritual, which took shape especially during and after the Babylonian exile. The book of Deuteronomy records the prophetic Torah as it existed in the latter part of the seventh century B.C. Leviticus and Numbers give the form that the priestly Torah finally assumed in the days of Ezra (middle of the fifth century), and in Ex. xxi.–xxiii. we have the law-book of the early prophets down to the end of the eighth century B.C. The psalter Professor Smith regards as "the hymn-book of the second temple," the titles of the psalms as untrustworthy, and the collection as probably including productions of the Maccabean period; and he puts the close of the canon not earlier than the middle of the second century, the date of the book of Daniel being about B.C. 164. Ample proof of these positions is furnished by the Old Testament itself, and Professor Smith presents the evidence clearly and skilfully.

This historical conception throws a flood of light on the Israelitish records. When, for instance, David complains (1 Sam. xxvi. 19) that his enemies, in driving him out of his land, are forcing him to serve other gods than Yahwe, this is unintelligible till we recollect that David, in common with all his generation, believed that the deity was attached to the soil, that Kemosh belonged to Moab and Milcom to Ammon as truly as Yahwe to Israel; and the prophet Hosea's threat (Hos. iii. 4), that the children of Israel should remain many days without king, prince, sacrifice, image, ephod, and teraphim, and afterwards return to Yahwe their god and David their king, would be strange in the mouth of a man who did not regard the image and the ephod as lawful elements of worship. Our author takes care to point out that through these weak beginnings, this ethical and religious muddle, the Israelites made their way to pure and elevated religious views, and their growth is all the more wonderful that it began in such ignorance. Renan's generalization about the Semitic monotheistic instinct has been much laughed at, and in truth, to say nothing of Assyrians, Sabeans, and Arabians, the early Israelites, with their fetish-worship and human sacrifices, are as innocent of monotheism as Hindus or American Indians; yet the fact is that they advanced steadily to a belief in one God, and held it with a firm grasp, and that from them we and all the world have received it. Professor Smith sees in the Old Testament history the leading of God, and insists that the modern criticism, which is nothing but a common-sense interpretation of the facts, not only makes the ancient records real and living, but exhibits God's dealings with man as an unforced, natural process, not severed from the circumstances of time and place. To suppose that the levitical law was given whole to Moses at Sinai and then buried in oblivion for almost a thousand years seems to him to be charging God with unwisdom; yet this is what the traditionalists are willing to do in order to save the headings in the Pentateuch. They sacrifice the whole history for the sake of "the Lord said to Moses." However, the position of this party is not so shallow as would seem from this statement. They see that in giving up the externally supernatural in the Pentateuchal legislation they are in danger of surrendering it everywhere, and their fear cannot be said to be baseless. They are unwilling to rest on the evidences of God in history that Professor Smith finds in the development of the Israelitish religion—their faith demands a visible miracle. We do not mean to say, however, that our author rejects the externally supernatural in the Old Testament. He seems to maintain (p. 291) that the inspiration of the Hebrew prophets was something more than elevated religious conceptions, profound consciousness of God, and clear natural insight into the future. But he touches this point so lightly that we are not sure that we know his meaning. He says plainly (p. 27) that he does not assume the impossibility of the supernatural; his method is simply to interrogate the facts; but whether he actually finds the outwardly supernatural in the Old Testament, we are not able to determine. What he does say clearly and well is that revelation is above all things the voice of God speaking to the soul of man through his moral consciousness.

The criticism of the Hebrew text is hardly inferior in interest to the reconstruction of the history. Here the chief importance attaches to the Septuagint, whose valuation as an instrument of critical research has greatly changed of late. All existing Hebrew manuscripts of the Old Testament, as is well known, were written after the text had been fixed by the Masoretes and their predecessors. We owe our Hebrew text to the Scribes; who were they, and what was their text-critical procedure? Recent investigations have shown, as Professor Smith points out, that they often acted in a careless and arbitrary manner. They were very uncritical, as we might suppose; they selected their standard manuscripts not for their correctness, but for their practical value, and they allowed themselves to change the text to suit their own views. A manuscript unmanipulated by them would be of priceless value. Now, precisely such a manuscript we have approximately in the Septuagint, the Alexandrian Greek translation of the Old Testament made in the third and second centuries before the beginning of our era. It is only a translation, and we have not the autographs; the Greek text has doubtless suffered much in the course of transmission to us, and the translators did not always do their work intelligently; nevertheless, this version, as it stands, is of inestimable value for the establishment of the true Hebrew text. We are glad that Professor Smith has brought out its merits so clearly. It used to be thought a mere haphazard rendering of our received text, fit for nothing but to be cast aside and trodden under foot when it differed from the Hebrew, and the Alexandrian MS., in fact, practises a system of harmonization. But modern criticism has given the Septuagint its rights, and it were greatly to be wished that the revision of the English version of the Old Testament now in progress could make use of it. In several books, notably in Samuel, the text may be greatly improved from the Greek, and its readings deserve consideration everywhere. Our author's defence of the Septuagint is very well put. In connection with it he might have added a word on the Syriac and Latin Vulgate versions, which, though greatly inferior to the Greek as critical instruments, are far from being worthless.

Not the least effective part of the book for its immediate circle of readers is the first lecture, in which the author undertakes to show that the modern Biblical criticism is only treading in the footsteps of the Protestant Reformation of the sixteenth century. Luther was very free in his critical judgments: Esther he thought a Judaizing book, unworthy to be in the canon, and he spoke with hearty contempt of James as a straw-epistle. So far as his critical conclusions are concerned, they may be of small value when tried by the modern standard, but that is a secondary matter; the essential point is that, representing the religious reform of his time, he looked on the Bible as a living body of edifying truth, not a dead mass of dogma. In this he is at one with the new criticism: its object is to find life in the Bible; it rebels against tradition unsupported by facts; it differs from Luther only in employing more delicate instruments and doing more thorough work than his. This ought to be a powerful consideration with the membership of the Free Kirk; one may believe that John Knox, if the facts could have been properly presented to him, would not have been afraid to reject the Mosaic origin of the Pentateuch and to accept Maccabean psalms, and his followers ought not to be less free.

Professor Smith's volume is a welcome addition to the literature of Biblical criticism. It is the only English book that gives anything like a popular survey of the field, and its vigorous, fresh style, and interesting mode of treatment, make it decidedly readable. The author's historical-critical results seem to us to be in the main correct; there may be difference of opinion about details, but the general conclusions rest on a sound interpretation of the facts, and are supported by the unity and naturalness they give to the whole history. It is not the lecturer's purpose to attempt new investigations (but see the reference in Note 3, p. 437, to his interesting article on Hebrew totemism). The occasion required rather a statement of conclusions agreed on by the body of critics, but there is always something gained when the facts are collocated, as here, under the guidance of a sound judgment, a quick eye, and a new point of view. For Professor Smith, Biblical criticism is not a dead body of statistics, but the restitution of a historical development instinct with divine life.

BAGEHOT'S BIOGRAPHICAL STUDIES.*

BAGEHOT has brought more knowledge of life and originality of mind to the elucidation of the theory and practice of English politics than any man since Burke. He is the only Englishman of first-rate talents who, during the last half-century, has applied the whole force of his mind to the analysis of the mass of laws, maxims, and habits which go to make up the English Constitution. In the course of a few years he will undoubtedly be recognized by all the world as the most eminent of constitutionalists. If this recognition has not been yet attained, the failure, such as it is, is due mainly to the versatility of Bagehot's interests, and to the consequent difficulty felt by ordinary students in believing that a writer who excelled in so many fields of speculation—in the sphere of criticism, of imaginative literature, and of political economy—could be pre-eminent in one field; and to the lucidity of Bagehot's explanations, which led even those who learnt most

* 'Biographical Studies. By the late Walter Bagehot, M.A., and Fellow of University College, London. Edited by Richard Holt Hutton.' London: Longmans, Green & Co. 1881.

from his pages into the delusion that what their teacher explained so easily was in itself easy to explain and hardly needed explanation. Those, however, and we believe they are an increasing body, who are daily more and more aware that the death of Bagehot deprived England of one of her most original thinkers, will welcome with very special interest the 'Biographical Studies,' which are, we fear, nearly the last gift that the public will receive from their author. This series of reviews and fugitive criticisms does not, indeed, add much to our knowledge of the writer's views or conclusions. It would be ridiculous to expect from fragments of his work the merits of complete and careful workmanship which had received the workman's last touches. But the very fact that the 'Studies' are merely studies makes them peculiarly valuable as a means of acquiring an insight into Bagehot's mode of thought and into the secrets of his power. They do not, we repeat, add much to our knowledge of his views, but they add, or may add, a good deal to our understanding of Bagehot's genius.

The peculiarity of his mind, which gives the peculiar tone to every word he wrote, is the combination in him of three qualities which are not very often found apart, and are very rarely indeed found to co-exist in the same individual. These characteristics are capacity for abstract speculation—the keenest relish for actual, concrete, every-day facts—intense, one might almost say excessive, openness to truth (which is a different thing from the love of truth). The 'Biographical Studies' are from the very nature of their subject not the work in which one would at first sight seek for the most marked specimens of our author's capacity for abstract speculation. It is rather to his constitutional or economical theories that his admirers would at first sight point for proof of his speculative ability. But, though the assertion may sound a little paradoxical, it is to our minds the simple truth that Bagehot's passion for facts is nowhere so remarkable as when he is dealing with theoretical topics, whilst his speculative turn of mind is nowhere better seen than in his mode of dealing with the characters and lives of actual living men. Take, for instance, almost at a chance, the following sentence from his 'English Constitution': "Most people, when they read that the Queen walked on the slopes at Windsor—that the Prince of Wales went to the Derby—have imagined that too much thought and prominence were given to little things. But they have been in error; and it is nice to trace how the actions of a retired widow and an unemployed youth become of such importance." These words show exactly the point in which Bagehot differed from most theorists—from such able men, for example, as Hallam or Mill: in the very midst of speculative analysis of the influence and position of the monarchy he turns to the every-day, known, palpable fact of the interest excited by the Queen's walking on the slopes at Windsor. In a precisely analogous manner he is always prone to pass immediately from the anecdotes and trivialities of biography to some principle which they suggest, or rather of which they are a concrete example. All through his essay on Lord Brougham or his essay on Gladstone there are scattered remarks which you scarcely know whether to group under the head of comments on individual character, or under the head of reflections on human nature. "Lord Brougham's intellectual powers," writes Bagehot, "were as fitted for the functions of a miscellaneous agitator as his moral character. The first of these, perhaps, is a singular faculty of conspicuous labor. In general, the work of agitation proceeds in this way." Then follows what may be equally well described as an inimitable analysis of public agitation, or an unrivalled analysis of the character of the great agitator who, even as chancellor, could not give up the rôle for which he was created by nature. Take, again, Bagehot's mode of criticising Gladstone's oratory. He gets from Mr. Gladstone himself a description of an orator's functions, whose "work from its very inception is inextricably mixed up with practice," and "is cast in the mould offered to him by the mind of his hearers"; and having obtained from the great minister this curious piece of unconscious self-portraiture, proceeds to draw a picture which is at once a sketch of Gladstone and an analysis of Parliamentary oratory.

We have spoken of Bagehot's powers of speculation and grasp of concrete facts as, what they certainly are in themselves, two different qualities. But we should fail to convey a true view of his mind if we did not insist upon the consideration that in his genius these two characteristics are so intimately blended that they form only one mode of looking at the world either of thought or of actual life. It is in this mixture of different characteristics that half the special power of his intellect, and more than half the special charm of his writing, lie. The following critique on Lord Brougham's restless activity is a charming specimen of Bagehot's style and manner of thought, though it is greatly spoilt through the impossibility of our citing the whole of it:

"Now, it seems to be a law of the imagination that it only works in a mind of stillness. The noise and crush of life jar it. 'No man,' it has been said, 'can say, I *will* compose poetry'; he must wait until—from a brooding, half-desultory inaction—poetry may arise, like a gentle mist, delicately and of itself.

> "'I waited for the train at Coventry;
> I hung with grooms and porters on the bridge
> To watch the three tall spires; and there I shaped
> The city's legend into this.'

Lord Brougham would not have waited so. He would have rushed up into the town; he would have suggested an improvement, talked the science of the bridge, explained its history to the natives. The quiet race would think twenty people had been there. And, of course, in some ways this is admirable; such life and force are rare; even the 'grooms and porters' would not be insensible to such an aggressive intelligence—so much *knocking* mind. But, in the meantime, no lightly-touched picture of an old story would have arisen on his imagination. The city's legend would have been thrust out; the fairy frost-work of the fancy would have been struck away; there would have been talk on the schooling of the porter's eldest son."

In this passage, if anywhere, we have the concentrated essence of our author's genius. The touch, "the quiet race would have thought that twenty men had been there," and "there would have been talk on the schooling of the porter's eldest son," is really perfect. Brougham's force and Brougham's foibles are hit off in a sentence and a half. The expression, "*knocking* mind," strikes not only at Brougham but at a whole class of character. But there is more in the passage than this. Who can fail to see that in the description of the "brooding, half-desultory inaction" which Bagehot assigns as the condition of disposition under which alone poetry may arise, there is suggested not only a whole theory as to the difference between active and poetical intelligence, but also a picture of one-half of Bagehot's own character? Here at last one comes across his openness to truth. He not only pursued truth, which is a rare thing, but, what is rarer, he let her come freely to him. This intellectual accessibility is patent to intelligent readers in all his writings. It is very closely connected both with his grasp of fact and with his extraordinary insight into character. It tinges every part of his speculations, and is seen nowhere more strongly than in that portion of his political views which has, rightly enough, excited some unfavorable comment. His estimate of Louis Napoleon inevitably jars on the feeling of every one who remembers either the *Coup d'État* or Sedan. One must, however, in fairness to Bagehot, admit that on the particular point which he pressed upon the attention of Englishmen at a time when they were filled with indignation at the massacre of the 2d of December, he was in the main right. He contended not so much that Louis Napoleon was not a scoundrel, as that his power rested on much more permanent foundations than on a success in a street-fight. That the calmness with which Bagehot analyzed the Imperial policy is not wholly a subject of praise, even intellectually, we admit. A man who is never carried away by passion will never understand passion; but it is indisputable that the coolness with which a young man just fresh from college could let all the facts of French politics, even when they were facts which he disliked, have free access to his judgment, is a remarkable testimony to his openness towards truth of every description.

Bagehot's intellectual qualities can in no way be better illustrated than by a comparison with the powers of a man who at present as far surpasses Bagehot in general reputation as he undoubtedly fell short of Bagehot in intellectual freshness and ingenuity. Neither the author of the 'English Constitution' nor the author of the essay on 'Representative Government' would, we suspect, complain of being compared one with the other. Bagehot and Mill have some strong points of resemblance. Both were thinkers who throughout life mixed more or less in practical affairs. They were both political economists; they were both occupied with political and constitutional problems; they were both free from all undue reverence for received opinions; they were both devoted followers after truth. Yet, despite all these points of similarity, and others which might easily be discovered, it would be difficult to find two writers belonging to the same age and country, and even in a certain degree to the same school, whose turn of mind was at bottom more different. Mill (of whom we, at least, would never speak except with the utmost respect) had a clear intellect, which, owing to his paternal training, had early acquired an extraordinary command of all the instruments of logic. From his childhood upwards he had learnt to argue, and to argue correctly. By the age of nineteen he could express himself with a clearness and precision rarely attained by a man of twenty-nine. His information was extensive, and his knowledge of the elements of different sciences remarkable. He lacked, however, and lacked through life, all originality of conception or grasp of facts. It was not exactly knowledge which failed him, but the power to bring into one view the experience of every-day existence and the conclusions which he had drawn from books or from reflection. Mill wrote much and ably about the British Constitution. We may be certain he never reflected on the light which might be thrown on the constitution of his country by explaining to himself and his readers how it happens that the English public cares to learn that "the Queen walked on the slopes at Windsor." Mill, again, had none of Bagehot's power of letting truth flow easily into his mind. It is not that the author of the 'Treatise on Logic' was a thinker uninfluenced by the sentiments or the prejudices of others. His autobiography sufficiently proves both the candor with which he attempted to learn from others and the excessive deference which he paid to authority, when the authority was one made impressive to him by the force either of association or of personal affection. What limited his power of acquiring truth was partly, indeed, excessive reverence

for philosophic dogmas impressed upon him in youth, and partly also an inability, very commonly found with thinkers of considerable power, to gaze calmly at phenomena which do not apparently square with their theories. The truths he saw he could sedulously and devotedly pursue, but his warmest admirers will probably admit that there were truths which he was incapable of seeing. Of such incapacity hardly a trace can be found in Bagehot. His defect, if so it may be called, lay rather in excessive readiness to give weight to considerations which seemed at least fatal to the general theories—for example, in political economy—in the soundness of which he on the whole believed. He was, perhaps, slightly deficient in that "tenacious grasp of abstract principle" which he happily specifies as the marked characteristic of Professor Cairnes's mind. One feels certainly at times as though the weight given by Bagehot to special experience prevented him from following out to their due length the conclusions which he was above most men capable of deducing from general principles.

It must, however, always be carefully remembered that a dread of empty abstractions, which reminds one sometimes of Burke, was in Bagehot's case nothing but one form of his intense desire to ascertain and welcome what was true. His estimates of two very different characters afford a curious illustration of the strength of this love of truth. For Sir George Cornewall Lewis he expresses more than once a kind of admiration and almost reverence which to most readers will, we suspect, appear excessive. Neither Pitt, nor Peel, nor Gladstone, nor Palmerston receives from Bagehot anything like as high a tribute of respect as he accords to a solid, learned, fair-minded man, whose judgments, though always sensible, were certainly not always sagacious, whose literary talents were far inferior to Bagehot's own, and whose political career was not marked by any extraordinary triumphs. Bagehot himself admits that, "apart from . . . massive simplicity of understanding and . . . immense accumulation of exact knowledge, there was nothing *very* remarkable about Sir George Lewis. He had . . . some great qualities in an extraordinary measure, but in other respects he was no more than an ordinary man; in some respects he was even less than one." Bagehot's admiration, nevertheless, for a man whose reputation as a politician is already forgotten, and whose literary works will certainly not be long remembered, is both explainable and well-grounded. Alone among the politicians of his generation, perhaps of any generation, Lewis exhibited from the beginning to the end of his life that "strong love of bare truth" which is the last virtue generally to be found in the cabinet of a statesman. With Bagehot's reverence for Sir George Lewis one may contrast the severity of his judgment towards Lyndhurst. It is not that he shows himself insensible to the ex-chancellor's talents, or to the personal charm by which Lyndhurst conciliated even bitter opponents, and gained something like reverence from a generation who had forgotten the political errors of his youth. For Lyndhurst's intellectual powers his critic has nothing but unbounded admiration: "He had the most disciplined intellect of his time. There is in every one of his productions evidence not only of natural, sinewy strength, but of careful culture and intellectual gymnastic." But Lyndhurst had committed the one crime for which Bagehot had no pardon: he had deliberately preferred darkness to light. "Lord Lyndhurst had many great qualities. He had a splendid intellect, as great a faculty of finding truth as any one in his generation; but he had no love of truth. With this great faculty of finding truth he was a believer in error—in what his own party admit to be error. All his life through he could have found the truth as a statesman, just as he found it when a judge; but he never did find it. He never looked for it." Hence the most tolerant, the most subtle, the coolest of all critics pronounces on Lyndhurst this final condemnation:

"He would have acted more profitably if he had acted more conscientiously; . . . he would have been among the foremost of the winners, instead of being among the foremost of the losers. There was nothing he would have liked so much, there was nothing which he appreciated so much, as success in the game of political life; nothing that he despised and detested like the want of success. . . . Such was the great man we have just buried; great in power, but not great in the use of power; a politician, not a statesman; a man of small principle and of few scruples. . . . He played the game of life for low and selfish purposes, and yet by the intellectual power with which he played it he redeemed that game from its intrinsic degradation."

HOLUB'S 'SOUTH AFRICA.'*

No part of the African country which Dr. Holub traversed, on the north and south line from Algoa Bay to the Zambesi, was previously unexplored or is now unfrequented by white men. In fact, his route was along a great highway of traffic, and the native kings, through whose territory it passed, affect, in some cases, the European costume and even the European style of living, and tolerate resident missionaries. Nor were our traveller's hunting adventures peculiarly exciting, and though his natural-history collections were enormous, he candidly relates his sporting failures, and lets it be seen that he has no ambition to pass for a fancy marksman, or a tremendous slaughterer of the brute creation. "It was my object," he says on one occasion (i. p. 269), "to observe the different kinds of game, rather than to kill a number of them." Accordingly, if we set aside the memoranda of scenery—including a fresh and vivid description of the Victoria Falls—and the astonishing catalogue of animal life encountered, the main interest of the narrative is ethnographical and political. After leaving the diamond-fields Dr. Holub journeyed partly among the Boers, the vanguard (such as they are) of European civilization, and largely through the various kingdoms and tribes of the Bechuanas—the Batlapins, Barolongs, Banguaketse, Bakuenas, Bamangwatos, Marutse, etc. He was in Cape Colony during the Zulu War, which he justifies; he arrived upon the heels or upon the eve of revolutions in the chieftainships just enumerated; and he met that forlorn and fanatical body of Boer emigrants, bound for the Damara territory in the character of armed invaders, who afterwards perished miserably, and whose "true motive in migrating" was "that the President had taken up with some utterly false views as to the interpretation of various passages in the Bible, and that the Government had commenced forcing upon them a number of ill-timed and annoying innovations" (referring especially to the project of a railway from Delagoa Bay to the Transvaal, an enterprise as to which the Scripture is certainly silent). Dr. Holub witnessed, in other words, the movement of populations and the progress of civilization, and his observations are of great service in forecasting the coming transformation of Southern Central Africa.

We should at the outset say a word about the personality of our author, whom the opening sentences of this book at once pleasantly recommend to the reader, and who never forfeits our respect. Dr. Holub was a Bohemian physician possessed with a desire to follow in the footsteps of African explorers, and determined to qualify himself by degrees by actual experience. He landed at Port Elizabeth with very little in his pocket, and presently made his way to the diamond-fields, where he began to practise. The money thus accumulated he dedicated to the expenses of longer and longer excursions from that base, returning after each one to repair his fortunes by resuming his profession, until, his plans having been thwarted by sickness and the loss of his baggage, he revisited Europe with his large assortment of trophies and his diaries, but with future African conquests in view. His amiability and humanity, and his devotion to science, are worthy of Livingstone, whose disciple he is, while he possesses, if not a high degree of literary skill, a peculiarly agreeable gift of narration, and has been very fortunate in his translator.

In the jostle of South African nationalities and civilizations the prime disturbing element is easy to discern. With genuine border recklessness the white settlers sell fire-arms to the natives without a thought of the peril involved in case of conflict, and knowing conflict by mutual encroachment to be inevitable. The Cape Colony is just now engaged in the formidable task of disarming the Basutos. Among the graphic illustrations of these volumes is one of Basutos returning from the diamond-fields meeting others going thither—the latter half-clad in skins, with gourds slung to their assegais; the former in full white-man's garb, with plump bundles, and every man his gun. Dr. Holub says (i. p. 212):

"Of the thousands of black men who at that time [1873] acted as servants in the diamond-fields, the majority belonged to the Basuto, Zulu, and Transvaal Bechuana tribes. They earned from 7*s.* 6*d.* to 10*s.* a week, and rarely stayed more than six months at the diggings; for as soon as they had saved enough to buy a gun—which would seldom cost more than 4*l.*—and about 5 lbs. of powder at 3*s.* per lb., a few bullets and caps, a woollen garment or two, and perhaps a hat, they considered themselves quite in a position to return to their own homes and buy themselves a wife. A servant had to be bound to his master by a certificate drawn up by a proper official, and this had to be renewed at every change of situation, a penalty being imposed when the document was not forthcoming. Whenever a servant wished to complete his engagement and to return home the employer, if the man's conduct had been satisfactory, would give him a certificate to the local authorities, that he might be permitted to buy a gun. The certificate was practically equivalent, therefore, to a gun-license; and thus it had been brought about that many hundreds of natives, both in the colony and in their own independent states, were in possession of fire-arms, with liberty to use them."

One may judge of the justice, to say nothing of the expediency, of taking away the arms thus legitimately acquired. And we get a glimpse of the spread of fire-arms, throughout the extent of Dr. Holub's wanderings, from the following statement with regard to the Marutse alone, the dwellers on the north bank of the Zambesi (ii. p. 341):

"At the time of my brief sojourn in the district, the number of guns that had been introduced into the country from the south and west amounted to 500 flint muskets, 1,500 ordinary percussion muskets, 80 percussion elephant-guns, 150 rifles, 30 double-barrelled guns of various sorts, 10 breech-loaders, and 3 revolvers. After I left, the great bulk of these were thrown into the Zambesi by the people in revolt, and, as they were not replaced, I do not suppose that the entire number of fire-arms in the kingdom would exceed 1,100 or 1,200 at the most."

* 'Seven Years in South Africa. Travels, Researches, and Hunting Adventures between the Diamond-fields and the Zambesi (1872-79). By Emil Holub. Translated by Ellen E. Frewer.' Map and 200 illustrations. 2 vols. Boston: Houghton, Mifflin & Co. 1881.

The capacity of the Boers to use theirs, so remarkably exhibited in the late rising, is revealed in one or two places by Dr. Holub. In springbock hunting (i. p. 33)—

"I have known an expert marksman bring down two running antelopes by a single shot from his breech-loader. Other instances I have witnessed when, both shots having missed, or the second having been fired too late, the herd has scampered off to a distance of seven hundred yards or more, and come to a stand, when a good shot has made a selection of a special victim for his unerring aim. Well do I recollect one of these experts pointing to a particular antelope in one of these fugitive herds and exclaiming, 'Det rechte kantsche bock [*sic*], Mynheer!' [The right-hand buck, Mister.] He brought the creature down as he spoke."

So, on the road to Wonderfontein (i. p. 151): "We received a visit in the course of the afternoon from the farmer's son, who quite astonished me by the dexterity with which he handled my revolver, making shot after shot at a mark with unerring precision."

The Dutch town of Potchefstroom, on the Mooi River, which stood a long siege in British hands in the late insurrection, is thus attractively depicted by our author (i. p. 165):

"In the summer-time grass grows freely in the less frequented streets, and even in the dry season the place with its flat-roofed or gabled houses, all neatly whitewashed, rising among the foliage of the foreign evergreens, the cypress, the eucalyptus, and the ivy that have been acclimatized, has all the appearance of one large, well-cultivated garden, and offers a striking contrast to the dead yellow of the dried-up grass in the surrounding valley. . . .

"The streets are straight, dividing the town into rectangular blocks; and at the places where they intersect, open squares are left, the most spacious of which is appropriated for a market-place. The English church, all overgrown with ivy, is very picturesque, but, with this exception, none of the public edifices rise above the level of the ordinary style of building. . . .

"Although the town has no pretensions to architectural beauty, yet the places of business are thoroughly commodious, and the private residences are often quite elegant villas. The great charm, however, of them all, even of the most modest, lies in the well-kept orchards and gardens with which they are surrounded, the hedges being gay with myriads of roses, with fig-bushes, and with the bright leaves and fiery blossoms of the pomegranate, which turn to their large and luscious fruit. The whole atmosphere seems pervaded with color and fragrance, and for many consecutive months of the year a tempting supply of fruit hangs in the hedgerows, so that the owner may gather in their produce without depriving his plot of ground of its ordinary aspect of a gay and enjoyable flower-garden."

The three most interesting native chiefs, met and characterized at greater or less length by Dr. Holub, are the well-known Sechele, whose residence was then at Molopolole; Khame, the vigorous "prohibitionist" ruler of Shoshong; and his next neighbor on the north, Sepopo, the bloody tyrant of the Marutse. "Morena," said our Bohemian, as he sat at tea with Sechele, in his fifteen-thousand-dollar house, "furnished throughout in European style," with chairs and couches of walnut covered with red velvet, and a silver service—"Morena, when I was only thirteen years old, I read your name in Nyaka Livingstone's book. I little thought that I should ever see you and speak to you; far more surprising is it to me to find myself drinking tea in your palace." And the King, who, "although he still practised rain-magic, had become familiar with some passages of Scripture, said, with a sanctimonious air, 'His ways are past finding out,'" and thereupon gave his drowsy wife "such a tremendous poke that she had a narrow escape of knocking her cup off the table with her forehead." The impression made by this veneered monarch was that of an utter hypocrite.

The narrative reaches the climax of interest in Dr. Holub's prolonged stay on the shores of the Zambesi, which he turned to excellent account in noting the traits and manners of the people, here described with great fulness. This important stream drains a country that produces spontaneously trees bearing edible fruit for all the year round; offers inexhaustible scope and variety to the sportsman, with its elephants, lions, zebras, gnus, buffaloes, hippopotamuses, baboons, antelopes, ostriches, etc.; is inhabited by fine races, endowed with unusual mechanical aptitude, a tolerable musical sense, and decided artistic feeling, who are expert fishermen, clever architects, cleanly in their personal habits, fairly modest, though by no means chaste, and who treat their women with consideration, preferring female rulers when they can get them. Of all these matters space fails us to give more than a hint, and indeed it is difficult to make excerpts. We close with a picture of the bloodthirsty and superstitious "Sepopo, Morena of the Zambesi" (ii. p. 137), afterwards deposed:

"He was a man of about five-and-thirty, dressed in European style, with an English hat upon his head, decorated with a fine white ostrich feather. He had a broad, open countenance, large eyes, and a good-humored expression that betrayed nothing of the tyrant that he really was. Advancing to meet me with a light and easy tread, he smiled pleasantly as he held out his hand, and after greeting Blockley [a trader] in a similar fashion, he bestowed a nod of recognition on our servant April. He was accompanied by some of the principal court-officials, only one of whom wore trousers; two others had woollen garments fastened across their backs, whilst the rest were only to be distinguished from the general mob by the number of bracelets on their arms. The most noticeable part of the procession was the royal band: on either side of the King were the myrimba players, bringing out the most excruciating sounds with a pair of short drumsticks from a keyboard of calabashes suspended from their shoulders by a strap; these were preceded by men with huge tubular drums, upon which they played with their fingers, accompanying the strains with their voices. Followed by this motley throng we were conducted to a tall mimosa. . . ."

The General Principles of Constitutional Law in the United States of America. By Thomas M. Cooley, LL.D. (Boston: Little, Brown & Co. 1880.)—This manual has been chiefly prepared for the use of students. The design, the author states in his preface, has been to present the general principles of constitutional law, whether they pertain to the Federal or to the State system, or to both. He adds that "mere theories have received very little attention," and that "the principles stated are those that have been settled judicially or otherwise in the practical working of the Government." No one is better qualified to expound constitutional law than Judge Cooley. His work on 'Constitutional Limitations' is one of the best-considered treatises on constitutional law that have been produced in this country, and the author's long experience as a judge has given him a right to speak with greater authority than falls to the share of most legal writers. Lawyers who are familiar with the decisions of the Supreme Court of Michigan know that Judge Cooley's judgments are among the best handed down from that very able tribunal. Of course, in a manual of this sort there is little scope for originality; most of what the author has to say is found in other books. On the whole, the question is whether the book is valuable as a manual, since this is the purpose for which it is designed. We have no hesitation in saying that it will be found an excellent compendium of the general rules of what may be called constitutional politics, and also of constitutional law. All the strictly legal part of the book is excellent. It is when Judge Cooley abandons exposition and goes back to definitions and general principles that he is weakest. Chapter ii. is devoted to this branch of his subject, and we cannot but think that it might be improved. He begins, for instance, with a definition of a state. This is something which many able commentators have tried their hands upon without much success. He defines it to be "a body politic or society of men, united together under common laws, for the purpose of protecting their mutual safety and advantage by the joint efforts of their combined strength." The objection to this definition is that it seems to imply the notion of a final cause in social organization, the necessity of which, as a fundamental notion, no one accustomed to modern methods of speculation on these subjects will admit. It is possible, of course, for a society of men to unite together for the purpose of protecting their mutual safety and advantage, and thus forming a state, but nine-tenths of the states in the world have had no such origin; and if their existence does not originate in this purpose, it is difficult to see what the advantage is in introducing the idea of an object or purpose at all. Austin notes the fact that the word *state* has numerous meanings—*e.g.*, it is generally synonymous with the "sovereign"; that is, it denotes the individual person or body of individual persons who wield power in an independent political society, and this is the meaning which he usually gives it. Or, again, it may denote the individual or body which is sovereign in a given society, together with the subject-individuals and subject-bodies who hold political rights from that sovereign. It is the second of these meanings that Judge Cooley apparently has in mind.

With regard to sovereignty he says: "In theory sovereignty must be a unity, and the sovereignty of a state must extend to all the subjects of the government within the territorial limits occupied by the associated people who compose it, so that the dividing line between the sovereignties must be a territorial line." This is very clear, but how are we to reconcile such a statement with that contained in the preceding paragraph, that "all civilized states recognize a body of rules or laws which is called the law of nations, and the rules are either rules of public international law, as they relate to and regulate the intercourse of states with each other, or private international law, as they define and protect the rights, privileges, and obligations of citizens or subjects of one state passing into another, or owning property, making contracts, or conducting operations that may be governed by the laws of another. In contemplation of the law of nations all civilized states are and must be equal in rights, since, from the very definition of a civilized state, it is impossible that there should be in respect to it any political superior." If the dividing line between sovereignties is territorial, how is the existence of sovereignty to be reconciled with the existence of a non-territorial superior law? All this might be cleared up by an examination of what is meant by the term *law*. The moment that this is done we find that the word *law* in ordinary parlance and the same word as used in the phrase *law of nations* have two entirely distinct meanings—that in the former case the thing involves the idea of sovereignty residing somewhere, that in the latter case the term is used by analogy merely. All this, perhaps, Judge Cooley would regard as "mere theory," and, in fact, we cannot help thinking that he has that dislike for fundamental

principles which long practical acquaintance with the law is apt to produce in the best legal minds.

A Manual of English Prose Literature, Biographical and Critical, designed mainly to show characteristics of style. By William Minto, M.A., Professor of Logic and English Literature in the University of Aberdeen. New edition. (Edinburgh and London: William Blackwood & Sons; New York: Scribner & Welford.)—Professor Minto's 'English Literature' is, we think, on a somewhat novel plan, and one which must prove very useful for purposes of instruction. It is hard to say whether it is designed primarily to teach English literature or rhetoric, as the authors are considered mainly from the point of view of style, and the work is introduced by a brief treatise upon rhetoric. On the whole, therefore, the starting-point appears to be rhetoric, and the needs of the teacher of rhetoric to be the guiding principle of the work. As a supplement to a treatise upon rhetoric, containing an abundance of practical illustrations of its rules, it will be found very serviceable; even by itself it will answer tolerably well for a course in rhetoric, as the introductory sketch, if short, is clear and good, and at any rate the detailed concrete application of its rules is the most valuable part of a course. Not only is the plan of the work novel, but its execution is peculiar. The introduction, of 28 pages, consists of three chapters—Elements of Style, Qualities of Style, and Kinds of Composition. The work itself is in two Parts; Part II. being the history of literature proper, while Part I. is a detailed application of the principles and rules of rhetoric to three prominent authors—De Quincey, Macaulay, and Carlyle—selected for their special fitness for this purpose. This is perhaps the most characteristic feature of the book. In Part II., divided into ten chronological chapters, the same process is followed, of discussing the style of the leading authors in the light of the principles laid down, although of course not with the same minuteness. But it is only the leading authors; the inferior writers are passed over with very brief mention. It is not always easy to understand the principle of selection. In chapter iv. (1640–1670), for example, three authors—Fuller, Taylor, and Cowley—are the subjects of elaborate discussion; Bunyan, Clarendon, Browne, Milton, and Hobbes receive a page or two apiece; while a host of lesser writers have each only a short paragraph.

The spirit of the work may be best stated in the words of the preface, in which, after insisting emphatically upon the need of rules of composition, the author goes on to say of the conditions adopted by him that "their chief recommendation is that they recognize diversity of style according to diversity of subject and purpose. . . . A principal aim in this Manual is to make students familiar with the fact that there are varieties of good style." A good illustration of Mr. Minto's independence of criticism is found in his judgment upon Bunyan. After quoting Macaulay's estimate, "expressed with characteristic slap-dash extravagance," he goes on: "Even the assertion that 'the vocabulary is the vocabulary of the common people' is inconsiderate and erroneous. The language is homely indeed, but it is not the every-day speech of hinds and tinkers; it is the language of the Church, of the Bible, of Fox's 'Book of Martyrs,' and whatever other literature Bunyan was in the habit of perusing. As for the 'old unpolluted English language,' it needs no microscopical eye to detect in the 'Pilgrim's Progress' a considerable sprinkling of vulgar provincialisms, and even of such Latin idioms as are to be found in his favorite old martyrologist Fox."

Animal Life as affected by the Natural Conditions of Existence. (New York: D. Appleton & Co. 1881.)—During the winter of 1877 Professor Carl Semper, of Würzburg, delivered a course of lectures before the Lowell Institute at Boston on the "Natural Conditions of Existence of Animal Life." These lectures are now published as one of the volumes of the "International Scientific Series," with wood-cut illustrations, both excellent and well printed. Professor Semper takes as his text in these lectures the view that enough has been done in the way of philosophizing by Darwinists, and that the task now before us is the application of exact investigation to the current hypotheses of evolution. Semper is one of the few German naturalists who have withstood the current of Haeckelism, believing that a dictum from the high-priest at Jena, in spite of its cant about "biogenetic principles," the "falsifications of Ontogenesis," and a number of similar axiomatic expressions, which still await their explanation, cannot solve the problems of existence. Semper, of course, acknowledges, like all modern naturalists, the extensive influence which the Darwinian theory has exerted on the development of the natural sciences. While admitting, however, that Darwin has shown the possibility of discovering the path which nature has followed in order to produce her innumerable variety of animal forms, and also that the natural genealogy of the organisms now existing is one of the grandest problems propounded to modern zoölogists, he is by no means prepared to follow the scientific genealogists of the more advanced school, who settle the problem off-hand, often in accordance with their personal equation. Semper naturally sides with those biologists who, while in full sympathy with the theory of development, yet look with suspicion upon any attempt to explain the origin of life by mere philosophical theories not based upon experiments.

Unfortunately for the biologist, the greater number of the experiments he is called upon to perform require so long a time that the life of no one naturalist will allow him to follow more than a small part of the problems. He is, therefore, compelled to assume a concurrence of present conditions similar to or identical with those he imagines to be capable of producing certain results in the past. He may take, for instance, the action of food, upon which depend, of course, all the vital processes, and see how far the amount of nourishment varies in animals of the same group placed under different circumstances, and what the result of this variation is; or he may trace the greater or less dependence upon food of the different classes of the animal kingdom, and their resulting numerical preponderance. Closely related to this question are, of course, the various modes in which animals of different classes obtain their food, and the causes which may lead to its abundance or scarcity. The student is at the outset brought face to face with the problem of the influence of inanimate surroundings, such as light and heat, upon the medium in which they live. Former study respecting the distribution of marine animals, as well as more recent investigations of the fauna of the depths of the sea, have shown temperature to be the all-important factor governing the physical conditions under which marine animals exist. Professor Semper in the course of his lectures traces the influence of light upon the development of the eye in different stages of growth of one and the same animal, and the effect which a greater or smaller degree of heat may have upon the growth of an animal. The modifications animals may undergo when, in consequence of their migrations, they are gradually subjected to different surroundings are well treated in the chapter upon the influence of stagnant and brackish water, or of water the chemical composition of which may little by little be changed, as also the comparative conditions of animals living habitually in a dry atmosphere, or one saturated with moisture, at a great altitude or near the level of the sea.

One of the most interesting chapters of the volume is that on the action of currents, especially marine currents, in influencing the distribution of animal life. The chapters on coral-reefs are noteworthy as the first attempt to explain the formation of coral-reefs not, according to the generally received views of Darwin, by elevation and subsidence, but by the simple action of the current and prevailing winds. This theory, however, does not account satisfactorily for all the phenomena of the growth of coral-reefs. It has lately been modified very considerably by Mr. Murray, who has shown that plateaux upon which reefs grow may to a great extent owe their origin largely to the accumulation of débris of molluscs, corals, echinoderms, and annelids living on the bottom, as well as to those of pelagic animals, and that winds and currents only act as a stimulus to certain parts of the reefs.

The subjects of parasitism, of mimicry, of the development of the eye, and of the interdependence of animals are briefly treated in the concluding chapter, which closes with the hope that naturalists will hereafter carry out experimentally the most exact lines of research possible, weaning themselves from the convenient but pernicious habit of theoretical explanations based upon general propositions.

Beiträge zur Steuer-Reform. Von L. Delsa. (Deutsche Zeit- und Streit-Fragen.) (Berlin: Verlag von Carl Habel. 1881.)—The events of the last twenty years have transformed Germany more than any country in Europe. From the loose and clumsy fabric of government established in 1815 have been developed, under the headship of Prussia, first the North-German Confederation and then the new and mighty German Empire. These achievements have, however, been as distinctly military as those of Frederic the Great and Napoleon, and with an uneasy consciousness of the Scripture maxim that those who use the sword shall perish by it, the rulers of Germany are determined that in her case, at least, the result shall not be easy of accomplishment. Moreover, by the absorption of Alsace and Lorraine they have placed Germany under heavy recognizances to remain, for one if not two hundred years, armed to the teeth and in sleepless vigilance. Figures can hardly show how terrible is the blood-tax which takes three of the best years out of every man's life, and which, when he should be forming his habits and opening his career in a business or profession, gives him the habits of the camp and destroys the individuality of thought and character which is the very essence of industrial enterprise. But figures can and do show that money must be had as well as men, and that large armies are not merely non-producing but consuming. The subject of taxation is, therefore, imperiously presenting its claims to attention, and since it is, as in some other countries, mixed up with politics, Prince Bismarck is finding out that there are things which cannot be accomplished by strength of will alone.

The pamphlet under review aims to deal with general principles of taxation, and starts with two maxims which are not without force in the United States: "Questions of taxation should be treated on the basis of the general economical condition of a country, and have nothing at all to do with poli-

tics"; and again, "No party can expect to retain permanent hold upon a country which does not identify itself with its economical interests, and make up its mind to treat this and the kindred subject of taxation, not from the standpoint of party but on scientific principles, with a due regard to local circumstances." In Germany, as in the United States, customs belong to the general Government, but it is significant of the condition of the two countries that while they give *us* such an enormous surplus revenue that if it were not for paying off the war debt we should be puzzled to know what to do with it, in Germany there is anxious consideration how they can be made to produce more. Of course free-trade receives attention from our author, but he points out the undoubted fact that absolute free-trade exists nowhere in the world, and that the real question is of the wisdom of particular expedients. He adds, what our free-traders are apt to overlook, that import duties must be regulated with reference to internal taxation, because if any home article is taxed, and the corresponding foreign article is admitted duty free, not only is the home producer not protected but he is overweighted. Although our general Government has more revenue than it needs, this is by no means the case with local ones, and serious injury might be done by recklessness in this respect. While, therefore, reform of the tariff is one of our first needs, this is not to be achieved by a simple application of the sponge, but by an intelligent review of the whole subject—a consummation, we may fear, more to be desired than expected. With us, as customs belong to the Government, direct taxes accrue to localities, but in Germany the grasp of the state falls heavily upon both. In Prussia, even before the events of 1866, direct taxation was about as severe as could well be borne, but the new and heavy burdens, which form the usual drawback to national glory, have left little or nothing to be hoped for from this source, and thus has come the tampering with protection, pure and simple, which marks increasing financial embarrassment.

We have further a rather interesting comparison of direct and indirect taxation. The only specific argument urged for the former is that it gives to every citizen a sense of his duties, in demonstrating that the existence and administration of the state depend in a measure directly upon himself. On the other hand, it is very unbending in its times and modes of collection, often bears very hard upon the taxpayer, and, with its delays, severities, and uncertainty, always leaves a considerable proportion uncollected. Indirect taxes are nearly always voluntary, and if placed mainly upon luxuries may be made to come from the rich, instead of, as is often charged, from the poor. They can always be closely collected, and their returns pretty accurately estimated. Against them it is to be said that state expenditure is less likely to be under control than where the taxpayer has a direct interest in it (though this view overlooks the modern facility of borrowing); that the cost of raising them is greater in proportion than in the case of direct taxes; that there are greater temptations to frauds, such as smuggling and illicit manufacture; and that the taxpayer almost of necessity pays more than he would under the direct system, though we believe there are few persons who would not rather pay a good deal more to escape direct relations with the tax-gatherer.

If the German Imperial Government has been obliged to go beyond the customs, and claim a share with the local governments in the proceeds of direct taxes, it has long been matter of surprise to us that our States and cities, which represent the overburdened side, do not render indirect taxation more available. With regard to tobacco, Mr. Delsa defends the policy of Government monopoly in manufacture on the ground not merely of economy but quality. Every smoker will think with a shudder of the consequence of such action on the part of our Government. Of course it could not be attempted by a less authority, but any tax-collector who sees the myriads of tobacco-shops in any considerable town or city must sigh over the waste of potential resource in licenses to sell; and the same remark applies to licenses to sell liquor, which Mr. Delsa thinks still offer an available resource in Germany above the tax on manufacture.

Coming to direct taxes, Mr. Delsa passes over those upon real estate and buildings, first because he thinks they are already well adjusted and not in need of reform—a remark which we should be glad to believe was equally applicable to this country—and then because they are very properly given up to local authorities, while he is treating of imperial taxation. He, therefore, devotes the rest of his attention to the income-tax, a subject unavoidable to a nation which indulges in an army of a half-million of men, but which we will spare our readers, as recalling the "infandum dolorem" of the civil war.

A System of Instruction in the Simplest Elements of Music. Adapted to Young Children. The Rainbow Tints in Primary and Secondary Colors, illustrating the Notes of the Gamut, as arranged by nature. By Mrs. J. M. Frost. (New York: American Bank Note Company, Type Department. 1880.)—Mrs. Frost's work consists of three parts: first, a short pamphlet of half-a-dozen pages containing a general introduction and instructions as to the use of the other parts; second, a folding cover of two leaves which, when opened, form a tablet twelve inches by twenty-two in size, on which are represented the bass and treble clefs of the ordinary musical notation, the lines and spaces being represented by different colors; third, a box of small cubical blocks about half an inch in height, also colored so as to correspond to the colors of the clefs. When one of these blocks is placed upon the corresponding color of the staff it represents a musical note; for example, the third space of the treble clef is colored blue, and when a blue block is placed upon it it represents the note C (do). The object of this simple apparatus is to teach children from three to seven years of age to recognize quickly and easily the names and places on the staff of the musical notes. By the use of colors, and under the guidance "of an appreciative mother or teacher," it is believed that the child "will *play* himself into the beginning of a sound musical education with hardly a suspicion of what he is really about." Mrs. Frost says: "In 1879 the work gained the approval and signatures of such high authorities as William Mason, S. B. Mills, Max Liebling, August Wilhelmj, and others." The plan is conceived and carried out entirely in the spirit of the Kindergarten system. The child is enticed by the pleasure he naturally takes in matching the colors of the blocks and the tablet into learning the names and positions on the staff of the different notes, and "as he grows older, and becomes accustomed to the printed page, the colors will fade from his memory, as we forget the colors on the map, but the relative locations and the names will be remembered."

It may not be amiss to mention that the advantage of availing one's self, for the purposes of instruction, of the vivid impression made upon the mind by bright colors, especially in the case of young children, has been insisted upon by Herbert Spencer and Auguste Comte. Some thirty years ago Oliver Byrne, formerly editor of 'Appletons' Dictionary of Mechanics,' and more recently one of the chief contributors to Spon's great 'Dictionary of Engineering,' published the first six books of Euclid, beautifully printed in colors, and with Euclid's demonstrations expressed in a manner conformable thereto. Mr. Byrne personally assured the writer that the plan was eminently successful, but we have never seen any public notice of the work, and have never heard of its being adopted by any school. The costliness of the book may, however, have been one of the principal obstacles to its adoption. We will further mention an indirect effect of Mrs. Frost's method which should not, perhaps, be overlooked. While matching the different shades of color of his blocks to the corresponding shades of the tablet the child is unconsciously exercising and sharpening his powers of appreciating shades of color, and thus laying the foundations of a more than ordinarily acute observation of external objects which will be throughout life a source of advantage and pleasure.

A single criticism may approve itself. In studying harmony, chords are always reckoned from the lowest note upward, and in all works on physics it is, and always has been, the custom to represent the solar spectrum with the red at the bottom and the violet at the top. By this manner of representation the scale of colors, according to the generally received undulatory theory of light, is brought into harmony with the scale of notes on the musical staff. Of course the child knows nothing about vibrations, and it makes no difference to him what color is taken as the representative of a particular note. But when there is no possible objection to scientific accuracy it would seem to be best to preserve it, and accordingly we would suggest for Mrs. Frost's next edition the following order of representing the musical scale: C red, D orange, E yellow, F green, G blue, A indigo, B violet—an order exactly the reverse of that presented by Mrs. Frost's tablet.

A Nihilist Princess

From the French of M. L. GAGNEUR.

12mo, price $1 25.

This novel, recently issued in Paris, and here admirably translated, is likely to attract much attention. It is evident that the author has studied his scenes and characters on the ground. It would be difficult to believe that he has not been present at meetings of the Nihilist committees, and that he is not familiar with their intent. At the same time he seems equally at home in the palaces of the nobles, in which, indeed, a great part of the action of his exciting book takes place. He throws a strong and lurid light upon the wrongs, the outrages, and the oppressions that have produced the present dangerous state of affairs in Russia. The strength of the book lies in its plot and its succession of thrilling incidents.

Sold by all booksellers, or mailed, post-paid, on receipt of price, by the publishers,

JANSEN, McCLURG & CO.,

OREGON RAILWAY AND NAVIGATION COMPANY,
No. 20 NASSAU STREET,
NEW YORK, June 15, 1881.

COUPONS OF JULY 1, 1881, from Bonds of the Oregon Railway and Navigation Company, will be paid at maturity by the Farmers' Loan and Trust Company, No. 26 Exchange Place, New York.

T. H. TYNDALE,
Assistant Secretary.

Notice to Investors.

We offer for sale a limited amount of RICHMOND & DANVILLE RAILROAD SIX PER CENT. GOLD BONDS, due in 1915, at 103 and accrued interest, with the right to advance the price from time to time without notice. These Bonds are secured by a consolidated mortgage on the Richmond & Danville Railroad and the Piedmont Railroad, and the lease of the North Carolina Railroad. We can confidently recommend these Bonds, as the annual report for the year ending September 30, 1880, showed that the Company had reduced its debt over $450,000 during the two preceding years, besides adding largely to the rolling-stock and machinery, and also purchasing 6,300 tons of steel rails. For seven months ending 30th April, 1881, the net receipts exceeded $240,000, equal to about 6 per cent. on its capital stock, after paying interest, rents, and all other fixed charges, besides paying large amounts for equipment, steel rails, and additional workshops. The receipts for carrying mails last April show an increase of over 100 per cent. over same month last year, and from freight of 39 per cent.

Previous to 1st of May 40 per cent. of the Atlanta & Charlotte freight went *via* the Carolina Central Railroad; now all its through freights go over the Richmond & Danville Railroad, which will add largely to its income. Richmond & Danville Railroad stock selling at 110.

Respectfully,

THOS. BRANCH & CO.,
Richmond, Va.

The Nation.

NEW YORK, THURSDAY, JUNE 23, 1881.

The Week.

THE "Half-Breeds" could have elected Mr. Depew on Saturday if all those who have supported him during the contest had been present and voted for him. The opportunity was, however, neglected, and there is, perhaps, as little likelihood of its recurrence through the absence of Stalwarts and Democrats as there is of an adjournment through the absence and "pairing" of the Administration men themselves. At all events, the situation remains very much as it was last week, except that the members are getting tired, and are receiving reminders from their constituents, who are probably still more tired, that the delay and expense are becoming scandalous and ought to be promptly ended. Mr. Wheeler has appeared on the ground in person, not to "take command of his forces," apparently, since he is said to advise the choice of one Stalwart instead of two Administration men—or, to be specific, Depew and Cornell. This is highly self-sacrificing considering his own prominence in the balloting; and the Stalwart hostility to Depew being so intense, and the bribery matter, as things stand at present, not having been cleared up, it is possible that his generosity may be rewarded, and the compromise result in Cornell or Lapham and Wheeler. He is not, however, in favor of making any offers of compromise, and thinks that the Opposition should be pressed hard enough for overtures to proceed from them; and that then they should be given one of the Senators to avoid disorganizing the party, as might happen if the Administration men were too greedy. The bribery investigation has been fitfully continued but without results, and the Grand Jury of Albany County has taken up the matter and examined A. D. Barber, under whose command the "Black Horse Cavalry" are believed to have performed their evolutions for years. He was very frank, but nothing appears to have been learned from him except that he had given over playing cards upon learning that it was ungentlemanly. One of the ways of enlisting the cavalry aforesaid is reported to be to lose money to legislators at cards, a practice invented after Tweed's confession had demonstrated the unfitness of check-books, which are provided with "stubs."

Mr. Wheeler's compromise, proposing the return of one Stalwart and one Half-Breed, calls renewed attention to the real significance of these terms. A Stalwart is now nothing but a partisan of Mr. Conkling in his particular quarrel with the Administration; that is, he believes in the extreme doctrine of "senatorial courtesy," thinks Conkling and Pratt were grossly insulted by the President, and did perfectly right to resign their seats, and that they ought to be sent back as a rebuke to Garfield, Blaine & Co. As this is absolutely all there is of him, there does not seem to be the slightest reason for considering him a tolerable substitute for his chief, or the smallest basis for a treaty with him. Instead of thus giving half a vindication to Mr. Conkling and half a censure to the Administration, it would be infinitely more decent to arrange with the Democrats for the short term, and throw the responsibility where it belongs, on those who vacated their seats at the risk of changing the balance of power in the Senate. The Half-Breeds, of course, have not the courage to do this, and the Wheeler compromise is sure to be proposed by the Conklingites themselves in the last resort. As the contest is not over the spoils doctrine, but over an act of folly which is not likely to be repeated, the result in any case will bring little comfort to reformers beyond the mere fact of the temporary displacement and eclipse of Conkling and "Me-too."

Mr. Conkling has now been "insulted" and "humiliated" by the entire Senate in voting unanimously for Robertson's confirmation, and by the President and his entire Cabinet, having been already insulted and humiliated by the late President and his Cabinet. He has also been insulted by members of the New York State Legislature, by the late Vice-President, Mr. Wheeler, and by the great majority of the Republican newspapers of the State. We doubt whether any public man in ancient or modern times has passed through so much of what he calls "the hurricane and the surfeit of mire and detestable accusation." It would seem as if this must incapacitate him for that career of usefulness in private life which the henchmen fondly anticipate for him. No man ever succeeds in anything who carries with him through life, as Mr. Conkling must hereafter, the sense of having been found out. There is no character strong enough to support it, and it is all the more crushing when the part you have been acting has been a pompous and aggressive one. The whining, humble charlatan can creep into comparatively comfortable obscurity when his day of reckoning comes and his pockets have been turned inside out, but there is no peace for the loud-mouthed, braggart, overbearing impostor after his exposure.

On Tuesday night there were held at Albany three "conferences," as they are now called, but virtual caucuses. Mr. Conkling was present at that of the Stalwarts, and the better opinion seems to be that he took matters very seriously, and went over the whole story of his shameful treatment by the Administration, and confirmed his supporters in their resolution to stand by him to the end. According to the *Herald*, however, it was a very humorous occasion, and Mr. Conkling's speech consisted entirely of warnings against the control of the Republican party by monopolists, and of doleful complaint of legislative lobbying and bribery. But such waggery would never have been guarded so carefully as it was from all the other special reporters, and we conclude that the *Herald* has been imposed upon. The Half-Breeds, too, held a conference, and were in excellent spirits; and still another group, called the Half-Stalwarts, whom we take to be the same as the "Jelly-Fish," or perhaps the "Featherheads," met and surveyed the prospect of some one of their number "filling the bill" of Mr. Wheeler's compromise.

Judge Van Alstyne, of Albany, has been charging the Grand Jury in that city about bribery and corruption. He told them that rumors about bribery within the county had been flying about for some time; but, nevertheless, he "perhaps should not have felt the occasion resting upon him to call their attention to it" if it were not that these rumors had "gone broadcast." Any doubts he might have had as to his duty in the matter were dissipated by finding in his morning paper this statement: "English enemies of American institutions are rejoicing at Mr. Conkling's attempt to discredit his opponents by the charge of bribery." Why are they rejoicing? the judge asks. "Because they are the enemies of American institutions," he sagaciously answers. He, therefore, determined, come what might, to charge the Grand Jury against corruption. He has also been impressed by the fact that "the titled and untitled are in sharp conflict," in some place or places not named, and that "the rich and the poor the world over stand face to face in opposition." He further argues that "enemies of republican institutions believe that if corruption grow up among the people" there will be a change in the form of the Government, and there will be a king or monarch "strong in his power to aid the few and suppress the many." We are very glad that the judge noticed all this in time, and determined to disappoint these malicious foreign critics. There will be much ill-concealed chagrin in their palaces and clubs when they see his charge, but they can hardly expect an American judge to witness their indecent joy unmoved. Some, we fear, will get as much comfort out of Judge Van Alstyne's charge as out of the stories of corruption.

Governor Cornell has vetoed a singular bill providing pensions for the public-school teachers of this city and Brooklyn. He says there is nothing extra-hazardous in the teacher's vocation, and that it does not involve personal sacrifice or require great ability or arduous preparation. He objects, further, that the bill not only would entail a great charge upon the general taxpayer, but would take away the teacher's ambition to quit his calling for "other and more profitable duties." Contentment in it seems to the Governor undesirable, and costly training for it and

adequate salaries he probably regards as wasteful and inexpedient. He does not express surprise that the system should be limited to these two cities, and he does not, of course, allude to the serious objection to pensioning a body of public servants whose appointments are subject to political caprice and favoritism.

General Grant's sensitiveness about personal allusions begins to have the appearance of monomania. Long ago he made up his mind that any exposure of an unworthy acquaintance of his was a covert attack upon himself. The other day he read the report of an interview with General Thomas L. Young, member of Congress from Ohio, in a New Orleans newspaper, in which Mr. Young was said to have stated that the General was a bank president. He is, in fact, a bank director, but apparently suspecting that the inaccuracy was designed to bring him into odium as a "gold-bug," he made use of the first reporter who came handy to spread his belief that Mr. Young was a "liar." This was the more unfortunate because the latter had really spoken of him as a bank director, and in the midst of a circle composed wholly of the ex-President's admirers. Mr. Young naturally feels hurt, and has come out in a very pathetic letter, recounting the numerous occasions on which he has been a political worker for Grant, and protesting that he never meant to "talk slurringly" of him or to "belittle" him. Mr. Young has always been his "humble admirer," and still subscribes himself his "humble friend"; and says General Grant can be belittled by "but one man." He does not, in spite of the public assault on his veracity, intimate that the General can ever belittle himself so far as to forfeit the very humble admiration and friendship of an Ohio Congressman.

Mr. Evarts's speech before the Monetary Conference, which many people were curious to see, has been published in full by the *Herald*, and is interesting as an illustration of how much a man may say with considerable force and lucidity on a subject to which he has evidently given no special attention. It must have been hard to deliver it, however, to a set of Gradgrinds like the members of the Conference, because the considerations with which it dealt were such as have now no weight whatever with financiers or economists, as they were nearly all sentimental. He advocated the restoration of silver on grounds of general fitness and respect for Nature, or, as he called it, the *Natura Rerum*, and personified the metals much as the Western men did in the discussion here two years ago by talking of the "intolerable burden" imposed on gold by mono-metallism, just as the Western men used to denounce gold for its baseness in abandoning us in the hour of our extremity during the war. He appealed also strongly to the good feeling of England and Germany, and seemed to argue that as it was harsh and unkind to drive silver out of circulation, great and friendly countries ought not to do it. As Mr. Evarts was probably in the eyes of the foreigners the *pièce de résistance* of the American delegation, his address must have been fatal to the American case, as revealing the fact that the United States had no business reasons to offer in support of the very serious demands they were making on the gold countries.

The President has dismissed Mr. Bentley, the Commissioner of Pensions, and put in his place one Major Dudley, an Indiana politician who helped Dorsey to "carry" the State. Mr. Bentley had faults, but he was none the less a competent and upright man, possessing long experience of the duties of one of the most difficult places in the Government service, and he has been dismissed at a moment when those duties are more than usually complicated and difficult, and when the public money in the hands of the Bureau is more than usually exposed to the attacks of fraudulent conspiracy. The excuse of the President is, we understand, the old one that the "pressure" for Mr. Bentley's removal was so great that he could not resist it. But then it is the business of the President to resist "pressure." Such resistance is the chief of the duties for performing which he draws his salary. In fact, resistance to "pressure" is the principal duty of nearly every man who occupies a fiduciary position. Nobody who has the care of anything valuable ever escapes "pressure," and it becomes doubly strong when it is known beforehand that if very strong it will succeed. No bank president in this city would be free from "pressure" for one moment if it was known that if pressed very hard he would make liberal donations out of the bank capital. To qualify men to resist "pressure" is the chief object of the Christian religion, of the Campbellite Church, and of Williams and Hiram Colleges. Why Presidents should expect to be excused for yielding to "pressure" when they get $50,000 a year for not yielding to it, and make oath on the Bible not to do so, passes our comprehension. We were in hopes, too, after reading the President's announcement to the Virginia Republicans, that he was going to use the Federal offices in that State for the good of the public service and not to "support" local politicians, that he was returning to the faith which he preached before his nomination; but this Bentley affair is well calculated to shake one's faith in any change for the better. Still, even the answer to the Virginians shows he has not wholly forgotten those lessons of his better hours.

Several of the Virginia Republican Executive Committee called upon the President last week to learn his position as to fusion with the Readjusters. General Wickham, as spokesman, stated his belief that the mass of the Republicans of Virginia could not be brought to support the Mahone ticket because they distrusted the fidelity of the Readjusters, in the first place, and were opposed to their repudiating doctrines, in the second. Even if the approaching Republican Convention nominated no ticket, or endorsed the Readjuster's nominations, he believed there would be a bolt and a straight ticket put in the field. The delegation wished to know whether certain threats as to removals from Federal offices in the event of opposition to fusion were authentic. The President thereupon replied that he had always been a Republican and would do nothing opposed to the interests of the party, and that he believed that any action squinting towards dishonoring public engagements would be ruinous. Whether or no, however, the Readjusters' policy was financially dishonorable, he remarked, the Virginia Republicans must themselves judge. General Wickham assured him that the Readjusters' platform advocated repudiation pure and simple, and it appeared to be the understanding that the conference, which was informal, had committed the Administration against the alliance proposed. As to removing officials who opposed the fusion, the President observed that he was guided in his appointments by two considerations: first, the public welfare; second, the character and capacity of the appointees. Notwithstanding the interview, there are dissentients among the Virginia managers who advocate the Mahone alliance, and will make a strong effort to have his ticket adopted by the coming Convention. That things are not running smoothly is shown by the removal of Lewis, who favors fusion, from the Chairmanship of the State Committee.

Judge Truax, of the Superior Court, has just decided the case of Williams *vs.* the Western Union Telegraph Company in favor of the defendants, his accompanying opinion being in direct conflict with the interpretation of the law bearing on the case given by his colleague, Judge Speir, who granted an injunction *pendente lite*, in the similar suit of Rufus Hatch, and by Chief-Justice Sedgwick, who granted one in the present case. The point of both suits, and of special public interest, is the right of a corporation to issue further stock-certificates to its stockholders to cover property acquired with surplus funds, or, in other words, the power of the directors of a stock company to expand the volume of its stock at will. Judge Truax decided that the law confers this power, although he does not "mean to be understood as saying" that a corporation can "water" its stock; there must be the actual property added to the corporate fund. The decision will be reviewed by the General Term, and if then necessary, by the Court of Appeals.

It has been a very quiet week in Wall Street. The applications for an extension of United States 5 per cent. coupon bonds at 3½ per cent. continue to come in. Of the $118,000,000 about $70,000,000 have already applied, and it is the general opinion that before July 1 not more than $20,000,000 will remain to be paid in cash. The Treasury at present is taking in rather more money than it is paying out, but the disbursements for interest, called bonds, etc., which will begin July 1, will

be very large, so that the money market bids fair to become very easy irrespective of foreign exchange. The market for the latter is supported by the demand for the remittance to Europe of half-yearly interest; on the other hand, the bankers here are beginning to draw at 60 days' sight in anticipation of cotton exports, bills so drawn requiring but one renewal before the cotton is actually shipped. It was supposed that the differences between the trunk-line railroads had been adjusted a week ago, but this appears not to have been the case, mainly because Mr. Vanderbilt is keeping the matter open for the purpose, according to the uncharitable in Wall Street, of buying stocks. The litigation to prevent the consolidation of the telegraph companies and the increase in share capital ended in the decision noticed above. General trade continues very good, and railroad receipts are extraordinarily large on the roads in the North and Southwest, where railroad building is in progress and supplies and materials have to be hauled; on other roads the business is fully as good as a year ago. The price of silver in London fell to 51*d.* per ounce, but closed at $51\frac{3}{16}d.$ At the close here the bullion value of the 412½-grain silver dollar was $0.8623.

The English Ministry received a severe check on the Land Bill on Thursday night last, in a vote on an amendment of a Liberal member, Mr. Heneage, proposing that, as the bill is based on the theory that in Ireland the tenants make all the improvements, such landlords as can show that they themselves or their predecessors have made improvements on their estates should be exempted from its operation. This was only defeated by 225 to 200, but the Government was evidently taken by surprise, and the House was not full, the total vote falling short of that on the second reading of the bill by one hundred. Nevertheless, the smallness of the majority seems to have given considerable comfort to the Tories, and was brought about by a union of the Whigs, or Conservative-Liberals, with the Tories. That it will have any real influence on the fortunes of the bill is very unlikely. All fears on this score seem to have been dissipated by the unqualified adhesion to it of the Ulster or Scotch-Irish farmers, who send most of the Irish Tories to the House of Commons, and who have on the matter of land-tenure now made common cause with the Land-Leaguers. They were at first disposed to stand by the landlords, and sent a force of men to gather in Captain Boycott's crops; but since the Land Bill was introduced they have come out in the most absolute manner in support of it, and will make short work of any Tory member who opposes it. It is this which gave so much force to Mr. Gladstone's warning to the Tories a few weeks ago, that if they defeated it they would have themselves to introduce and pass a still more radical measure. He still expects to send the bill to the Lords by the 20th of July, and they will hardly so late in the season spend much time in discussing it.

Two men have been arrested, and one has been committed for trial, for an attempt to blow up the Liverpool Town Hall, at the instigation, it is believed, of the American Fenians. This and O'Donovan Rossa's boast that he had something to do with the blowing up of the sloop-of-war *Doterel* in the Straits of Magellan have apparently alarmed the Cabinet, and a communication of some kind has been made to the American Government about Fenian plots in New York. What can be expected to come of any such communication it is hard to say. There is no way of preventing Fenians here from sending money to crackbrained emissaries abroad to enable them to wreck public buildings, and there is much reason for believing that the Fenians are not nearly as terrible as they would like to have people believe them. Nothing tickles the vanity of men like O'Donovan Rossa so much, and helps them so much in collecting money, as any kind of proof that they are frightening the British Government. They are quite capable of claiming the credit or discredit of every atrocity committed by any European criminal, if it only brings them notoriety and stirs up Sir William Harcourt or Mr. Gladstone. O'Donovan Rossa had certainly no more to do with the explosion on board the *Doterel* than with the Scio earthquake, and to appear to believe that he had is the greatest service that could be rendered him, next to lending him fifty dollars. Anyhow, it is wholly out of the power of the American Government to suppress the Fenian organization, or prevent its giving itself out as the author of any remarkable explosion that occurs anywhere. He would probably deny it in a court of justice, and how could it then be proved? There is one argument that may have some effect on him and his brother patriots in this country, and that is that their lying may have a most deplorable result for the hundreds of thousands of Irish laborers, both male and female, employed in England, and whom their employers are now threatening with dismissal in the belief that they are capable of conniving at the use of bombs. We must remember, too, that the device of proclaiming themselves enemies of modern civilization and all its products is not Irish, but French and Russian. The Fenians are simply paltry imitators when they proclaim themselves guilty of atrocious crimes.

The Italians are at last making an attempt to extend the suffrage. The new Ministry has introduced a bill which confers the suffrage on all who pay twenty francs of direct taxes and can read and write. At present the voters are persons who pay forty francs of direct taxes, and in some provinces who can read or write, or who pay a rent for a store or workshop, the amount of which varies according to the population of the locality in which it is situated. Consequently, the reform bill, though it will increase the constituency considerably, will not increase it enormously. An attempt to strike out the taxation qualification was defeated by a heavy majority; also an attempt to reduce the amount from twenty to ten francs; also an amendment in favor of universal suffrage and female suffrage. The last seems to find no favor among Italians at all, for only one member voted for it. The strongest argument against it with the Italian Radicals is the influence of the priests on the women. This is probably the most effective argument against it in every country in which Catholic women are numerous.

How severe the strain imposed by the Tunis affair, not only on the relations of the French and Italian governments but of individual Frenchmen and Italians, both in Tunis and France, is, has been revealed by very formidable riots in Marseilles, where there is a large Italian colony. The Italian Club in that city did not hoist its flag when a body of French troops was passing in parade, and the crowd hissed, and there was finally a row in which several were killed and many wounded. The indignation at Rome is very great, and the conciliatory and even deprecatory attitude of the Italian consul at Marseilles and of the ambassador in Paris seems to the Italian public to have an air of pusillanimity, and the Minister of Foreign Affairs, Mancini, has been compelled to promise in the Chamber to stir them up. The truth is that the Italians begin to find it hard to bear the patronizing attitude of France towards them ever since 1849, and the French have not yet thoroughly familiarized themselves with the idea that the Italy of to-day is not the Italy whose capital M. Rouher and his Emperor held so long in their custody. The riot will probably be settled, but it will leave behind increased bad blood, and the two Powers are so near each other, and touch at so many points, that it will probably be very difficult to keep the peace for some time. Besides, the Italians think they have two ships which can blow the whole French navy out of the water, and the possession of them—such is human nature—probably constitutes a standing temptation to war.

The strength of the war feeling in Italy is now undeniable, and it is largely due to the belief that France is seeking a quarrel. But the two great ironclads do not satisfy the saner portion of the population that Italy is ready to fight. The new Depretis Ministry tried to satisfy the bellicose by asking General Mezzacapo to take the Ministry of War, but he refused unless he could obtain an enormous vote of money to complete the equipment of the army, and this was denied him; so a much milder man, General Ferrero, has taken his place. Mezzacapo is to Italy very much what Trochu was to France before 1870. He has written a pamphlet, which has had a wide circulation, setting forth what Italy required to make her impregnable, which was about $100,000,000, to be spent on the army, but this in the present state of the finances was out of the question, and the army is not ready for war.

GENERAL GRANT'S "TALKS."

GENERAL GRANT'S "talks" with the reporters during the past week have naturally been very trying to those who have for the last eight years been laboring to keep up his reputation as a politician. His abuse of people since he told the story about General Hancock's connection with the Louisiana fraudulent bonds to Mr. Fowler, the Methodist minister, during the late Presidential canvass, has, of course, little weight. A charge brought by him against anybody in a "talk" hardly calls for an answer. His memory, in fact, seems to be failing him curiously on various matters on which one would expect him to be accurate. It is not simply when he is trying to damage some one whom he dislikes that he is wanting in accuracy, but when he is trying to help his friends. He has apparently been deeply interested in the contest at Albany ever since it began, and has lost no opportunity of putting in a word in order to support Mr. Conkling. By way of doing so he has given unqualified approval to the custom known as the "courtesy of the Senate," under which the Senators from the State for which the President makes a nomination are constituted a committee, whose report on the nomination is accepted as conclusive and governs the vote of the majority of the Senate on the question of confirmation. He has said that he always recognized this custom when he was President. This has, of course, had the effect of reminding people of what he really did when he was President, especially in the two notorious cases of Simmons of Massachusetts and McDonald of Missouri. One was nominated for the collectorship of customs at Boston, and the other for a collectorship of internal revenue at St. Louis. Simmons was opposed by one Senator from Massachusetts, the other remaining neutral; McDonald by both Senators from Missouri, and both by the more influential local Republicans of their respective States, but this did not prevent General Grant from pressing them to confirmation. Nor was there the excuse for disregarding the "courtesy of the Senate" in these cases which exists in Mr. Robertson's case—that the new nominees were men of high standing in the community. Both men were of low standing. Simmons was a pet and disciple of General Butler, and McDonald was a very ignorant adventurer, without any character at all, who soon after got into the penitentiary in spite of the efforts of General Babcock to shield him. In fact, the "courtesy of the Senate" ought to be a painful subject with General Grant, because his failure to respect it on these two occasions has done more to damage his reputation than any other incident of his Administration.

It would, however, be hardly worth while to comment on General Grant's testimony, or amend it in this matter, on account of any effect his "talks" are likely to have on the crisis at Albany. We doubt much, indeed, whether he could render the "Half-Breeds" a greater service than to go to Albany and continue them in that city. What is most valuable in the "talks" is the illustration they afford of the kind of thing the third term would have been if the Bosses had succeeded in imposing it on the country at the last election. Many Republican newspapers, and a very large number of Republican voters, try to persuade themselves and the country that the objections to a third term for General Grant were only those which would apply to a third term for any one, and that the opposition to a third term at Chicago, in which Judge Robertson was so prominent, was simply opposition to the establishment of an inconvenient and dangerous precedent, which might be established even in Washington's or Lincoln's case. We have always thought this a very narrow and unfortunate view of the matter, because, if adopted by the voters, it would have left absolutely without condemnation the peculiarities of General Grant's Administration—his use of the offices to reward his personal adherents, his indifference to the corruption of rich men, his contempt for the higher proprieties of his position, his defiance of public opinion in all that related to the character of his personal following, and his delegation of one of his most important functions to a small clique or "group" of Senatorial Bosses. That nearly everybody who remembered the services he had rendered in the war should shrink from his condemnation, was one of the effects of war on public opinion with which history has unhappily rendered us only too familiar. There is in our society no more striking reminiscence or survival of the savage or military ages than our readiness to recognize as a permanent title to the highest social and political honors simple success in a kind of work which hardly calls for any morality at all, and in which, though many great soldiers have been both good and great men, a man may reach the highest eminence while remaining cruel, perfidious, mendacious, corrupt, and ignorant. The only parallel for it to be found in modern society is the respect paid to sovereigns in monarchical countries without reference to the sovereign's personal character. In countries in which the monarchical and military tradition has never been broken the existence of these "twin relics of barbarism" is pardonable; the readiness with which something similar cropped up here after 1865, in the midst of a very industrial community, makes it very comprehensible. But neither of them is a thing to be fostered. Anybody who finds he is inclined to put up with everything from a successful soldier, and to teach his children that moral defects are of little consequence in a man who, at a critical moment, knew how to be strongest at the point of attack on a battle-field, to slay many enemies, and take many guns and prisoners, must not flatter himself that he is after all very superior, either mentally or politically, to the man who reveres a lying, dissolute, and drunken king, because he received the crown in the legitimate line of succession, or, in other words, is his father's son.

The attitude of Mr. Conkling towards the last and present Administrations, and the elucidation of its meaning afforded by his performances at Albany, combined with the string of comments on it all which General Grant furnishes, show us that the third term would have been accepted by both these gentlemen as a verdict of approval of nearly everything in General Grant's Administration by which the country was most pained and shocked. As we see, what they mean by "the courtesy of the Senate" is not a rule of procedure applicable to all nominations, and existing for the benefit of all Senators, or even all Republican Senators. In General Grant's mouth and in Mr. Conkling's it means the rule that General Grant's pet adherents and counsellors should have their own way, for Conkling supported the nominations both of Simmons and McDonald against the protests of one of the Massachusetts and both the Missouri Senators. Nor is it a rule of procedure applicable to all Presidents, for we see that neither of them is willing that General Garfield should choose his own cronies among the Senators, or make what nominations he pleases. It avails him nothing that the majority of the Senators approve of Judge Robertson's nomination, for instance, although the New York Senators do not. Under their system, which they would have carried out in the third term, it makes no difference what Senators approve of a nomination as long as the old cronies of General Grant do not. That Senator Conkling does not like a nomination is not only as powerful a consideration with General Grant now as it was six years ago, but he cannot see why it should not be as powerful a consideration with everybody as it is with him. The extraordinary approach to unanimity about Conkling's conduct which is now exhibited both by the press and by all other organs of party opinion, as we see, makes no impression on General Grant's mind whatever. His own opinion and Conkling's, when concurrent, are now to him, as they were between 1870 and 1876, worth more than all the opinions in the country put together. He is not in the least impressed by the magnitude of the opposition to Conkling, any more than he was during his term of office impressed by popular criticism of any of his favorites. It does not really set him thinking; it simply irritates him. If he were in office now, attacks on Conkling would only endear the latter to him. We doubt very much, too, whether he would let Brady go; whether he would not insist on his retaining his place until the press let him alone, or, in other words, until the public had grown weary of condemning him.

Moreover, the "talks" reveal, in spite of the failure at Chicago, a distinct increase of self-confidence, apart from confidence in Conkling, on General Grant's part, and it is not by any means useless speculation to ask what the remoter effects of a nomination at Chicago on this self-confidence would have been, in case of election, on the administration of the Government. It is not impossible that it might even have led to a breach with Conkling himself and the "running of the machine" without his advice, which, whatever its defects, would still have been the advice of a civilian and a lawyer. The

calm and satisfaction with which the General has accepted the silly tributes of his followers to the great insight into the nature and working of foreign institutions obtained by his hasty foreign travels, and finally their still more ridiculous praise of his eloquence, which we believe one of them has rated above that of either Demosthenes or Cicero, give one a by no means diverting glimpse of the possibilities of the third term in the way of arbitrary and illegal acts. To these arbitrary and illegal acts the country would have been disposed to submit in order to avoid the scandal of impeaching a man to whom, whatever his character or capacity, it undoubtedly owed much. The leading features of such an Administration, as the fancy conjures it up, may be somewhat amusing, but to have come as near it as we have done is a fact which it behooves us to ponder rather than laugh over.

THE COLLEGES AND THE PROFESSORS.

THIS is about the time of the year at which colleges attract most public attention and at which their affairs receive most serious discussion. This is due to a variety of causes. They are all sending forth a batch of graduates, whose opinion of themselves the newspapers, in the absence of more exciting matter, are busily engaged in moderating and chastening. Any friction, too, in the working machinery becomes unbearable to all concerned towards the close of the academic year; and, though last not least, at this season the graduates begin to talk of revisiting their Alma Mater and looking into her affairs. The result is apt to be one or more college controversies marked by considerable heat and acrimony. This year the concerns of three prominent colleges have been freely ventilated in the newspapers. There has been a very sharp discussion over the predominance of Congregational ministers in the governing body of Yale College, owing to somebody having discovered and proclaimed the fact that this predominance is not legally obligatory. There is pending at Dartmouth at this moment a trial of the president on a long string of charges, preferred by the professors, of conduct unbecoming a scholar and a gentleman in his intercourse with them. The worst trouble of all seems, however, to be at Cornell, the graduates of which have been raising a loud lament over the fact that the number of students is rapidly and greatly decreasing, that the best professors have left it, and that their places are taken by men of inferior standing. Shortly before this revelation was made the acting-president had been summarily requested by the trustees to resign not only his presidency but his professorship of history, and no explanation of the change has yet been made public, although it is said to have shocked and alarmed the Faculty and still further deepened the sense of insecurity which prevails amongst them.

Cornell, in fact, seems to furnish a typical example of the evil by which all American colleges are to a greater or less degree afflicted, and which more than anything else, except their poverty, interferes with their usefulness, and that is the comparatively small value placed on the professors by the governing body of the college, whatever it may be. Most founders of colleges in this country, of recent date, have been men who had not themselves received a university education, and had no clearer idea of its nature than that it was something which, if made cheap enough to be attainable by a poor young man, enabled him to better his condition. Founders, too, having generally made their money in material pursuits, instinctively recoiled from putting much of it, even for educational purposes, into anything which was not visible and tangible, and appreciable by standards with which they themselves were familiar. Being, too, desirous of making their foundation a memorial of themselves, they liked to see it in stone or brick, like all the other memorials which had impressed their own imagination. They have generally, also, had that strong objection which pervades the whole community, and particularly the farming class, and seems to grow stronger as the country grows in wealth, to paying large salaries to men whose labors do not show a pecuniary result. It is this which gives us poorly-paid clergymen and judges, and renders it so easy for the great corporations to deprive the Government of the services of experts in almost every field. To such a founder there are no "professors and professors"; at all events, there is to him no difference that he can see between one professor and another. Just as the late Horace Greeley used to object to high salaries for Supreme Court judges, because you could always get men to take their places at a much lower rate of pay than they are now receiving, the college founders cannot see why a professor's salary should be any higher than is necessary to get you a professor, and, having got a professor at their own figure, they despise him for taking so little. Having got him for less than they have paid their bookkeepers, they credit him with a bookkeeper's capacity—that is, with ability to perform faithfully a certain round of rather humble duties, which will fulfil the object for which the buildings were erected and keep the machinery in motion. In fact, the professor, in their eyes, is rather a man who "tends" college, as a hand "tends" a loom in a mill, than a person fit to govern, or direct, or manage an institution of any kind.

This view of the professorial calling, though very prominent in some American universities, to a certain extent colors the government of them all. It is the natural result of the dominance in all affairs of the commercial spirit. It is, in other words, "the business man's" view; and the business man being the greatest force in American society, the idea that he who has made $100,000 in a year, and can any day make $10,000, should yield his opinion on any question of administration to a man who acknowledges that $2,500 or $3,000 a year is as much as he can earn, strikes him as a little absurd. The college is to him a sort of industrial enterprise, turning out scholars just as a mill turns out yarns, and the professors are part of the "plant." He thinks he has to be looked after and kept up to his work like other "hands," by some outside system of inspection. The idea of letting professors have a college to themselves, to manage it as they please, without trustees or overseers of some kind, has a grotesque air to him, a little like the idea of trusting a lot of clerks to carry on his own business. He does not know exactly what they would do with the college if they got hold of it, but something very queer, he feels sure, because not only are they poor hands at making money, but they are dreamy, eccentric people, who are capable of any kind of folly outside their studies. He wishes very much, indeed, that a college could be carried on without professors, and has a vague notion that by some sort of improvement in organization this result may some day be attained.

This view has more to do than is supposed with that multiplication of small colleges over which the friends of the higher education utter so much lamentation, and which causes so much waste of money. The idea that a university is a building, that as soon as you get the building erected three-fourths of the work is done, and that it will not cost much to get a few professors to "run" it, accounts for the existence of nine out of ten of the little collegiate foundations into which so much hard-earned money is put by well-meaning and public-spirited men nearly every year all over the country. Not only is the money put into them largely wasted, as far as the immediate result is concerned, but they do much to make college graduates and collegiate education the laughing-stock of the newspapers and "the practical men," and to bring the professorial calling into contempt with the busy, bustling masses by whom the work of American life is mainly done. The poor pay of a professor would of itself suffice to make the ordinary American doubt his social value; but the doubt is changed into something like pity by the fact that he is not considered fit to manage his own business, which is the inference which plain people draw from the fact that he is excluded from the government of his college, or allowed very little share in it. The part the typical professor plays in the funny column of the country press, and the figure he cuts in popular stories, as a half-dazed person with spectacles, without any perception of the ludicrous, and with a very imperfect sense of his relations to the society in which he lives, is not wholly the product of the cheap humorists' fancy. The colleges themselves furnish the raw material for much of it.

The Johns Hopkins University at Baltimore, besides its other merits, has the very great one of having done much by the manner of its establishment to make clear to the popular mind the true nature of a university. It was started with ample funds, but it put up no buildings, or only one or two of the plainest and simplest kind. In fact, if we are not mistaken, it existed for some time in hired dwelling-houses. The funds were employed, and are now employed, almost exclusively in securing the services of men of greater or less eminence as professors, and in stimulating their mental activity in their various fields, and in providing students of marked promise with the means of prosecuting

their studies. The university has already made a considerable figure in the world, but has very little to show the business man who goes to Baltimore to see what has been done with the money. It has, however, rendered an inestimable service to the community in bringing out the fact that a university consists of a corps of competent and adequately paid teachers; that you might have a good university, though not a properly equipped one, if these teachers taught in a large barn. Without these no buildings, or laboratories, or apparatus, or "plant" makes a university. The next great step to be taken in the improvement of the higher education in this country is the committal of university management in a greater degree, if not wholly, to the teaching body. If the kind of professors now employed cannot manage a college from top to bottom, they must make way for another kind of professors who can, and these will be the only kind who will ever raise university education to the place it should occupy in the popular mind or exert a real and salutary influence on American life and manners.

FAREWELL DINNER TO MINISTER WHITE.

BERLIN, June 7, 1881.

THE farewell dinner given on June 1 to the American minister, Mr. Andrew D. White, deserves special notice in the columns of your paper, as well for the character of its recipient as for the spirit prevailing among the distinguished company partaking of the occasion. Mr. White was the representative of the United States in Germany not much longer than two years, but, in spite of the short duration of his official term, has won golden opinions among our people. The affability of his temper and the urbanity of his manners have made him a noble representative of the American people, but, more than that, his intimate relations with the most prominent men of letters and of public character, his uncommon knowledge of the German language, and his thorough familiarity with German history and politics, have enabled him to do more for the mutual understanding of the two nations, and for their mutual appreciation, than any of his predecessors in office, Mr. George Bancroft, perhaps, excepted.

However meritorious the services of politicians may be for the victorious party at home, as ministers abroad they are as good as useless if they do not speak the language and understand the character of the country to which they are accredited. A scholar, therefore, stands much higher abroad than a politician. In diplomatic circles here and all over the world little or nothing can be achieved by mere official applications and visits to the Foreign Department, and, more than in any other sphere of society, the greatest influence is exerted and the highest success secured by a timely dinner or by friendly social intercourse. On the whole, the United States Government has been very fortunate in its appointment of ministers to the Berlin court. It seems as if the noble spirit of John Quincy Adams, who under his father's administration was American minister in Berlin, had controlled the choice of his successors. In recommencing the diplomatic relations with Prussia President Jackson could not have chosen a better man as American minister than Henry Wheaton (1835–1846), the celebrated writer on international law. The only exception to the rule was the appointment of Mr. Hannegan, of Indiana, who in 1846 was rewarded by President Polk for his casting-vote for the annexation of Texas, and who was such a drunkard that the Berlin students of that time characterized dead-drunkenness by saying that a man was as drunk as the American minister. His successors, however, Messrs. D. D. Barnard (under Fillmore), P. D. Vroom (under Pierce), Joseph A. Wright (under Buchanan and later under Johnson), Norman B. Judd (under Lincoln), George Bancroft (under Johnson and Grant), Bancroft Davis (under Grant), and Bayard Taylor (under Hayes), were gentlemen highly appreciated for their character and of excellent standing in Berlin society. Mr. Wright was very popular here, being taken for a fair sample of an unsophisticated backwoodsman, while he was very shrewd and only affected a certain simple-mindedness. He tried to persuade Alexander von Humboldt to eat hominy and drink only cold water, instead of good wine, in his old days. Mr. George Bancroft, his immediate successor, was a great admirer of and favorite with court circles. For this reason he achieved much, and in 1868 concluded new treaties regulating the condition of nationality in the two nations, treaties susceptible of interpretation at the reader's pleasure, but which gained great temporary success by sacrificing accuracy of statement to secure a little advantage. For the greater part of his residence here Mr. Bancroft was, less for the frankness of his character than for his scholarship, his intimate relations with men of letters and his noble hospitality, much sought by Berlin circles, but towards the end of his sojourn the historian of his country became a little too much of a courtier, and was respected only as the good old uncle, as Bismarck used to call him. Bayard Taylor's sudden death was doubly lamented, as before his arrival here he was already very favorably known, and his appointment had been received with great applause.

However, to return to the White dinner, it was originated by Messrs. Lasker, Gneist, Kapp, and Bunsen. The invitations of these gentlemen met with such a hearty reception on the part of Mr. White's numerous friends that in two days the whole matter was arranged. Of the university and academy were present Messrs. E. Curtius, Mommsen, Sybel, Peters, Zeller, Wattenbach, Scherer, A. Weber, and Treitschke; of artists, Messrs. Knaus, Meyer von Bremen, Wilberg, Becker, and Siemering; of political men, besides the above-named committee of arrangements, Rickert, Behr-Schmoldaw, ex-Minister Delbrück, Lipke, H. H. Meier, Count Flemming, Schlutow, the Löwes, and Benda; of literary men, Auerbach, H. Kruse, and Spielhagen; of Ministers of State, Kameke (War), Puttkamer (Public Instruction), Lucius (Agriculture), Bernuth, Krüger, Liebe. Expressly excused were Field-marshal Count Moltke, the Duke of Ratibor, Count Stolberg, Ministers Maybach and Stephan, Chief Mayer, Forckenbeck, Werner Siemens, the engineer; several professors of our end of the neighboring universities, such as Georg Curtius and Georg Ebers, of Leipzig; Lazarus and Grimm, of Berlin. Altogether there were about one hundred to one hundred and twenty persons assembled in the large hall of the Kaiserhof.

Mr. White was seated between Professor Gneist and General von Kameke, and opposite to Ministers von Puttkamer and Lucius, and H. H. Meier. The Minister of War offered the first toast, to the German Emperor, while Minister von Puttkamer in a very fine speech proposed the health of the President of the United States, "our great and good friend." The third regular toast was proposed by Professor Gneist, to the guest of the evening. He struck the keynote, and gave the whole festival its tone, by his speech, comparing the present dinner to one of those great reunions which the old families of our country are accustomed to hold from time to time, and at which the old members after a long absence still recognize the family likeness preserved under all zones and climates in the new-born generations. Thus, to give the gist of Mr. Gneist's remarks in a few words, to-day the sons of the same Saxon ancestors who, on this and on the other side of the ocean, worked manfully and energetically to widen the empire of order and self-discipline, of self-government, progress, and liberty, meet again in their old home. Each of the two nations which form the greatest confederations in the world, follows its own pursuits and tries to solve its own problems—the one in a more ideal, the other in a more practical way; but if they march separately, they fight unitedly for the same ends. The higher the tasks of humanity grow the more we all feel the want of mutually supplying each other, and we owe it to our self-governing energy and patient endurance that our family likeness in the monarchy as well as in the republic is still the same. Mr. White returned his thanks in an elegant English speech, which likewise laid stress on the political and scientific relations of both cousins and their contributions to the common good. Mr. Kapp, after having read several letters of regret, and after having proved that the better the spiritual understanding of two nations is, the more durable their political relations will be, celebrated the spiritual brotherhood in arms of Germany and America; and Herr von Bunsen, in some very appropriate words, toasted the family of Mr. White.

It is surely for the interest of both countries that the successor of Mr. White be a gentleman of his personal worth and scientific attainments, and qualified by his high character and intercourse with others to make the most efficient propaganda for his own country. The Berlin climate does not agree with that of machine politicians. ? ?

ANTOINE DE RIVAROL.

PARIS, May 27, 1881.

RIVAROL has a singular place in the history of our literature: he was essentially a man of *esprit*, and his *bons-mots* are better known than his works. Who reads now his 'Discourse on the Universality of the French Language' and his translation of Dante? Rivarol has been well analyzed by Sainte-Beuve; we will take him only from the beginning of the French Revolution. He was a man of the *ancien régime*, a royalist; he ridiculed in his 'Petit Almanach de nos grands hommes' all the heroes of the French Revolution. He showed himself a staunch royalist in his 'Advice given to his Majesty Louis XVI.' (1791), and in his newspaper called the *Journal Politique-national*. This journal was so successful that Rivarol, though his habits were far from economical, had been able to lay aside a good sum of money when he emigrated to Brussels in 1792. This date shows that he was not among the early *émigrés*; he left Paris only when he could not remain in it, on the 10th of June, 1792. His enemies had become too powerful, and, as he himself wrote, "If the Revolution had taken place under Louis XIV. Colin would have guillotined Boileau, and Pradon would have guillotined Racine. When I emigrated, I fled before some Jacobins of my 'Almanac of Great Men.'" Seven days after he secretly left Paris some Jacobins came to his house to arrest him. "Where is the great man? We come to shorten him." Rivarol had been one of the accredited writers of the court, and many papers of his were found in the famous "iron safe." Barrère after-

wards cross-examined Louis XVI., during the trial of the King, on his relations with Rivarol. The witty writer who had said such sharp things of all the men in power was a marked victim, like so many of his more obscure literary friends.

Rivarol found in Brussels a large number of *émigrés;* he could imagine himself at times almost in Paris, as Brussels was the headquarters of the highest emigration. Chateaubriand has described it in his 'Mémoires d'Outre-Tombe':

"The most elegant ladies of Paris, the men of fashion who could only make war as aides-de-camp, awaited in the midst of pleasures the moment of victory. They had beautiful new uniforms. Considerable sums might have helped them to live for many years; they were eaten up in a few days. What is the use of economizing when one will soon be in Paris again? These brilliant knights looked disdainfully on us little country gentlemen, or officers in soldierly costume. . . . I met, at the Baron de Breteuil's, Rivarol, whom I saw only once in my life. He had not been named to me. I was struck by the language of a man who perorated alone, and who made himself heard like an oracle. The wit of Rivarol injured his talent. I was in the dress of an under-lieutenant of infantry. I was obliged to leave after dinner, and my haversack was behind the door. I was still browned by the sun of America and by the sea-air. I wore my hair dark and flat. 'Where does your brother, the Chevalier, come from?' asked the Baron de Breteuil of my brother. I answered: 'From Niagara.' Rivarol exclaimed: 'From the cataract!' I said nothing. He then began a question: 'And Monsieur is going . . .?' 'Where there is fighting.' And we got up from table."

This is, perhaps, a little dramatized, but it shows well the contrast between the serious and the frivolous emigration. Rivarol was frivolous in his life and in his habits. As a writer he was serious. He attached himself to the policy of M. de Breteuil, who was in favor of moderate views. There was another faction, which was influenced chiefly by M. de Calonne, and this faction published the famous Brunswick Manifesto, which offended France and helped the revolutionary party. Rivarol wrote a sort of counter manifesto, and tried to mitigate the bad effect of the declaration of the Duke of Brunswick. He wrote also, at Brussels, a 'Dialogue between M. de Limon and *un homme de goût.*' M. de Limon was a literary man, who had been once attached to the Duke of Orleans, who was then in the service of the Court of Berlin, and who had drawn up the Brunswick Manifesto. Rivarol exposed the folly and absurdity of the man. He was very severe, also, on Lafayette in a little pamphlet, 'De la vie politique, de la fuite et de la capture de M. de la Fayette' (Liége, 1792). His pen was indefatigable. We find him writing an 'Address of the Belgian People to His Majesty the Emperor' (published in London, at Owen's, 1793), a pamphlet in which he pleads for the Belgian constitution.

The influence of Rivarol at Brussels was, however, chiefly social; his *bons-mots* did more than his pamphlets. He saw constantly Mallet-Dupan, the author of the 'Considerations on the French Revolution,' Malouet, Montlosier. Madame de Coigny was his great friend, the spirituelle Madame de Coigny, of whom Marie-Antoinette said: "I am only the Queen of Versailles; she is the Queen of Paris." The famous and witty Prince de Ligne was very hospitable to Rivarol, and gave him a pavillion in his château of Bel-Œil. Rivarol became very intimate at Brussels with a banker of Amsterdam, who was very useful to all the emigration, David Cappadoce Pereira, who afterwards took refuge at Hamburg. The correspondence of Rivarol with Pereira has been partly published by M. de Lescure; it is greatly to the credit of the banker, who was a man of letters himself and a great admirer of Rivarol. The latter was obliged to leave Brussels for England. The expectations of the emigration had been wholly frustrated. "The business has been ill-conducted by the powers," wrote Rivarol to Pereira on the 16th of January, 1794. "This one would have only frontiers, this other only colonies, and this a bit of Poland; so that, after having sinned in the object, they have erred in the means. Instead of dividing the difficulty, they have divided France. Austria will be the dupe of the Punico-Britannic faith and of the tricks of Prussia. I don't know which she has more to fear, her allies or her enemies." Rivarol was well received in England by Burke and by Pitt; we know from the Memoirs of Montlosier that he dined with the Lord-Mayor, in company with Malouet and Cazalès. He did not like the climate of England. "Les Anglaises sont belles," said he; "mais elles ont deux bras gauches." Rivarol was somewhat offended by the intensity of hatred against France which he found; though he was an *émigré*, he was a Frenchman. He writes to Pereira: "I wrote the other day to a minister of this country that it was not well to have a neighbor at once powerful and ruined, for if he turns his armies to conquest and his ships to privateering he can show us at the same time Rome and Algiers."

Rivarol left England for Hamburg for the sole reason that he had no more money, and the booksellers of Hamburg made him overtures for his services. "You tell me," he wrote the Abbé de Villefort, "that your paint-brush enables you to live; it is enough for an *émigré*. Make crusts [the French call a bad picture a crust, *une croûte*] in order to have bread. My pen renders me the same service. *Venter largitor ingenii.*" His sister, the Baronne d'Angel, was in Hamburg, having accompanied General Dumouriez thither. He made a contract with the bookseller Fauche-Borel, and earned his salary as a man of letters, as many other *émigrés* did theirs in the most humble capacities. Hamburg was then, to use the words of Rivarol, "Consolatrix afflictorum et refugium peccatorum." A French countess and a French marquis kept together a wine-shop; great ladies were milliners; the more fortunate bought farms and turned farmers. M. and Madame de Milen kept a sort of establishment for balls, suppers, concerts. The Chevalier de Montmorency had a shop. The age of conferences had not yet dawned, otherwise Rivarol might have earned his bread by giving lectures. He contented himself with writing in the *Spectateur du Nord*, the journal of Fauche-Borel, who was one of the most industrious booksellers of his time. He had two printing establishments, one in Hamburg and one in Brunswick. The founder of the *Spectateur du Nord* had been a French *émigré*, who had crossed on foot in 1795 the whole province of Westphalia with a little car which contained a lady and two small children, his relations; his name was Amable de Baudus. He was born in Cahors, and had been a judge; he had refused to act against the ecclesiastics who were persecuted in France. Baudus had established himself first at Altona, then at Hamburg. One of his fellow-laborers was Charles de Villers, who was a great friend of Madame de Staël. Rivarol wrote some time for the *Spectateur du Nord*, but he was soon absorbed by a work of greater importance, a 'New Dictionary of the French Language.' The Dictionary was never finished, though the 'Preliminary Discourse,' which was published separately, had a very great success. Madame de Genlis was living at Hamburg with her family and her *coterie* while Rivarol was there. She married a niece of hers, Henriette de Sercey, to a rich merchant, M. Mathiessen; and her ward, Pamela, to Lord Edward Fitz-Gerald. Rivarol and Madame de Genlis were old enemies, and did not see each other. The ex-governess of the Duke of Orleans disliked the royalist pamphleteer.

Rivarol's best friend continued to be Cappadoce Pereira, who had taken refuge in Hamburg after the invasion of Holland. In the year 1799 Delille came to Hamburg. He also was an *émigré*, the harmless translator of Virgil. Rivarol had, in old times, much abused poor Delille. After the "Poem on Gardens" he had made the verse, which is still remembered:

"Delille passera; les navets resteront."

Rivarol received the "Abbé Virgile" with much pleasure, and the two enemies at once became friends. Delille, nevertheless, used to say of Rivarol afterwards: "C'est le plus aimable vaurien que j'aie jamais rencontré." Sénac de Meilhan also came to Hamburg, the author of so many false memoirs, the friend of Choiseul, the enemy of Neckar, one of the pests of French literature. Sénac de Meilhan ended his days afterwards in Vienna, in 1803. How many other names could we not cite in the Hamburg emigration?—Talleyrand, who lived chiefly with the Princess of Vaudemont, the last representative of a branch of the House of Lorraine. Among such people Rivarol did not throw away the pearls of his conversation. His wit was extraordinary. Speaking of the moderates of the Revolution he said: "Poor fellows! after having been incendiaries they offer themselves as firemen." This did not prevent him from saying of the *émigrés:* "They are always one idea, one year, and one army behind." Speaking of Talleyrand, who was lame, he said: "We could take him for the Justice of Horace, except that, for a long time, she has been running after him."

When the Terror came to an end, when the Directory was replaced by the Consulate, the French left Hamburg one by one, and soon it became the fashion to return to France, as it had been the fashion to emigrate. Rivarol found himself too isolated and went to Berlin. We will presently follow him thither.

Correspondence.

RECEPTION OF THE NEW VERSION.

To the Editor of The Nation:

Sir: In the editorial on "The New and Old Versions" (No. 832) I note this sentence: "As far as our observation has gone, the new translation has been either sternly rejected or received with apology and resignation by the orthodox denominations." Allow me to present divergent testimony concerning one such body, the (Trinitarian) Congregationalist, the successor, if not the heir, of the established church of New England. Andover Theological Seminary and Phillips Academy have adopted the revision for chapel use. Yale college has done the same. The newspapers of the denomination welcome it. Many clergymen in Boston and vicinity introduced it into their Sabbath services and prayer-meetings as soon as it appeared, and it can be seen in almost every pew. Not a few pastors have discussed the whole subject without reserve before their people, explaining clearly the age of the

manuscripts, their variations, and the methods of ascertaining the true text. In confidential conversation with many I have found none deprecating the changes on doctrinal grounds, constant use of the Greek having led them to look for what has been done. In Sabbath-schools the revision is used with the same freedom, and persons now preparing notes on the International Lessons for next year will certainly use it, either alone or with the older version. This will bring it before millions of scholars. The *Sunday-School Times*, undenominational but evangelical, has carried to forty thousand teachers its able and favorable articles on this subject. With seminary, college, academy, press, pulpit, and Sabbath-school thus committed to its free use, plainly nothing but its own faults could keep the revision from speedy adoption in this "orthodox denomination."

Another sentence in the article speaks of the original manuscripts as "none dating from much less than four centuries after Christ." I should count this a slip of the pen were not the interval compared to that between us and the Wars of the Roses, four hundred and thirty years ago. The Sinaitic and Vatican MSS. are placed by scholars about a hundred years earlier than this would indicate.—Yours, etc., CHARLES M. SOUTHGATE.

DEDHAM, MASS., June 15, 1881.

[We are willing to substitute three hundred and thirty years for "not much less than four centuries," and for "a period equal to that which separates us from the Wars of the Roses" a period equal to that which separates us from the abolition of the Papal supremacy in England by Henry VIII. We supposed that it would easily be seen that we had in mind, in using the Wars of the Roses as an illustration, not so much the number of years covered by the period as its separating power through social, political, and intellectual changes. There can be little doubt that there was much work of separation done in the first three centuries after Christ, and this of a kind not favorable to the purity of any kind of tradition. From the first to the tenth century the critical faculty was steadily declining, and credulity steadily on the increase in the Christian world.—ED. NATION.]

THE ELECTION OF A PRESIDENT BY BALLOT AND LOT.

TO THE EDITOR OF THE NATION:

SIR: In your issue of the 26th ult. my attention was attracted by an article giving the views of Senator Hillhouse, of Connecticut, in 1808, on the subject of "choosing the President by lot from the Senate." In lieu of the plan proposed by him, I would suggest that the Constitution of the United States be amended, and the House of Representatives be substituted for the Electoral College; and that on the meeting of Congress in December, 1884, and every four years thereafter, the House of Representatives, immediately after organization, proceed to the election of three members of the Senate, and the names of the three having the highest number of votes (not less than a majority) shall be placed in a box by the tellers, to be drawn by the Speaker. The *first drawn* to be President, the *second* Vice-President, and the *third* President *pro tem.* of the Senate, to succeed each other in the same order in the event of a vacancy by death or otherwise.

This would afford an opportunity of having a choice made by electors fresh from the people. It would cause the States to send their best men to the Senate, and it would prevent intrigue and turmoil—hitherto the inseparable concomitants of a Presidential election. The President and all officials being ineligible, the patronage of the Government would not be used to perpetuate power. Had such a law been in operation in 1860 thousands of millions would have been saved to the country; the virulence of sectional prejudices would have been materially assuaged, and the late civil war—with all the effusion of blood which it occasioned and the enormous national debt which it entailed—would never have been.

Of the propriety of this plan of election I have been convinced for the last forty years. Time and experience have only served to strengthen my conviction. I have seen all the Presidents of the United States except the first, have held confidential relations with many of them, and have studied this question from the impartial standpoint of a private citizen whose personal interests lay beyond the pale of politics, and whose ambition for the public good included him as one only of a multitude. An intimate acquaintance with the leading men of all parties in the Union, during a period covering more than half a century of our national life, inspires me with boldness to express my views on a subject of vital importance to the future welfare of the country. It is worthy of consideration. W. W. C.

WASHINGTON, June 13, 1881.

[The leading objection to this is that the Senators from one State are often infected with some political heresy which the rest of the country repudiates and dreads, and which might nevertheless put one of them in the Presidency. It might, at the election of 1876, have given us a Southern bulldozing Greenbacker; or a California anti-Chinese silver-man; or a Wisconsin Granger and Inflationist; or a New York boss and office-jobber. People will never consent to run risks of this sort, though they might some day listen to a proposal to elect three Senators, say, themselves, and from these three choose the President by lot. It would undoubtedly be a great gain if some element could be introduced into the election which was beyond the reach of "manipulation." —ED. NATION.]

BIENNIAL SESSIONS AND SENATORIAL ELECTIONS.

TO THE EDITOR OF THE NATION:

SIR: The people of New Hampshire can avoid any future difficulty in the election of United States Senators by appointing for the assembling of their legislature, instead of the first Wednesday of June, any day between the time of the State election in November and the middle of February. Then the legislature will always be in session in season to elect a senator before March 4th, the day on which the term expires. Their State elections are now fixed, as under a biennial system they should be, for the even years (1880, 1882, etc.), and as the senatorial terms expire in the odd years (1883, 1885, etc.), if their legislature assembles about the first of January, as it does in most of the States, it will always be ready to fill a vacancy occurring in the next March, and the people will thereby always secure a senator "fresh" from themselves, since he will take his seat in the Senate only four months after the election of the legislature which sends him there.

Hence it appears that their confusion, lately exhibited, in respect to the election of senators, arises wholly out of the circumstance that they convene their legislature at the wrong time. I venture to call your attention to this in view of your remark that "New Hampshire is furnishing an illustration of the inconvenience of biennial legislative sessions, a tendency toward which is observable in many States." There is such a tendency in Massachusetts, a great many honest people here being satisfied that annual elections and legislative sessions are unnecessary, undesirable, and for many reasons objectionable. But they do not intend to cheat themselves out of any part of their senatorial representation in adopting the biennial system, and there is no reason why the people of New Hampshire should do so any longer; unless, which is possible, they feel a pardonable pride in demonstrating that there can be no monopoly in the "Senatorial muddle" business, and that the smallest State can have one of its own. A. E. PILLSBURY.

BOSTON, June 18, 1881

THE DECLINE OF CULTURE.

TO THE EDITOR OF THE NATION:

SIR: Your St. Louis correspondent, in your issue of June 2, on the "Decline of Culture," seems to be very much astray.

He infers the absence of a high grade of reading from the scant sales of the ancient British reviews in a local bookstore, quite forgetting that those one-time great quarterlies have been largely replaced to-day by their more sprightly, though not less learned, juniors, the *Contemporary* and *Fortnightly Reviews* and the *Nineteenth Century*, which are reprinted in this country at so low cost as to be in a hundred hands now to one that held the older reviews ten or twenty years ago. Also, he overlooks the fact that most readers scattered over the West get their supplies of learned literature, whether periodicals or permanent technical works, by mail direct from the publishers and not from local booksellers.

I, for one, after fifteen years' residence in the West, am very far from believing in a decline in its pursuit of culture, and I have had much opportunity for knowing that, in spite of so large a portion of the interior being still in the bread-and-butter stage, the West will compare very favorably in this respect with the denser and longer-established East. F.

NEW MEXICO, June 10, 1881.

TO THE EDITOR OF THE NATION:

SIR: According to the correspondent in your issue of the 2d inst. (No. 831) the theory of the decline of culture is made to rest upon rather an un-Baconian basis, as it strikes me. If the reading of foreign periodicals were the chief test of culture doubtless the writer's induction, discouraging as it is, would have to be admitted. It is well known, however, among booksellers (of whom I am one) that the increase in demand for American periodicals has of late years been far greater, proportionally, than the decrease in demand for English reviews of similar grade. This is the natural result of our growing solidarity and of the increasing merit of current writing. Within the past decade the quality of contributions to the illustrated magazines

has improved in nearly equal ratio to that of the wood-engraving. The combined circulation of *Scribner's* and *Harper's* now probably exceeds a quarter of a million in this country, and in addition they meet with ready sale in England. The *Princeton*, *North American*, and *International Reviews*, the *Magazine of American History*, and the *Popular Science Monthly*—the last three being enterprises of recent date—seem to find ample support, and presumably are adding steadily to their subscription, as it is to be hoped your own invaluable journal is also doing. The *Library Magazine* of the American Book Exchange, containing a reprint of much of the best English thought of the day, has sold extensively for two years past. Hand-books upon finance, protection, free trade, and political economy were never so numerous as now, nor, so far as I can judge, so much read. If the reverse is true in St. Louis and Missouri the apathy complained of may be rather local than general.

At any rate, in spite of the encroachments of an overgrown press and numerous other drawbacks and obstacles, I do not see that there is occasion to despond over the status of our culture. F. E.

INDIANAPOLIS, June 13, 1881.

Notes.

SIX years ago (*Nation*, No. 545) we had occasion to say of Mr. Henry Van Brunt's translation of the first volume of Viollet-le-Duc's 'Entretiens sur l'Architecture' (Boston: Osgood), that it was "one of the most important publications, not only in America, but in English, in the department of fine arts." The second ten *Entretiens* having now been translated by Mr. Benjamin Bucknall, an English architect, the same publisher has brought them out in a volume called 'Lectures on Architecture' on the title-page, but 'Discourses on Architecture' on the cover, in conformity with Mr. Van Brunt's. The whole work, therefore, with its abundant illustrations, is now accessible to the English-reading public, whom we congratulate anew upon the fact.——The fourth, revised edition of 'Osgood's White Mountains' leaves nothing to be desired as a travellers' hand-book. The existence of several mountaineering clubs ready to criticise it and to improve it by furnishing the editor with the result of the most recent exploration places it beyond the reach of rivalry. The Appalachian club in particular has been serviceable in the revision.——Houghton, Mifflin & Co. have begun with the poet Longfellow a series of "Leaflets from Standard Authors"—sheets for the most part printed only on one side, and generally illustrated, and adapted to be passed from hand to hand in the school-room as the basis of exercises in reading, grammar, etc. Such innovations will be welcomed by all who feel the importance of the early cultivation of literary taste. ——The subject, rather than the quality of the criticism (though the writer should be thought competent), of a series of papers in the *American Architect*, by Mr. T. H. Bartlett, on "Civic Monuments in New England," deserves general attention. The comparative outline sketches are very instructive. The number for June 11 contains the first of these articles. ——The final issue of Moses King's *Harvard Register* is honest measure—four numbers in one—and is sure of preservation for its varied contents. Among the numerous portraits those of Prof. Francis Bowen and of the present Secretary of War are exceptionally well executed. There are several valuable because comprehensive articles, like that on college periodicals past and present, the historical and descriptive sketches of Harvard University, the brief accounts of living recipients of honorary degrees, the lists of the first scholars from 1777 to 1881, of the class secretaries and poets, etc. It is remarkable that only two of the class poets from 1835 to 1881—viz., Mr. Lowell and the late E. J. Cutler—merited and bore the name after graduation. Mr. Emerson was poet of the class of 1821. One department of the *Register* will be missed by its subscribers: the record of births, deaths, and marriages. Would it be beneath the dignity of the official Bulletin to continue it?——The fifth and sixth memoirs of the Peabody Academy of Science, Salem, are "Contributions to the Anatomy of the Holothurians," by J. S. Kingsley, and "On the Development of the Pluteus of Arbacia," by J. Walter Fewkes.——Bulletin No. 4 of the American Geographical Society reports the "Arctic Meeting" at Chickering Hall, October 28, 1880, for the reception of Lieutenant Schwatka, a chart of whose journeyings accompanies the text.——We can only allude this week to the appearance, complete, of vol. ii. of the 'American Catalogue,' containing the subject-entries of books in print and for sale July 1, 1876.——"One pagan less and one Christian more," says the *Français* of the late É. Littré, because the rite of baptism was administered to him *in extremis*. The same paper tells how his wife, when he had fainted in his last illness, took a little *médaille bénite* from her neck and put it around his; and how he returned it as soon as he regained his consciousness. This throws suspicion on the saving quality of the baptism.——Braumüller, Vienna, has begun the publication of a Goethe-Portrait Collection (*Goethebildniss-Sammlung*), edited by Dr. Hermann Rollett. The first *Lieferung* contains two etchings and eighteen woodcuts, and there are four more promised.——Mr. F. Gutekunst, Philadelphia, sends us a phototype portrait of the late Thomas A. Scott, noticeable on account of its size for this class of work, but also an interesting memento of a typical American, who played a great part in the development of the country and in the conduct of the war. The lines of care, age, and native decision of character, however, have been too much obliterated in the negative.

—A humorous interest is lent the July *Atlantic* by a paper on "The Gentlemen's Contribution to the Ladies' Deposit," by "Gail Hamilton," which is amusing but defies characterization. As a defence, not of the Howe swindle, which it appears "Gail Hamilton" has given over, but of the reasonableness of her own trust in it, she explains: "In regard to general probability I candidly avow that no originality and no magnitude of charity is so incredible as that the Omnipotent Creator of the world should let things go on as they are." The little argument there is, however, is naturally not obtruded, the mass of the paper being invective directed against the Boston *Advertiser*, which exposed the swindle. Nothing is said of her intention to sue the *Advertiser* for recovery of her deposit lost through the exposure, and we infer that it has been abandoned. Following her performance is an article by H. A. Clapp entitled "Sympathetic Banking," which gives a history of the Howe swindle from the unfeeling and masculine point of view. It seems a particularly cruel sequence when we read at the end of Miss Dodge's acridity the little bit of sweetness towards the *Atlantic* for giving her "fair play." "Trial by Jury in Civil Suits" Mr. John C. Dodge strongly objects to, and his paper, whatever one may think of its conclusions, is an interesting historical epitome. Mr. John Fiske explains "What is Mythology?" very readably, and does not lose sight of the limit beyond which the results of scientific research become speculation, though his speculation is confident. From the "Œdipus" performance at Harvard, to which he devotes a disappointingly brief paper, Professor Norton draws the practical conclusion that the proceeds of the entertainments should be set aside as the nucleus of a fund for an American School of Classical Learning at Athens. "H. H." has a bit of Norse travel, and Miss Jewett a good story. Miss Phelps's "Friends: a Duet" is over, to our relief, we frankly own, and may take its place among the more significant of phenomena for sociological investigation. Mr. Whittier's poem on the late James T. Fields is pleasantly melodious and kindly, and at the other end of the range of poetic intention are some verses entitled "Wounds," by Edgar Fawcett. The instalment of Mr. James's "The Portrait of a Lady" is the eminent thing in the number, and gives one a renewed sense of his fulness.

—Mr. William H. Rideing, who does this sort of thing better than most of its practitioners, opens *Lippincott's Magazine* for July with a very readable illustrated article called "At Knebworth with the Lyttons." In a second paper on monkeys Dr. Felix L. Oswald continues his series of "Zoölogical Curiosities." The travelling instincts of the public, active just now, are seasonably stimulated by three good articles on home and foreign travel: "Palmetto Leaves," a description of Charleston and its harbor, and life there before and since the war, by Robert Wilson; "A Trip to the Goodwood Races," which included a coach-ride from London to Brighton with an "Honorable" amateur coachman, by J. A. Dickson; and "Ranch-Cure," an invalid's successful experience in search of health in Colorado. The serial "Craque O'Doom" draws to an end without becoming more probable or agreeable. The three short stories are good, especially "Harcourt's V'line Mango," by S. A. Shields. This is a character-description by a "Bureau teacher" of a freed slave girl of the Topsy order at the close of the war, and though it does not clearly appear that the story is literally true, the dialect and some of the incidents are too real to have been invented, and have an intrinsic verisimilitude. One phrase of V'line Mango's is worth quoting: "Hannibal Jim Scipio he done made de Bruro come kase Marse Kurnel he wore out dat nigga, he did—jes' wore him out wid a cane."

—Mr. Aldrich's "Day in Africa" is the lightest contribution to the July *Harper*. It is a humorous account of a flying visit to Tangier from Gibraltar, and there is more of it to come. Mrs. Champney's description of Portugal continues fresh and interesting, Oporto this month furnishing the main theme, with an excursion into the mountainous region to the north of the Douro. An ascent of Mt. Washington in spring, and a glimpse of life at the Signal Service Station on the summit, lend a certain readableness to the second instalment of Mr. Drake's "White Mountains." The Canadian White House, its interior adornment, its adjacent pleasure-grounds, its etiquette, and its social occasions, are summed up with the aid of illustrations by Annie Howells Fréchette, under the title of "Life at Rideau Hall." Mr. Asa H. Waters does well to recall the inventive genius—wonderful for its thoroughness as well as for its versatility—of the Massachusetts inventor, Thomas Blanchard, whose name is now known to few, though his epoch-making ideas are in universal application. His eccentric lathe for turning irregular objects, from a gun-stock to a portrait-bust, led, as Mr. Waters truly says, to "an entirely new system of manufacture, called the 'uniformity system,'" or

the production of "interchangeable parts" on a grand scale, in competition with hand-work in detail. This lathe was patented in 1819. "A Bicycle Era" traces the history of the present contrivance, and figures a new machine in which the small wheel is placed in front, the rider sits a little forward of the large wheel, and the pedals are adjustable to his length of limb. The short are thus accommodated as they have not been heretofore, while the danger of "headers" is greatly reduced. In the article on "Hawthorne among his Friends" some attempt is made to fathom the local prejudice against him in Salem, his native place. This involves a consideration of his contentment, to say the least, with the company of his brother Democrats of the baser sort while Surveyor of the port. It appears to the writer, Mr. Holden, that Hawthorne's apology is found in the prologue to the 'Scarlet Letter,' which dwells upon the necessity of a change from his depressing association with the Brook-Farmers, the Transcendentalists, the scholars, and the poets. A straightforward article on "Railroads in Mexico" designates the principal ones now projected and in course of construction, and offers good reasons for distrusting them as profitable investments, and also for scrutinizing land-titles, "whether derived from Government or private individuals."

—The *Catholic World* for July is particularly strong in its specialty, the conduct of theological controversy by exhibiting the flaws of Protestant logic. What we always fail to understand is, why, since it is so well established that of the many varieties of logic the Protestant logic is the most fallacious *ex vi termini*, the writers for the *Catholic World* should exhibit such surprise every time a peculiarly outrageous case of it calls for exposure. The only explanation possible seems to be, as we have heretofore said, the mixed Catholic and Milesian character of the magazine. The fact that some of the contributors may be descended from Teutonic Protestants is trivial when compared with the prevailing flavor illustrated, for example, by the leading paper of the present number, by the Rev. George M. Searle, who is always very strong on the subject of miracles, and this time selects Dr. Hammond as his victim. We need not remind the reader of the *Catholic World* how Dr. Hammond fares in general; it will be anticipated that grave doubts are suggested as to his being a really scientific man, and that his attempt to explain away the supernatural origin of modern miracles is discovered to proceed from a desire "to get rid of Almighty God," so as "to banish, as far as possible, uneasiness about those moral laws," etc., etc. As Father Searle says: "This is plain to all, even to infidels themselves in their more lucid intervals." But the exposure of Dr. Hammond's well-known experiment, in which he cured a Catholic with Croton water by telling her that it was from Lourdes, after failing with the real Lourdes when he called it Croton, is worth giving: "In his little attempt at an argument," says his critic, "he (Dr. Hammond) innocently assumes that Almighty God cannot work a miracle without genuine Lourdes, or, at least, would not, for fear of Dr. Hammond. . . . There is really no evidence that the case was not a true miracle." We had our suspicions at the time that Dr. Hammond was wasting his energies in importing Lourdes water for the sake of settling the question of modern miracles, but we confess we forgot the inherent logical defect of his scheme. Similarly from the paper on the New Protestant Version, by Bishop Becker, we perceive the logical absurdity of the procedure, which is itself "an admission that 'the Book' was frightfully corrupt, and that Protestants have been fighting for a version confessedly wrong; else why correct it?" Why indeed, except in sackcloth and ashes? What the Protestants should have done was clearly to get together and pronounce the old version all right, as the Council of Trent authoritatively decided the Vulgate translation to be. "Roma locuta est: causa finita est," observes the bishop, whereas the Protestants can now "hardly fail to see that they have built their habitations on the shifting sands of ocean's shores," and would doubtless be in a bad fix if they should chance to discover Protestant evidence that all the doctrinal parts of the New Testament, say, were forgeries. The literary article of the number, on Calderon, shows what "infinite intellectual harm" Protestantism has done us in "narrowing our literary sympathies." The most important of the reviews, which are always readable, praises the Catholic S. H. Burke's 'Historical Portraits of the Tudor Dynasty' for telling the truth about the "bad Catholics" who established the Church of England "with an impartiality almost miraculous for its stern directness."

—The Boston *Medical and Surgical Journal* for June 8 is filled with a partial report of the centennial anniversary of the Massachusetts Medical Society (1781–1881), which can be read by the profession everywhere with pleasure. Its special historical value lies in what concerns the practice of inoculation and vaccination in this country. Its personal interest centres in the biographical sketch of the society's first President, Dr. Edward A. Holyoke, who surpassed his hundredth year, and of whom a silhouette is given, with numerous fac-similes of his handwriting. A curious letter, written after the completion of his century, contains the old gentleman's explanation of his longevity so far as he could furnish any. Rehearsing his diet, he observes: "But for the last forty or fifty years my most usual drink has been a Mixture a little singular indeed, but as for me it is still palateable and agreeable, I still prefer it. The Mixture is this, viz.: Good West India Rum 2 Spoonfuls, Good Cider whether new or old 3 Spoonfuls, of Water 9 or 10 Spoonfuls—of this Mixture (which I suppose to be about the strength of common Cider) I drink about ½ a Pint with my Dinner and about the same Quantity with my Pipe after Dinner and my Pipe in the Evening, never exceeding a Pint the whole Day; and I desire nothing else except one glass of Wine immediately after Dinner the whole day. I generally take one Pipe after Dinner and another in the Evening, and hold a small piece of pigtail Tobacco in my mouth from Breakfast till near Dinner, and again in the Afternoon till tea: this has been my practice for 80 years—I use no snuff." The Massachusetts Medical Society is the oldest continuous organization of the kind in the country. The oldest medical school in New England is that connected with Harvard University. The third foundation was that of Brown University in 1811, extinct for more than half a century. Dr. Charles W. Parsons, Professor of Physiology in Brown, has lately composed a history of this lost department, with much painstaking, and, having read it before the Rhode Island Historical Society, now permits it to appear as No. 12 of the Rhode Island Historical Tracts (Providence: S. S. Rider). The snuffing-out of the school by a parietary regulation of President Wayland's in 1827 is one of the most singular incidents in the annals of American education.

—The principle that if a thing is worth doing at all it is worth doing well, has been faithfully observed in a charming little volume just published in Boston by A. Williams & Co., entitled 'A Bicycle Tour in England and Wales.' The author is Mr. Alfred D. Chandler, a lawyer of that city, who, on importing his first bicycle, contended, against the ruling of the custom-house officials, that it was a carriage, and not simply a manufacture of steel, and on appeal to Secretary Sherman was sustained, thus saving ten per cent. on the duty, not only for himself but for all "wheelmen." The present compilation consists of brief notes originally communicated to the *Bicycling World*, and very properly left unexpanded. They outline, without rhapsodizing over scenery or antiquities or historical associations, the ease and drawbacks of a month's run from London, of which Margate was the easternmost point, Portsmouth the southernmost, York the most northern, and Holyhead the most western. This diary, if it can be so-called, is supplemented by borrowed matter—"Practical Bicycling Advice," "Hints on Continental Touring," various statistical tables of the fastest time, of bicycle depots in this country, etc.—and a chapter arguing in favor of the healthfulness of bicycle riding. The admirable typography is set off with a very unhackneyed selection of photographic views; and a route-map, and road-maps of South-eastern England and Eastern Massachusetts, complete the utility and attractiveness of the volume. When we reflect that two months' leisure will enable any one to cross the ocean and repeat Mr. Chandler's experiment, or vary it indefinitely, it appears certain that some of his readers will receive an uncontrollable impulse to imitate him. He allows four dollars a day for average expenses; tells how the bicycle can be carried in cities in a hansom, and at what charges on the cars; advises south-to-north and west-to-east routes in order to take advantage of the prevailing southwest winds; warns against illusions as to the uniform perfection of English roads; and lays down an axiom for bicyclists which holds equally good for pedestrians—viz., the object of journeying is not to cover the greatest possible distance but to enjoy one's self. He found very few towns of which he could praise the neatness, Stratford-upon-Avon being one; and it was not his "fortune to see in all England a single bicycle rider noticeable for grace and ease in the saddle."

—"C. P." writes us from Cleveland:

"Your reviewer quotes Lowell's 'Fable for Critics' falsely in his article on William Law, etc., in No. 832. The original fable reads:

> "'Who was born, as her mother, a Calvinist, said,
> With a Baxter's effectual caul on her head.'

Am I not right, or is there a variorum edition of the 'Fable'?"

We quoted the latest reading. The change appears to have been made since 1857. Compare the "Blue and Gold" edition of that year with the subsequent "Diamond" and "Household" editions.

—Boston has never been behind other American cities in the receipt of private benefactions. Her last stroke of good fortune is of a character to call for hearty congratulation. Mr. Henry Lee Higginson, long ago a student of music, and always a stanch Bostonian, founds at his own charge the Boston Symphony Orchestra, and provides amply for its permanent support. Knowing that a free gift is little esteemed, he makes the wise condition that those who are to enjoy the proposed concerts shall pay for the privilege, but that they shall pay for the very best music merely the cost of the cheapest public entertainment. The ultimate proportions of the scheme will be limited only by the degree to which it is appreciated. It begins next autumn and winter with a series of twenty weekly concerts in the Boston Music Hall, with secured seats at fifty or twenty-five cents, according to location. The orchestra will consist of sixty performers, and will be led by Mr. Georg Henschel. During the season six concerts will be given in the Sanders Theatre at Cam-

bridge, at two dollars for the course. Each of the Boston concerts will be preceded by a public day rehearsal. It is impossible that the sale of seats should cover one-half the expense of even this trial season. Private munificence has seldom taken a more graceful form.

—The Census Office has recently given out a statement of the product of the six principal cereals—wheat, corn, rye, oats, barley, and buckwheat—for the census year—namely, that ending June 1, 1880, and covering, therefore, the crop of 1879. The following are the figures regarding the whole country, to which are appended the corresponding figures for 1870:

	1870. Bushels.	1880. Bushels.	1880. Acres.	Increase, 1870–1880 per cent.	Average yield per acre, bushels.
Wheat.....	287,745,626	459,591,093	35,487,065	60	13
Rye.....	16,918,795	19,863,632	1,844,321	18	11
Oats.....	282,107,157	407,970,712	16,150,611	45	25

Barley.....	29,761,305	44,149,479	20,005,466	48	22

The most striking suggestion of these figures is the unprecedented advance in production during the past decade, amounting to nearly one hundred per cent. for all the cereals taken together, while the increase during the preceding decade was but 12 per cent. The increase in population during the decade was 30 per cent. It will be seen, therefore, that in the four principal cereals the increase has been greater than in population. In other words, we have made a gain per capita, while in the two minor cereals, rye and buckwheat, we have lost slightly on a per capita basis. The gain has been greatest in the cases of wheat and corn, the two principal breadstuffs. In the first the per capita has risen from 7.4 to 9.2 bushels, and in the latter from 19.7 to 35.4 bushels, nearly doubling the amount per capita in 1870. The amount of wheat consumed per head of population is usually estimated at from 4½ to 5 bushels. The crop of 1879 was, therefore, nearly or quite twice as great as the needs of our population, leaving nearly half of it, or fully 200 millions of bushels, for export.

—Out of the total wheat production the six New England States produced only .3 of one per cent.; the Middle Atlantic States, 9.2 per cent.; and the Southern States, 9.5; while the ten Western States, from Ohio to Minnesota and Kansas, produced 71.1 per cent. of the total amount, leaving to the Territories and the Pacific States 9.9 per cent. In the production of corn the proportions are somewhat different. New England produced .5 of one per cent.; the Middle States, 6 per cent.; the South, 20; and the ten Western States, 73.2; while the Territories and the Pacific Coast contributed but .3 of one per cent. In production of wheat Illinois ranks first, followed by Indiana, Ohio, and Michigan. In respect to corn, Illinois is first, with Iowa, Missouri, and Indiana following in the order given. In production of oats, Illinois again ranks first, followed by Iowa, New York, and Pennsylvania. California produced the most barley, and Pennsylvania the most rye, while New York leads in the production of buckwheat. The production per acre of cereals in the different sections of the country presents some interesting facts. Following the grouping of the States given above, it is seen that the average yield of wheat per acre in the small and highly cultivated farms of New England and the Middle States was 14.7 bushels. This is greater even than that from the fertile soils of the Western States, which average but 13.5 bushels. The Territories and Pacific States have the highest average, 18.9 bushels, while in the South only 6.6 bushels are raised per acre. In corn, the average for the Western States is greatest, being 35 bushels; that of New England and the Middle States, 31; of the Territories, 22; while in the South it is but 15. Whether the low average yield of cereals in the South (for the figures regarding the other cereals are similar in this respect) is due to the fact that the climate is unfitted to these crops, or to the imperfect methods of tillage common in this section, or to both these causes, is an interesting question. Another fact is developed from these figures, viz., that in Dakota, Kansas, Nebraska, and Iowa, whose soils are comparatively new, and where a heavy yield of wheat is to be expected, the number of bushels per acre is but 9, 9, 9, and 10 respectively. It may be suggested that these low averages are due to the imperfect tillage of the large farms into which these States are, in the main, divided.

—The *Index* of May 26 contains a lively and well-written article of five columns by Mr. Fred. May Holland, entitled "Facts about Hegel," which will interest those who are concerned with the Concord School of Philosophy. The writer urges that because Hegel's system is extinct in Germany; because he favored Napoleon, Prussian aristocracy, the subjection of women and Goethe's theory of colors; because he gave the initial impulse to the Tübingen scepticism, disparaged Newton, is essentially anti-scientific, and rests his conclusions withal upon a method so extraordinary, it must be set down as definitively irrational, unpatriotic, etc. All these facts, and more of the same sort, are familiar to those who have studied the matter, and indeed are mostly admitted by Hegelians here and abroad. It is because we are quite in sympathy with the writer's general position of antagonism that we regret the more that he does not raise the real philosophic issues, but lays himself open to the charge of writing like an advocate appealing to popular prejudice. If Hegel had been as corrupt as Bacon, or a woman-hater like Schopenhauer, as mediæval in his theology as Rosmini, or as dogmatic toward science as his Concord followers themselves, the truth or falsity of his logic and its method would be in nowise affected. His admirers now rally chiefly about this, almost as generally as they formerly did about his philosophy of nature. As the progress of science has entirely discredited the latter, even for those who stand within the charmed circle of discipleship, so it seems reserved for the new psychology, which has grown up on the basis of Kant, to pass final verdict upon the logic, and indeed upon all the post-Kantian speculators. If the Hegelian claim of absoluteness be allowed, it will be because the natural history of absoluteness in belief is psychologically important, and with little reference to its objective validity; for to think will always be to condition, and the infinite (not the brute fact, as Hegel said) will always mark the point where thinking stops. If "all that is real is rational," it can be so only in the familiar sense of the theory of cognition which identifies the world with my conception of it, or else (which is more correct for most Hegelians) in the sense of a pious faith in a transcendent rationality of things-in-themselves as a refined anthropomorphic "form." The identity of opposites can be accepted only as a hyper-subtle refinement of the doctrine of relativity, which includes even the excluded middle as a special case, because both terms are identical in their mutual exclusiveness. If evolution and thought are radically trichotomous, then the structure and function of the nervous system must be proved peculiarly so; and of this there seems as yet no degree of probability. Hegelism is, even when it fancies itself most otherwise, essentially passive, receptive, feminine. It has created nothing new during the past quarter of a century, save explanations of explanations in long perspective. As Schopenhauer said of reason, its conceptions are never immaculate, although all Hegelians piously believe them to be so. It simply follows or inculcates historic motives in church, state, and even in science, and, of course, finds far more in Aquinas than in Luther, in a strong than in a good government. In a word, substituting inarticulate insights for unutterable emotions, it would not be very inaptly defined as Methodism in thought. Finally, we are not a little sceptical about the thoroughness of either philosophic or scientific study for tired teachers during our American dog-days weather. Of all midsummer schools Hegelism is most indebted to the midsummer lassitude in the news-market, which makes it a god-send to the famished columns of our papers great and small.

—The resignation of the Astronomer Royal for England, one of the most distinguished savants of the present century, is a noteworthy event of the past fortnight. Sir George Airy was appointed Astronomer Royal by Lord Auckland in 1835, on the resignation of Mr. Pond, the fifth incumbent of that position. Mr. Airy's resignation will take effect August 1 next, and he will have attained the advanced age of eighty years four days previously. He is believed to perform, with as yet unimpaired vigor, the arduously exacting duties of the Director of the Royal Observatory; and few would have thought him the man to resign his post at any age whatsoever, so long as his health would permit the prosecution of his labors. As we have yet no indication of his failing health, it will be hoped that his relief from the routine of observatory-superintendence may enable him to devote the remainder of his life to the completion and publication of his numerical lunar theory, already in a state of such advance that his failure to finish it would be a deplorable loss. It is understood that Mr. Edward James Stone, now the Director of the Radcliffe Observatory at Oxford, and for many years previously Her Majesty's Astronomer at the Cape of Good Hope, will be the successor of Airy at the Royal Observatory. Mr. Stone is a thorough, practical astronomer, and the Lords of the Admiralty could hardly appoint a better man. He has also the additional experience of a term of years as the chief assistant of Airy at Greenwich, and it may be presumed that the Royal Observatory will, under his administration, be directed with all that rigorous attention to thorough system which should characterize Government establishments of this sort.

—A good idea of the length to which researches in comparative storiology may be carried is afforded by a recent Italian work entitled 'Quattro novelline popolari livornesi, accompagnate da varianti umbre raccolte ed illustrate da Stanislao Prato' (Spoleto, 1880). The four stories are those technically known as "The Three Citrons" ('Pentamerone,' v. 9), "The Envious Sisters" (Pitrè, No. 36), "The Prince who Married a Frog" (Grimm, No. 63, "The Three Feathers"), and "Hans the Hedgehog." These stories fill eleven quarto pages, and are followed by twenty of variants from different

parts of the province of Umbria. The remaining one hundred and twenty-two pages are devoted to comparative notes on the four stories, and probably offer the most complete example yet known of such investigations. It is, however, by just such minute comparison that the vexed question of the origin of popular tales is to be solved. If the theory of "conscious borrowing" is to be proved, it must be done by establishing all the links in the chain of evidence, and especially by showing the prevalence of so-called Aryan myths among the non-Aryan peoples. Signor Prato's work is very creditable to his industry, and continues in a becoming manner the work initiated by Imbriani, Pitrè, and Comparetti.

A GENTLEMAN PRIVATE.*

THE marked success which this book has had in England shows how deep and strong is the interest which a new phase of human experience excites. An Oxford graduate, who was smitten with a love for "soldiering" during the first enthusiasm of the Volunteer movement after the Franco-German War, entered the ranks by ordinary enlistment, in the hope of winning the commission in the regular army which he had failed to secure by original appointment, because he had passed the age at which the law limits the commissioning of University men.

The narrative of the writer's experience has some of the best features of good story-telling. It is simple, direct, modest, and full of the details which everybody wants to know. We are made familiar with the real life of the enlisted soldier in the British Army on the peace establishment, in barracks, in the camp of instruction, and on foreign post and garrison duty. The only favors shown the young recruit, in the instance before us, were such as flowed naturally from the fact that he was a man of education and character who was going through a rough apprenticeship with an honorable ambition. He was avowedly put forward as fast as he proved his fitness for advancement, but he was obliged to prove his efficiency by fair competition before he was promoted. His "Volunteer" training had given him great assistance, for he had been lieutenant in a Volunteer regiment, and seems to have been a good drill-officer, and at home in the "school of the soldier." Thanks to this preparation, and to the good-will of his colonel, he was only a few weeks a private soldier, and a few months saw him through the non-commissioned grades to first sergeant. Here a hitch occurred in his progress, and a couple of years passed before he doffed the chevrons and put on the uniform of a lieutenant. Of course, his case was recognized as a special one by his comrades in the ranks as well as by his superiors. A recruit with an income of eight hundred pounds a year was not seen every day, and nothing could prevent its being known and made matter of common talk in the barracks as well as at the officers' mess. But the recruit seems to have had good sense and discretion, and by determining to excel in every duty, and to show that he was not above his business, he managed to conciliate the good-will even of those who knew he would soon be promoted over their heads.

Interesting as the book is, it would plainly have never been written for the mere purpose of telling the tale. The writer had a higher object. He wished to show that a young man, bred a gentleman, could "take the Queen's shilling" as if he had been only a clodhopper, and yet preserve his self-respect, the respect of his associates of all degrees, and fairly work his way up to an officer's commission in the army. He is careful not to make the picture a rose-colored one; for, no doubt, it was a pretty severe ordeal. He proves, however, that it can be done, and, in proving it, does more; for he shows that, if enlistments from the better educated classes were encouraged, the ranks might be filled with men who would greatly raise the character of the army, not only without lowering discipline and efficiency, but with a positive increase of all the good elements of soldierly conduct.

The lesson ought to be even more valuable in its bearing upon the American Army than in its relation to the British. We have adopted the English method of filling the ranks by recruits picked up in saloons and pot-houses, from among men who have lost their ambition in life and injured their stamina by dissipation. The natural result is that army-service in the ranks is looked upon as disreputable, and the social gulf between the private soldier and the officer is, if possible, more impassable with us than in the English army. A young man with military tastes shrinks from the loss of social caste which he must face if he would try among us this experiment of making his way through the ranks to a commission. No better proof of the difficulties under which he would labor can be found than in the statement which, whether true or false, has lately had a wide circulation, that when the distinguished general who now commands at West Point was a cadet the effort was made to put him in Coventry, because he recognized when off duty the claims to social equality of a worthy non-commissioned officer who was the son of his own guardian. The story is *ben trovato*, if not strictly true; for we all know that prior to the Civil War, if not since, the ostracism would have been mercilessly applied in such a case. The great rebellion demonstrated that a truly republican equality between officer and man in social life is perfectly consistent with firm and steady discipline. The self-respecting young soldier who is taught that willing obedience is the best education for command, does not presume upon the social recognition given him. If only the ranks could be filled with such material as flocked to them in the great peril of 1861, there would be no reason for different relations between the officers and men of any battalion in the United States service from those which exist between the officers and men of the battalion of West Point cadets. Then we should have a republican army worthy of the name, and not a poor imitation of the aristocratic organizations of Europe.

But how can such a consummation be reached? We think a change in the relation of the West Point Academy to the Army will be found a necessary preliminary step. The cadets are now, too commonly, the foreordained officers of the Army by the grace of the political machine, operating through the members of Congress from the several districts. Suppose that instead of this they were selected from among those of a given age who have enlisted in the ranks, acquired the education necessary, and who have risen to the grade of sergeant by fair competition before they have outlived their youth. In short, suppose the career of this Oxford graduate, who is telling us of his pilgrimage through the ranks to a commission, were that which was offered to the young American soldier as a rule, and not as a strange exception to the rule; can there be any doubt that the ranks would be filled with ambitious and spirited young men of good education, whose blood moves quicker when they hear the music of fife and drum? Five years of such service, under regulations which ensure treatment as men and not as menials, would be no bad preparation for life if the coveted commission were not reached, and sixty or seventy prizes of that kind offered every year would keep hope eager and ambition fully aroused. West Point would then take its proper position as a school for higher military science, in which the young officer who had already won his commission could perfect himself in the highest studies of his profession, and win further honors in the form of assignment to staff, ordnance, and engineer corps. It would be wise, perhaps, to reserve this further educational course for those who remained unmarried to its close, and to appoint none but unmarried men to commissions from the ranks. There would be cases in which such a rule might seem unnecessary, but experience seems to prove it the only safe way to secure social harmony in the little communities at army-posts, whose members are thrust into pretty close intimacy with each other by force of their circumstances. The period between enlisting and getting a commission would thus be a formative period and one of probation. A young, unmarried man would often be transformed by it, and, when he had passed it, would choose a wife quite differently, in many cases, from his mode of choice before his own development had occurred. Such a modification of our system as is thus suggested seems fairly practicable, and if so, it is surely one which ought to be desired by everybody who would see the Army made to harmonize with the republican system of our government. As throwing a flood of light upon the question, though written without reference to America, the book before us is well worth study; its perusal will be found attractive even to those who do not attack the problem in its seriousness, but can enjoy a clear and lively story of the private soldier's life.

* 'Through the Ranks to a Commission.' London and New York: Macmillan & Co. 1881.

MURRAY'S HISTORY OF GREEK SCULPTURE.*

THE announcement of Mr. Murray's work on Greek sculpture could not but awaken the hope that a gap in our English studies of the arts was at length to be satisfactorily filled. His position and opportunities justified high expectations in respect to his book. It seems a pity, indeed, to treat the history of Greek sculpture independently, for so intimate was its connection with architecture that its own development cannot be properly understood without constant reference to that of the mother art. Still, each had such an amount of independence that a separate treatment is possible, if not the best.

It was natural to expect that Mr. Murray would bring to his subject not only all the resources of ample, exact, and fresh learning, but also the modern spirit of historical enquiry, and there was consequently some disappointment at finding that he had thought it necessary to begin his book with a discussion of the theory of art, in which he undertook to treat of "Artistic inspiration," of "Imitation in art," of "Theories of beauty," and other similar topics belonging to the so-called science of æsthetics but which have little to do with the history of art. Doubtless much may be said upon such topics by a judicious thinker that shall not be without its value, but they have so long been favorite fields for the exhibition of confusion of mind and intellectual pretension that a wary reader has come to look with distrust upon every new discussion of them. Mr. Murray's opening sentences were not encouraging, and his second page settled every doubt respecting his competence to deal with the philosophy of art. Such an assertion as the following

* 'A History of Greek Sculpture, from the earliest times down to the age of Pheidias. By A. S. Murray, of the Department of Greek and Roman Antiquities, British Museum.' With Illustrations. London: John Murray; New York: Scribner & Welford. 1880. 8vo, pp. xv.-295.

is decisive: "Marble is an immovable, inorganic substance, and it cannot be employed to imitate a living organic body, unless the artist seizes a particular aspect presented by this body during so short an instant of time that it may practically be considered as lifeless like the marble"; an assertion reinforced on the next page by the still more surprising statement that "the moment available for the artist is too short for even a pulsation of life." But Mr. Murray, as if to balance his new and strange doctrine, lays down propositions of which the truth is at least indisputable, as, for instance, that "artistic inspiration is not known to be a thing of strictly definite compass," and that "it is the mind that controls and selects." This last aphorism is followed by two sentences that exhibit the prevailing complexity and obscurity of the style of his introduction:

"In the progress of art, then, there must be developed a mental power of controlling the impulse of imitation, and it would be an instructive pursuit if its course could be followed. If it could be assumed that the impulse to imitate knows no limits beyond those imposed by this mental faculty, and, of course, those of material, which are bought by experience, then it could be imagined that the dawn of this faculty will be coeval with the dawn of imitative impulse."

We turn from such confusion as this to the chapters treating of the history proper, with confident anticipation that Mr. Murray's learning will at least make good his incapacity as a thinker; but only for a fresh disappointment. His treatment of the earlier stages of the development of Greek art is marked by the lack of sense of the real problems involved in the subject, and a failure to grasp the historic significance of the facts known to us. The most interesting question presented by the early arts of the Greeks is one which our present means of knowledge leave unsolved, but on which we may hope that future discoveries will throw light. It is this: By what course, with what steps, as the result of what changes in national conditions, were the arts Hellenized? In Homer the arts are mainly Oriental or Egyptian. The earliest traditions and myths represent the arts as introduced to Greece from abroad. The works of art found at Mykenæ, at Troy, and in other sites of prehistoric Greek civilization bear a foreign stamp. In the period between the Homeric times and the beginnings of the proper consecutive history of the Greeks the character of the arts was transformed, and we find them at this latter date still, indeed, displaying elements derived from foreign sources, but exhibiting in their essential spirit, and in the use of these foreign elements, the original creative force and quality of the native Greek genius. The change marks the greatness of the revolutions in the Greek world during the centuries between the Homeric period and the age of Lycurgus and Solon. It is noticeable that the Greeks themselves were apparently but little aware of the significance of the change. The centuries which had left no consecutive monumental record were foreshortened to the Greek of later days, so that the slow processes of gradual evolution seemed to him to have occurred in a brief space of time. A curious illustration of this natural consequence of the absence of historic records is afforded by their fancies in regard to Dædalus. His very name implies a personification of the unknown inventors of the arts. It is a myth in itself, and the whole story of Dædalus is in accordance with the Greek disposition to give an individual form and existence to abstract qualities and types. Though Homer refers to him as if a real person in a famous but disputed passage ('Iliad,' xviii. 592), so little was remoteness in time of this mythical personage recognized that we find artists who flourished as late as the sixth century before Christ spoken of as his pupils, and even as his sons, who were supposed to have shared in his adventures.

Mr. Murray's grasp of the artistic conditions of the Homeric period and of the succeeding centuries is feeble. He has not even brought together the literary evidence concerning it in a satisfactory manner. He has, however, in his third chapter displayed considerable ingenuity in an attempted restoration of the Shield of Achilles, in which the scenes represented in the marvellous work of Hephaistos are depicted in forms drawn from existing examples of Phœnician, Assyrian, Egyptian, and early Greek work. It is a curious jumble, suggestive indeed of the rudeness of early art, and affording a striking illustration of the contrast between the developed power of poetical description and the undeveloped condition of the plastic arts in the Homeric days. We cannot discuss Mr. Murray's theories of the poetic imagination and its limits. They are obscure; and Mr. Murray's style, which even in plain passages is clumsy, becomes strangely involved when he enters upon speculative considerations. Indeed, Mr. Murray's English sometimes touches the sense of humor by its unconscious awkwardness and unintelligibility, as, for example, when he says that "the skill of those who framed the responses of oracles was too singular a quality to build much on in the way of fact" (p. 142); or as when he says that "the two temples which represent with the greatest resemblance to each other the combat of Greeks against Centaurs may most reasonably be assumed to have been nearer than the others to the time when the various groups of the battle were inspired in the sphere of high art" (p. 246). Just afterward, speaking of the Theseion, he tells us, "Had its name been certain it would naturally have been older than the Parthenon by some years," which is certainly a novel argument in respect to the age of a building.

We have no space for more numerous citations of this sort, for there are still to be pointed out in Mr. Murray's work graver faults than those of grammar and logic. There is much carelessness in his citations; the Greek in his notes is often misprinted, the references are not always correct. When he touches upon architecture he is apt to make blunders that indicate ignorance. He speaks of the eastern frieze of the cella of the Theseion "extending across to the *epistyle*," where he means *peristyle*. He talks of the sculptured *frieze* of the temple at Assos, when the fact that it was the *architrave* which was sculptured is well known as an exceptional and extraordinary variation from the usual practice of the Doric architects. In describing the pediment groups of the temple of Ægina he states that Cockerell says "that from the manner in which the sculptures were scattered among the ruins it was impossible to judge from the place of finding whether a statue belonged originally to the west or east pediment." Cockerell, however, does not say this, but only "that the *grouping* of the fragments must be to a great extent hypothetical."

Errors of other sorts are not infrequent. The well-known ancient city of Temesa, on the west coast of Bruttium, is spoken of as "some unknown place called Tamesa." In speaking of the works of Ageladas, who flourished near the end of the sixth century B.C., Mr. Murray says that there was at Olympia a statue by him "of Timasitheos from Delphi, who had won the pancration twice at Olympia and thrice at the Pythian games, yet who by joining in the memorable attempt of Kylon to seize the Acropolis of Athens had paid for the deed with his life, and had tarnished a name famous for bravery as well as for athletic skill. This event occurred in B.C. 507, but no date is assigned for his victories in wrestling." The confusion of the facts of history displayed in this passage is simply astounding in an author who has read Herodotus and must be supposed to have formed some conception of the sequence of events in the history of Athens. There was scarcely an incident more noted in that history, or of which the consequences were more lasting, than the attempt of Kylon to seize the Acropolis. The story is told by Herodotus (v. 71), but Thucydides (i. 126) gives a fuller account, and there are further details in Plutarch's Life of Solon. The exact date of the enterprise is uncertain, but it took place not far from 620 B.C. Now, Mr. Murray has confused this famous event with the comparatively unimportant conspiracy of Isagoras, more than a hundred years later, about 509 B.C. Timasitheos was not born for some seventy or eighty years after the attempt of Kylon for participation in which Mr. Murray says he was put to death. He did take part in the attempt of Isagoras to secure power, and, as Herodotus tells us, was after its failure cast into prison, where he died. In a note Mr. Murray says: "Herodotus, who describes Kylon as an Olympian victor, says nothing of Timasitheos." On the contrary, Herodotus, after mentioning his imprisonment, adds, "Of his prowess and bravery I might tell great things."

It is no agreeable task to expose the errors of an author like Mr. Murray, but the very fact that his official position is likely to give weight to his work makes it incumbent to point out its feebleness and untrustworthiness. It becomes the more necessary to do so when we find journals professing to be critical speaking in the highest terms of the book. The *Saturday Review* says of it: "The pages are so full of interesting and novel statement, of abstruse reflection and ingenious theory, and of a knowledge obviously exhaustive so far as research has yet proceeded, that the reviewer is tempted at first to resign his critical position altogether, and confine himself to enthusiastic praise. It is a fact that from a certain point of view, the scientific or exact, Mr. Murray's book does seem to us to demand something little short of undiluted eulogy." We will only add that the illustrations are worthy of the text.

VICTOR AIMÉ HUBER.*

VICTOR AIMÉ HUBER well deserved to have his life written. A man of brains, courage, conscience, and inherited literary talent, of wide acquaintance with countries and persons, an undoubting Protestant, and of humble birth, yet with all this a radical conservative under a weak and despotic government, is in our day of interested or ex-officio conservatives a singular phenomenon. The circumstances of his life were such that, had his biographer chosen to use his materials with this end in view, he might have made his book almost as interesting to the English-speaking as to the German public. It is perhaps unnecessary to say that he has not done so.

Huber's maternal grandfather was the celebrated Göttingen scholar Heyne, and his mother that Theresa Forster who was so mixed up in the queer doings of the romantic revolutionists of the period of liberty, equality, fraternity, especially the latter. In 1792 she eloped with Huber from her husband, who died broken-hearted two years later, upon which she married the man of her (second) choice. Ludwig Ferdinand Huber was the son of a Leipzig profes-

* 'Victor Aimé Huber. Von Rudolf Elvers.' Bremen: C. E. Müller.

sor, famous, Goethe tells us, as a collector of engravings. For the sake of Theresa, Huber gave up his position at Dresden, and they took up their abode, she with three children, in French Switzerland, hoping to support themselves by literary labor. Huber was an unsparing critic, but his wife, in other relations self-willed and independent, was here a most patient pupil. Her tales, most of which were in the Defoe style, founded on Forster's experiences, were highly successful, a success won in the face of serious domestic difficulties. Six more children were added to the family; five of them were sickly, and the mother had no one to help her in nursing or caring for them; her husband was often ill, yet while "no tailor or sewing-woman entered my house, we gradually progressed from nothing to closets and chests full of linen, lived comfortably, and moved in the best society." Being asked what was her husband's share in her works, she answered, in the style of the time: "That is a metaphysical secret. [It was] what the stem is to the flower, air to breath, warmth to sunlight!" In 1798 they removed to southern Germany, where they prospered till Huber died in 1804.

Victor Aimé, his youngest child, was born in 1800. In 1806 he became Fellenberg's first pupil at Hofwyl, and remained in his care more than ten years. In 1816 he exchanged the stimulating atmosphere and noble scenery of Berne for the cramped intellectual life and sandy plain of Göttingen, where he remained more than three years, engaged, much against his will, in the study of medicine, but finding time for other studies, especially Spanish literature. After getting his doctor's degree, the influence of his mother, now the editor of the leading literary periodical of the time, obtained for him what we should call a travelling fellowship, and he spent the next two years in Paris and in Spain, whence, after a two months' stay at Hamburg, he went to Edinburgh. He remained less than a year in Great Britain, returning to Augsburg with the intention of practising his profession there; but difficulties with the officials forced him to adopt literature as a means of livelihood. After a two years' stay, he went once more to Paris as a correspondent. His services in this capacity were in great demand, not only for the German but for the English press as well. Such labor was, however, so far distasteful to him that he wished to devote his time to lasting literary work, a history of Spain being the subject nearest his heart. Meantime he visited London and became a regular contributor to the just-started *Foreign Quarterly Review*, his first article, on contemporary German literature, being, he thought, "much too good for those English." More agreeable work was the preparation of several little books on Spanish life and character, which obtained considerable popularity. After visiting Italy, he adopted definitively the career of teacher, to which he remained faithful, in spite of offers of important positions as editor and librarian. In 1839–40 appeared his 'English Universities,' in two volumes, a work which, in spite of the author's indifferent opportunities for preparation, continues to be quoted as the best, in England as well as in Germany. The book at once attracted attention in the former country and in the United States, bringing the author in correspondence, among others, with Thomas Wright and Longueville Jones. In 1843 appeared a translation, edited by F. W. Newman, "in three magnificent volumes, with many gorgeously-colored illustrations, which stood in striking contrast to the learned German text." Nor were these the only changes. The undercurrent of conservative opinion in the original required, the editor thought, correction in the shape of foot-notes, which were added in generous measure.

During the following years Huber was extraordinarily busy, especially with political pamphlets and articles. His success in opposing progress was so great that he was commissioned by the Government to start a fortnightly journal at its expense, and authorized to pay unusually high rates for contributions. Before the publication was begun, however, he made another visit to England (May, 1844), where he was cordially welcomed. Knowledge of the German language seems not to have been general in London, for he was constantly annoyed by being addressed, and on one occasion hearing himself cited in Parliament, as "Mr. Heber." His biographer tells us that he speaks in his letters of intercourse with Carlyle, Hallam, Maurice, Lockhart, Senior, etc., etc., but neither the letters nor extracts from them are given. He was admitted to the floor of the House of Commons, and was to be seen everywhere, from Ascot to Quaker meetings, but devoted the greater part of his time to investigation of the arrangements for avoiding and mitigating pauperism.

On his return to Berlin Huber began his lectures as professor of modern literature at the University, his first theme being Dante; but his political course made him so unpopular that among two thousand students he was not able to secure a single listener. In his journal, too, he allowed himself such freedom in criticising the Government that its subsidy was withdrawn after the completion of the seventh volume. But his release from this labor had the advantage of making possible another journey to England, where he hoped to find pecuniary and other assistance for a scheme he had for many years meditated for the improvement of the condition of the laboring class, by settling them in quarters or suburban villages of their own, on a plan very similar to that afterward carried out at Mühlhausen and elsewhere. His services in this cause were recognized by the Paris Exhibition of 1867 by the award of a medal as "auteur des publications ayant servi de départ à la fondation d'un premier groupe de maisons séparées pour la classe ouvrière"; but they found no sympathy in England. Nobody was willing to discuss the subject as being of other than theoretical interest. Huber accounted for this by the fact that the upper classes were too comfortable and well-to-do to be able to understand the condition of the poor. This supreme English comfort rendered the people, he said, incapable even of thought and reflection. Lord Ashley (Shaftesbury), to whom he was everywhere referred, told him that it was absurd to suppose that anybody in England would put money into an undertaking which should not promise equal returns with railways and the like; while his plan was based on the assumption "that there were people who were free from the thirst for riches, and would content themselves with moderate interest on their outlay."

But if Huber failed to get money he at least got a good deal of useful information from his stay in London. Among other institutions which he visited was O'Connellville, the only really co-operative village which he found, and which owed its existence chiefly to the wish to obtain votes for O'Connell's supporters by colonizing workingmen outside of London, where they should have a freehold and hence a vote. Acquaintance with devices of this kind made him naturally a greater enthusiast than ever for parliamentary government. As on his former visit, he received much attention, appearing at the bar of the Lords in the suite of the Speaker to listen to the Queen's speech, and accompanying Judge Coleridge to the Oxford assizes, being greatly edified by the trumpets and drums whose noise enlivened the drive of himself and the judge to the latter's lodging: English law and procedure, "without sacrificing power or dignity, are yet so Christian and human in their relation to man and life." He naturally came much in contact with Baron Bunsen, and it is worth while to note that, though viewing him from the opposite quarter, his judgment was hardly more favorable than that of Varnhagen and Humboldt.

Huber did not die till 1869; but, passionately interested as he was in public life, the revolution of 1848 and the events following destroyed completely his faith and hope. In 1847 he advocated strongly the armed support of the Swiss secessionists by Austria and Prussia. He hated heartily the new Prussian constitution, and refused for some time to take the oath required of him as professor, until, the King himself having taken it, he argued that when the general has surrendered his sword flight is no disgrace in the soldier. In 1853–4 he was disappointed that Prussia did not become Russia's active ally; and the war of 1866 saddened him beyond measure. The last public incident recorded of him is too characteristic of his school to be omitted. Though disapproving the war, he nevertheless, when it had once been begun, accepted an honorable post in the voluntary sanitary administration, but gave it up on the representations of a friend that such organizations should be discouraged because they lessened the responsibility which the Government was bound to take.

The Vegetation of the Rocky Mountain Region. By Asa Gray and Sir J. D. Hooker. From the Bulletin of the U. S. Geological and Geographical Survey. Vol. vi., No. 1, 62 pp. (Washington. February, 1881.)—This sketch of the botany of the great interior region of the United States is the result of the journey which the distinguished authors made to the Pacific Coast during the summer of 1877 as associates of the Government survey of that year. The region considered, and compared botanically, with the regions east and west of it, extends from the eastern edge of the great plains which form the elevated plateau from which the Rocky Mountains spring, to the eastern base of the Sierra Nevada, and from the British south to the Mexican boundary; although that portion of the country lying between the thirty-sixth and forty-third degrees of north latitude, with which, from personal observation, the authors are most familiar, is most fully treated. The alpine flora of the three regions into which botanically the country is divided, is first considered. Here the interior region is the richest, embracing 184 species, while the Pacific flora, owing to a more restricted surface of sufficient elevation to support alpine plants, and, probably, too, because the alpine flora of the northern mountains is not yet well known, is credited with but 111 species. In the Atlantic flora there are but 52, restricted to the high mountains of New England and New York. The number of trees of the region under consideration is very small, although the number here reported can be now somewhat extended through explorations made during the past year. They are mostly coniferæ, if not in the number of species, in individuals and in economic importance. Of the list of 53 species which is given, 5 are Atlantic, and 18, of which 3 are coniferæ, belong to the southern edge of the region, and properly to the Texano-Arizona flora, where belong the peculiar plants of Mexican origin which extend along our southern boundary from Western Texas to Southern California. With the exception of three or four conifers, none of the trees of the Rocky Mountains are of first-rate economic importance. The comparison between the herbaceous flora of the Rocky Mountains and that of the other

portions of the country is not fully worked out, although mention is made of the herbs and shrubs which characterize the Rocky Mountain flora. Five genera, of only a single species each, occur here and nowhere else. Of these two are characteristic shrubs.

The fourth and last section of the paper is devoted to a brief examination of the origin of the present North American flora. This is found, as Professor Gray has shown more than once before, in the botany of an earlier geological period, where must be sought the key to the distribution of the plants of the northern hemisphere. Here the American associate yields the pen to his English companion, who will, in a second portion of this most important contribution to our knowledge of botanical geography, "develop the relations of the whole North American flora to those of other parts of the northern hemisphere." Sir Joseph Hooker is admirably equipped for this task. No botanist has ever travelled so widely or seen *in situ* the botany of so many widely separated regions, and his deductions will be thus largely based on personal observations.

Genoa: How the Republic Rose and Fell. By J. Theodore Bent, B.A. Oxon., author of 'A Freak of Freedom; or, The Republic of San Marino.' With eighteen illustrations. (London: C. Kegan Paul & Co. 1881. 8vo, pp. 420.)—If a person is already tolerably familiar with the course of Italian history, and that of Genoa in particular, he can read Mr. Bent's 'Genoa' with much profit, for he has got together a good deal of interesting material, and tells his story in an entertaining manner. But let not the unwary student approach this book with the purpose of learning from it the history of Genoa; for a book professing to be a history, more completely devoid of systematic and clear arrangement, we have never seen. There is, to be sure, an attempt at order: the facts are grouped in chapters, headed "Genoa at the Crusades," "Genoa and her Pisan Rival," "Genoese Commerce in the Black Sea," etc. But the effect of the whole is bewildering in the highest degree, as the events follow one another, in accordance with this classification, with very little regard to chronological order, and there is nowhere any consecutive sketch of the history of the republic, or even a chronological table, to give the reader a clue.

Not merely is there this disregard of chronological order; there is a general disregard of dates, events being often told without any but the vaguest indication when they occurred. For example, no date is given for the establishment of the office of Doge (p. 61), the battle of Malvasia (p. 157), and the capture of Genoa by Charles V. (p. 197). The two battles of Meloria are not clearly distinguished (p. 80), and on page 159 it would be certainly understood that the second was fought in 1296 instead of 1284. The date 1302 is given for an event on page 103, and it is immediately added that "thirty years later" Boniface VIII. did certain acts—who died in 1303. When we reach modern times the confusion in chronology disappears, and this part of the book is much the best. The chapters which treat of Andrea Doria, the Fieschi conspiracy, and other events of modern history are interesting and, on the whole, satisfactory; although the author does not agree with the usual judgment as to the great admiral, and represents him as cruel, selfish, and overbearing. Three citizens of Genoa (leaving Columbus out of account) have won a great name in history—Sinibaldo Fieschi, better known as Pope Innocent IV.; Andrea Doria, and the Marquis of Spinola. Of these, Innocent IV. is mentioned, but not in such a way as at all to give the impression of his real greatness; Andrea Doria has the greater part of three chapters devoted to him, nearly one hundred pages in all; Spinola is not, so far as we remember, even mentioned. The four great families—the old nobility, the Grimaldi and Fieschi, and the "nobility of the country," the Spinola and Doria—form, of course, the subject of frequent mention; and an attempt is made (p. 57) to characterize them. One would have been glad, however, of more fulness on this interesting topic.

If the chapters which treat of Andrea Doria are the most satisfactory in the book, those upon Genoese commerce in the Black Sea and the rivalry with Venice are perhaps the least satisfactory. These topics present really the most important part of Genoese history—that is, the career of Genoa as an independent power; and this long contest with Venice was the most significant series of events in the history of the Mediterranean during the Middle Ages. But with so little insight is this contest narrated that the war which raged from 1350 to 1355 is never once called by the name by which it is generally known, "War of Caffa"; the reader is hardly informed that the possession of the important colony of Caffa was the principal object in dispute; and, above all, the relation of this war to the civil war which was then raging at Constantinople, and the nearly contemporaneous invasion of Europe by the Ottomans, is hardly hinted at.

Mr. Bent's style as a writer of English can hardly be commended. Such sentences are common as: "Many of the expatriated Greeks . . . returned home, except one" (p. 111); "like France did" (p. 163); "Prince Andrea was now approaching an age which few succeed in reaching, and if they do so cease to mix in worldly affairs" (p. 263); "Giannettino, whom report said was, etc." (p. 268). We find a misprint (p. 59) of Conrad II. for Conrad III.; Constantine, the last Emperor of Constantinople, is called (p. 121) John Paleologus; Cyprus is said (p. 135) after the reign of Catharine Cornaro to have become "an easy prey to the Sultan of Egypt"—it fell to Venice and afterwards to the Ottomans; Alfonso of Aragon is called (p. 211) grandfather of Ferdinand the Catholic, instead of his uncle. "Dissertations," near the bottom of p. 335, evidently should be "dissensions"; "allegiance," in the middle of p. 344, should be "alliance." There are a number of excellent illustrations, but, of course, no index.

Butler. By the Rev. W. Lucas Collins, M.A., Honorary Canon of Peterborough. (Philadelphia: J. B. Lippincott & Co.; Edinburgh: Wm. Blackwood & Sons. 1881.)—This is the first of a handy series announced as "Blackwood's Philosophical Classics," the plan of which is about the same as that of the Oxford English-Philosophers Series. A brief biographical sketch introduces, and an index of the best literature about the author concludes, each volume, the main part of which is devoted to exposition. It is assumed that the size and number of the volumes written by most philosophers are due to the necessity they felt of combating the views of others, and that their positive precepts can be presented in far smaller compass—a view which seems to us essentially correct for most thinkers not strictly contemporary. This is particularly true of Butler. His 'Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature' was not only written with reference to issues now dead or dying, but is in a style so confused and prolix that we know of few good books likely to lose less and gain more by abridged restatement. Thus treated, as it is very judiciously by Mr. Collins, the argument is clear and comprehensible enough; but as the author left it, and as it is still used in many colleges as a text-book, it comes to illustrate almost every vice of teaching even in its own department. Butler's fundamental assumptions that, as nature and Scripture are from the same author, we ought to expect the same sort of difficulties in each, and that Christianity is a republication of natural religion, few would now care strenuously to deny. The concluding position, however, that Christianity also reveals certain truths "not discoverable by reason," which is, of course, the object of the whole argument, is an entirely new assumption which no logic or analogy can ever make probable to reason, but which must always imply an element of faith. The argument that probability is the guide of life, and that especially all moral truth depends upon probable evidence, and the incessant inference from a remote and unseen God to familiar nature, if it does not tend—as Martineau thought it did—indirectly to atheism, is probably calculated to rouse more doubts about revealed religion than it answers. Butler never imputes any kind or degree of moral obliquity to those opposed to him in opinion, and, unlike many modern apologists, was content to urge that revealed truth was on the whole probable, without assuming for it any degree of axiomatic certainty.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Abbott (Rev. E. A.), How to Tell the Parts of Speech	(Roberts Bros.)	$0 75
Anderson (J. I.), New Manual of General History: Part 1, Ancient	(Clark & Maynard)

BUTTERFLIES.

Their Structure, Changes, and Life Histories, with special reference to American forms. With an Appendix of Practical Instructions. By Samuel H. Scudder. Illustrated. Square 8vo.

HENRY HOLT & CO., New York.

The Artist's Edition. Reproduced from the Original Drawings. Each copy numbered and signed.

The First of May.

A Fairy Masque. Presented in a series of 57 designs by Walter Crane. Issued in a handsome portfolio designed and decorated by Walter Crane.

200 FIRST PROOFS, on India-paper, 24x17 inches, price $80.

300 SECOND PROOFS, also on India-paper, 18x15 inches, price $48.

The success attained in the reproduction of this work has been so great that the engravings can hardly be detected from the original drawings, so admirably have the delicacy and even the gloss of the pencil been preserved, and by the same process the text has been reproduced in perfect harmony with the tones of the drawing, so that the two form one picture.

J. W. BOUTON, 706 Broadway.

Truth or fiction—which?

Ploughed Under.

"A novel of great strength."—*Boston Post.*

"A remarkable book."—*Philadelphia Times.*

"The story is, in fact, a poem; as much so as the prose poems of Longfellow or Philip Sidney."—*Chicago Standard.*

"Why the Indian is what he is can be answered by any one after reading this book."—*N. Y. Herald.*

"Like 'Uncle Tom's Cabin' and 'A Fool's Errand,' it is an employment of fiction for the highest purposes of truth."—*Norwich Bulletin.*

READY—Price $3, Post-free.

BENJAMIN FRANKLIN'S LIFE and Writings. A Bibliographical Essay on the Stevens's Franklin Collection of Books and Manuscripts. Containing a History of the Franklin Papers and a list of upwards of 200 titles of printed Books of and relating to Franklin. By Henry Stevens, of Vermont. Privately printed. 36 pp., imp. 8vo, on finest hand-made paper; illustrated with 5 steel portraits and a fac-simile of Franklin's celebrated Letter to Strahan. Cloth extra, post-free, $3, net.

To Summer Tourists.

ALLAN STEAMSHIP LINE,
From Baltimore to Halifax, and vice versa.

The A 1 British Royal Mail Iron Screw Steamships,
HIBERNIAN, 3,200 tons, Capt. Lieut. Archer, R.N.R.,
NOVA SCOTIAN, 3,200 tons, Capt. Richardson,
CASPIAN, 3,000 tons, Capt. Trocks,
LEAVE BALTIMORE EVERY FORTNIGHT, WEDNESDAYS,
FOR HALIFAX, NOVA SCOTIA.

Cabin passage to Halifax, $20 gold. Round Trip Ticket, $35 gold.

This opportunity, by offering, as it were, an abbreviation of a European trip, is exceptionably agreeable to those who desire a change from the usual round of American pleasure resorts.

For further information apply to A. SCHUMACHER & CO.,
5 South Gay Street, Baltimore, Md.

TO SUMMER TOURISTS.

THE NEW REVISED EDITION OF THE
Lake Superior Transit Co.'s
Tourist-Guide for 1881

IS NOW READY.

Over one hundred routes via lake, river, and rail.

For copies apply to
E. W. NICHOLS, Agent,
294 Canal Street, cor. Broadway, New York;
Or of
T. P. CARPENTER, Gen. Pass. Agent,
Buffalo, N. Y.

NORTH GERMAN LLOYD
STEAMSHIP COMPANY,
FOR SOUTHAMPTON AND BREMEN.

The Steamers of this Company will sail every Saturday from Bremen Pier, foot of Third Street, Hoboken.

RATES OF PASSAGE TO LONDON, HAVRE, AND BREMEN.

First Cabin, $100; Second Cabin, $60. Steerage, $30. Prepaid Steerage Certificates, $28.

For freight or passage apply to
OELRICHS & CO., AGENTS,
Bowling Green.

Colosseum House,

7 COLOSSEUM TERRACE, ALBANY STREET,
REGENT'S PARK, LONDON.

A first-class Boarding and Apartment House in the immediate vicinity of the most beautiful Park in the Metropolis and the Zoological and Botanical Gardens.

Omnibuses pass the door every five minutes.

Two minutes from Underground Railroad, and ten minutes from Euston Square Station.

Conducted by Mr. and Mrs. Yardley, who are permitted to refer to Dr. and Mrs. H. I. Bowditch, Boston; Dr. and Mrs. S. K. Towle, Haverhill, Mass.; Mr. and Mrs. Fred. T. Brown, 673 Madison Avenue, New York; Edward Bowditch, Esq., Albany, N. Y.; Dr. Charles F. Folsom, Boston.

Camp Chocorua,

A Summer Camp for Boys between the ages of eight and fifteen opens July 1 at Asquam Lake, Holderness, New Hampshire. Boys are taught to swim, row, and fish, and something of the practical work of camping-out. The best references furnished.

For further information address ERNEST BERKELEY BALCH, Camp Chocorua, Holderness, New Hampshire.

THE HYGEIA HOTEL, Old Point Comfort, Va., situated 100 yards from Fort Monroe. Open all the year. Equal to any hotel in the United States as a Summer Resort or Cold Weather Sanitarium. Send for circular describing hygienic advantages, etc.

BLOCK ISLAND, R. I.—Ocean View Hotel. Ten miles at sea; surf and still-water bathing; splendid bass and blue fishing; hotel lighted with gas; strictly first-class accommodations; 350 guests; telegraphic cable. Send for illustrated circular. O. S. MARDEN, Manager.

The Nation.

NEW YORK, THURSDAY, JUNE 30, 1881.

Beginning with the next number the Nation *will be issued as the weekly edition of the New York* Evening Post.

It will retain its name, and have the same editorial management as heretofore and an increased staff of contributors, but its contents will in the main have already appeared in the Evening Post. *Its political and literary standards will remain unchanged, but it is believed that greater variety and interest will result from the consolidation.*

The size of the Nation *will be enlarged to twenty-four pages of the present form, but for convenience' sake the page will be divided into three columns. The subscription price will at the same time be reduced to Three Dollars per annum. Subscriptions already paid at the previous rate will be proportionately extended.*

For the present the Office of the Nation *will remain at No.* 115 *Nassau Street, and letters for the Editor or Publisher should continue to be sent to that address or to Box* 25, *New York City, together with books for review (whether for the* Evening Post *or* Nation), *of which but a single copy will be needed.*

The Week.

THE balloting for successors to Conkling and Platt has continued unmarked by any change of importance. Mr. Wheeler's vote increased to fifty and Mr. Depew's to fifty-three on Thursday, and these were the highest Half-Breed figures of the week. So much ingenuity of speculation has already been exhausted by the correspondents and other observers that there has been even a dearth of rumors. One of these was that Conkling was at last tired of the struggle and had determined to withdraw, whereupon the friends of Crowley were greatly encouraged until the report spread to the Cornell men, who were quite as ready to welcome any intimation that they would soon be free to vote for their man without "antagonizing" his former Boss and benefactor. Nothing appeared to come of this, however, and the balloting went on as before. Jacobs has withdrawn his name, owing to the doubt about his eligibility involved in the fact of his being a member of the electing legislature, and, at a Democratic caucus, Mr. Clarkson N. Potter was selected in his place. The Bribery Committee have made no report, but will probably make no fewer than three, each representing its author's political leanings; of course, it makes no difference that the point at issue has nothing to do with political opinions. Meantime Sessions has been indicted by the Grand Jury, and has demanded an immediate trial. The Court agreed with his wishes, but the District-Attorney remarked that it would be impossible to get just now in Albany a jury that would agree, and the accused gave bail.

Mr. Windom has announced his conversion to civil-service reform, owing to the experience he has had in the Treasury of "pressure" for offices, and of the absorption of his time in seeing candidates, to the neglect of the proper business of his office. This confession has been received with varied feelings. Civil-service reformers are disposed to look on it as a great triumph of the cause, while the "practical men" insist on treating it as a mere ejaculation, such as a man utters when he is in great trouble, and not the expression of a deliberate opinion. But then the conversion of other sinners just as hardened as Mr. Windom has been effected in a similar manner. Mr. James was an old "worker," who saw nothing wrong in the spoils system, but was converted by actual experience. Probably most of the conversions of old politicians will have to be effected in this way. We have little doubt that poor Mr. Kirkwood is already on the anxious bench, and is asking eagerly what he should do to be saved. The President's case seems the most hopeless of all, as he is really sinning against the light, and with the swing and *verve* which is characteristic of backsliders. But he is an impressionable man, and takes his opinions and practices greatly from the company he keeps. Should his Cabinet officers be won over to the truth, there is hardly a doubt that he would himself come back to it. The only absolutely hopeless case among his companions, we fear, is Mr. Blaine. There is about as much chance of his conversion as of Conkling's. They are both too old, and owe too much of all the pleasant things they have had in life, to the spoils system to try now a new régime. Asking them to turn civil-service reformers is very like asking the Sultan to live with one wife and become a constitutional monarch and pay as he goes.

The "storm of obloquy" to which General Brady has been subjected, following upon his dismissal from his postmastership, has proved very disagreeable to that ex-official, and he has accordingly taken the prompt measure of demanding an immediate trial to enable him to prove his complete innocence. He appeared by counsel in the District of Columbia Criminal Court last Thursday, to ask that the Grand Jury investigate the charges against him at once. The public press had reported that he was to be criminally prosecuted, his counsel said, and he wanted no delay, as he was "suffering under abuse and slander." The special assistant District-Attorney replied for the Government that hitherto no official charges had been made, that the Government had nothing to do with what the newspapers were saying, and that the investigation must be pursued "carefully, cautiously, and impartially." This view was concurred in by the court, who declined to charge the Grand Jury as desired. There is nothing novel about Brady's action, of course. The best thing to do, if you are unable to stave off an investigation of your crookedness entirely, is to get a trial before your prosecutors have had time to get up their case. The impudence of Brady's demand has nothing remarkable about it; he simply considered it his duty to himself to take all the chances open to him. Doubtless, also, he expected to make some impression upon the public conviction of his guilt which he says is so hard for him to bear. His complaint, in his letter of instructions to his counsel, of "the destructive effects in business and social life of a procrastination in this matter," might be made, however, by every person whose conduct has rendered him subject to possible indictment. Against such discomforts as this even technical innocence is, it is well known, no protection.

The Philadelphia *Evening Telegraph* falls foul of General Grant for his disrespectful treatment of the President in not calling on him when he first went to Long Branch, which it says is "not a little matter and purely personal, but one of the most painful exhibitions of General Grant's real character the country has yet seen." General Grant has, since this was written, gone to one of the President's receptions and paid his respects. The interview, it is true, was very brief and the conversation was confined to the weather, but it was a good deal for General Grant. Even if he had stayed away altogether, it would not have been so painful an exhibition of character as that which he made last fall on Staten Island during the canvass, in insisting on the withdrawal of Mr. George William Curtis from a room in which he had been acting as chairman of a Republican meeting before he (General Grant) would consent to show himself to the audience, who were calling for him. We do not believe there is a "European despot" or brutal general in Europe who would permit himself such a piece of public discourtesy towards any respectable man, however humble. Mr. Curtis, we think, owed it to the public not to comply, but he took a different and more peaceable view of the proprieties of the occasion.

It is, however, fortunate that the meeting of the President and ex-President at Long Branch did not result in "peace," as was expected by many politicians. "Peace" in political parlance means mutual satisfaction about offices between persons who never think of offices as a means of efficiently administering the Government. Consequently "peace" would probably have resulted in injury and not in benefit to the public service. The President cannot satisfy General Grant and Mr. Conkling except by putting a batch of worthless, or nearly worthless, persons into important positions, so that the

country as well as the newspapers gains by the continuance of "war" and "discord."

Public attention has been agreeably diverted from the political contest at Albany by the sudden appearance of a bright comet, the first one visible to the naked eye which has appeared since that of Coggia in 1874. It was first seen in the southern hemisphere about the end of May, but the information respecting it sent by telegraph was so meagre, and the words of the brief despatches so mutilated in transmission, that very little seems to have been known of it until it suddenly appeared in our skies on the morning of June 23. Dr. Gould seems to have telegraphed it as a return of the great comet of 1807, but, although it is moving in an orbit somewhat near that of the latter comet, it does not seem possible that the two can be identical, for the double reason that the observation of 1807 indicated a period of more than a thousand years, and that it is impossible for so bright a comet to have returned at intervals of seventy-four years without having been previously detected. We may, therefore, conclude that this is the first visit of the comet, at least within historic times. Its course is remarkable from its being on nearly the same meridian with the sun during its whole apparition, thus rendering observation of it extremely difficult. It is still moving towards the north pole, and will probably disappear from view within a few months at no great distance from the pole. Observations with the spectroscope at the Harvard Observatory show that the nucleus gives a continuous spectrum, a result which agrees with that obtained from the comet of 1874. Dr. Draper has succeeded in photographing the comet—a feat which does not seem at all difficult after his success with the nebula of Orion, but which has never before been attempted.

It is expected that of the $118,000,000 United States 5 per cent. coupon bonds all will be extended at 3½ per cent., except, perhaps, $20,000,000 to $25,000,000, which are practically out of reach of the market. The interest on these bonds will be stopped July 1, and the principal will be paid after due notice. During the week the Treasury decided to permit those holders of the registered 5 per cent. bonds who had given notice of their intention to extend at 3½ per cent., but whose bonds had not actually arrived at the Department on the day when the original limit of $175,000,000 had been reached, to extend them, so that instead of $75,000,000 of these bonds remaining for cash redemption, the amount to be paid off will probably not be much over $50,000,000. Notice of the intended payment of these bonds will probably be made July 1. Besides the above-named cash disbursements to be made by the Treasury, there will be due July 1 about $30,000,000 for interest, principal of bonds, etc.; and it is safe to estimate that between now and the time Congress assembles in December the Treasury will pay out more than $80,000,000 of cash, less ordinary receipts. Notwithstanding such a prospect for the money market, and that the time has passed for gold exports this year, except from some unforeseen cause, the Stock Exchange markets during the week were all depressed. The reason for this was because the statements of the Vanderbilt railroads for the half year were disappointing, and because of the renewal of cutting of freight and passenger rates over the trunk-lines. General trade continues active and as to profits satisfactory, and there is less speculation in merchandise than a year ago. In the foreign markets money is as abundant as here, and rates for loans are as low or lower.

Mr. Timothy Howe's speech on silver to the Monetary Conference has been printed in some of the Western papers, but we have not as yet seen it. The New York *Times*, which has enjoyed that privilege, reports it as having been humorous, and having been addressed to disabusing the foreign "gold bugs" of the notion that the United States Government had any especial interest in the remonetization of silver. We have no doubt his remarks helped the Conference to the conclusion, which they will speedily embody in an adjournment *sine die*, that there has been nothing serious in this meeting on the part of the United States from the beginning. It has been a hollow, unbusinesslike affair, mainly political in its origin, and of somewhat the same nature as a good campaign song or torchlight procession. The London *Times* has just been giving some excellent advice to its own Government on the propriety of withdrawing from it altogether at once, or, rather, on the impropriety of having ever taken part in it. This impropriety lay in the fact, to which we called attention in these columns some weeks ago, that the whole "silver movement" is encouragement to the theory that Government can fix and regulate the value of money—one of the most pestilent and dangerous of political heresies. Of course, if it can fix the value of silver in gold, or of gold in silver, it can fix the value of gold or silver in anything else, and the way is open for the wildest experiments of the Communists. The bi-metallic theory as now preached is, in fact, simply a branch of the greenback theory, and even more delusive and mischievous.

The boat-race at New London, Monday, between the Harvard and Columbia eights was rather a tame affair. The Harvard crew seem to have "won as they pleased," and there were very few spectators to enliven the occasion. Columbia led at the start, but was beaten very soon, her "form" proving very "ragged," and the men being exhausted at the end. One of them fainted and will be unable to row for ten days, his physician says, which involves a serious loss to Columbia in the Philadelphia races next week. Harvard won by four lengths in twenty-one minutes and forty-five seconds, which would have been lowered if the crew had been pressed, and throughout rowed a race that gives promise of a close contest with Yale to-morrow. In fact, the Columbia race was, as an event, hardly more than a preliminary to this.

The question of fusion with the Readjusters (for whom, by the way, the happy euphemism, "Liberals," has been lately invented) has, as we anticipated last week, caused great dissension in the Virginia Republican camp. Lewis and his followers accuse the Wickhamites of selfishness and folly, and are little disposed to accept the "ostracism" with which the latter threatened them in case of a refusal to subscribe to the straight-out policy. About fifty of them assembled in Washington last Thursday and adopted resolutions giving formal expression to their indignation at the removal of Lewis from the State Committee chairmanship, declaring that "the evident sentiment of a large majority of the Republican party in the State of Virginia is in favor of supporting the Liberal ticket" nominated by the Readjusters, and protesting that, "in common with all good Republicans" of their State, they believe in paying "the entire just debt of Virginia." The gathering of these gentlemen at Washington was mainly due to their desire to call on the President and remove the false impression possibly left on his mind by the Wickham interview. The President being at Long Branch, however, they appointed a committee to wait upon him when he should return, and adjourned. On Tuesday a meeting of the State Committee was held, at which the Wickhamites were defeated on several important points. Lewis was recognized as chairman, the Wickham call for a convention, July 24, at Staunton, was rescinded, and August 10, at Lynchburg, substituted; and the choice of delegates restricted only by excluding attendants on the late Mahone convention. Staunton is a small town where Wickham's railroad influence is powerful, and Lynchburg is similarly under Mahone's sway, which is what gives the change of place its supposed significance. It is now nearly time for the President to come to a conclusion as to the difficult and subtle question whether the Readjusters are repudiators.

Cash, the South-Carolinian swashbuckler, who killed Shannon, the elderly lawyer, in a duel, has, after all, been acquitted on his second trial. On the first the jury disagreed, which of itself, the Charleston *News and Courier* assured us, would put an end to duelling in South Carolina. It now says that what this verdict means is "Not guilty, but don't do it again," and that the mere trial has been a lesson to Cash which he will not soon forget, as he had every reason to believe that he would not be tried at all, "there having been only one trial for murder for killing in a duel since South Carolina was a British colony." By a statute passed since the Cash duel, killing in a duel has been made murder, and participation in a duel since January, 1881, disqualifies for public office. We trust the *News and Courier's* hopeful view is a sound one. For ourselves, we fail to see why a jury which refuses to convict Cash

should feel compelled by the new statute to convict any other man who hereafter does what Cash did. The ethical notions, whatever they were, which procured Cash's acquittal, will not be rooted out by statute. They will only disappear under the influence of a better moral education and a better social code. By the bye, why did Shannon have to fight in order to procure exemption from outrage? Is there no legal process in South Carolina to enable a decent citizen, who is being pursued with public vituperation by a big blackguard, to have him shut up or reduced to good behavior by bonds? This is a question of considerable importance to immigrants, most of whom come from countries where the police are powerful and energetic, and where a ruffian who went about "posting" people and calling names would be speedily laid by the heels and lodged in jail.

No one has yet explored the connection between the heated term and the impulse to invent hoaxes, but nobody can doubt that there is a connection. Last week the finding of some human bones in a quarry in Western New York was published as the solution of the Morgan mystery which so stirred the generation before us, a little more than fifty years ago. The mendacious reporter represented the workmen who came upon the skeleton, and who probably had never heard of William Morgan or the Anti-Masonic party which made so much capital out of his taking-off, as carefully "gathering up the dirt in their hands and sifting it through their fingers"; and this precaution was of course rewarded by the discovery of a silver ring "bearing the monogram 'W. M.'" But the workmen instinctively felt that there have been many persons in the world who could lay claim to this "monogram," and they were not satisfied till they had unearthed also what appeared to be a tin tobacco-box, revealing, as it dropped to pieces, "a manuscript, the writing of which was scarcely legible." Taken, however, to the convenient office of "Dr. Phillips" and "placed under a microscope," the crumpled paper gave up some disjointed, bloody menaces and the name of an apologist of Morgan's abduction, one "Henry Brown." Here the author of the hoax rested his case as if proved, and succeeded in getting it talked about all over the country, and perhaps in shaking the faith of the "citizens of Batavia" in the bones in their local cemetery, long ago buried as Morgan's, over which they were on the point of raising a monument. Truth had meantime been putting on her boots, and when she had overtaken the humbug, declared the bones not those of an adult, and the ring, the tobacco-box, and the manuscript pure figments of the imagination.

At the municipal election held in this city three years ago, one Jacob A. Hatzel, a candidate for alderman, was defeated by methods which, after much trouble and expense, he demonstrated in the courts to have been fraudulent. Meantime, however, the term had expired for which he had been lawfully elected, and the rival candidate had enjoyed beyond recovery the honors and emoluments of the office. Mr. Hatzel accordingly sought relief of the Legislature, and persuaded it to pass a bill directing the city of New York to make good his salary and his costs at law. Governor Cornell, however, has been obliged to veto the measure, as running counter to a constitutional prohibition, and can only suggest the passage of a statute forcing a successful candidate, whose seat is contested, to give bonds for indemnity to the amount of his salary in case his election is invalidated. It is to be feared, however, that this would be a premium on contesting, though perhaps not more so than the practice of Congress in such matters.

The Sultan has been for some time so absorbed in bringing to justice persons suspected of murdering his uncle, Abdul Aziz, that he has had little or no time to attend to the Greek or any other question—a circumstance to which, perhaps, we owe it that the Greek question has been settled so soon. In fact, every kind of Government business is reported to have been substantially suspended at Constantinople during the proceedings. That Abdul Aziz committed suicide after his deposition has been generally believed until now. He was undoubtedly insane. The body was examined by seventeen doctors almost immediately after his death, and they agreed that the nature of the wounds and the general condition of the body left no reasonable doubt that it was a case of suicide. This, too, was the belief of the people in the palace, including the dead man's mother, who was afraid his life would be attempted, and watched him carefully. Why the present Sultan should at this late date have adopted the murder theory, and have begun to act on it, is one of the mysteries of the harem. It may be due to the intrigues of some of the pashas anxious to poison the Sultan's mind against rivals, and it may be due to his anxiety about his own safety, which is said to have been very great for some time back. Two subordinates, one of them a professional wrestler, confessed the crime, but it is said they did it under torture. Anyhow the court, which was utterly illegal both in its constitution and procedure, has found four of the accused persons, all palace underlings, guilty of murder, and five others, including Midhat Pasha, Nuri Pasha, and Mahmud Pasha, who planned and carried out Abdul Aziz's deposition, guilty of complicity. This will probably end Midhat's remarkable career. He is a man of ability, and the European varnish on him is deeper than on most of the Turks who profess to be civilized, and he has thus been enabled to impose a good deal on the English Jingoes and others who have been trying to believe in Turkish regeneration. But he is at bottom a thorough barbarian, and was, before he got into the glare of European publicity since the war, as savage, corrupt, and dissolute as any of his compeers. The most mischievous of the pashas are, in fact, the polished ones, who humbug the European "publicists" and "jurists," and there is probably not one of them who would not best serve his country at the bottom of the Bosphorus.

The two principal topics of foreign news are the Bulgarian crisis, which we have discussed elsewhere, and the progress of the Land Bill through the British Parliament. This is still so slow that Mr. Gladstone was to move on Tuesday that the several stages of the bill were hereafter to have precedence over all other business. The Home-Rulers amused themselves for some time abusing Mr. Foster, who, though he bears it bravely, seems sensitive to their attacks, and thus provokes them. The passage of the bill or a dissolution is now certain. Mr. Chamberlain, in a speech delivered in Birmingham a fortnight ago, announced positively that the Ministry would stand or fall by it substantially in its present shape, and the London *Times* has expressed what is probably the dominant sentiment of the English public in calling on the House either to pass the bill or turn the Ministers out of office, as the time for criticism has clearly gone by. Resistance to evictions continues in Ireland, but with less tumult, and there are no further Fenian outrages, but a portion of the London press appears to think that if attention is called to the violence and truculence of the articles in the New York *Irish World*, either that paper will be put to shame and mend its manners, or some outside influence will be brought to bear to restrain it. It would be hard to think of any other excuse for the notoriety they give it, and which is just what it desires.

A little incident has occurred in London which illustrates many things, and which the Prince of Wales's enemies are likely to attribute mainly to his influence. The Army and Navy Club has, by a vote of 359 to 38, restored Colonel Valentine Baker to membership, on the ground that the offence which led to his expulsion did not affect his character as a gentleman. Colonel Baker's offence was a criminal assault on a young lady in a railroad carriage. He had no defence, was sentenced to one year's imprisonment and a fine, and was dismissed the service. He bore it all with fortitude, and served creditably with the Turks during the late war, the Jingo press doing its utmost to magnify his exploits, and has come back to England and been taken by the hand again by his old friend the Prince of Wales. There is hardly a doubt that if the Queen had not insisted on it, the military authorities would have managed to let him off with some less serious punishment than cashiering. He never ceased to be a hero in Jingo circles, and his restoration to the Club either has or will be considered to have a touch of defiance to the Radicals in it. But it is a bad time to exasperate the Radicals, or display contempt for their notions of morality and decency.

THE "MONOPOLISTS" AND THE CIVIL SERVICE.

THAT the feeling of hostility to "monopolies," as it is now the fashion to call great combinations of capital, is growing in the public mind, there is no doubt. Not only have "leagues" against them begun to be organized, but ministers have begun to preach against them in the pulpit, and, though last not least, politicians who find themselves hard pressed now take to denouncing the great corporations instead of denouncing the South and "the rebel brigadiers," as they would have done in like circumstances four years ago. Even Conkling and Platt are setting up as the foes of monopoly, just as four years ago they would have set up as the foes of the Southern whites. We do not mean to suggest by this comparison that the charges against the monopolists are as unsubstantial as most of those against the Southern whites were, but simply that attacks on monopolies now appear to be the winning card to that class of the community which watches most carefully the drift of popular sentiment and has fewest convictions of its own. Thus far the railroad corporations are the principal objects of this growing hostility because they furnish a commodity which nearly everybody must use, and because in starting their business they have been aided by the state's right of eminent domain. This alone clouds in a great many people's eyes the title of the stockholders to the money invested in making the railroad itself, or even the title of the bondholders to the security for their loan. In other words, to many of those now engaged in the anti-monopolist agitation the contribution of the state to railroad enterprises in the shape of the right to take land at a fair valuation, or in the shape of limited liability under the charter, seems to cover the whole property, and makes the question of legislative control simply one of expediency, without any element of morality in it at all.

But whatever the theory on which they propose to exercise this legislative control, and whatever the extent to which they propose to carry it, the mode in which it is proposed to exercise it is always some system of inspection through Government officers. The railroad companies are to be obliged to submit their charges and their mode of transacting their business generally, in so far as it brings them into direct contact with the public, to the revision and amendment of a board of some kind armed with powers of final adjudication. There is such a board in England. It has been in operation now for several years, and, it is said, with excellent results, and its powers are far more extensive than those of any State railroad commission as yet appointed in this country. Its example is often cited in the agitation now raging, but curiously enough no mention, so far as our observation goes, is ever made of the feature in all foreign inspection and control of corporations which alone gives them efficacy, whether in England, France, or Prussia, and that is the separation of the administrative machinery of the Government from party politics. We know from our own experience that no partisan politician can be trusted to inspect anybody who is rich, and keep anybody who is rich up to his duty or within the law. The class known in our politics as "workers" is the class which supplies most of our Government officers, either in person or through recommendations of others. This class is above all things interested in carrying elections, and money is more and more necessary to the carrying of elections. It therefore makes everything subordinate to the raising of money. It distributes the offices only to those who will consent to make contributions from their salaries for party purposes. It gives contracts, where it can, only to those who will pay a percentage on their receipts for party purposes. If it has to inspect banks, or insurance companies, or railroads, it makes its reports depend on the readiness of the corporations to contribute to campaign funds, or to give places to persons who will contribute to campaign funds. The inspection of insurance in this State by the late superintendent, Smyth, elucidates the whole system admirably, and so do Brady's Star-route contracts, coupled with General Garfield's letter to him during the canvass.

Mr. Henry Ward Beecher preached on "Monopolies" last Sunday, and startled his audience by saying that "if an exigency should come and it were requisite there should be a man in the Presidential chair favoring all forms of railroad monopoly, it would require but five pockets"—that is, the owners of five great railroads—"to put him there." Now, if the owners of five great railroads put a man who sympathized with them in the Presidential chair, what harm would it do? How could he help or favor them? He does not make laws. Under the Constitution the only open way he has of procuring the passage of laws is by recommendation or argument in his messages. He cannot grant monopolies by prerogative, as Queen Elizabeth claimed the right to do. Nor can he lawfully relieve any man or corporation from any legal obligation. How, then, could a President be serviceable to the monopolists? Simply by failing to enforce laws which imposed duties on them or interfered with the conduct of their business in their own way—in other words, inspection or supervision laws. He could not and would not do this publicly. He would do it, as all such things are done now, by appointing as inspectors, or supervisors, or commissioners, or judges persons designated, or "owned," as the slang phrase is, by the monopolists, or friendly to them; or by removing or "calling-off" any inspectors, supervisors, or commissioners who made themselves obnoxious by the thoroughness of their investigations, as in the St. Louis whiskey cases during the Grant period. And he would obtain the confirmation of these persons by the Senate by bargains with Senators, under which he would purchase their acquiescence in such appointments by placing other offices in his gift at their disposal. In fact, no matter from what side we approach the question, we find that it is only through a good administrative machine that the state can reach or restrain the monopolists, and it is only through a bad administrative machine that the monopolists can defy the state or do it any harm. In other words, as long as we sell places in the civil service in return for contributions to campaign funds, no restraining legislation can do the monopolists much damage. They can always either (1) have their own men appointed as inspectors, or (2) have a rigid inspector "called-off" or dismissed to make room for their own man, or (3) avail themselves of the poverty and insecurity of inspectors under the present system to purchase their silence. All these means are now successfully employed to resist the Government, or defraud it, by persons having interests hostile to it. As long as the system is maintained, resistance to the execution of fresh laws will simply be to the monopolists an affair of a little additional expense. The system is utterly unfit for the exercise of any control over large capitalists. It does not enlist the amount of ability requisite to watch capitalists, or, if it does obtain the needed ability, it does not obtain the character necessary to resist the temptation which capital, when it thinks itself harassed, is always ready to use for its deliverance. Most of the executive, and even the detective, talent of the country is now employed by the "monopolists." The great railroads, for instance, use the most effective means yet devised in any part of the world to get the best men into their service and to keep them there. They carefully select their employees in the subordinate positions; they give them tenure during efficiency, and sure promotion and good pay in return for marked zeal and long service. They have, in short, just the kind of servants the Government ought to have, but the Government has a kind of servants that no money-making corporation would employ, and who, when pitted against the corporation servants in any kind of competition, naturally go to the wall.

Mr. James Parton, in one of his trenchant articles in the last *North American Review*, calls attention to this necessity of strengthening and elevating the Government service as a barrier against the growing influence of what is called "the money power" in our politics and society. If that service could be made to contain one or two hundred thousand of faithful, painstaking, duty-loving, well-equipped men, devoted to their employer, and without any ambition apart from the service, and sure of their places as long as their work was done with diligence and fidelity, it would undoubtedly form a very valuable counter agent to the fierce money-getting, speculative fever by which almost all other callings are now ravaged. But we can hardly expect the Anti-Monopoly Leaguers to trouble themselves about the play of social influences. What does surprise us, however, is that they should clamor so much for legislation which they know perfectly well they will not be able to execute with the only instruments which, under "the spoils system," the Government can place at their disposal.

AUSTRIA IN THE EAST.

THE "Eastern Question," as it has so long been called—that is, the question of the ultimate fate of the region which used to be Eu-

ropean Turkey—continues to assume new phases almost every six months, and the rapidity with which it passes from one to the other well illustrates the fatuity of the Tory Ministry in England in supposing the Berlin Treaty to be a permanent, or anything like a permanent, settlement. The Greek question may now be considered disposed of after two years' wrangling, and the Turkish troops have begun to evacuate the ceded territory. It has been succeeded by what may be called the Austrian question, for all the other troubles of European Turkey are really part of the Austrian question—that is, are due nearly or remotely to Austria's determination to get the strongest possible foothold on the still disputed territory of southeastern Europe. Our readers may remember that ever since 1876 we have been pointing to Austrian expansion in the direction of the Bosphorus, with the support and connivance of Germany, as the almost certain result of the attacks on what Lord Beaconsfield used to call "the integrity and independence of the Ottoman Empire," which were begun in that year by the remonstrance known as "the Andrássy Memorandum." Since then Austria has never faltered in the task of seeking compensation in the East for her losses in Germany. She obtained two large provinces of Turkey in perpetuity under the Treaty of Berlin, and when her hold on these was secured she set to work to extend her influence on all the adjacent region by every means within her reach.

In Servia the Austrians have succeeded in obtaining the railway scheme on which they had so much set their hearts, and which will have an ultimate connection with the line to Salonica, and have made a treaty of commerce by which they hope to monopolize the Servian markets. By a stretch in the term "frontier trade" many classes of Austrian goods—and one which affects England and America to some extent, agricultural machines and tools—are to go in at half the duty charged upon the same articles from other countries. In Rumania the Austrians have created the Danube question, insisting that the government and regulation of the Danube between Galatz and the Iron Gates shall be put into the hands of a mixed commission, consisting of delegates from Rumania, Bulgaria, Servia, and Austria (though Austria has no territory on this part of the river), with a second vote for Austria in case of equal division. The Rumanians oppose this very strongly, and it may not pass at present, but the Austrian agents and the Austrian newspapers are very loud in their advocacy of the right of Austria to preponderance on the Danube. In this case preponderance means monopoly. At present all the regular lines of steamers on the Danube as far as Braila and Galatz belong to Austria, though the river is nominally free to all the world by the Treaty of Paris. It is hoped that the projected mixed commission will limit this freedom by making such regulations for the examination of captains and pilots, for ships' papers, etc., that it will be impossible for foreign captains and vessels to ascend the Danube. Austria is strongly supported by Germany in this matter. England and France oppose but mildly, as up to this time they have had too much interest in keeping Austria in the European concert on the Greek question.

All these things come from articles which the Austrian delegates succeeded in getting inserted in the Treaty of Berlin of 1878. Another such provision was the one by which Bulgaria was substituted for Turkey in all engagements with Austria and with private companies in regard to the completion of the railway system. There were really no engagements of Turkey with Austria, though an attempt has been made to make an exchange of notes appear as such. Great pressure was brought to bear upon the Bulgarian Government, and a conference called the *Conférence à quatre*, containing delegates from four states —Austria, Turkey, Servia, and Rumania—has been going on at intervals for some months at Vienna for the purpose of accomplishing the junction of the railways to Constantinople. Austria insists that Bulgaria alone and unaided should build the bit of line between Eastern Rumelia and Servia, according to the old contracts made with Hirsch, although they are most iniquitous. He built the road as far as it was easy, then stopped when he came to the difficult places, and by bribery at Constantinople and various diplomatic manœuvres succeeded in getting the responsibility for the further completion of the road thrown upon the Turkish Government. The Bulgarians greatly prefer another route, which is much shorter and easier to build, from Sistova, on the Danube, to Tirnova, through the Balkans by the Hain-Bogaz Pass to the Adrianople railway at Yeni-Zaghra. The Hain-Bogaz Pass is easier than the Predeal Pass, through which the railway runs from Bucharest to Kronstadt in Transylvania. This road would be joined to the Austrian roads by a short road in Rumania, from Simnitza, opposite Sistova, to Craiova, on the main Rumanian line. What will result from this cannot be known until the issue of the *coup d'état* in Bulgaria.

This is a most unfortunate event, both for the Bulgarians and generally for the cause of liberal government in the East. Prince Alexander, from the day he ascended the throne, has always had the idea of overturning the constitution. The first Russian Agent, Davydoff, urged him to do this; the next, Cumanin, advised him to stick to the constitution, and made himself so obnoxious in this way that Prince Alexander, on his recent visit to St. Petersburg, succeeded in having him removed and replaced by Hitrovo, lately Russian Consul-General at Constantinople and at Salonica. The step of Prince Alexander was approved at St. Petersburg, at Berlin, and especially at Vienna. The King of Rumania, who is very constitutional, blames him very much. The so-called Conservative party on which the Prince relies is small in numbers, and, if the election is conducted with any fairness, it will probably go strongly against him, although at the same time he is putting his subjects in a very difficult position, because, while desirous of governing themselves, they are proud of having a prince of their own instead of a Turkish pasha. The Liberal party has taken the field, and is explaining to the people that it is much easier to get another prince than it is to get back liberty when once it has been taken away. Self-government in Bulgaria has been far more successful than its warmest friends could have expected, and the faults which have been noticed there are in no way owing to the constitution—they would have existed under any form of government; and some acts which have been blamed by foreign Powers were due to the initiative of the Prince himself. Military governors, Russians, each attended by a member of the old Conservative Ministry (in office for a short time when, immediately after his accession to the throne, the Prince tried a small *coup d'état*), have been sent to the provinces in order, so the Prince pretends, to ensure the fairness of the election. They have exercised a great pressure on the voters, and have frightened them with the prospect of a Turkish occupation in case the Prince should leave the country.

Meanwhile the Prince has obtained from the Porte orders to the Mussulmans to support his ideas and vote for him. But what is more important is the great danger that exists of an Austrian occupation in case the Prince should leave and any trouble should break out in the country. That such an occupation is intended is now an open secret. The latest information we have from Bulgaria is that, in case the elections go against the Prince, he will not convene the Assembly, nor will he abdicate, but make a real *coup d'état*, and retain his hold on power by force. It is easy to see why his course is approved at St. Petersburg. The Government there is, as we have before now remarked, strongly interested in showing its own subjects that a constitutional government and representative institutions are not suited to a Slavic people. In fact, the establishment of such institutions in Bulgaria with Russian consent has, by the galling contrast it presents to the policy of the Government at home, furnished Russian malcontents with some of their most effective ammunition. The Prince, too, has the higher clergy on his side. The Exarch came up from Constantinople and summoned a sort of synod of the bishops and archbishops at Sofia, which resolved unanimously to give the Prince the support of the church. The Exarch, however, also convened a meeting of Liberal and Conservative leaders, in order, if possible, to bring about a compromise, but without result. At the conference the Conservatives admitted the use of administrative pressure to influence the elections; and as the army is almost entirely officered by Russians, the Prince has at his disposal any amount of physical coercion he chooses to use. In fact, the crisis bears a very striking resemblance at all points to that raised by MacMahon in France in 1877. It is too much to hope that it will end in the same way. The elections took place on Monday, and the result is not known at this writing, but the Prince has apparently carried the great towns both on the Danube and in the interior.

CARLYLE'S 'REMINISCENCES' AND THEIR EDITOR.

LONDON, June 14, 1881.

IT is long since we have had so exciting a literary quarrel as that which has been raging over the ashes of Thomas Carlyle. Every one, of course, deplores it; but it is to be feared that many have enjoyed it, especially when politics, overshadowed by our melancholy Irish question, have become a weariness. Nothing was less foreseen, when Mr. Carlyle died in the odor of sanctity, as one may say, four months ago, than that he had left such a battery to be discharged as that which has startled us all. For many years past it had been known that Mr. Froude was constantly with the old man, and intended to write his life; but few people dreamt of an autobiography, and still fewer expected to see it appear so soon. You have, no doubt, all read the 'Reminiscences,' which one may treat as practically an autobiography, but probably you may hardly understand why it and the editor's conduct in publishing it have excited so much indignation in England. Gossip is, of course, just as busy here as anywhere else; people have long allowed themselves to say of one another all, and more than all, that is written in this book. Of late years a new and unfortunate habit has grown up of publishing in certain weekly papers, those which now go by the name of "society journals," a great deal of such gossip, tales and anecdotes, and comments upon private persons, which would formerly have never found its way into print. This gossip is by no means confined to people who figure in public life, and who might be considered fair game; it relates just as much to men of letters or artists, or people known in the fashionable world for their riches, or their beauty, or anything else which makes them conspicuous. Strict moralists have cried out and lamented the decadence of public sentiment; but these papers continue to be bought, especially by women, and have in some cases become very valuable properties. This being so, and personal gossip having become the order of the day, one may be surprised to find such a sensation created by a book which says no more about people dead years ago than the society journals tell us every week about each other. However, there is the fact. Whether it be that the person who tells the anecdotes and makes the sarcastic comments is in this case a great literary man, whose judgment carries more weight than that of an anonymous journalist, or whether it be that gossip in a book differs so entirely from gossip in a newspaper, I do not profess to decide; but there is no denying either the anger of those whose friends or relatives have been dealt with by Mr. Carlyle—such as the relatives of Mrs. Basil Montagu, of Mrs. Edward Irving, of the Marshall family—or the sympathy which this anger has generally met with from the public. A different and perhaps more serious ground of complaint may be found in the effect which the book has had on the estimation in which the departed sage is held. Our cultivated public was full of admiration for him, most people having read some one of his books, probably the 'French Revolution,' and the rest accepting the tradition of his great influence thirty years ago, and placing him among the four or five chieftains of our contemporary literature. Not one in ten thousand had seen him, or knew anything of his personal ways, his gruff manners, or the frequent sharpness of his tongue. A book like this, therefore, in which he says so many harsh, occasionally even unkindly things, about so many people, including some who had been kind to him, and others whom, like Wordsworth and Lamb, we love for the pleasure their writings have given us, came upon them like a thunderclap. That a great preacher of silence, strength, and righteousness should have been so little charitable and so very profuse in his judgments, and should have shown such painful weakness in his lamentations over his wife and his own want of appreciation of her while she lived, has caused the most painful revulsion of feeling.

The excitement in the literary world has been evidenced by the number of articles on the book by eminent writers, such as Sir Henry Taylor, Mrs. Oliphant, Mr. Cotter Morison, and Miss Julia Wedgwood, which have appeared in our leading magazines. Of these Mrs. Oliphant's is, perhaps, the most interesting by the details she supplies of Mrs. Carlyle and the domestic life in Cheyne Walk. Both what she tells, and what one gathers from other sources, show that Carlyle was not mistaken in his estimate of his wife's powers. She was an extremely bright and clever woman, whose natural sweetness had, perhaps, a little suffered by his protracted ill-health and by the trials almost inseparable from the career of wife to a struggling literary man. He was evidently an affectionate, yet not a considerate husband; too much absorbed in his own thoughts and his literary projects to be watchful of her health or comfort. The sense of his own powers and of the inadequate recognition which for a long time they had met with, his contempt for the frivolity he saw around him, even the attention which his life-long dyspepsia forced him to pay to himself, had all contributed to make him even at home something of an egoist. They disposed him to be always measuring himself with others, and therefore made him too harsh in his judgments of others. He was not by any means an unkindly man, but his vein of humor had plenty of satire in it; and he habitually applied to mankind a standard so high that few people could come up to it. Unfortunately his wife, who had many mortifications to undergo, many trying efforts to make in the struggles of their earlier life, did not do as much as a wife might have done to soften down these asperities of his. She was the most unwearied and loyal of helpmates to him; but she felt the trials of her life, even those which came from him. A well-known writer, in his article in the *Quarterly Review* on the 'Reminiscences,' relates that she once said to a friend, "Marrying a man of genius is a mistake; I've had a hard time of it. But wait till I die and see what an apotheosis I shall have." And having an insight into character which was not inferior to his own, she amused herself and him by sarcastic reflections on the people they met which did not, to say the least, diminish his tendency towards a criticism more acute than tender.

In a certain sense, therefore, it cannot be denied that the 'Reminiscences' fairly represent their author on one side of his mind. But before condemning him on account of them two things must be borne in mind. The first is, that he wrote them at a time of peculiar depression and misery. When he wrote the "Recollections of Edward Irving" and the "Memorials of Jane Welsh Carlyle" (and it is upon these two, not on the piece relating to his father, that the charges against him are founded) he was an old man, in bad health, and had just lost the partner of his life, whose society had cheered and supported him to an extent which he now for the first time recognized. He was alone in the world, surrounded by comparative strangers, living at Mentone, on the Mediterranean coast, as wretched as any man could be. It was not unnatural that whatever he wrote should bear the impress of his wretchedness, that he should seek some relief from the pain that oppressed him by committing his wailings to paper, that his view of life being more than usually gloomy, his views of the men and women he had known should also be tinged with bitterness. Her gifts and her sufferings being always uppermost in his mind, there was a natural tendency to disparage other persons in comparison with his wife, and almost to resent the worldly goods, the reputation, the happiness which others had enjoyed whom he felt to have been her inferiors in real merit. When one is unhappy it is not the good points of other people which most readily rise to one's recollection. A book written under such circumstances is not to be taken as the expression of a man's deliberate judgment, even though it contains evidences of his powers of analysis and description equal to any which his earlier works furnish.

What it is even more important to remember is that these 'Reminiscences' were not really a book at all. They were not written for publication. They were jotted down to relieve his own mind, just as in mental distress we try to lighten the full heart by expressing in a letter, or it may be in a diary, the feelings which would overwhelm us unexpressed. It is clear even from what Mr. Froude has told us that Carlyle did not in the first instance design these outpourings for the world's eye, and this becomes clearer from a postscript to them which his niece has published in one of the letters written in the course of her controversy with Mr. Froude, where he says that though he has never been able to make up his mind to destroy them, he thinks they ought to be destroyed. This, it need hardly be said, is the impression which the 'Reminiscences' themselves convey. It is hardly to be imagined that he could have written a great deal of what is now in print, least of all, perhaps, those moving ejaculations of grief for his wife's loss in which one seems to hear the sighs and groans drawn from the old man's inmost heart, had he ever thought of an indifferent world reading them when he had gone.

It is of course upon this that the reproaches levelled at Mr. Froude for having published the 'Reminiscences' in their present shape are grounded. There can be no doubt that Mr. Carlyle gave him full power to do what he liked with his manuscripts, relying, as he says in his will, on the discretion of his literary executor. People complain that the executor has not exercised this discretion wisely, either as respects the persons reflected on in the 'Reminiscences' or as respects the memory of Mr. Carlyle himself—a memory in which all England is interested as that of one of our greatest literary men. There is, perhaps, more weight in this second count of the accusation than in the first, for, after all, the criticisms passed on the people whom Carlyle knew will be discounted by those who observe the general gloom and bitterness of the book. Mr. Froude's defenders adduce two arguments on his behalf. The one is that a book must not be spoiled by retrenchments and omissions; that the more eminent the author the clearer the duty of giving it to the world in the form in which he left it; that otherwise we should not have the genuine thing, but only an editor's selections from it; and that it is better that two or three people should be nettled by criticisms which are really not worse than, if so bad as, what the newspapers make every day, than that the work of a great author should be spoiled by expurgation. The second is, that as regards Carlyle himself, it is in the interest of truth that his autobiography should appear much as he left it; that subsequent generations, who will read his books and judge him calmly, will value this revelation of himself as a commentary on everything else he has done, and a priceless monument of a striking character and career; that it would have been a loss to the world to have destroyed it; and that if given to the world, it ought to be given complete. Suppose that Atticus and the other people to whom Cicero's letters were addressed had destroyed them, fearing they might lower his reputation or wound the feelings of the survivors mentioned in them, we might, perhaps, have had a higher

conception of Cicero's constancy and singleness of political aim, but we should have lost not only the best means of appreciating his character as a whole, but materials of priceless value for the history of the last age of the Roman Republic. We should execrate the memory of Atticus if he had cared so much less for posterity than for the consistency of his friend. And after all, just as we do not like Cicero the less, though, perhaps, we respect him the less for his weaknesses, and certainly admire the brilliant wit and intellectual life which are displayed in his letters, so may it not be that, when the first sense of annoyance and disenchantment has passed away, we shall come back with enjoyment to a book so full of striking pictures of the life of the time, and of scenes in his own life, as this last work of Carlyle's is?

I need not attempt to decide between these opposite views, still less need I repeat the stories which pass from mouth to mouth in London regarding the personal side of the dispute between Mr. Carlyle's niece and Mr. Froude. For the moment public feeling is, no doubt, on her side; and the respect for Mr. Carlyle has suffered so serious a shock that one hears that the subscriptions to the monument it is proposed to erect to him are coming scantily in. This has no doubt given great satisfaction to the Quarterly Reviewer, who openly attacks the proposal to commemorate Carlyle in any such way. But those who feel the wonderful poetic power of his books, and the lofty tone of moral earnestness which reigns through them, will not allow their judgment of the man, as a literary man, nor their sense of his claim to honor among the luminaries of this century, to be prejudicially affected by outpourings of grief and of recollections which grief has embittered—outpourings which it is abundantly clear he would never have himself laid before that very world whose want of sympathy he so often bemoans. Y.

GERMANY'S COMMERCIAL INTERESTS.

BERLIN, June 10, 1881.

THE Hamburg question—*i.e.*, the compulsion of the old Hanse-town to give up the greater part of its advantages as a free port and to enter into the Customs-Union of the Empire—has for the last few months occupied the foreground of public interest. It is now on the point of being decided according to Bismarck's dictate. The treaty which he concluded on May 25 with the delegates of the free city is endorsed by its Senate, and has just now been submitted to the approval of the corporation of the burghers. This will not be withheld, whereupon, in conformity with Article 34 of the Imperial Constitution, the Senate will apply to the Federal Council for the admission of Hamburg into the German Customs-Union. In the face of high pressure from Berlin, and the impossibility of getting better terms, all these steps are mere formalities, and will in due time be taken without much opposition. The whole question may, therefore, be considered as settled. From October 1, 1888, Hamburg will form part of the Customs-Union, excepting a small district of the inner city, which, under certain restrictions, remains a free port; the control of customs in the city and in Cuxhaven belongs to the Hamburg Government, but will be exercised outside by the Prussian authorities. The necessary docks, wharves, and stores will be built at the common expense, but the Empire need not contribute more than forty millions of marks (a little over ten million of dollars) to that end. In order to facilitate trade and commerce, the Chancellor, at the request of Hamburg, has finally consented that ships coming in and going out, if sailing under the custom-house flag or lights, can pass freely and unmolested by custom-house regulations.

It is, therefore, less the result which has been reached after two years of tribulations than the way in which it has been reached. There is a difference of opinion even among free-traders whether in our days a free port is entitled to existence in a country like Germany; but what all alike abhor is the constraint and compulsion imposed upon Hamburg, whose objections were not listened to and which had simply to yield to the will of the stronger. It is a policy that may be excused if observed against a beaten enemy, but not towards an old ally and kinsman. The Senate, with a rather melancholy resignation, recommends the terms granted by Bismarck as the best obtainable. His press organs and political satellites, of course, did everything in their power to make the position of Hamburg unpopular, and even detestable, in the eyes of the educated and uneducated mob. With an ignorance and shallowness only equalled by the envy and greediness of these poorly-fed mouthpieces of the Chancellor, they cried out that Hamburg preserved the old traces of foreign dominion, that the English and French merchants ruled its free market, and that out of mere selfishness and lust for base gain the Hamburgers excluded national manufacturers and preferred dealing with foreign countries. Now, the truth is that Hamburg, in its own interest and as one of the great marts of the world, sells foreign as well as domestic manufactured goods; that in its large bonded warehouses all the goods of the Zollverein, as well as foreign merchandise, are sold to foreign and home traders, and that the greater the sales the better it is for the trade. The Hamburger is too shrewd a merchant not to exert himself to the utmost to do as large a business as possible, even in the face of the impediments thrown in his way. I trust the city will, therefore, in the end not lose its great importance, and the Government will only waste about a hundred million of marks, which of course must be paid out of the taxpayers' pockets.

I am at a loss to discover any advantage which the Empire will derive from the change. In the eyes of our agrarians the great crime of Hamburg was that by rectifying Russian spirits it had created a flourishing trade, which, as the protectionists against their better knowledge pretended, crippled the competition and export of German spirits. Hence the hatred of our landed aristocracy against Hamburg. The spirit interest, however, had assumed such large proportions that even the Chancellor in his last negotiations was bound to respect it. He had to consent that the rectifying distilleries, which in future will be outside of the free-port boundaries, should be at liberty to continue their business under certain restrictions. Next, the inland population declared that the rich Hamburgers ought to pay an average sum six times higher than that imposed upon them in consideration of their not paying custom-house duties. The manufacturers, especially those of Saxony and the South, complained that Hamburg flooded the German markets with imported foreign goods, while it did all in its power to prevent the export of German manufacturers. Bismarck profited by these prejudices, artificially raised, expecting a higher revenue from the old Hanse-town. I think, however, that he is mistaken. Say that the costs for new buildings, piers, warehouses, will be eighty to one hundred millions of marks; the interest on that sum will eat up more than half the duties to be paid by Hamburg proper. The only class of its population which will gain by the new arrangement is the Hamburg manufacturer and retail merchant, who, after 1888, will have open intercourse with the back country; but his advantage, in the public interest as well as from an economical point of view, is inferior to that of the wholesale trade of the city. It thus, after all, turns out but a very small victory of the national idea, as Bismarck's admirers call it, over State rights. The new state of affairs will neither enhance the well-being of Hamburg nor the wealth of Germany, nor bring new income to the imperial Treasury. The mushroom principalities are fostered and nursed with all possible care, while the sooner they go overboard the better it will be for the interests of the whole; but the largest mart of Continental Europe is at the mercy of the Chancellor. How can his plans be explained? What is he driving at? It is the old hatred of the great leading cities of the country not dependent upon the will of the Government, which as early as 1849 he wished to have destroyed, and which, if he cannot fully attain his end, he threatens to isolate and reduce to insignificance and starvation, as his late comical attacks on the Berlin city government have fully shown.

In a recent letter I mentioned the memorial which, specifying the rich bounties bestowed by France on her mercantile marine, induced the Chancellor to suggest to our merchants to ask state subsidies for the purpose of competing better with other nations. When lately the German-Chinese memorial was laid before and accepted by the Reichstag, another memorial, advocating Government subsidies for establishing steamship lines to Eastern Asia and to the South Sea, made its appearance. This time, also, the Chancellor does not directly propose to come to the assistance of the German shipping interest, but declares himself willing to receive proposals. The debate in the Reichstag has more than amply proved that no benefit other than to be let alone will be expected, and no favor asked on the part of those interested. The author of this document is a Mr. Weber, formerly German consul at Apia in the Samoa Islands, and partner of the bankrupt firm of the Godeffroys. Naturally, in his present state of mind, when all hope of resuscitating his former splendid establishment is gone, he paints black upon black. The great fault of the memorial is that we do not see where the consul ceases to speak officially and where the broken merchant and melancholy observer begins. Deputies Schlutow and Delbrück, the former a prominent shipping merchant and the latter the former Minister of State, ably refuted the statements of the memorial, and proved that our China and South Sea trade, instead of having lost its former prominent position, has greatly increased, and will further increase when the present transition from sailing vessels to steamships has been consummated. Moreover, they explained that if some of our manufacturers do not sell as much as those of other nations it is chiefly their own fault, as, besides being unreliable, they do not adapt themselves to the tastes and wants of the Asian markets. Let me quote only one fact, which at all events proves that our connections with China are already flourishing. Hamburg has a steamship line of nine fine steamships to China which pays 11 per cent. dividend, and the shares of which are quoted at 158½. Why should it ask for Government subsidies?

If there be any consolation in the present turbid state of our politics, it is the defeat of one of Bismarck's wildest socialistic schemes. In spite of all kinds of temptations, even the present Reichstag has, as Deputy Bamberger said, refused to ride with the Chancellor in the train bound for Utopia. The original bill, according to which the general Government out of its own funds was to contribute one-third of the premium to be paid by the workingmen for their compulsory insurance against accidents, had in the course of the debate dwindled down to a temporary experiment of only five years; but, neverthe-

less, this limited experiment of practical state socialism failed by 185 votes against 39 (Conservatives and Social-Democrats). The third reading of the bill will take place in about a week, but there is little prospect that the result will be changed. A majority could, perhaps, be obtained, if Bismarck would meet the opponents of the bill half way by permitting private companies, as well as the Government, to insure the workingmen's risks; but the Chancellor insists on exclusive state insurance as a condition *sine quâ non*, and already declares that he will submit the law anew to the next Reichstag, and that in the elections it will be made a deadly weapon against the Liberal parties. In the debate on the proposed measure one of the Social-Democratic deputies thanked the Chancellor for his voluntary support of his party. "He has not caught us," the gentleman triumphantly boasted, "but we have caught him. He expects to use us as a wedge, but we hold the thick end of it, and will give the ultimate decision." In answer to these words the *Provincial Correspondence*, Bismarck's official organ, declares that "the Government can only remove revolutionary dangers by recognizing the legitimate demands of the working classes, and by showing its willingness to do away with their misery and distress. For this reason state subsidies to workingmen are a practical and eminently political and salutary means, the application of which cannot longer be withheld." I, for my part, do not perceive any difference between this official pronunciamiento and the wild speeches of socialistic agitators, who want nothing more than to have the Government take into its own hands the patent medicine of state assistance for the "legitimate complaints" of the workingmen. ??

ANTOINE DE RIVAROL.—II.

PARIS, June 10, 1881.

WE left Rivarol at Hamburg. His last French friend there was Chênedollé, a young poet, who had no pleasure in the tedious work of the Dictionary. Their long collaboration ended finally in a miserable quarrel (exiles are apt to quarrel among themselves), and Chênedollé left Hamburg. Rivarol was heartily sick of this city; he has described it in verses which laugh at its old senate, its watchmen, its undertakers dressed in the *fraise* of Henri IV., its post-office, with the lazy officials and the perpetual notice, "Noch nicht angekommen," its smoked beef. He could not converse with the heavy northerners, and said with a sigh: "Do you expect me to *extravaser* myself for such people?"

After having settled his affairs with the bookseller Fauche, Rivarol left Hamburg for Berlin in the autumn of 1800. He was preceded thither by his European reputation, and recommended to the King; he was, indeed, a member of the Academy of Berlin; and Louis XVIII., who was then in Mitau, gave him an official mission near the King of Prussia. Rivarol had been very angry at the beginning of the Revolution with Frederic William II.; he went so far as to call him the "Jacobin King." He found his conduct equivocal, and accused him of having entered the coalition only to serve his selfish interests. Frederic William III. found more favor in his eyes, though he had maintained the peace of Basle, which had seemed to all the Royalists a betrayal. This King had received with a quiet dignity the ambassadors of the French Republic, Duroc and Beurnonville. He was obliged to act very cautiously in his relations with Russia, on account of the fantastic character of Paul I. Louis XVIII. had for his official representative in Berlin the Marquis of Moutier; but the marquis asked for an assistant—he was old, he could not appear much at court. Rivarol was chosen, it being thought that he could counteract a little the influence of General Beurnonville, the French ambassador.

The King of Prussia was rather afraid of Rivarol; he was too famous, too witty. He had decided that the *émigrés* of distinction could be received at his court, even without presentation by the ambassador, inasmuch as he had recognized the rights of Louis XVIII. All that was needed was a letter or certificate signed by four Frenchmen, who had already been so presented. The King, who had at the moment of Rivarol's arrival a visit from Louis Bonaparte, the brother of the French Consul, made great difficulties, so much so that Rivarol was not presented. He found a protector in the person of Queen Louise, who became a sort of official negotiator, and with her help Rivarol obtained permission for Louis XVIII. and his niece to reside in Warsaw, under the names of Count de Lille and Marchioness de la Meilleraye.

"To see myself in Prussia," wrote Rivarol at the time, "is one of the things that most astonish me. I had, indeed, proposed to myself to make once in my life a pilgrimage to the temple of Mars, but I did not foresee that circumstances would render me a resident of it. Though everything here has the military aspect of Sparta, the Muses have their sanctuary. Evenings at Rheinsberg are surely better than those of the new-rich at Paris. Here the master, without forgetting the duties imposed by his rank, can make himself loved. Whoever has a true talent finds in him a protector; whoever is unhappy is sure of his kindness. If military tactics have precedence of philosophy it is because the men who make it their profession to kill and be killed are more respected than those who do not incur the chances of war. The great Frederic so completely accustomed the *élite* of the nation to live for dying and to die for living, that one consequently sees hardly anybody ambitious of any other glory than the glory of arms. When a power is quite military, the bellicose spirit naturally becomes the national spirit. The same impulse has now overtaken France. If you do not become the happiest people in the world, you will at least fill long and fine pages in the book of history."

Rivarol was much interested in the artificial state of things which had been created in Paris. He could not, however, relinquish his French taste; the porcelain of Berlin did not seem to him equal to that of Sèvres; he did not much like the imported Roman architecture of the palaces. He laughed a little at the Academy of Berlin, which had lost its great men, Voltaire and Maupertuis: "A place in the Prussian Academy resembles somewhat a canonry. The Chevalier de Boufflers has had a seat for years; he has slept so long in it that he now thinks of going to wake up in France and die there." France seemed still to Rivarol the promised land; "I see her from afar, but I shall never return to her."

Rivarol had found in Berlin with the Chevalier de Boufflers the charming Madame de Sabran. He became very intimate with the Princess Dolgorouki, who was painted by Madame Vigée-Lebrun in the costume of a sibyl. Madame Lebrun, the most agreeable painter of portraits of that age, speaks in her amusing memoirs of the Princess Dolgorouki, whom she met at the house of Count Cobentzel, in St. Petersburg: "The beauty of Princess Dolgorouki struck me. Her features had something Greek, mixed with something Jewish." She was extremely clever, spoke French to perfection, and had a great court of admirers and friends. It was in her honor that Potemkin had given the famous banquet at which diamonds were served in cups of crystal. It was for her that he had sent a courier from St. Petersburg to Paris in order to buy a pair of shoes for a ball. The friendship of Princess Dolgorouki for Rivarol soon made of him a sort of lion in Berlin. He seems to have felt for the amiable Russian something more than common friendship. She became his Beatrice; he wrote verses for her; she inspired him and consoled him in his exile. He had received some indirect offers from the First Consul, Bonaparte. He had but to speak one word to have his name struck off the list of the *émigrés*, but could not decide to utter it, as so many others had done. "Condemned to live in Germany," he wrote in a letter, "I still have the soul of a Frenchman. The injustice of a few men shall never detach me from my country. When the thunder is heard it is allowable to look for shelter. That is what I did. If the political horizon changes I shall see Paris again."

Rivarol fell ill in the year 1801, but not so much at first that he could not write many letters. He kept up an active correspondence with his friend Cappadoce. After a while he became more ill, and on the 11th of April, 1801, he died of a pernicious fever. Sulpice de la Platière wrote, in 1802, a 'Vie philosophique, politique, et littéraire de Rivarol,' and said that Rivarol died like an Epicurean. "He wished," said he, "to be transported to the country, and asked that his room be filled with flowers, and his windows opened, so that he might to the end see beds of roses and breathe their perfume. Feeling that life was abandoning him, he said to the persons who were by him: 'My friends, there comes the great shadow. These roses will now be changed into poppies. It is time to enter into eternity.' Then he had a short moment of delirium, and asked for some Attic figs and for nectar." The same writer says that Princess Dolgorouki published an advertisement in all the German newspapers, saying that all the creditors of Rivarol would be paid by her on presenting themselves at her house. Now, this is all romance, yet it has been repeated a hundred times, even in the *Biographie Michaud*. There is an authentic account of the last days of Rivarol written by M. de Dampmartin, who was his friend and his executor. M. de Lescure has published this "Relation." M. de Dampmartin wrote at the time to a brother of Rivarol's:

'All the accounts of the death of your illustrious brother are spoiled by romantic details which have not the slightest foundation. The account of the *Journal des Débats* is well executed in point of style and sentiment, but it has not the least accuracy. Rivarol was not transported to the country; he suffered and died in his furnished apartment, in the midst of Berlin, where he certainly could see neither country nor rivulet; but his fellow-lodgers showed him a kindness worthy of all praise. As he lost his mind during the two last days, he did not make the speeches which are put in his mouth. At the time of his death there was nobody with him but the *curé*, Donadei, the lodger and his son, and myself. Princess Dolgorouki took the greatest interest in your brother and I doubt not of her regrets, but she did not advertise that she would pay Rivarol's debts. Such an announcement would have been very extraordinary, as he lived most quietly. Besides, the Princess owed him still thirty-five louis, and her friend, Madame de Galitzin, twenty-five louis, for the purchase of his little library. The two sums have been paid exactly."

Donadei, who is mentioned in this letter, was an intimate friend of Rivarol's. He was an executor with M. de Dampmartin. The papers were all left in their hands. Rivarol left a son, who was in Paris; he had always provided for his education, and he left him everything he had, which was but very little. I do not know what became of this son.

There appeared an edition of the works of Rivarol in five volumes at the beginning of the century. Afterwards a selection was made from these five volumes, and this reduced edition is all that is now read of the man who, for a number of years, passed for the most brilliant wit and *homme d'esprit* in France. He missed being a great man; he was too meteoric, he left no mark, he spent himself in *petite monnaie*. Still, his name deserves to be remembered. He was firm and courageous in the face of the French Revolution; he abhorred its crimes and excesses, though he felt inclined by his natural liberalism towards parliamentary government. He was a victim among thousands of victims; for if he did not die on the scaffold, he suffered the long death of exile.

Correspondence.

CARL SCHURZ ON THE INDIAN PROBLEM.

To the Editor of The Nation:

Sir: Among the few statesmen of commanding influence in practical politics whose views upon broad questions of public economy are entitled to respect, no one occupies a higher position than Mr. Carl Schurz. He possesses a mind which is at once highly trained, vigorous, scientific, and practical, and all his public speeches and writings are distinguished by an intellectual power which is rare enough among English-thinking men, and still rarer among Germans—the power, namely, of observing with quiet impartiality the concrete facts of life, and then of reasoning cautiously from those facts to sound general conclusions. In the current number of the *North American Review* he has an admirable article on the "Present Aspects of the Indian Problem," which he discusses with a grasp of facts, a calmness of judgment, and a breadth of view which, to those gentlemen who recently pursued and persecuted him with their furious hate, ill-temper, self-conceit, and perverse ignorance, must be simply exasperating and sickening. Mr. Schurz neither agrees with those whose sentiment in regard to the Indian is expressed in the couplet which belongs to the popular poetry of the Western plains,

> "Lo! the poor Indian, whose untutored mind
> Steals the fat ox, nor leaves the horse behind,"

nor yet with those who, seeing in the Indian the virtue undefiled of the "natural" man, claim for him all the rights and privileges of American citizenship. His hope is simply that the Indians may become self-supporting as small farmers and herders, and possibly also as merchants on a small scale, and as a means of preparing them for such careers he suggests three things—first, that the Indians "be taught to work by making work profitable and attractive to them"; secondly, "that they be educated, especially the youth of both sexes"; and, thirdly, "that they be individualized in the possession of property by settlement in severalty with a fee-simple title." In regard to the first two suggestions there can be no doubt about their soundness and practicability, but the third proposition calls for careful consideration. What does Mr. Schurz mean by "individualizing" the Indians "by settlement in severalty with a fee-simple title"?

There is reason to believe that Mr. Schurz has not carefully studied the legal status of the Indian and does not see the importance of studying it, and I cannot but think that by consequence he is throwing his influence in favor of legislation which is essentially unwise and unjust to the Indian. In the article under review, for example, he strongly commends the "Severalty" Bill, which was before the Senate last winter, and which in its sixth section provides that, after the allotment of land in severalty, the allottees "shall be subject to the laws, both civil and criminal, of the State or Territory in which they may reside." It is not quite clear what the effect of this provision would be, and it seems that even the framers of it do not pretend to understand it thoroughly. Senator Coke, of Texas, in the argument upon it said: "If the courts declare him [the Indian] a citizen on the facts stated in this bill, of course *he will have to take his chances as a citizen;* but until they shall declare him a citizen we desire some jurisdiction by which the Interior Department, the representative of the national Government, can aid the Indian in his efforts to become civilized." In the January number of the *American Law Review* I examined the authorities relating to the legal position of the Indian, and the conclusions to which I was led may be quite briefly summarized as follows:

1. That an Indian as a member of a tribe and living with it on a reservation is not a citizen—that is, a member of our body politic, subject to its laws, and owing allegiance to the sovereign power and entitled to its protection; that as a visitor among us, and separated from his tribe, he stands on the same footing as any resident alien, excepting that under our existing naturalization laws he cannot become a citizen.

2. That Congress possesses absolute power over the Indian tribes without the limits of a State, and over the Indian tribes within the limits of a State the power to regulate their intercourse with the white man.

3. That if the tribal relations were broken up and the Indians were made persons subject to our laws it would follow, first, that all children of Indians hereafter born would be citizens, and as such entitled to vote; secondly, that all treaties with the Indian tribes would be abrogated; and, thirdly, that the Indian tribes within the limits of a State would be withdrawn from that protection which Congress may extend over them in the exercise of its power to regulate commerce, and that those who are without the limits of a State would be withdrawn from that general control and protection which Congress may properly exercise over subject tribes or "wards of the nation," but cannot properly exercise over citizens.

Now, if these propositions are true (and the decisions of the Supreme Court have really placed them beyond dispute), it is clear that the proper way to solve the Indian problem, for the present at least, is not by "individualizing" the Indians out of their tribal relations, and that a bill like the "Severalty" Bill, which leaves it in doubt whether the effect of it will be so to "individualize" them, is an unsafe measure. This is a matter of vital importance to the Indians, and it is unfortunate that hitherto but little attention has been given to it.

The Indians are not yet prepared for citizenship; they are prepared neither for its rights and privileges nor for its obligations. It would not, therefore, be of any advantage to them to make them citizens, to impose upon them the burden of taxation, and to give them the right to vote and to use their property without restraint, and to enjoy all those liberties which are now secured to us in our constitutions, and which the experience accumulated during the long period of our struggle for them has taught us to use wisely. This is not the relief which the Indians need, or which they are asking for. On the other hand, it would be a positive disadvantage to them to break up the tribal organizations and to "individualize" them before the law. What the Indians now most need is, as Mr. Schurz himself says, "the protecting and guiding care of the Government during the dangerous period of transition from savage to civilized life." This "protecting and guiding care" may be extended to them so long as the tribal organizations are maintained and they are governed as distinct political communities, but cannot be extended to them if they are "individualized" and incorporated as members of our body politic. If "individualized," those Indians who are within the limits of a State would be withdrawn from the power of Congress to keep them exempt from taxation, to prevent the introduction and sale of liquor among them, and, in general, to regulate and control our intercourse with them. To be sure, they would have the protection of the Fourteenth and Fifteenth Amendments, but that would be of little practical value to them as compared with that which Congress may now give by virtue of its power "to regulate commerce with the Indian tribes." On the other hand, as to those Indians who are without the limits of a State, although their position would not be affected in the same way as that of the Indians within State limits, still it would be unfavorably affected; for, if placed upon the same footing with other citizens, Congress could not properly, even if it could legally, give them the protection which their present situation calls for. It would certainly not be in accord with the spirit of our institutions that the Indians should exist as a peculiar, favored class of citizens, and that, as such citizens, Congress should exempt them from taxation, and manage the large funds which it now holds in trust for them, and in general exercise over them a special control and supervision. The argument which was urged in favor of making the negro a citizen does not apply to the Indians, for there is no analogy between the two cases; the negroes were all residents within States, and they were practically at the mercy of the hostile State legislatures. It was thought best, therefore, to give them the right to vote, and by the Fourteenth and Fifteenth Amendments to restrict the power of the States to wrong them by discriminating legislation. The Indians, however, are mostly resident without State limits, and those who are within State limits Congress may effectually protect against unjust State legislation through its power to regulate all intercourse with them. If, therefore, we should make them citizens, so far from giving them protection against injustice, and more particularly the protection of the national Government as against the injustice of any State, we should actually deprive them of it.

It seems to me, therefore, that the best interests of the Indians require, not the passage of such an ambiguous instrument as the "Severalty" Bill, but the enactment of a law which, while it shall embody in general the views of Mr. Schurz, shall also distinctly and firmly maintain the existence of the tribal organizations. Consistently with this lands may be allotted to individuals, and the jurisdiction of the United States courts in the neighborhood may be extended over them, or special courts may be established to protect their rights to such allotted lands, and, if necessary, the power of Congress may be limited by constitutional amendment, or it may limit its own power by special statutes. In one respect, indeed, an enlargement of the power of Congress is to be favored. It would be well to add an amendment to the Constitution by which the Indians within State limits might be brought wholly under the control of Congress and placed on the same footing as Indians without State limits; for it is to be assumed that a policy guided and sus-

tained by the good sense and humanity of the nation as a whole would be more in accord with substantial justice and the general welfare of the country than any policy of a single State, controlled by its own narrow and selfish interests.—Yours truly, GEORGE F. CANFIELD.

NEW YORK, June 22, 1881.

SYMPATHETIC BANKING.

TO THE EDITOR OF THE NATION:

SIR: In his excellent article in the last *Atlantic* on the Ladies' Deposit swindle of Boston Mr. H. A. Clapp naturally alludes to a similar enterprise that was lately exposed in Munich, the Dachauer Bank, of which Fräulein Adele Spitzeder, a retired actress, was the heroine; but he neglects to mention one feature of the Bavarian institution which gave it a firmer basis of "sympathy" than was even claimed by Mrs. Howe. The Boston adventuress could only refer in a vague way to certain benevolent Quakers, who, of course, were never visible to the eyes of the curious. But the Spitzeder received tangible, open, and effective support from the Church which refused to bury Molière because he was a comedian. She was aided not only by prayers, which doubtless secured the divine favor for her benevolent scheme, but also by fervid exhortations from the pulpit and industrious canvassing by the clergy among the peasants and artisans. The cupidity of depositors was, in other words, stimulated by the priests, to the advantage, first, of a woman whose career had been disreputable, whose character was bad, and whose "banking" system could not possibly be honest, but who attended Mass regularly and made large bequests to the cause of religion; and, secondly, of the Church itself, which greedily accepted such bequests and made no enquiry into the lawfulness of their origin. In view of these facts it is doubtful whether Mr. Clapp is justified in saying that the superior intelligence of the Boston public required Mrs. Howe to adopt a more adroit and seductive system. If she succeeded so well by purely secular methods, what would have been the result if the clergy had taken her up; if Dr. Peabody had prayed for her in the Harvard pulpit, if Mr. James Freeman Clarke had publicly preached in her behalf, and Rev. Phillips Brooks had gone about soliciting deposits from his parishioners?

The reckless if not positively dishonest willingness of the Bavarian Church to encourage and profit from such a swindle as that of Spitzeder may serve also to draw attention once more to a recent experiment in "sympathetic banking" at Cincinnati, through which thousands of pious victims lost their *petty hoards*, and for which a worthy Catholic prelate is now doubtless suffering pangs of the keenest remorse.

I have the honor to be, etc., H. T.

HILLSBORO, OHIO, June 21, 1881.

THE TEMPERANCE PLANK IN THE OHIO PLATFORM.

TO THE EDITOR OF THE NATION:

SIR: In last week's *Nation* you quote from the platform of the Ohio Republican Convention the following resolution:

"The public interests require that the General Assembly should submit to a vote of the people such amendments to the constitution of the State relative to the manufacture, sale, and use of intoxicating liquor as shall leave the whole matter to legislation."

Upon this you remark: "This may be taken to mean much or little, and was, of course, so intended."

Here you do the Ohio Republicans great injustice. Nothing could be more definite than the proposition enunciated by them. The present constitution of Ohio, adopted in 1851 during the first gush of the political temperance excitement, provides that "the General Assembly shall have no power to license the traffic in intoxicating liquors." The object of the proviso was, of course, to prohibit and to prevent the retail trade in liquors entirely. The effect may have been to prohibit it in theory (I believe there is a section in the Revised Statutes of Ohio making the retail sale of liquor a misdemeanor), but at the same time to make the trade practically quite free, and moreover to give it this privilege, that the dealers in whiskey or beer, to be drunk on the premises, alone of all merchants pay no license-tax to the State or to its cities.

The object of the proposed amendment to the constitution is to put the liquor-trade in a position to be subjected to the control of the State, and to make it pay its due share of the public burdens, as is done elsewhere; while at present, under pretence of being everywhere unlawful, it is everywhere in Ohio carried on most openly with perfect freedom from all police-regulation and from all taxation.—Respectfully, L. N. D.

LOUISVILLE, KY., June 20, 1881.

Notes.

FORDS, HOWARD & HULBERT publish immediately 'The Fate of Madame La Tour,' an anti-Mormon novel, by Mrs. A. G. Paddock, a Gentile resident of Utah. They have in press an edition of the Revised Version of the New Testament in which the readings and renderings preferred by the American Committee are incorporated in the text instead of being relegated to the notes.——A member of this committee contributes a chapter to Dr. Alexander Roberts's 'Companion to the Revised Version' (New York: Cassell & Co.) in defence of the "American Appendix." He intimates that the constitution of the American Bible Society may be altered to permit it to publish an edition like that announced above by Fords, Howard & Hulbert.——Van Antwerp, Bragg & Co., Cincinnati, have printed a new edition, from the plates, of Carl Ritter's 'Geographical Studies' and 'Comparative Geography' as translated twenty and sixteen years ago by W. L. Gage. Each volume contains a spirited likeness of the author.——Macmillan & Co.'s 'Memorials of Lord Beaconsfield' consists wholly of the London *Standard's* obituary notice and its various reports down to the last rites of the ex-premier. The steel portrait is very feeble, especially by contrast with such a masterpiece as Mr. Cole's wood-engraving in a late *Scribner*.——Readers of the May *Harper* will remember the article on "Camp Lou"—in the Adirondacks, namely. While prescribing camp-life in that country even in winter as a cure for consumption, it was noticeably free from extravagance. The author, Mr. Marc Cook, has now reprinted it, with fuller details, in a book entitled 'The Wilderness Cure' (New York: Wm. Wood & Co.) It will hardly excite any illusions, and its influence must be wholly good.——An extra number of the *Monograph* (Bangor) begins a translation of Bodenstedt's much-discussed 'Letters from America.'——An exhibition of American wood-engravings will be opened October 4 at the Boston Museum of Fine Arts. No contribution from a single source should exceed ten in number, and the prints need not be framed. They should be sent before September 28 to the Curator, at the expense of the Museum both ways.——The Board of Regents of the University of Michigan are planning the establishment of a School of Political Science, in connection with the literary department.——The constitution of the Chicago Democratic Club adopts thorough civil-service reform ground in its eighth article. This is more significant than like doctrine in party platforms, as lately in the resolutions of the Democratic Iowa State Constitution, the party there being in a hopeless minority.——A Swiss gentleman, the translator, by permission, of several of the late George Eliot's works, writes to the *Athenæum* that he made in the winter of 1849–50 a portrait of Miss Evans—"petit buste peint à l'huile"—which he utterly refuses to copy or let be copied for any one except Mr. Cross.——Mr. Christern will receive subscriptions for a 'Manuel de l'Amateur d'Estampes,' edited by M. Eugène Dutuit, and illustrated by fac-similes of the rarest engravings, executed by heliogravure. The work will form eight volumes of 500 pages 8vo.——Dietrich Reimer, Berlin, has brought out a map of the boundaries of the Cis-Danubian principalities according to the Treaty of Berlin on a scale of 1 : 300,000. The various originals on which it has been based by Dr. H. Kiepert were those made by the European Commission of 1879, part of which have never been multiplied, and all are inaccessible to the general public. He has amended or commented it also from other sources. In general, the transcription of proper names has been done *à la française*.——The same publisher sends us the twelfth edition of his political and physical wall-maps of Africa, beautifully colored, and designed for school use, but issued in six sheets stitched in atlas form. The editor is Richard Kiepert.—— *Le Livre* for June anticipates the third sale of the Firmin-Didot collection with some account of its riches, particularly of the MSS. It also gives a reduced specimen of the plates engraved after Hans Makart's designs for the procession in honor of the Imperial silver-wedding at Vienna in 1879. The various symbolic groups of this cortège, it will be remembered, were conceived in the spirit of the Renaissance: the one reproduced in *Le Livre* represents the car of Gutenberg, with his press in operation. The fifty plates, after having been used in the magnificent municipal memorial of the festival, are about to be destroyed, but *Le Livre* has acquired the right to take a few last impressions from them, which are offered by subscription, with explanatory text, for one hundred francs.——Lecture-course committees should not overlook the fact that Mr. Edward A. Freeman, the historian, is engaged to lecture during the coming season before the Boston Lowell Institute and Baltimore Peabody Institute. Doubtless he will be open to other engagements.

—The inscrutability of the feminine mind appears to be the moral of Mr. Howells's "A Fearful Responsibility," which is concluded in the July *Scribner*. Mr. Cable's "Madame Delphine" ends also, in a tremendous act of self-sacrifice to bring about an illegal union between white and imperceptibly not-white blood. "Uncle Remus" shows no decline of his powers, though he is in the afternoon of his "Rainy Day." On the contrary, Mr. Harris has never better displayed his mastery of the plantation dialect and mode of thought than in the present instalment of his negro fables. In his "Mr. Lion hunts for Mr. Man" we have a black version of Æsop, with graphic-poetic touches such as—"Sun, she rise up en shine hot, but Mr. Lion, he keep on; win', hit come up en blow, en fill de elements full er dust; rain, hit drif' up en drizzle down; but Mr. Lion, he keep on," etc. "Mr. Ben-

jamin Ram," a new character on Uncle Remus's stage, is described as "wunner dem ar kinder fiddlers w'at can't git de chune down fine 'less dey pats der foot," and indeed Mr. Harris's padding or setting continues as droll and interesting as the fables themselves. The author of 'A True Republic' returns to the attack on established political notions and usages in a first paper entitled "The People's Problem." As in his former work, Mr. Stickney's style is nervous, condensed, epigrammatic, and his argument unfolds itself in an order perhaps too severely rigid and numerical to be as clear as he designed it to be: we do not always need to see the end from the beginning in order to be led along to conviction. We doubt, too, if Mr. Stickney has avoided the ambiguity which commonly attends the use of the word "people" in political discussion. "The people are angry," he says, in view of such obstructions as the street-cleaning and Senatorial deadlocks. But are they angry? And who are "the people"? Later on he says: "It is a most singular system of slavery. We, the people, have forged our own chains, have put them on, we keep them in repair, and we renew them." This is hardly the mark of anger. Still, the article is full of suggestiveness, and some points are very forcibly presented. Thus: "We all know that there are two or three men—the Governor of the State of New York, the United States Senators from New York, and the Vice-President of the United States—who could, by a word honestly spoken, give to the city of New York clean streets, and save hundreds, perhaps thousands, of lives." Likewise, this is a very happy phrase: "Centralization of odium is, however, a remedy which we do not have." Mr. Stickney attacks the proposal to admit Cabinet officers to the floor of Congress, and speaks lightly of examinations for fitness in the lower grades of the civil service as a beginning of reform that shall extend finally to the heads of departments. In neither particular can we agree with him, but it is only fair to await the development of his remedy, which is promised in the next number of *Scribner*.

—The German historian of the United States, Professor Von Holst, discusses "The Army Question in Europe" in the July number of the *International Review*. His article is not the less interesting for being suggestive rather than conclusive. The effect of American economical competition upon the European military establishments is his specific subject, and his presentation of significant facts is comprehensive. Our army costs us but $1 *per caput* against $1 77 of cost to the inhabitant of Europe, and, besides this direct tax, but $\frac{1}{20}$ of one per cent. of our population is withdrawn from productive labor, while over one per cent. is thus withdrawn in Europe. As germane to the question of economical competition Dr. Von Holst also mentions, of course, our superior territory and resources, and the fact that our immigrants have in general been exclusively a charge to Europe and are productive capital to us, who get their services without having to pay for the cost of their infancy and training. Europe, he concludes, will have to get rid of its military incubus, but he scouts the notions and methods of the peace societies and prescribes a strictly homœopathic treatment—in accordance with the maxim *Similia similibus curantur*. Germany, he thinks, must begin the reformatory movement, because its geographical position, history, and political structure render it the most exposed of European countries. She can do so "only by enhancing and not reducing her military strength." This should be brought about by giving boys an early military education, and thus rendering the whole population, as it were, a defensive army in case of need. A corresponding decrease in the offensive force would follow, of course. He suggests two years' service also instead of three, and defends the idea against well-known objections. Early military instruction, moreover, would, he imagines, quicken the sense of duty, which "is getting more and more blunted in all strata of society." His scheme, it must be acknowledged, compels the inference that the other Powers would follow Germany's example when they saw her reducing her armament. The military question is certainly an imminent one, but, as it is inextricably bound up with the social question through which, indeed, American competition must operate in order to affect it practically, we wish Professor Von Holst had considered that also with reference to Germany, instead of confining himself merely to predicting the speedy downfall of the English aristocracy. If we send Germany cheap food, does such "competition" tend to impoverish the nation as a whole, or to reduce the rents of landlords, whose farms will be worth less? In short, the professor leaves room for another article showing the precise applicability of this one more fully, if the subject is to be allowed the immediate interest he claims for it. Of the other papers of the number, which is a "solid" one, Mr. Edward Atkinson's explanation of "What Makes the Rate of Interest?" is particularly worth notice on account of the rarity with which what may be called "human" considerations figure in economical discussions. Such things as these have a novel sound and were well worth saying: "A very low rate of interest in a country of such unlimited possibilities as our own is not a matter to boast of overmuch. . . . The productive capacity of this country has, during the last decade, outrun the social, political, and industrial education of the people. . . . This is a mental, not a material question. The ability to use borrowed capital on a large and profitable scale is a rare capacity, and whoever possesses it can always command a high price for his services." In short, a main consideration which fixes the rate of interest is the demand for capital, and this is in great part determined by the amount of brains in the people who want to borrow.

—"M. C. R." writes us from Baltimore:

"Nearing, as we are, the close of our centennial fervors, we should like to ask, What contributions to our historical literature will remain to commemorate the national enthusiasm? Aside from magazine articles and battle-field orations, has any substantial and permanent literary monument been raised to the memory of the founders of the great Republic? Has historic criticism evolved any new theories of Revolutionary facts or characters, or superseded any old one? If Schlegel reasons well when he makes the first requisite for a national literature to be national recollections, do not our national recollections need a more patronizing and protective policy?"

—Heretofore the population of the world has been largely distributed according to its valleys, and every work on physical geography, even the most elementary, calls attention to the primary difference between the structure of the New World and of the Old, in the greater simplicity of structure of the former as compared with that of the latter, and the influence these physical features have had on the political history and resources of the respective countries. Europe, in particular, is a country of small basins, almost every one of which has been at some time the seat of a particular political organization, the existence of which depended largely on the character of these basins and the barriers which separated them. The Census Bulletin No. 78 shows the actual distribution of our population in 1870 and in 1880 according to the drainage-basins, both in detail and in larger groupings. The tables include about one hundred basins or drainage areas, differing greatly as to aggregate populations and relative density, and ranging from the Delaware River, with an average population of one hundred and seventy-six on each square mile of its area, to the great basins of the Yellowstone and Little Colorado, with one person to each ten square miles. The most noticeable feature is that the density in these various river-basins is not proportionate to their food-producing capabilities. Formerly this relation was much more intimate than now, or than it will be in the future. Modern steam transportation has so changed the terms of the problem that the valleys of the Delaware and Hudson, with their large cities and great manufactories, may continue to have a vastly denser population than the fertile agricultural valleys of Ohio and of Western New York. Yet, in the wider sense, the old rule holds good now. More than half of our aggregate population is in the fertile basin popularly called the "great Central Valley," and nearly one-half in the actual basin of the Mississippi. Of the several portions of the Mississippi basin that of the Ohio River has naturally the denser population; most thickly-gathered is that of the Miami basin, which reaches one hundred and nine per square mile. Bulletin No. 88, which deals with the distribution of population according to elevation, is equally interesting to scientists. It is usually believed that elevations more than five hundred feet above the level of the sea are more healthy for people of our race than lower ones. These tables show that in the United States, while nearly all of the large cities are below five hundred feet, nevertheless more than three-fifths of the entire population live above that level. The most of the agricultural land of the United States lies between the elevations of five hundred and fifteen hundred feet, and considerably more than half of the entire population live within these altitudes. The greater increase in the total percentage of population during the last ten years was in this belt, and will probably continue to be during the next decade, for it contains a majority of the farming land open to foreign immigration, and it is the region where the natural family increase would be greatest.

—The language in which scientific investigators make known their work is expected to be quite unintelligible to those not professionally acquainted with the subjects treated. Indeed, it might to the world at large be an open question whether the language itself expressed anything more than the vagaries of a wandering mind but for the facts that everything written is well understood by a considerable body of persons, and that such practical results of mathematical and chemical formulæ as the successful prediction of eclipses and the application of chemical principles to the purposes of daily life show that the men really know what they are talking about. To this, however, the American Philosophical Society has been offering an exception so notable as to be worthy of very serious investigation, in the interests either of psychology or of science. Mr. Pliny Earle Chase is a member of the Society whose personal qualities and intellectual standing have given him a high and well-deserved place in the esteem and affections not only of his scientific associates, but of all who know him. This gentleman has, for nearly twenty years, been publishing a continuous series of investigations, in the Proceedings of the Society and elsewhere, of which, we feel confident, not a human being except himself understands the processes or conclusions. His contributions seem to increase rather than diminish in number, volume, and unintelligibility. Unless vigorous measures are taken to explain and popularize Mr. Chase's work, there is great danger that the men of the future will be perplexed to assign it a category. There is, indeed, plenty of vague and unmeaning specu-

lation in scientific literature, but it consists mostly of isolated papers by authors who, having freed their minds, were thereafter content to remain silent. We know of no such long-continued series of investigations as those alluded to except by men who had something of value to communicate. The second hundred of Mr. Chase's papers is well advanced, and the volume of Proceedings just issued contains a number more, including forty-four "Photodynamic Notes." He describes his papers as being in support of the General Postulate: "All physical phenomena are due to an Omnipresent Power, acting in ways which may be represented by harmonic or cyclical undulations in an elastic medium." Among the titles of the "Photodynamic Notes" are: The Photodynamic Year; Centre of Planetary Inertia; Earth's Rupturing or Projectile Locus; Weighing the Sun by a Soap-bubble; Centres of Density and Nucleation; Infra-Mercurial Photodynamic Notes; Photodynamic Projection of Hydrogen.

—It is very difficult to present extracts from Mr. Chase's statements which shall fairly represent their intelligibility, because intelligibility is injured by the separation of the parts of a series from what precedes them, and so much of the matter is in the form of tables and formulæ that only the commencement and conclusion of processes can be dissociated from them. The photodynamic estimate of the earth's mass (p. 268) commences as follows:

"I have shown, in my discussion of 'Earth's orbital eccentricity and its correlations' (Note 3), that Sun's surface is the fulcrum of equilibrium between the two principal masses of our system (Sun and Jupiter), at the locus of rupturing projection, or the secular perihelion centre of gravity of Sun and Jupiter. I also showed, in my first paper on photodynamics, that the antagonistic mean leverage of Sun and Jupiter produces disturbances, at the directrix-locus of the stellar-solar paraboloids, which furnish a very close approximation to the ratio between solar and terrestrial superficial gravitating energy. The forces which have established these harmonies must act under special conditions of equilibrium at the centre of condensation (Earth), and it seems probable that those conditions may be less subject to extraneous disturbance than either of the other adjustments which I have investigated."

A conclusion from the results of "Nodal co-ordination" is—

"The sum of the reactionary gravitating impulses at Jupiter's surface during a half-rotation is due, in part, to the sum of the reactionary impulses at Sun's surface during the time of communicating orbital velocity, and in part to the acceleration of Sun's atmospheric condensation to the locus of nebular rupture."

Other statements in which nothing is lost by disconnection, since they begin new subjects or state conclusions, are:

"If we take axial rotation at the centre of density as the unit of comparison, the synchronous rotation and revolution of the nebular hypothesis has been accelerated 365.2565-fold by Earth's condensation and other causes" (p. 363).

"The accumulating evidences of universal photodynamic energy, leading to various accordant æthereal, gaseous, and cosmical harmonies, are such as to justify another tentative step in the same direction. From chemical analogy the planetary aggregations at the centres of nebulosity and of density may well be presumed to give indications of the comparative energies of condensed and of uncondensed æther" (p. 369).

"The reaction of gravitation against photodynamic action, at the centre of any stellar system, requires that

Modulus of light : Stellar semi-circumference : : $V\lambda$: Vr" (p. 368).

Excepting the last, these extracts are exceptionally free from technicalities, being attempts of the author to state his results in ordinary language. Most curious are the combinations of chemical, geometrical, and astronomical terms, and the use of a mathematical nomenclature of which no explanation, so far as we can find, is attempted. Mr. Chase speaks, for instance, of "the fundamental radius of my harmonic forecasts"; "the modulus of reacting-mass"; "harmonic nodes"; "supra-Neptunian harmonies"; "the solar nucleal equation"; "the photodynamic centre of planetary inertia"; "Jupiter's isochronous radius"; "a pendulum-extremity of wave propagation"; "Earth's nascent velocity"; "nucleal efficient velocity"; "Saturn's locus of incipient subsidence"; "Venus's linear centre of oscillation of incipient subsidence, or of secular aphelion"; "a series of paraboidal abscissas which complete the photodynamic demonstration of a harmonic nodal action uniting the solar, planetary, and stellar systems." All this, be it remembered, is from the published Proceedings of the oldest scientific society in the country, and has been going on without interruption since 1863, without leading to any result that any one besides the author has yet been able to understand. We think the Society owes it to its good name to institute some enquiry by which the meaning and results of the most extended series of papers it has published in recent times shall be made known, if they exist.

—In the last number of the *Hermes* Professor Mommsen has volatilized the unfortunate brother of Romulus. The dissipation of his shadowy figure is not much to be regretted. Independent existence he had little or none in literature. Occasionally he serves as a *deus ex machinâ* to the desperate Roman poet who cannot get an oblique case of Romulus into his hexameters. Remus is a popular negro name which is just now unusually current, thanks to Mr. Harris. Other use for Remus is not discernible. The notion of a founder is the notion of a unit; a twin founder, Professor Mommsen thinks, is a solecism in the legend of Rome, and the legend itself felt it to be so by eliminating the untoward twin as soon as possible. Professor Mommsen has reviewed the evidence with his wonted skill. The legend of the twins was full blown 458 A.U.C., when the famous image of the she-wolf with her sucklings was set up. Starting from this well-established fact Professor Mommsen finds but one Greek authority of any importance, the Syracusan Callias, contemporary and historian of King Agathocles, who died 289 B.C.—465 A.U.C. According to this author Latinus, king of the aborigines, and son of Telemachus and Circe, married Romé, daughter of the Trojan woman that fired the fleet of the Trojans and forced them to settle in Latium. Of their three sons Telegonus—so Horace's Telegonus was not "parricida" after all—became the founder of Tusculum, Romus and Romulus the founders of Rome. Part of this story is Greek, but part is of native Italian origin. Latinus, Romé, and Romus are Greeks, but Romulus and the aborigines are Italians. From this it appears that the legend of the twins was current in the middle of the fifth century of the city, at least a hundred years before the real beginnings of Roman literature; and yet whence this superfluous son of Mars? There is no trace of Remus in sacral legend, no expiatory sacrifice perpetuating his name, no trace of him in political nomenclature, none in legendary topography. There was a house of Romulus and a cave of Romulus, but only poets speak of *domus ista Remi*, and for that the pentameter, not the people, must be held responsible. The conclusion at which Professor Mommsen arrives after a careful investigation, which cannot be followed here in detail, is that the legend of the twins was developed from the consulship, which is thus made essentially like the original kingly power. The story of Romulus and Remus, or Remus and Romulus, to take the older arrangement, presents us with an anticipation of the double rule, one king acting, the other not acting, and differing from the consulship only in length of tenure and turn of office. The oldest form of the legend knew nothing of the twins, and recognized only one king, as only one supreme god. As the hind suckled Telephus, so the she-wolf suckled Romulus. The twins are a creation of republican Rome, and the legend was worked out between the expulsion of the kings and the Samnite wars.

—Our correspondent in Cairo sends us the following extract from a private letter from the new Director of the Boulak Museum. It should be read in connection with the letter, "A New Discovery for Egyptology," on p. 313 of the present volume:

"BOULAQ, le 1 juin, 1881.

"Je pars ce soir pour Alexandrie. Avant de quitter le Caire, je suis allé lundi à Sakkarah, où la pyramide à laquelle on travaillait lors de votre visite [le 1 mai] vient d'être ouverte. Elle est de *Teti*, le premier roi de la VI^me^ dynastie: cela fait trois rois dont on ouvre la tombe—Ounas (V^me^), Teti (VI^me^), et Papi II. (VI^me^), ce dernier jusqu'à présent inconnue. Mariette avait trouvé Papi I. et Rameren II. À nous deux nous avons presque complète la VI^me^ dynastie. J'ai laissé des instructions détaillées sur les fouilles à faire en juin et juillet: on attaquera trois pyramides nouvelles. J'espère que ce sera avec succès. . . .

(Signé) "G. MASPERO."

—We noticed a short time ago the remarkable collection of Sicilian proverbs made by Giuseppe Pitrè, filling four volumes of his "Biblioteca delle Tradizioni popolari siciliane," to which the indefatigable collector has just added another volume, the twelfth, devoted to 'Spettacoli e Feste' (Palermo, 1881). A third of the book contains an account of the religious drama in Sicily, this designation covering everything that is dramatic in its nature, from the miracle play to pantomimes, allegorical processions with or without words, dramatic rites, and musical dialogues. The remainder of the work is taken up with the customs and usages of the various festivals of the ecclesiastical year, some thirty-seven in number. This part of the volume will prove a veritable treasure-house for the student of comparative customs, and gives a deep insight into the life of the Sicilian people. The author has not gathered his material from present usage merely, but has ransacked the archives of Palermo, and communicated to his work a high historical value. Pitrè's important work is to be completed in five more volumes, two of which will supplement the Songs and Tales already published, one will be a study on the Sicilian popular traditions, and two will be devoted to children's games and plays, and usages, beliefs, and superstitions. If the collector lives to complete his task, no other country in Europe can show such a noble monument of its popular literature erected by the untiring industry of one man.

—The 'Exempla codicum Latinorum litteris maiusculis scriptorum,' edited by Professors Zangemeister and Wattenbach (Heidelberg: Köster, 1875), is out of print, and a new edition is demanded. The editors, in order to give those interested the best terms, are about to open a list of subscribers to the work, and the attention of American Latinists is called to this important undertaking. It will cost forty marks, and include the supplements, sixty-five plates in folio with the text. The first edition cost sixty marks, and the number of plates was fifty. Professor Zangemeister writes that, so far as the editors are informed, only two or three copies have been disposed of

in America. For the credit of American scholarship we hope that this is a mistake. With all our Latinists and all our libraries a better showing should be made. At any rate, America should take at least the fifty copies which the editors desire to allot to this country.

BADEAU'S GRANT.*

IN the *Nation* of February 20, 1868, we gave some account of the first volume of this work, then just published, and remarked that it proved that General Grant was as fortunate in his selection of a person to render him service with the pen as he had repeatedly shown himself to be in his selection of soldiers to aid him in his great work. Our article ended thus: "The general execution of the author's task thus far is good enough to make us look forward with impatience to the appearance of the second volume, which will treat of matters as to which there is much greater difference of opinion than there is as to the subjects of the present volume." The first volume brought the narrative down to the 9th of March, 1864, when Grant was made Lieutenant-General and assumed command of all the armies of the United States. The second and third volumes, now published, complete the work. To review two volumes of the size and importance of these would require much time and much space, and we must limit ourselves to the simpler undertaking of giving some idea of what they contain. And, in the first place, they are not only a very full history of the military career of General Grant, but they are the completest and fullest history of our war, during its last year, of which we have any knowledge, or which, it is safe to say, is in existence. Though Grant was all this year with the Army of the Potomac, he was commander-in-chief, and General Badeau has embraced in his story very full accounts of the campaigns of Sherman in Georgia and the Carolinas, of Sheridan in the Valley of Virginia, of the series of operations which ended with Thomas's victory at Nashville, of the capture of Fort Fisher, and of many other military enterprises.

A history should have two qualities in a high degree: it should be readable and it should be trustworthy. It may be said with emphasis that these volumes possess the first quality. They are nowhere dull, and it is not too much to say that they are often intensely interesting. The author had a story of the highest dignity to tell, he possessed exceptional opportunities of knowing it thoroughly, and he has told it well; and this is true in spite of the fact that these two volumes are almost an apotheosis of Grant, who is credited with every military virtue and with a large share of the other virtues. There are pages on pages of almost unbroken panegyric. Tennyson's 'In Memoriam' and Badeau's 'Grant' may, in some measure, be classed together. And yet these volumes are so full of matter, and the matter is so well arranged and handled, that one reads and reads with an absorbed interest, and finds with surprise how much of the smoke of incense he can endure. How far these volumes are trustworthy is a question to be determined only by careful and thorough examination. When an author lays down the proposition that his subject is a perfect soldier, and not only keeps that proposition steadily in sight, but does so with the devotion of a worshipper, an unfavorable presumption at once takes possession of cautious minds. We have all heard certain lines about blindness to faults and kindness to virtues. The dead Thomas must have many able admirers, and the living Warren will probably agree with them that the present work cannot be allowed to escape criticism, and there may well be found men who can write who will not consent that Gen. Badeau shall have the last word about Meade.

For ourselves, the book is, in one respect, a great disappointment. Principal among the matters of which we spoke thirteen years ago as involving a much greater difference of opinion than existed as to the subjects treated in the first volume, was Grant's disastrous assault at Cold Harbor. This has always seemed to us a dreadful thing, so bad as to be inconsistent with the theory that Grant's great successes in the West were solely due to him. In the capture of Fort Henry and Fort Donelson, in the operations preliminary to the investment of Vicksburg, and in the great victory gained over Bragg at Chattanooga, we thought we saw ingenuity of plan, careful preparation, just adaptation of means to ends, and a wise audacity leading to triumphant success; and we forgave what seemed to be lacking at Shiloh for the grand tenacity with which Grant held on till Buell came and helped him to victory. But at Cold Harbor, to all appearances, a gallant army was advanced against field-works, well constructed and well manned, in the vicious parallel order of battle; and Burnside's folly at Fredericksburg was repeated, eighteen months after, by a man who had strong claims to being reputed a great soldier, and who had behind him all the lessons of three years of hard fighting. Hooker declared: "Early in the campaign [of Chancellorsville] I had come to the conclusion that, with the arms now in use, it would be impossible to carry works by an assault in front, provided they were properly constructed and properly manned"; and Hooker was a fighter, whatever else he may have been. The battle of Cold Harbor seemed to show that in June, 1864, Grant had not come to the same conclusion, and we looked forward with impatience to Badeau's explanation of the puzzle.

The result, as we have said, is a disappointment. He takes many pages to tell the story, and he praises Grant for what he attempted to do, and what he did do, but he does not seem to us to better the matter much. We may admit all he says of the desirableness of gaining a great victory then and there, but the question remains whether Grant went to work in the right way to win it, or whether he adopted a plan which was almost certain to end in costly failure. "All night of the 1st and all day of the 2d of June the rebels were busily engaged in strengthening their position" (p. 285). "Timber was slashed and abatis constructed all along the line. At every point complete advantage had been taken of the natural circumstances of the ground; everywhere the enemy was absolutely covered, and the assailants were exposed to the full force of the rebel fire" (p. 287). The author does assert, it is true, that Grant's plan was that the principal attack should be made on his left, but he says that the commanders of his right centre and right were also directed to attack, and that the broken character of the ground and the thick copsewood made it impossible to ascertain where the rebel lines were weakest, except by actual assault. At last, he says, "all along the front the advance had been made, and on the left the assaults had been repeated, and yet had failed" (p. 295). He apparently attributes the failure to Hancock and to Burnside, but he adds a statement which carries more conviction with it: "The only cause of the repulse was that, behind intrenchments, Lee's gallant soldiers were almost invincible." If Grant had one hundred thousand men to Lee's eighty thousand at Cold Harbor, as Badeau says, and the disproportion of the forces was no greater, surely he could have done something far better than what he did do. Badeau puts Grant's loss at seven thousand, and Lee's as probably not greater than twenty-five hundred. Swinton says: "It took hardly more than ten minutes of the figment men call time to decide the battle. . . . The loss on the Union side in this sanguinary action was over thirteen thousand, while on the part of the Confederates it is doubtful whether it reached that many hundreds." He adds: "It is difficult to see how battles can be won on the principle here adopted. . . . It is not easy to discover on what ground success can be hoped from such general assaults along a line of many miles, and consequently everywhere weak, made by corps commanders independently of each other, and directed against positions which have not been reconnoitred." Swinton's further criticisms are full of significance, but we must pass on with the remark that Badeau has failed, in our judgment, to clear Grant's reputation from the shadow which Cold Harbor left upon it, and the further remark that Grant's tactics in the East were sometimes, and notably at Cold Harbor, such as to suggest the question whether McPherson may not have had more to do with his tactical successes at the West than any of us knew. Badeau's presentment of the case is the less satisfactory from the fact that his account of Grant's action in the battle of the Wilderness shows that he knows the difference between wise and unwise fighting. Of that he says (ii. 168): "There was no blind butting at the enemy, but a constant endeavor to discover his weak point, and to strike him between the joints."

Another claim which Badeau makes for Grant, and frequently insists upon, seems quite untenable: he says that Grant very early "morally defeated" the enemy, and quotes from a letter of his to the Government written on the 26th of May, 1864, such phrases as these: "Lee's army is already whipped. . . . A battle with them outside of intrenchments cannot be had." This may have been all very well for Grant to write at the time, but it does not increase our respect for the judgment of his biographer to find him publishing, nearly seventeen years after, his assent to these declarations, when we know that it took Grant more than ten months more to cause Lee to lay down his arms, and remember that in the next month, in open fighting outside of the fortifications, Lee took from us in a single affair four guns and sixteen hundred prisoners; and that afterwards sharp attacks upon us were frequently made, and often attended with very heavy and sometimes discreditable loss to us. It may be that Badeau would say that what he means by saying that Lee "abandoned offensive movements for ever; sometimes, indeed, he returned the blow that was given, but he never initiated a great attack again," was that Lee never again moved his whole army against ours at any one time. If he does not mean this his statement is not true. If he does, his statement amounts to little or nothing.

There is nothing more to say unless one should undertake the enlarged criticism of a detailed review. The author seems to us to have been very successful in steering the safe middle course between the dryness of the scientific report and the effusiveness of the sensational writer. He writes with clearness and taste, and his methods of arrangement are excellent. We are the more grateful for the prevailing simplicity of his style because his comparison of Lee to a wounded lion, his mention of a "paludal waste," and some such slips, imply that he has felt and generally resisted the temptation to fine writing. Of his treatment of the principal soldiers other than Grant it may be said that Sherman and Sheridan are only less perfect than he; that Butler

* 'Military History of Ulysses S. Grant, from April, 1861, to April, 1865. By Adam Badeau, Brev. Brig. Gen. U. S. A., late Military Secretary and Aide-de-Camp to the General-in-Chief.' Volumes ii. and iii. New York: D. Appleton & Co. 1881.

has many good words said of him; that Thomas is made to appear in a very unfavorable light, and hardly any other commander of note gets any warm praise, while Warren is sharply dealt with. Meade is, upon the whole, treated with patronizing approval. It is probably impossible for one of the Grant group to write a perfectly fair book. There is nothing that we can recall that shows that any one of them has ever frankly and unreservedly admitted the superiority of the Army of Northern Virginia to any army which they encountered at the West. They see, as we all see, that Grant forced the surrender of Lee's army and ended the war; but they also see that it took him a year to do it, with enormous outlay of men and money, and they do not like it. And here we may say that we feel a very great distrust of Gen. Badeau's figures, and think that he is uniformly disposed to make the opposing armies less different in numbers than they really were. We think that the value of his book is impaired from the fact that he assumes Grant to have been a soldier of almost superhuman perfection. As he has this postulate to advance from and knows how long it took Grant to finish his work, and as he does not like to admit that Lee and his army were more formidable antagonists than those which our forces defeated at the West, he is under a constant temptation to overestimate the numbers of Lee's army and to underestimate the excellence of our soldiers and generals. Yet Grant himself acknowledged that the fighting in the Wilderness was the hardest he had ever known—that even Shiloh was not comparable with it.

The history before us would have been improved by readiness on the part of the author to admit that Grant was, after all, a man like the rest of us. There was something sublime about him, as in the grim grip with which he held on at Shiloh; in his simply saying, when Hunter told him he did not know where the enemy was, "I will find out where the enemy is," and at once putting the whole army in motion towards the Valley of Virginia from its retired position near Washington; in the clearness of vision and relentlessness of purpose with which he perceived and directed his blows against the enemy's vital point, though it might by no means be his weakest; but he was still human and not infallible. No competent authority, so far as we know, has fairly calculated what would have been the chances of Grant's success if he had come to the general command a year earlier than he did. In the spring of 1863 the country had been discouraged by an almost unbroken series of failures in the East, and it was slow to appreciate as it deserved the true meaning of Lee's failure at Gettysburg, and the magnitude of the disaster which then befell the Confederate arms. From Gettysburg to the Wilderness was a long, disheartening period of ten months, but then Grant came to the front with almost as complete a command of all our vast resources as if our country had been Holy Russia and he the Great White Czar. Yet with all this advantage his progress was slow, and he won at last more by the intrinsic superiority of the resources of the North to those of the South than by the possession and employment of extraordinary soldierly qualities. He had great abilities, and he undoubtedly exerted them to the utmost, and the United States of America owes him a great debt of gratitude; but we doubt, to say the least, whether he deserves a place with Julius Cæsar and Napoleon Bonaparte, and the few great soldiers of all time. He achieved vast results, but not by the use of inferior forces against superior—on the contrary, he used superior forces against inferior, and used them with extreme lavishness. Let any well-read student of military history turn to the part of General Badeau's third volume which follows page 132, and his disposition will be to say, This cannot be history; it must be panegyric. There is probably no better sentence in all these volumes than that in which the author says: "The especial fitness of Grant for supreme command consisted in his ability to select subordinates in whom he could confide, and then in his willingness to trust, and even incite, them to act on their own responsibility."

It only remains to say that these volumes contain a few, and altogether too few, accounts of Grant as a man, the best of which is the description of the life at headquarters at City Point.

GONSE'S FROMENTIN.*

A PORTRAIT of Fromentin, beautifully etched by Gilbert, which forms the frontispiece of this elaborate study by M. Gonse, is a speaking witness to the justice of the latter's exposition of his subject as a man of particularly refined intelligence, and, even if Fromentin's fame were confined to his own country, would arouse the interest of a foreigner in knowing as much as possible concerning an individual of a type so eminently French and so conspicuously distinguished. Fromentin was born at La Rochelle in 1820. His grandfather had been a lawyer, and his father was a physician of repute, who had himself dabbled in painting in the studio of Bertin while a medical student. He designed Eugène for the law, and sent him to Paris to study for the profession when he was nineteen years old. There the young man devoted his leisure to literature, and to poetry in particular, and looked forward to a literary future. He was introduced to Michelet, Quinet, and Sainte-Beuve, and attended their soirées. A specimen of his verse, which M. Gonse gives, has an interest of curiosity and the formal merit of much French poetry that is little inspired. M. Gonse says in his ornate fashion: "It is worth remarking that it was on the poetic anvil that little by little he forged the fine prose of the 'Sahara.'" One could have, of course, no better training for the formation of a prose style. By and by, however, he began to draw and etch a little, without revealing the promise of his future merit. The Louvre began to attract him, and his preferences were original. "Strange to say," observes M. Gonse, "he never judged painting from the literary point of view"; an observation worth bearing in mind, because it is the key to Fromentin's success in both arts, or rather to the qualities he displayed in the prosecution of both writing and painting. To the Italian school in general he was nearly indifferent; Leonardo perplexed more than delighted him. For Titian's portraits he had "un culte muet," and he was interested in Salvator. But the Dutchmen aroused his enthusiasm from the first, as naturally as they repel a critic like Mr. Ruskin, to whom pure painting appeals so little. In 1843 he determined to become a painter, and began to study with Rémond, who then represented the academic school of landscape. Rémond had little influence upon him, and a year after he entered the studio of Cabat, who is officially to be called his real master. In 1846 he made his first journey to Algeria, and Africa at once aroused in him the intense enthusiasm which made him, as we know, the not unworthy associate in interpretation of that country of Marilhat, Delacroix, and Decamps. Elsewhere he travelled little, and had the national lack of interest in foreign countries that are civilized. He was never in England, we believe, and never in Rome, so far as appears, making, outside of France and Africa, but two journeys, one to Venice, which he painted well, and the other to the Low Countries, which resulted in his 'Maîtres d'Autrefois,' a work on the old masters of Holland and Belgium—*the* work on this subject, one may say. He wrote also two volumes on Africa, the famous 'Sahara' and 'Sahel,' and a romance, 'Dominique.' He shares with many illustrious painters the fortune of not having been a member of the "Institut," but his books brought him on a first ballot fourteen votes in favor of his election to the Academy. He owed his country only his button of officer of the Legion of Honor. His death at the age of fifty-six was unhappily premature, M. Gonse thinks, and was, at all events, unexpected.

The love of pure painting, which, as we have said, characterized him from the first, is an intellectual rather than a spiritual feeling, and Fromentin falls short of spirituality in precise proportion to the difference between it and the quality that distinguishes a man of intelligence whom the French call *spirituel*. He speaks in one letter here quoted of tumultuous emotions and a susceptibility in revolt, but no such state was characteristic of him, and was doubtless quickly brought into subjection by his sense of measure, which was supreme. This would mean with a genius of another race an emotional coldness, but with him it means simply balance of temperament dominating keen sensibilities. His poetic sense was far less profound than that of the other French painter whose biography we have recently had, Millet; less penetrating than that of Daubigny, or indeed of any of the Fontainebleau school, but it was very real. It was, in one word, like every other trait of his, refined. A superficial criticism, mindful only of the delicacy of much of his work—the arched necks and flowing manes and tails of his horses, his love of clearness without excessive brilliance in painting sunlight (so different from the inclination of the *Fortunistes* in pursuing the same attempt), his slate-like violet tones and the kempt look of his compositions—might adjudge his painting elegant merely, in the depreciating sense often given to that epithet. But it was as far from mere elegance as he was himself from being an exquisite. M. Gonse thus describes his studio at the outset of his career: "L'atelier avait une tenue sévère et élégante qui vous frappait, mais sans recherche préméditée. Fromentin le voulait, par-dessus tout, d'une propreté et d'un ordre extrêmes. À vrai dire, c'était plus un salon qu'un atelier." He had a horror of disorder, of crudity, of excess; and he was equally free from primness and formality. It is easy to understand why his prose and his painting both have in an eminent degree the quality known as style—that is, a dignity and distinction apart from essential individuality. Such a type of man is, it is unhappily not quite needless to say, a very positive one. He was in every way original—in fact, an excellent vindication of the consistency of culture and high training with individuality. There were simply no rough corners, no awkwardnesses, no aggressive violence in his individuality. In a positive way he illustrates the mean of poise, intelligence, insight, rather than negatively avoids the defects of energetic extremes. He belongs to the small and distinguished aristocracy of art, not by an exclusiveness of sympathy, but by a refined dignity of effort. All this may be inferred from some admirable sentences of M. Gonse better than it can be exactly expressed. Comparing Fromentin and Marilhat, he says:

"Au fond, l'art du peintre de l'Égypte [Marilhat] est du même ordre que celui de l'Algérie: chez tous deux, même éducation de l'œil et du cerveau, même tendance à idéaliser le vrai, ce qui est le propre des natures cultivées, même recherche des lignes élégantes et des pondérations harmonieuses, se

* 'Eugène Fromentin, Peintre et Ecrivain. Par M. Louis Gonse, Directeur de la *Gazette des Beaux-Arts*. Ouvrage augmenté d'un Voyage en Egypte et d'autres Notes et Morceaux inédits de Fromentin, et illustré de gravures hors texte et dans le texte.' Paris: Quantin; New York: J. W. Bouton.

développant sur l'étude sincère, exigeante, attentive, affinée, du morceau aussi bien que du motif général. Idéaliser, harmoniser, synthétiser le vrai, même le vrai *absolu*, lui faire parler en un mot un langage expressif ; . . . tel est le but qu'a constamment poursuivi Fromentin, qu'il a atteint pleinement et d'une façon unique dans ses livres, qu'il a souvent atteint dans ses tableaux."

It will be seen that M. Gonse prefers the writer in Fromentin to the painter, though praising the latter highly. The former scarcely needs analysis, and is here sufficiently treated in far less space than the painter, though an excellent review in detail of the 'Maîtres d'Autrefois' is given. In the course of this the remark is made that what stamps the book as a veritable novelty in the domain of art-criticism is the fact that in it "shop" ("questions de métier") occupies the most prominent place without apparent effort and without pedantry; and any one who has read the work will recognize the felicity of the observation. The novel 'Dominique' is described as lacking in unity, though praised for other qualities, and the 'Sahara' preferred to the 'Sahel,' in opposition to George Sand's opinion. Apropos of the 'Sahara,' M. Gonse quotes M. Montégut's remark that it is impossible to discover in it a vague expression, a feeble epithet, or an abstract word, and adds that for appositeness and propriety of terms Fromentin is "without an equal," and that this is in effect his great originality; and he contrasts unfavorably with him in this respect Gautier, for whom, nevertheless, he protests great admiration. Despite Gautier's reputation, it is easy to sympathize with this. In an unpublished and incomplete address, entitled "Un Programme de Critique," here given, Fromentin has himself something to say of the Romantic movement, a few incidental sentences of which we must make room for. They are characteristic and sound, and, we dare say, would have been exceedingly unpopular had they been delivered:

"Vous connaissez l'histoire de ce quatre-vingt-neuf artistique, qui eut aussi [like the *other* Revolution] ses ardeurs, ses luttes, ses tempêtes, quelques petitesses, de grandes gloires; qui, le jour de son triomphe, se baptisa d'un nom mal choisi et se fit tort en s'appelant *romantisme;* qui prit des devises bizarres, affecta très-innocemment des tendances farouches, discuta prodigieusement, créa presque autant, se couvrit de ridicule et d'éclat, commit quelques excès, produisit des œuvres admirables, mais au fond ne promulgua rien."

Fromentin's pictorial art is very minutely examined, nearly every picture of importance receiving its due of attention. Taken as a whole, the first part of the book—or rather the second, for the first is biographical—is an admirable critique. It is written *con amore*, in the best sense of the term—the sense which implies perfect harmony between the sympathetic admiration of a friend and the impartiality of a writer who esteems highly his vocation of critic. M. Gonse finds Fromentin lacking in the technical education which, as we might expect to find the director of the *Gazette des Beaux-Arts* saying, and as, of course, is perfectly true, demands the severest studio-training. The drawing of even Fromentin's favorite horses he finds insufficiently studied, which indeed the painter felt himself, by the way. And he finds such fault in general as seems to him deserved, with perfect freedom. But he is withal immensely courteous and—persons who have seen Fromentin's work, a good deal of which has been exhibited in this country, will bear out the remark—finds with reason much more to praise than to blame. After Fromentin had passed his first period, of painting like an admirer of painting, and his second, of more or less uncertain groping, his work was certain, original, and fine. M. Gonse points out that his execution was especially admirable—perhaps we should rather say his handling; and he notes the peculiarity of the painter's general point of view, which, in these days of specialists, is worth remarking—namely, that he painted "man in nature," not landscape simply, nor landscape as a background for figures, nor figures merely—for which last, indeed, he had never fully qualified himself. "Le but qu'il s'est fixé," says M. Gonse, "est simple et net: faire vivre l'homme dans la vie même de la nature qui l'encadre." His qualities were a sensitive feeling for action and movement, a lively imagination, a happy gift of composition, with elegant and choice forms, and, in rendering nature, a faculty catching the "infinite surprises of luminous effects." He was a painter more by instinct than by education, and his instinct often guided him better than his patient studies. "His virtues," concludes M. Gonse, "are aristocratic tastes, reserve of manner, absolute respect for himself and his talent, and a horror, perhaps excessive, of noise and militant attitudes." One notices the last-mentioned trait in his objection to Van Dyck's theatricality, but we presume M. Gonse means only that it is excessive, considered absolutely; Fromentin would certainly not have known how to supply its absence had he lacked it.

The consideration of Fromentin as a writer is largely amplified with inedited material. There is an extremely interesting correspondence with George Sand given, from which one perceives how perfectly he carried into intimate personal relationships the courtliness and delicate reserve that characterized his manner in general; the correspondence might be called a lesson in manners as well as in epistolary form. George Sand esteemed him enthusiastically; she had, as is well known, an admirable critical faculty, that gave her an intellectual sympathy with qualities unlike her own. Fromentin was very unlike her. "You are a great painter of *localité* in literature," she says; "I am not precisely of your opinion that the Seine is only a *river*." Some notes for a fragment entitled "L'Île de Ré" and an incomplete "Voyage en Égypte" fill out the volume. The book itself is one of Quantin's best performances. Paper and type are luxurious. The indexes are exhaustively complete. Besides the initial portrait, there are many plates "hors texte," etched by various competent interpreters of Fromentin's delicate refinements, and numerous fac-simile sketches and "process" reproductions of his studies in the text. It is a monument worthy of the subject; indeed, to say, as can be justly said, that Fromentin was worthy of just such commemoration, is almost a descriptive eulogy.

THE AMERICAN CATALOGUE.*

MESSRS. LEYPOLDT AND JONES are to be congratulated on the completion of their 'American Catalogue.' The second volume has appeared, and our literature now has a bibliographical record of which it need not be ashamed. Of what we had before, the less said the better. Roorbach belongs to what might be called the shabby age of American bibliography. Kelly was an improvement in outward looks. But Roorbach and Kelly were only lists of authors, and Kelly is now ten years old, whereas the 'American Catalogue' comes down to the present time, and includes an alphabet of subjects. In the latter respect we are put on a par with other nations, and have the advantage over some. England has only Watt, equally valuable and difficult to use, and the two subject-volumes of Low's 'English Catalogue,' extending merely from 1837 to 1857; and a few—very few—special bibliographies. Germany has the subject-volume of Kayser, published in 1838, and covering eighty-two years, from 1750 to 1832; besides Hoppe's 'Katalog' and Schwab and Klüpfel's 'Wegweiser,' which is a careful selection of books published during the nineteenth century, to say nothing of a host of special bibliographies on every conceivable subject, continually brought down to date by supplements or new editions. For France there is the subject-volume of Brunet, general in name but prevailingly French in contents, and the excellent volumes of Lorenz, 'Table des matières,' 1840–75. For Norway there is Botten-Hansen's 'Norwège littéraire.' But there the list ends. Bertocci in Italy and Bruun in Denmark have only begun. Hidalgo in Spain gives only a dictionary of titles with an index of authors, and in Portugal Da Silva's work, valuable as it is, is only a list of authors and their works. The Slavic nations have, so far as we know, no classed bibliographies covering a series of years, though Mezhoff's excellent catalogues offer a substitute in Russia. Dutch literature has a complete author-list; but Van der Meulen's 'Register' extends only from 1850 to 1875, and the classed bibliography projected by Muller remains a project.

The 'American Catalogue,' to be sure, does not profess to be a complete national bibliography, but only a list of the books remaining "in print" at a certain date; but with this limitation, it is the peer of the works which we have enumerated above. It has been prepared in a conscientious manner that leaves little to be desired. It is excellently printed on good paper, with broad, perhaps too broad, margins. The titles are as exact as a good deal of care and a lively distrust of the publishers' own lists could make them. Though their fulness is far from what is called "bibliographical" it is sufficient for most purposes. Mr. Jones, in a neatly written preface, explains how the work is arranged and what will be found there, and what not. The title-page only promises all works for sale July 1, 1876; but a supplement adds the more recent books of most of the leading publishers. The preface is followed by an admirable list of "bibliographical aids," compiled by Mr. Leypoldt, and introduced with some words of apology which are entirely unnecessary, for it is the most valuable contribution ever made to the bibliography of English bibliography. It is a curious indication of the extent and complexity of our literature and of the hurry of the present age that works of this kind—bibliography, as it were, raised to the second power—should have become necessary and even be multiplying. Powers's 'Handy Book about Books' had not got out of print when Sabin prepared a new and Americanized edition. Petzholdt's 'Bibliotheca Bibliographica' is so useful that we are anxiously expecting a supplement exhibiting the publications of the last fifteen years. A member of the Paris Geographical Society who is collecting the titles of bibliographies of geography and travels alone has already found over eleven hundred. The present list, of thirteen quarto pages, is arranged dictionary-fashion under specific subject-headings, with copious cross-references. As the compiler asks for additions and corrections, we may suggest a cross-reference from Guatemala to Mexico, for one of the titles under the latter treats of both countries.

The body of the work follows. We will not be so bold as to say that there are no mistakes in distributing the titles under their proper heads. We can only assert that in poring over the pages for some time and with some care we have found none. The headings seem to have been selected with

* 'The American Catalogue. Under the direction of F. Leypoldt. Vol. ii. Subject-Entries of books in print and for sale (including reprints and importations) July 1, 1876. Compiled by Lynds E. Jones.' New York: A. C. Armstrong & Son, 1881.

good judgment. The inevitable difficulty of choosing among synonyms and antonyms is rendered of little account by a liberal supply of cross-references. One thing we object to decidedly—keeping the (subject) "Index to the Appendix" of vol. i. in a separate alphabet from the rest of the work. It was unnecessary, for the whole of vol. i. was printed before the greater part of vol. ii. Nearly all these titles could have been incorporated in the main body of vol. ii., and the nuisance (it is not too strong a word) of two alphabets avoided. We have examined the comparative number of the entries under the different classes of headings to see if any conclusions could be drawn from them as to the reading of the American public. We have not reached any startling result. Americans appear to distribute their attention with great impartiality through the classes of theology, history and its related sciences, art, science and the arts, and literature. It may be noted that the proportion of theology to all publications is larger than the percentage of theology reported by public libraries as borrowed from them. But it is uncertain whether the reason why the people do not take out more theology is precisely that they have so much of their own—just as nobody takes Shakspere or the Bible from a public library—or that the classes who buy most theology are not the classes who use public libraries. Our personal observation would lead us to the latter conclusion.

The section containing works about the Bible is noteworthy for two reasons: first, for its length (twenty-one double-columned quarto pages), and, secondly, for a novelty in arrangement. In all catalogues which we can remember the books of the Bible have been arranged in the order in which they came in the English version; here they are arranged alphabetically, which produces a queer effect in its mixture of Old and New Testament names, but is, no doubt, a necessary concession to the diminished familiarity of the present generation with the Scriptures. The works about the "Whole Bible" are thrown into thirty classes. We miss a class, "The Bible and Science," which certainly should have been made for a half-dozen works now lost with a hundred others under the rubric "Miscellaneous." The new Dante Society will find only three works about Dante published as yet in America, and two of them reprints. Shakspere is usually an important rubric, and we are surprised to see so little under it here—only a column and a half. Perhaps it is a healthy sign that our people are more inclined to read Shakspere than to read or write about him. Such a work as this must, we should think, increase the sale of the books recorded. We have noted half a dozen books in as many minutes on subjects in which we are interested and which we should like to buy. To booksellers, of course, it is indispensable; but it is almost equally needful to careful bookbuyers. It will take its place at once as a most valuable assistant of the book-committee in every library whose purchases extend beyond the merest current literature, or where any attempt is made to fill up particular branches; and it may even be found useful as a supplement and corrective of the classed catalogue, or perhaps as a substitute for one in those unhappy libraries which are too poor to have a guide of their own.

HOLMES'S COMMON LAW.*

THIS book is not a history of the growth of the common law, like Reeves's; nor is it, as the reader might anticipate from its opening sentences, an account of the common law as it stands to-day, such as Kent's, which the author has recently edited. It can best be described as an historical essay describing the influence of the primitive conceptions of the childhood of the Teutonic races upon the common law of to-day, an explanation of the savage or mediæval origin of certain anomalies which we have retained in our modern legal system from convenience, in spite of the logical confusion caused by their survival, while they still bear the traces of conceptions, beliefs, and arguments so strange that we can hardly realize that they ever seemed for a moment true. The book is a valuable contribution to the latest of the sciences—the study of prehistoric man, and his progress through savagery and semi-civilization to modern modes of thought. The study is an interesting one, and enhanced by the brilliancy and learning with which Sir Henry Maine and his followers have handled it, calling comparative philology, comparative mythology, and the analogies afforded by existing savage customs to bear upon the obscurities of the past. While the main theory has received elaborate treatment from English scholars, the important branch of the history of the common law has received curiously little attention from them, and we have had to go to German sources, to Sohm, the Maurers, Nasse, Stobbe, and others, to find much of real value. It is pleasant now to be able to look with pride upon our American contribution to the study.

This book of Mr. Holmes's, and the essays on Anglo-Saxon law, published a few years ago, by Adams, Lodge, and others, to which it may well be considered a sequel, give a very excellent (though not yet complete) view of the sources and growth of our legal system. Those essays were an examination of the Anglo-Saxon law as to crime, real and personal property, family relations, and the courts and legal procedure. In this later volume the author follows the subject down, with more or less fulness, through the dry year-books and mediæval commentators to our own time. In three points he finds the ancient influence most strongly marked—in the fictitious personification of things and animals, in the fictitious transfer of status by succession, and in the limited remedies allowed by the early law, from which arose a corresponding limitation of legal rights.

It is well known that the early laws of savage nations are very largely ceremonial or criminal in their nature, mercantile law hardly existing until civilization appears with its attendant wealth and trade; and their criminal law is very far from our modern notion of what criminal law should be. It has no thought of preventing crime by penalties imposed by the state. It is little more than an attempt to regulate private vengeance. The religious notion of expiation is prominent in it, and it assumes revenge as an evident duty, but sets limits to it by prescribing with some precision the retaliation which the injured one or his friends can inflict in return for the crime. This in itself was a great aid to civilization by arresting family feuds, and it prepared the way for another great step forward—the substitution for the blood revenge of a money payment, fixed in amount and payable to those injured, to end the feud. This stage had been reached by the early Saxon law, and in this (which might now be considered criminal compounding of felony) our modern system of fines and penalties imposed by the state had its rise, through the extension of the king's courts, and their grasping disposition to treat private injuries as offences against the king, to be expiated by fines paid into his coffers.

In close analogy to this, Mr. Holmes shows here the manner in which the savage law recognizes the duty of avenging an injury upon the immediate instrument of it, even if it be a senseless brute or inanimate object. In the same way that the Kukis of Southern Asia avenge the death of a comrade who has fallen from a tree by making it the duty of his relatives to cut the tree down and scatter it in chips, so the Jewish law directed that an ox that had gored a man should be stoned to death, and that its flesh should not be eaten; the Greeks exiled the axe that caused death, and, as late as two centuries after Christ, still sat in judgment on inanimate things in the Prytaneum. The early Roman law had similar provisions, but as early as the twelve tables the improvement had been devised of allowing the owner of the slave, animal, or thing in fault the privilege of paying a sum of money in lieu of surrendering it; and this optional right of buying off the vengeance, instead of surrendering the cause, slowly crystallized into an imperative obligation of the owner to pay for the injury, just as the fine put an end to the blood feud. In the case of innkeepers and ship-owners, Mr. Holmes thinks that their peculiar position led to another innovation, the holding them liable for wrongs committed not only by their slaves but by free persons in their employ, and "for the first time one man was made answerable for the wrongs of another who was also answerable himself," and the modern doctrine of principal and agent appears; but this is to be construed with reference to the author's view of succession in status and of bailment, to which we shall presently refer.

Amongst the early Teutons we find the same duty to destroy the injurious animal, slave, or thing, a burden not falling necessarily on him who owned it at the time of the injury, but following the thing into the hands of any one who might come to own it, however innocent. The Saxon law as early as Alfred's time recognized the right to buy off the vengeance, and, later on, the duty to pay for the injury wholly replaces the surrender, and limitations based upon negligence and the amount of damage caused are recognized; but in Bracton's time the weapon with which a murder was committed was still *deodand pro rege*, and given to the Church for the benefit of the soul of the deceased. As late as Shakespere the old law was still in force, and traces have remained in our indictments almost to the present day. In England it was not until feudalism had introduced a closer relation between men that the responsibility of a master for the acts of his servant was clearly recognized. But the distinction between animate and inanimate things had before this been felt to be important by them (as it had been long before by the Romans and the Jews), and the responsibility of the inanimate object had disappeared before that of vengeance upon animals and slaves was abandoned, the latter remaining as late as "The Forme and maner of Baron Courts," when it was held that "ane wylde or headstrang horse" that had run away with a man and killed him should be escheat, and it was not until the modern era had set in that this distinction faded before the notion of legal punishment as a deterrent penalty applicable only to free and intelligent beings.

Mr. Holmes next passes on to a rather unsatisfactory metaphysical discussion of the modern theory of criminal law, of torts, trespass, negligence, malice, etc., which we should weary our readers by describing. Before passing on to the more valuable portions of this unequal volume, we will refer to some other instances our author points out of the personification of inanimate things. In real property we find easements attached to the dominant estate, not its owner, and following the estate into the hands of a disseisor; and the same is true of the fixtures. Similarly the obligation to pay rent follows

* 'The Common Law. By O. W. Holmes, Jr.' Boston: Little, Brown & Co. 1881. 8vo, pp. 422.

the land into the hands of the disseisor of the tenant, and continues so long as the land remains, even if the buildings burn down, while if it be a suite of rooms that is let and burnt, rent no longer runs because now the tenement to which it attaches is gone, although the contract may be written in the same terms in the two cases. A still more striking case of the survival of this ancient view of a thing as a person is found in that branch of commercial law which was among the earliest to develop—admiralty. Here we still have proceedings against the thing, not its owner. Thus, a ship is chartered and entirely under the control of the hirer, and through his carelessness runs into and destroys another vessel. But, instead of suing the person at fault, the injured party proceeds against the ship, and thus throws the loss ultimately on the innocent owner, while, no matter how great the damage may be, the latter can discharge himself by surrendering the vessel and her freight. Again, freight has been called the mother of wages, for the debt was the ship's and no one else's, and if she was lost the sailors lost their pay. Similarly as to salvage and contracts to carry cargo, the obligation rests on the ship and not on her owner or charterer. It is needless to point out the close connection of all this with the decision of Henry VI.'s reign, holding a ship responsible which had by her motion thrown overboard a man who was drowned, and declaring it forfeited as an accursed thing.

Mr. Holmes's view of bailments is equally vigorous. To get at the origin of the English law he goes back, not to the civil law of the Roman prætors, but to the Saxon days when almost the only personal property that a man did not keep on his back was cattle, which the nearest hostile clan was watching a chance to steal. When the cattle were raided the herdsman did not stop to talk it over with the owner. He called his comrades and followed in hot haste. If he came up with the cattle within three days he took his oath to their having been in his possession, and no other legal process was necessary. It was thought best that the thief should be liable to only one action, and as he was responsible to the bailee from whom he took the property for breaking, he could not be proceeded against by the bailor. As the bailee had full protection (in theory, at least), so he was absolutely responsible to the bailor, whether careless or not, negligence being a complicated issue which the simple legal processes of the day were ill fitted to determine. Possession was the main issue in nearly all these early civil proceedings. The jury, who were neighbors, knew whose the cattle were of their own knowledge, if the proper forms of sale had been complied with, and, in the absence of anything that we should call evidence, that generally determined the matter. This extended liability continued to be the rule until the beginning of the eighteenth century, when its unreasonableness and oppressiveness, no doubt, were felt, and Lord Holt boldly overruled it in the famous case of Coggs *vs.* Bernard, limiting it to bailees holding themselves out in a public calling; and it has since been restricted substantially to common carriers by similar judicial legislation. The only criticism we would offer to this is that we think the original liability of bailees was not so extended as our author supposes. (See v. Bar, p. 98; Alfred [Einl.] 28, and Will. i. 37.)

Mr. Holmes pursues a similar method of historical investigation in his chapter on the history of contracts, showing how the right to personal property was affected by the limitation of remedy to the two early forms of action, debt and covenant, and the practice as to the necessary official witnesses or sealed instrument required to bring a contract before the court. He sketches the rise of the doctrine of the necessity of consideration to bind a bargain in the ecclesiastical tribunals under the influence of the civil law, and the introduction of the actions of assumpsit and case in the law courts, in a manner very interesting to lawyers; and he closes his volume with an account, which we wish was longer and fuller, of the doctrine of succession, under which, by a convenient, fictitious transfer of status, the heir, and afterwards the executor and administrator, are considered to be legally the deceased himself, a privilege afterwards extended to assigns and agents, thus preserving important rights that would otherwise have perished with the deceased or become inoperative. The summary with which the lectures originally closed is, we are sorry to find, not preserved.

Our readers will see from the account we have given that the volume contains much that is novel and brilliant, and that it shows calm consideration and unusually profound legal study. It is neatly and clearly written and well printed. It is, indeed, so very good that we dislike to point out its faults; yet we must admit that it is injured by long philosophical discussions of intent and the like, which, if they were worth preserving anywhere, would only be so in a condensed form, as a part of a complete philosophical treatment of the subject, which this volume makes no claim to be. Printed here, they give a tediously discursive and aimless air to the book, and hide its real historical value.

History of the Colony of New Haven, to its absorption in Connecticut. By Edward E. Atwater. (New Haven: Printed for the Author. 1881.)—A better theme no writer of local history need ask for than the theme of this stout octavo volume. No one of the pioneer colonies of New England was composed of better materials, none was organized with nobler or more far-reaching views, or applied itself to its rude work in the wilderness in a wiser and at the same time a more heroic spirit, than that which, under the lead of Davenport and Eaton, laid the foundations of New Haven in 1638. But the history of this enterprise, from the beginning down to its early and unrighteous extinction as a separate jurisdiction, was a pathetic succession of failures and disappointments. In the idea of its leaders it was to have been a commercial colony, it was to have been a seat of the highest learning, and, most of all, it was to have embodied the theocratic theories of John Davenport in a sort of visible kingdom of heaven on earth. The great commercial hopes of the planters failed in the failure of their Delaware Bay enterprise, and foundered in the disappearance of "the phantom ship." The noble foundation for a college that was laid by Governor Hopkins was plucked to pieces by envious hands, and is traceable to-day only in two or three meagre grammar-school endowments in different parts of New England, and in a part of the funds of Harvard College. Finally, the ideal Church-State which Davenport had so painfully elaborated "after the pattern showed him in the mount," perished when New Haven was merged in Connecticut; and the broken-hearted pastor turned his back on the site of the New Jerusalem which he had "builded foursquare," declaring, in a letter, "in N. H. C. Christ's cause is miserably lost."

To say that Mr. Atwater's history does, in every respect, full justice to the subject, would be higher praise than we are prepared to award. And yet the positive faults of the book are not many nor serious. The narrative is lucid and orderly, and unblemished by faults of taste. The indication of authorities and sources is not as full as it ought to be, although the reader has throughout a sense of confidence in the accuracy of the writer. The minuteness of detail which is wearisome to the casual reader is precious in the eyes of the antiquary who has any interest in the localities of the colony. The most serious criticism to be passed on the work is the lack of proportion in dealing with some of the minor provinces of the tiny empire. A more vivid dramatic faculty, and a quicker appreciation of the occasional humorous aspects of the almost tragical story, would have added to the literary charm of the book; but these negative faults will easily be overlooked in the strong feeling of delight and gratitude with which those who love the memory of the founders of New Haven will welcome this solid and excellent work.

Kant and his English Critics. A Comparison of Critical and Empirical Philosophy. By John Watson, M.A., LL.D. (New York: Macmillan & Co. 1881.)—The interest taken to-day in Kant's 'Critique' has hardly a parallel in that excited by any other philosophical work. It is most analogous to that felt in the first critical movement by the generation which grew up immediately after the publication of Locke's Essay. Other philosophical leaders engage us through the central thought which forms the basis of their teaching, as Berkeley by his Subjective Idealism or Schopenhauer by his Pessimism; or else some theory which seems capable of being detached from the system in which it lies embedded (like Leibnitz's Principle of Continuity, or Hamilton's Law of the Conditioned, or Descartes's proof of God's existence) lays hold of the more reflective minds and draws them still to regard writers whom they would otherwise forget. But Kant's by no means well-compacted treatise interests both in sum and in detail. This year a century ends since it was published, but it is, like its own *Ding an Sich*, independent of time. Not to speak of its influence in Germany, or of the numberless shorter discussions of its meaning scattered up and down the magazine literature of England and America, during the last fifteen years Kuno Fischer's careful commentary has been translated into English, Prof. Mahaffy has restated the first half of the 'Critique,' Prof. Monck has admirably condensed the whole, and Prof. Caird has with remarkable philosophic imagination analyzed and discussed the entire body of Kant's speculative writings. Besides these larger works, the lucid statements of Prof. Bowen in his 'Modern Philosophy' are well known, and soon Dr. Wallace promises an epitome of the system in the series of Philosophical Classics. Such various and minute inquisition into the meaning of an unattractive and highly technical writer, accessible to English readers in a translation of only middling merit, implies a general conviction that through the Idealism of Kant the world becomes most intelligible.

Chiefly in connection with this larger Kantian agitation Prof. Watson's book finds its significance. It is itself a part of a controversy, and assumes that its reader has not only a large acquaintance with the 'Critique,' but such an interest besides as will delight to trace in Kant's subordinate and less perfectly stated doctrines the influence of his fundamental principles. And such a tracing presents many peculiar difficulties. One who is crossing a bridge between the old and the new, and who has not a resident's familiarity with the ideal language of the country toward which he travels, retains many of the dogmatic and empiric modes of speech, and of conception too, which were proper to the land from which he set out. The careful student of philosophic language values these ambiguities as historic indications of growth; but a careless listener, sensitive only to his own tongue, is apt to neglect whatever

is not uttered in it. He must be a curiously erratic thinker who cannot justify himself out of Kant's 'Critique.' What is in large measure true of all philosophers is pre-eminently true of Kant, that in attempting to understand him the whole must be comprehended before the parts.

Now, in the English philosophical literature of the last few years few portions of Kant's great argument for Idealism have escaped this imperfect and therefore erroneous understanding, and Prof. Watson has ingeniously cast a restatement of the whole drift of that argument in the form of replies to popular empiric treatments of it. Thus, on Kant's mode of putting his problem, as set forth in the introduction to the 'Critique,' Mr. Balfour furnishes the text; on Part I., or the Æsthetic, Prof. Sidgwick; on the claims of Psychology, as against Kant's Deduction of the Categories, Mr. Lewes; on the Principles of Pure Understanding, Dr. Stirling; on Phenomena and Noumena, Mr. Spencer. Two concluding chapters, on the logical inconsistencies which render the system of Kant unfit for a final resting-place, present the view now generally held by the English Hegelian school, viz., that the work of Kant came to completion only under the later master's treatment. These chapters will probably be found as valuable as any in the book.

The style has nothing of the tangled and esoteric mode of expression common among Hegelians. Prof. Watson has caught something of the full ease of sentence for which his master, Prof. Caird, is remarkable. Only one sometimes wonders after a half-page of excellent diction that the resulting thought is not more considerable. Polemic writing is a business of doubtful profit. To convict an adversary of talking nonsense is not the same thing as to talk sense one's self. The present need, at any rate, in Philosophy is for constructive work put in such fashion that its worth may be examined. Many of the younger Hegelians show a lamentable inclination to interject parenthetic suggestions of assured truth in the breathing spaces which they allow themselves while putting to flight the armies of the alien. From its very plan Prof. Watson's book is not without traces of this tendency. It is essentially controversial. Yet its controversy never becomes wrangling. Throughout there is a learned, competent, and dignified discussion of high themes, and upon a method which may make the deeper thought of Kant more accessible to some readers of the popular philosophical writers of our time.

The Organization of the Early Christian Churches. (Bampton Lectures, 1880.) By Edwin Hatch, M.A. (London: Rivingtons; New York: E. & J. B. Young & Co., Cooper Union. 1881.)—The organization of the Christian Church may be viewed from two different standpoints. It is an order divinely established once for all, admitting of no change, and requiring none, its latest form being substantially a copy on a larger scale of its earliest. Or it is an organization subject to the same conditions as other social institutions; its form will change to meet wants created by new times and circumstances; it will take a special coloring from particular influences brought to bear upon it. The former is the attitude of dogmatic ecclesiasticism; the latter, that of the scientific historian, and also that adopted in these lectures. The author does not go to the New Testament for his explanation. With a candor surprising from its rarity, he confesses that the New Testament contains no theory of ecclesiastical policy. Abandoning the familiar *à-priori* method of the theologians, he treats the facts of ecclesiastical precisely as the historian would treat those of civil history. He regards the organization of the church as a process continued from age to age, and he attempts to point out the various stages in its early growth. There was nothing special, he maintains, in the organization of the early churches. The names of officers, their functions, and their relation to each other and to the other members, were similar to those of the existing contemporary societies, after which they were modelled. They adopted the organization which they found at hand, and which commonly obtained whenever individuals united in a corporate capacity. The early Christian churches were philanthropic agencies. As in other societies, so in theirs, the bishop was merely president. This title he even shared at first with the other officers; but he soon came to monopolize it as recipient and administrator of the common fund. Associated with him were the deacons, who distributed the alms when the sphere of labor was extended. They were to each other as chairman and treasurer and outdoor relieving officers. The presbyterate was modelled after the patriarchal and communal system of government by elders which prevailed among both Jews and Gentiles. The presbyters formed the bishop's council, which, like the synedria of the Jews, was chiefly a court of discipline, the bishop being merely president. His supremacy arose when the necessity for a unity of faith, as a bond of union, involved also the recognition of a single authoritative teacher in each church.

As yet, however, office brought no power. The relation of the bishop to his presbyters, like that of chairman to committee, was one of primacy, not supremacy. Nor were the clergy regarded as a separate class. "The bishops and presbyters of those early days kept banks, practised medicine, wrought as silversmiths, tended sheep, or sold their goods in open market. They were men of the world, taking part in the ordinary business of life." Union with the state, however, and the rise of monasticism worked an organic change. The clergy became a separate, independent class, while the local and œcumenical councils, whose decisions the state enforced, tended to merge the former individuality of the churches in a formal unity, and prepared the way for the development within the church of the imperial system of the state. From the rapid increase of the churches which ensued on this alliance arose the parish and cathedral, and the whole complex mediæval system which still survives under a variety of forms.

Such is a brief outline of the position taken in these lectures. The author writes with a thorough and comprehensive knowledge of his subject, free from all preconceived ideas, and anxious only to arrive at conclusions warranted by the facts of history. If the last word on some points has not been spoken, the treatment of the whole subject has been placed upon a scientific basis, and the solution of the questions with which the volume deals thereby considerably advanced.

TO

The Nation,

From JULY, 1865, to SEPTEMBER, 1880.

Net price (no trade discount), paper, $2; cloth, $2 50. Purchasers will please remit with order. Address Publisher of the *Nation*, Box 25, New York, or

Q. P. INDEX, Bangor, Maine.

IN any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address PUBLISHER OF THE NATION.

BOTH VERSIONS IN ONE BOOK.

The Comparative Edition of the New Testament.

Embracing the Revised and the Old, or King James, Versions, arranged in Parallel Columns.

BOTH VERSIONS ON ONE PAGE.

Large 12mo.

Cloth extra, plain edges	$1 50
" bev. boards and carmine edges	1 75
Imitation panelled calf, yellow edges	2 00
Arabesque, gilt edges	2 50
French morocco, limp, gilt edges	4 00
Turkey " " "	6 00

As the changes that have been made in the revision of the New Testament are now exciting a great deal of interest, and comparison between the new and old versions will be constantly made, we have prepared a comparative edition containing the two versions arranged in parallel columns, so that the alterations can be seen at a glance. This arrangement makes the work one of great popular value, as it does away with the necessity of using two books and saves the time that would be occupied in seeking corresponding passages.

The proof-readings of our Comparative Edition have been gone over by so many competent proof-readers that we believe the text is absolutely correct.

This edition contains the Preface to the Revised Version, and also the list of readings and renderings preferred by the American Committee, recorded at their desire.

The American readings adopted by the Committee on Revision are incorporated in the text, and those not adopted will be found in the Appendix.
